**DELL-FOYN**

*London : The Educational Book Co., Ltd.*

**Dell, ETHEL M.** (d. 1939). A British novelist. She gained her first success with *The Way of an Eagle*, 1912. Specialising in the aristocratic "strong silent hero," her novels were full of romantic improbabilities, and appealed to a wide public. Her best-sellers included *The Knave of Diamonds*, 1913; *The Rocks of Valpré*, 1914; *Great Heart*, 1918; *Storm Drift*, 1930; *The Prison Wall*, 1932. She died Sept. 17, 1939.

**Della Cruscan School.** Name given to a small clique of 18th century British poetasters who wrote verses marked by insipid sentiment; employed extravagant conceits; and adopted a bombastic classicism. The chief figure of the group was Robert Merry (1755-98), who styled himself a new Petrarch and took the name of Della Crusca after the *Accademia della Crusca* (*q.v.*) at Florence, where he was the soul of a literary salon. The clique included Hannah Cowley (Anna Matilda), Edward Jerrold (The Bard), Mary Darby (Perdita), and others, and their verses appeared in two London daily papers, *The World* and *The Oracle*, in which they were heralded as poets of genius. The school was finally crushed by the publication of two satires, *The Baviad*, 1794, and *The Maeviad*, 1795, by William Gifford (*q.v.*).

**Della Robbia, ANDREA** (1435-1523). Florentine sculptor. The nephew of Luca della Robbia, he learned his art in the workshop of his uncle. Soon he began to execute reliefs himself, and some are among the most remarkable of their kind. He made them for secular as well as for religious uses, and in some ways effected improvements in his uncle's methods and designs. The foundling hospital at Florence has some fine examples and there are others at Arezzo and Prato. Andrea had seven sons, of whom five followed his calling. Two, inspired by Savonarola, left it for the monastic life. The other three, Luca (b. 1475), Giovanni (1469-1529), and

Girolamo (1488-1566), have all left fine examples of their art. Girolamo also built a palace in Paris for the king of France, but this no longer exists. See *Bambino illus.*

**Della Robbia, LUCA** (1399-1482). A Florentine sculptor. He was probably a pupil of Lorenzo

Luca della Robbia, Florentine sculptor. After Vasari

Ghiberti. His finest achievement was the marble reliefs of the Cantoria or singing gallery executed for the cathedral of Florence, 1431-40, part of which is still preserved in the Museo del Duomo, and he was associated with Donatello in other work for the cathedral. Sculpture in enamelled terra-cotta was brought to a high state of perfection by him. Luca died in Florence, Feb. 20, 1482. Specimens of his work are in the Victoria and Albert Museum, London, including twelve plaques in blue on a cloudy white ground, depicting the cycles of the months; but the largest number is in the National Museum at Florence.

**Della Robbia Ware.** Terra-cotta figures and relief sculptures covered with a brilliant stanniferous glaze. At first this glaze was colourless, but Luca della Robbia, who developed the process to such perfection that it became known by his name, added oxide to give colour. Typical

Della Robbia ware has a blue background; the designs are classic in style, finely and boldly modelled. Luca and his partners were prolific producers and their successors continued to work until 1568, when the secret was lost. See *Terra-cotta.*

**Deller, SIR EDWIN** (1883-1936). British educationist. Born at Paighton, he began his administrative career at 19 in the office of the Kent education committee, combining with his daily work the study of law at London university. In 1912 he became a secretary in the academic department of the university, and assistant secretary of the Royal Society in 1920. Returning to the university in 1921 as academic registrar, he became principal in 1929, a position he retained until he died on Nov. 27, 1936, as the result of an accident while inspecting work in progress on the new buildings, a development he had done much to promote. Deller received a knighthood in 1935.

**Dellys.** Seaport and military post of Algeria, 50 m. by rly. E. of Algiers. It has a good roadstead, and the town is divided into a new European quarter with fine buildings and streets, and an old Arab quarter with squalid houses and narrow lanes. There is a trade in olives and wine. Pop. 18,864.

**Delmenhorst.** Town of Germany, in Oldenburg. It stands on the Delme, 7 m. W. of Bremen, and its industries are connected with the manufacture of linoleum, cigars, bricks, iron ware, and the

Della Robbia Ware. Terra-cotta enamelled relief, representing the Nativity and Annunciation to the Shepherds. This relief dates from c. 1430, but the border of roses is probably a later addition  
Victoria & Albert Museum

preparing of wool and jute. It has Roman Catholic and Protestant churches. Units of the 51st (Highland) division captured Delmenhorst on April 20, 1945, during the advance on Bremen. Pop. 31,978.

**Delolme, JEAN LOUIS** (1740-1806). Swiss writer. His early life was passed in Geneva, where he was born and where he studied law and practised as an advocate. For one of his writings he

Della Robbia. Madonna and Child with saints, a typical terra-cotta relief by Andrea della Robbia

was obliged to leave the country in 1769, and until 1775 he lived mainly in England; but he died in Switzerland July 16, 1806. Delorme's fame rests entirely on his work on the English constitution. This appeared in French in 1771, and then in English, and until the rise of more critical scholarship was regarded as a standard book.

**Delorme**, MARION (1613-50). French courtesan. She was born at Blois, Oct. 3, 1613 and at an early age went to Paris, where she became as famous for her beauty as for her lovers, including Cinq-Mars, Condé, Richelieu, and the duke of Buckingham. Her house became known as a meeting-place of Fron-

Marion Delorme,  
French courtesan  
From a print in the  
*Bibl. Nat. Paris*

dists, and she was about to be imprisoned by the government when she suddenly died, July 2, 1650. Long afterwards it was said that she had escaped to England and married, that she returned to Paris, and lived on into the 18th century. She was the subject of a play by Victor Hugo, 1831, and of a novel by G. P. R. James, 1830. *Consult* Cinq-Mars, A. de Vigny, Eng. trans. W. Hazlitt, 1847; *Confessions* de Marion Delorme, E. de Mirecourt (pseud.), 1860.

**De l'Orme**, PHILIBERT (c. 1515-70). French architect. Born at Lyons, he spent some years in Italy, and after his return in 1536 came under the notice of the French court. On the accession of

P. De l'Orme,  
French architect

Medici, and though his monumental scheme was greatly modified by his successors, the design and plan were an memorable achievement. His great ability as a constructor supports his claim that he revolutionised building in France. He died in Paris, Jan. 8, 1570.

**Delos**. Smallest of the Cyclades Islands (q.v.). Formerly known as Asteria and Ortygia, according to the legend it came into being from a blow of Poseidon's trident, whence the name Delos (visible). Originally a floating island, it was fastened by Zeus with chains to receive the wandering Leto (Latoia), who there gave birth to Apollo and Artemis. Held sacred from the earliest times, it was the seat of a famous temple and oracle of Apollo, in whose honour the

Henri II he became architect to the king, for whom he designed a theatre at St. Germain-en-Laye. In 1564 he began the palace of the Tuileries for Catherine de'

Delian games were held every five years. About 477 B.C. it became the treasury of the Delian League, a confederacy of Athens and other Greek states formed to resist the common enemy, Persia. About 458 the funds were removed to Athens, a step which led to the establishment of the Athenian empire.

After enjoying a long period of independence (322-161) Delos was again placed by the Romans under the control of Athens. From that time it enjoyed great prosperity as a commercial centre until in 87 it was sacked by a general of Mithradates. Excavations in the now deserted island, begun in 1829 and continued in 1873 and 1877 by French archaeologists, led to the discovery of important remains.

**Delphi**. Small town of ancient Greece, in Phocis, famous for its oracle of Apollo. The town lay on the S. slope of Mt. Parnassus; its inhabitants were Dorians and the government was an oligarchy. The principal seat of the worship of Apollo, Delphi was also associated with that of Dionysus, and every four years it was the scene of the celebration of the Pythian games. The temple of Apollo possessed great wealth of its own, and it was also used as a safe deposit for their treasures by many Greek states.

The oracular responses were given by a priestess called the Pythia, who, according to tradition, sat on a tripod placed in the centre of the temple over a chasm, from which a vapour arose from the river Cassotis flowing underneath. This vapour was supposed to give inspiration to the utterances of the priestesses. The oracle was regarded as being biased in favour of the Dorians. It was also noted for the ambiguity of its utterances (see Croesus). During recent years extensive excavations at Delphi have revealed the site of the temple and its surroundings, and many of the buildings described by ancient writers have been identified.

**Delphinidae** (Lat. *delphinus*, dolphin). Large family of aquatic mammals. Forming part of the sub-order of toothed cetaceans, its members are of small or medium size, mostly marine, and usually with numerous teeth in both jaws. There are two sub-families comprising respectively true dolphins, porpoises, killer whales, grampuses, blackfish or pilot whales; narwhals and belugas or white whales. Killer whales, which eat seals and small cetaceans, are the only members of the family that subsist on warm-blooded animals. All others feed on fishes and invertebrates, except a dolphin

Delphi. Ruins of the Gymnasium, looking east. Above, remains of the Treasury of the Athenians within the sacred precincts of the city

reputed to be a vegetable-feeder in the rivers of Cameroons. Fossil dolphins occur in pliocene crags.

**Delphinine.** Chief alkaloid contained in the seed of *Delphinium staphisagria*. It is very poisonous. It is prepared by percolating alcohol containing tartaric acid through the powdered seeds. The alcohol is evaporated off and the remaining liquid, freed from oil, is extracted with benzine. The alkaloid dissolves in the benzine, a little sodium bicarbonate is added, and then ether. This last extracts the delphinine, which separates out in crystals when the mixture is left standing. Delphinoidine is the other important alkaloid in delphinium seeds. Both alkaloids resemble aconite in action but are rather weaker. The seeds are used as a parasiticide.

**Delphinium** OR LARKSPUR. Genus of plants belonging to the family Ranunculaceae, natives of Great Britain, North America, and S.E. Europe. Hardy annuals and perennials, from 1 ft. to 6 ft. high, with blue, white or pink flowers, they are grown from seed sown in April where the plants are to flower, thinning out in May. The perennial kinds may be lifted and replanted in autumn or spring. They thrive in any ordinary garden soil.

*Delphinium exaltatum*, or giant larkspur

**Delphinus.** One of the Ptolemaic constellations. Its first star lies near Pegasus, and the constellation is easily picked out, for its leading four stars, Alpha, Beta, Gamma, and Delta, form a lozenge with stars of almost equal brilliance. Ten stars of the constellation are noted in Ptolemy's catalogue. See Constellation.

**Delta.** Physical formation occurring at the mouth of certain rivers. Most rivers are loaded with silt, some of which tends to be deposited whenever the current of the stream slackens. The deposit of silt at or near the mouth of a river may take the form of a bar,

or may become a delta according to how the sea or lake currents react with the moving water of the river. When a slow-moving, heavily loaded stream flows into comparatively still water, the load is deposited more or less evenly to form a flood plain of alluvium just below the level of the water, with a steep, abrupt slope at the seaward edge. In course of time the inevitable surface irregularities in this level of alluvium cause the river to flow more readily in certain channels, and the banks of these channels are built up and rise above water level. In time the flood plain emerges permanently at its landward edge, and the river crosses it in a few channels, or distributaries, with banks slightly raised above the surrounding level. The delta has then become permanent.

The term delta comes from the shape of the Nile mouth which is like the Greek letter Δ, but it now includes any formation where the river branches into distributaries.

The Po, Danube, Rhône, and Nile have deltaic mouths. The Mississippi has a delta which, in reality, begins at the mouth of the Ohio. It advances a mile in 15 years, and its area is 12,000 sq. m., while that of the Ganges-Brahmaputra covers 50,000 sq. m. The Rhône delta in Lake Geneva is 20 m. long, and has increased a mile in 1,900 years. At Buttermere and Crummock Water in the English Lake district, and at Lakes Thun and Brienz in Switzerland, a delta has made two lakes where there was formerly but one. See Danube; Mississippi; Nile; River, etc.

**Delta Amacuro.** Territory in the N.E. of Venezuela. It is mostly N. of the main river, and contains several mouths of the Orinoco which flow into the Atlantic. Serpent's Mouth Channel separates it from Trinidad. It has rich iron mines and exports cocoa. The capital is Tucupita. Pop. 28,165.

**Delta Connexion.** Alternating electric current is usually generated as three phase, i.e. in three distinct windings contained in each alternator at the power station. Each winding produces alternating currents which rise to a maximum one after the other in regular sequence (at 120° apart). When the windings are joined in a triangular formation, they are said to be connected in delta (after the Greek letter Δ). The same term is used for such a connexion of windings in an A.C. 3-phase transformer or motor.

**Delta Metal.** Alloy of copper and zinc, similar to but harder and stronger than brass. A typical

composition would be 55 p.c. copper, 42 p.c. zinc, 1-2 p.c. iron, and small amounts of manganese and aluminium. It is used in both the cast and forged conditions and may have tensile strengths of between 20-40 tons per sq. in., depending on its treatment. The name is derived from the Greek letter Δ, or D, the initial of the discoverer, Alexander Dick. See Alloy; Brass.

**Deltoid Muscle** (Gr. *deltoeidēs*, delta shaped). Triangular muscle which covers the point of the shoulder. It is attached above to the clavicle (collar-bone) and to the scapula (shoulder-blade), and below to the outer surface of the upper part of the humerus (upper arm bone). Its chief action is to abduct the arm, i.e. raise it outwards from the body; the anterior fibres of the muscle also assist in drawing the arm forward, and the posterior fibres in drawing it backward. See Anatomy; Muscle.

**Deluge** (Lat. *diluvium*, washing away). The O.T. tells of a great flood which swept away all mankind with the exception of Noah and his family (Gen. 6). Noah was saved in an ark (*q.v.*), which, on the waters subsiding, rested on the mountains of Ararat (Armenia). To ascertain whether the ground was dry, Noah sent out first a raven and then a dove. The raven did not come back; the dove returned twice, bringing the second time the leaf of an olive tree, and then flew away altogether. After the flood God made a covenant with Noah that he would not bring another flood, and as a sign he set a bow (the rainbow) in the clouds.

A strikingly similar story is found in Babylonian literature in the Gilgamesh epic (c. 3000 B.C.). The epic is contained in cuneiform tablets, first deciphered in 1872. Gilgamesh is told the story of a flood by his immortal ancestor, Ut-napishtim. Ut-napishtim was advised by the god Ea to build a ship to escape the flood which Bel and three other gods were bringing upon Shurippak. The ship which he built was 120 cubits long and broad, had six decks and a mast, and was smeared with bitumen. When the rains ceased it rested on Mt. Nisir, E. of the Tigris. Then Ut-napishtim sent forth a dove, a swallow, and a raven, and the raven did not return. After the flood the god Ea made a covenant with Ut-napishtim. Another form of the Babylonian story has survived in the fragments of Berosus, an Egyptian priest who lived in the 3rd cent. B.C.

**Deluge Legends.** Stories relating to the flood. Research has traced traditional tales of a primeval flood, local or general, more or less parallel with the Noah story, among peoples in every grade of culture. Besides the Babylonian epic of Gilgamesh, and the version by Berosus, flood-myths are traceable to Greece, across Persia, India, and Polynesia to America.

Interesting coincidences in detail occur. In India and Peru a warning is given; there may be one survivor or a few. The survivors escape by ark, as in Cambodia, by canoe, by a coconut shell, or by a turtle. They reach a mountain, animal messengers are sent out; the earth is repopled. That these myths are degenerate reminiscences of the Biblical story is no more admissible than the suggestion of their independent invention. They are explained as an element in the cultural drift observable throughout the eastward track of early mariners. See *Creation Legends*.

**Delusion.** A false belief. In mental disease it has generally three characteristics: first, it is evidently untrue; secondly, no amount of argument will correct it; thirdly, it tends to be inconsistent with the individual's education and surroundings. Despite the popular belief that a person may have a particular delusion, but be sane in all other respects, no delusion can exist as an isolated disorder, but is the superficial outcropping of some form of mental disease. For example, depressing delusions accompany melancholia; grandiose ideas are mainly met with in mania, general paralysis, and paranoia; delusions of jealousy and marital infidelity are common in alcoholic insanity.

A delusion must be distinguished from an illusion, which is a false perception of something actually seen or heard; and an hallucination, which is the vivid mental creation of something imagined as seen or heard. See *Hallucinations*; *Illusion*; *Insanity*.

**Delville Wood.** Wood of France, in the dept. of Somme. It lies between Longueval and Ginchy, 10 m. E. by N. of Albert, and was the scene of heavy fighting in the First Great War. Some 159 acres in extent, and known to the British as Devil's Wood, it was attacked and taken from the Germans by a S. African brigade, July 15, 1916. The government of S. Africa purchased the wood from the French government in 1920, erecting thereon a South African national memorial which

was unveiled Oct. 10, 1926. See *Somme*, *Battles of the*.

**Delyannis, THEODOROS** (1826-1905). Greek statesman. In 1878 he represented Greece at the Berlin congress and was four times prime minister between 1878 and 1905. He was assassinated, June 13, 1905. Delyannis's lifelong policy was the enlargement of Greece, and the recovery of its lost provinces from Turkey.

**Delysia, ALICE** (b. 1885). French actress. Born in Paris, March 3, 1885, she was a midinette before appearing on the stage of the Moulin Rouge in 1901. After playing in Paris music halls, she went to the U.S.A. in 1905. Her London debut in *Odds and Ends*, 1914, established her reputation as an actress of sophisticated charm and vivid personality. She starred in many of C. B. Cochran's revues, e.g. *Pell Mell*, 1916; *Mayfair and Montmartre*, 1922; *On with the Dance*, 1925; and in the musical plays, *Princess Charming*, 1928; *The Cat and the Fiddle*, 1933; *Mother of Pearl*, 1933. During the Second Great War she toured the military camps of the Near and Middle East, 1941-43.

**Demades.** Athenian orator and politician. He belonged to the pro-Macedonian party, and as such was a bitter opponent of Demosthenes. Twenty years after the overthrow of Greek independence at Chaeronea (338 B.C.) he joined a conspiracy to murder the Macedonian Antipater (q.v.). This was discovered and Demades put to death. Utterly unscrupulous, he is called by Plutarch (who acknowledges his eloquence) the shipwreck of Athens. *Prom. Deema-deez*.

**Demavend.** Loftiest peak of the Elburz Mts., Persia. Situated 45 m. N.E. of Teheran in Mazandaran prov., it is a snow-capped and dormant volcano. It yields lava and sulphur, and its alt. is estimated at 18,549 ft. The town of Demavend lies to the S. in Teheran prov.

**Dembinski, HENRYK** (1791-1864). Polish soldier. Born at Cracow, Jan. 16, 1791, he joined the army, 1809, and fought under Napoleon in the invasion of Russia in 1812. He distinguished himself as a cavalry commander in the Polish revolution of 1830, and on Kossuth's invitation accepted command of the Hungarian forces in 1848. Dembinski died in Paris, June 13, 1864.

**Deme** (Gr. *dēmos*). Name for a township or parish after Attica was divided by Cleisthenes (q.v.).

**Dementia** (Lat. *demens*, out of one's mind). Condition of weak-mindedness or mental degeneration, which may develop from other forms of insanity, or may be the result of physiological decay of the mind in old age. Mania, melancholia, general paralysis, epilepsy, chronic alcoholism, and injury to the brain following fracture of the skull or apoplexy, may all terminate in dementia. The senses gradually become weakened, the intellectual faculties reduced, and the memory impaired. Loss of self-control, irritability, and childishness are manifested. The patient then becomes dirty in his habits and requires constant attention. Periods of maniacal excitement or depression may occur and suicide may be attempted. Eventually, muscular weakness becomes extreme, the patient is bedridden, and death follows from pneumonia or prolonged exhaustion. Treatment is of little avail. See *Insanity*.

**Demerara.** River and settlement of British Guiana. The river rises in the Maccari mts. and, flowing N., almost parallel with the lower Essequibo, enters the Atlantic at Georgetown; its length is about 180 m., of which some 80 m. are navigable by large ships. The settlement lies mostly between the rivers Demerara and Berbice, and fronts the sea for some 65 m. It was originally a Dutch colony. The kind of brown sugar known as demerara was originally produced in this colony. See *Sugar*.

**Demerara.** This city, capital of British Guiana, originally the Dutch Stabroek, is now called Georgetown (q.v.).

**Demesne** (Lat. *dominium*, lordship). Name for a certain class of land, the modern form being domain. On manors in feudal times demesne was the land kept by the lord for himself, as distinguished from that granted to his tenants. Similarly, demesne of the crown was land retained by the king; and this now forms the crown lands. Ancient demesne is land that was in the hands of the king at the time of the Norman conquest. The word is sometimes used for the land attached to a large residence. See *Manor*.

**Demeter.** In Greek mythology, goddess of agriculture, whose Roman counterpart was Ceres. She was the daughter of Cronos and Rhea, and by Zeus became the mother of Persephonē (Proserpine). Her daughter was carried off by Pluto, the god of the underworld, as she was gathering flowers near Enna in Sicily. Demeter set

out to look for her daughter, and was told by Helios (the sun-god) what had happened. Zeus having declined to assist her, Demeter refused to allow the earth to produce any of its fruits until her daughter was restored to her. Eventually Zeus agreed to have Persephonē brought back from Hades, provided she had eaten nothing during her stay in the underworld. It so happened, however, that Persephonē had eaten a pomegranate seed in the Elysian Fields, and it was impossible to do more than arrange for her to spend six months of the year with her mother and six months with Pluto.

The story is an allegory of the process of agriculture. Persephonē, during her stay in the lower world, is the seed planted in the ground. When she returns to her mother she is the corn rising from the earth. The rites of the festivals associated with Demeter, the Eleusinia (*q.v.*) and the Thesmophoria (*q.v.*), symbolised the growth of corn, and probably the process of life, death, and life beyond the grave. The mysteries of these festivals were close secrets. *Prom. Deemeeter.*

**Demetrius.** Name of a Russian prince and of several pretenders. The prince, a son of Ivan the Terrible, was murdered in 1551, after his father's death. About 1600, in the reign of Boris Gudunov, a pretender from Galicia claimed to be the dead prince. Various influential people, including the Jesuits, acknowledged him. He joined the Church of Rome, and having gathered an army, invaded Russia proper. He defeated the tsar's troops, entered Moscow, and, Boris having just died, was crowned tsar in 1605. Demetrius reigned for about a year, until he was killed at Moscow, May 17, 1606. A second false Demetrius appeared about 1607. He collected a large army, the people believing he was the dead prince, defeated the Russians, and ruled for a time over a large part of their country. He was killed in Dec., 1610. The third Demetrius was recognized as tsar by some of the Cossacks, but was executed 1612.

**Demetrius Nicator** (d. 125 B.C.). King of Syria, 146–140 and also 129–125 B.C. The son of Demetrius Sôtēr, he regained the throne with the help of Ptolemy Philometor, king of Egypt. Taken prisoner in a campaign against the Parthians, he remained ten years in captivity. Demetrius recovered his kingdom about 129. A few years later, defeated by a usurper, Alexander Zabinas, he fled to Tyre, where he was murdered.

**Demetrius Phalereus** (c. 345–283 B.C.). Athenian orator and statesman. Born at Phalerum in Attica, a pupil of Theophrastus, he was appointed administrator of Athens by Cassander in 317 and held the position for ten years. He made himself so popular that the grateful citizens erected 360 statues in his honour. When Demetrius Poliorcetes conquered Athens in 307, the populace, instigated by his opponents, condemned him to death. After finding refuge in Alexandria, where he was kindly received by Ptolemy Lagus, he was banished by the latter's successor to Upper Egypt, where he died.

**Demetrius Poliorcetes** (337–282 B.C.). King of Macedonia. Son of Antigonus (*q.v.*) king of Asia, he assisted his father in his campaigns against his rivals, and drove out the garrison of Cassander from Athens. For this he was acclaimed by the city as its liberator. At the siege of Rhodes, which lasted a year, he gained his surname Poliorcetes (the besieger) from the machines constructed by him to break down the defence. In 301 he and his father met Cassander and Seleucus at the battle of Ipsus, in Phrygia, and were completely defeated. Antigonus was slain, and it was not until 294 that Demetrius could occupy Macedonia, which he ruled till 288, when he was driven out by Pyrrhus (*q.v.*). He died in Asia, the prisoner of Seleucus.

**Demetrius Sôtēr** (d. 150 B.C.). King of Syria, 162–150 B.C. The son of Seleucus IV, and grandson of Antiochus the Great, he was brought up in Rome, where he had been sent by his father as a hostage. On the death (164) of Antiochus IV Epiphanes he escaped and returned to Syria, where he was received as king, after he had murdered Antiochus V Eupator (162). After a short reign, during which he was engaged in wars with the Jews led by Maccabaeus, he fell in battle against the pretender Alexander Balas. The Babylonians called him Sôtēr (saviour) because he liberated them from the tyranny of the satrap Timarchus.

**Demi** (Fr., half). In heraldry, human beings, animals, and monsters are often shown cut in half, when they are described as a *demi-man*, *demi-lion*, etc. The upper or fore half is always shown unless specified. Many inanimate charges are similarly treated.

**Demi in heraldry** similarly treated.

**Demijohn.** Originally *Dame Jeanne*, the nickname humorously given to a type of large (up to 10 gall.) bottle, bulging, with narrow neck, usually with wicker casing.

**De Mille, Cecil BLOUNT** (b. 1881). American film director. Born at Ashfield, Mass., Aug. 12, 1881, he was educated at the Pennsylvania military academy and the American academy of dramatic art. Dramatic author and actor until 1913, he then abandoned the theatre to produce films, becoming director of Famous Players Lasky, and president of Cecil B. de Mille productions. His silent films, *e.g.* The Ten Commandments, King of Kings, The Sign of the Cross, were spectacular entertainment based on quasi-Biblical themes. Though crude and extravagant productions, they were among the first pictures to feature thousands of performers. His later pictures included The Plainsman, 1937; Union Pacific, 1939; Reap the Wild Wind, 1942; The Story of Dr. Wassell, 1944; Unconquered, 1948; Samson and Delilah, 1949.

Cecil B. de Mille

His sister Agnes was a dancer and choreographer. Her ballets included Three Virgins and a Devil, 1946, and she was responsible for the dances in Oklahoma, 1943.

**Demisemiquaver.** In music, a small note, equal in time-value to half of half a quaver, as its name indicates. Its form is that of a quaver with three black strokes on the stem,  Like quavers, demisemiquavers may be grouped thus with continuous strokes:

**Demiurge** (Gr. *demiourgos*, artisan, architect). Name given by ancient philosophers to the Creator of the world out of chaos. According to the Gnostics, the Demiurge was a being subordinate to the Supreme Being, in some respects evil, partly identified with the Jewish Jehovah.

**Demmin.** Town of Poland, in Masuria. Formerly Prussian, it stands on the river Peene, 30 m. S. of Stralsund. It has a trade in wheat and timber, and manufactures textiles, beer, etc. An old fortified place, it was a member of the Hansatic League. Its fortifications were levelled in 1759. Pop. 12,378.

**Demobilisation.** Process of disbanding soldiers from compulsory military service and returning them to civilian life. At the end of the First Great War, countries in which conscription was the normal method of raising armies demobilised their troops by releasing them in yearly classes. In Great Britain soldiers were demobilised according to the requirements of industry. Each serviceman had his industrial group, actual trade, and whether he was married or single, entered in his pay-book. There were 43 industrial groups, and the U.K. was divided into 19 areas for the purpose of dispersal. Men over 41 were discharged first, and thereafter the order of priority was: miners, men required for demobilisation clerical work, men whose return to civil life created employment for others, key men required by industry; and men who had positions waiting for them. Demobilisation began on Dec. 11, 1918, and was completed in May, 1920. Each man not an officer received 28 days' leave with full pay, ration and family allowances, unemployment insurance paid up for a year, and any gratuity due.

A more equitable system of demobilisation for men who had served in the Second Great War was announced on Oct. 14, 1944, to take effect at the end of the war in Europe. The scheme divided service personnel into two categories of release, A and B. In Class A, men and women were released by groups based on a combination of age and length of service; two months of service equalling one year of age. Thus a man aged 22 with four years' service was in the same group as a man aged 40 with one year. Class A men received eight weeks' leave with full pay, ration allowance and, where applicable, family and dependants' allowances, and war service grant. Each man had an outfit of civilian clothing. At the end of his discharge leave came such gratuity as was due to him. Men qualified in respect of foreign service received an extra day's pay and allowances for every completed month overseas. At the expiry of their release leave, men from all three services were placed in a special reserve, to be recalled only in extreme emergency. Officers and men were treated alike. Women received the same benefits, except that they were given cash in lieu of clothing.

Class B was voluntary; it was restricted to those normally

employed in certain industrial categories. They received three weeks' leave and emoluments, but payment for foreign service and of gratuities was held over until after the state of emergency had ended. At the end of leave, they were directed to reconstructural employment, and were liable to

individual recall should such employment be discontinued.

The demobilisation of all three services began on June 18, 1945. At the end of 1948, by which time the demobilisation of war service personnel was almost complete, releases had totalled 4,984,180 men and 478,870 women.

## DEMOCRACY: RULE BY THE PEOPLE

G. W. Keeton, LL.D., Dean of the Faculty of Laws, Univ. Coll., London

*Few words have become so widely and frequently misused and misunderstood as the word democracy, which is here given clear and authoritative definition. The subject is treated from other aspects under such headings as Government; Politics; Sovereignty; State, etc.*

The term democracy is one which has improved in meaning with the progress of political science. It was first used by the Greeks; and Aristotle, in his *Politics*, distinguishes six types of government, three good, and three perverted. The three good types of government were constitutional government, aristocracy, and kingship. The three bad types were democracy, oligarchy, and tyranny. The distinguishing factor between these classes was whether, as in the good type, government was in the interests of the community as a whole, or whether, as in the bad type, it was in the interest of the ruling class. The conception of democracy, i.e. government by the masses, as a perverted type was due to Aristotle's distrust of the plain drift away from aristocracy which was taking place in the Greek city states in his day; although it should be pointed out that, from Aristotle's point of view, aristocracy meant government, not by a superior class, but by the best persons within the state, i.e. persons specially qualified by abilities, training, and experience for government.

Aristotle's conception of constitutional government, or *polity*, corresponds fairly closely with modern conceptions of democracy, in the sense that laws should be framed in the interests of the community, with the assent of as large an active element of the community as possible. One further comment upon his conception must be made. In discussing both constitutional government and democracy, Aristotle was necessarily thinking of the *direct* participation of numbers of citizens in the work of government. This was possible in the Greek city states, and again in Rome, so long as the structure of government of a city state was retained. The ancient world never developed the conception of representative

institutions. This was the particular contribution of England to political theory, although even in England, the house of commons represented only a small, propertied class within the community, until the Reform Act of 1832 ushered in an era of rapidly extending democratisation, culminating in adult suffrage.

In recent times, democracy has tended to become something of a political slogan, and has been used in contrast to such terms as dictatorship, or totalitarian regime. Yet democracy is not strictly today a *form* of government at all. It may exist in many different forms. For example, in Great Britain, it has slowly evolved within a unitary state, under an unwritten constitution. Its outstanding characteristic is parliamentary sovereignty, i.e. the capacity of parliament to make or unmake laws, free from any external legal check. As a consequence of parliamentary sovereignty, a government depends for its continuance in office upon the support of a working majority in the house of commons. Control by the community at large is directly possible only through the medium of a general election, although during the life of parliament the pressure of public opinion both upon government and upon parliament is considerable.

The U.S.A. possesses a different form of democracy. This operates within the limits of a written constitution, which can be changed with difficulty; it affords an illustration of a far-reaching division of governmental power, which Montesquieu thought was the principal safeguard against arbitrary power. The American constitution exhibits two distinct types of division of power. In the first place, it divides power between the central government and the governments of the separate states. Certain topics are

reserved for the central government; the remainder are the province of the state governments. Secondly, both in the central government and in the government of the states, there is a separation between legislative, executive, and judicial power. The American president is elected by popular vote for a fixed term, and is not a member of either house of congress. The position of a governor of a state is similar. Both president (or governor) and congress (or state legislature) can thus independently assert that they correctly interpret the will of the people; and if both sides persist in their attitude, there is no immediate way of resolving this deadlock. Moreover, the judiciary has power to pronounce a law, whether passed by congress or by a state legislature, unconstitutional, *i.e.* not in accordance with the written constitution, and it thereupon becomes null and void. No similar power can be possessed by an English court, owing to the omnipotence of parliament.

#### Characteristics of Democracy

Clearly, then, the essence of democracy lies deeper than the form of government; it has been well said that democracy is not so much a form of government as a way of life. Its chief characteristics from this point of view may be summed up as follows:

1. An essential test of democratic government is that it should, at regular intervals, submit itself to the test of free election by the adult community as a whole. In recent years, in some dictatorships, lip-service has been paid to democratic ideals by sham elections, with candidates selected by the ruling party, and with no adequate guarantee (*e.g.* by secret ballot) for freedom of choice.

2. There should be freedom to express views in opposition to those of the dominant party; and if the popular vote should be adverse to the party in power, some alternative party should be ready to undertake the responsibilities of office. This principle is carried so far in the English constitution that the leader of the opposition has a defined constitutional position, and receives a salary. The opposition is, in a very real sense, "His Majesty's Opposition." Thus, under both the American and British forms, the democratic system works best where there are two well-organized parties of comparable strength, each of which has enjoyed periods of office in the fairly recent past.

It is the freedom to advocate differing political programmes and the alternation of parties in government which distinguishes Anglo-American democracy from, *e.g.*, the Soviet one-party state.

3. All persons, whether private citizens or public officials, should be equally accountable for their acts before some tribunal. In the 19th century it was assumed that all persons should be equally accountable before the ordinary courts of the state, but during the past sixty years there has been a steady growth of administrative law and an increase of administrative tribunals. Such a development is consistent with democratic theory if the tribunals apply a known and certain set of legal rules and if the forms of justice are scrupulously adhered to in proceedings before them. Here again democracies are sharply differentiated from totalitarian regimes in which a political party enjoys a privileged position, and is not answerable in the ordinary courts for many classes of acts. Such a position is often associated with a system of secret police, organized to maintain it.

4. Equally important in a democratic state is the independence and impartiality of the judiciary which, in the last resort, is the bulwark of the liberty of the ordinary citizen. Hence, in all totalitarian regimes, the party in power has destroyed both the independence and the impartiality of the judiciary, and has substituted "political" justice, designed to further its political objectives.

#### Maintenance of Freedom

5. Finally, a striking characteristic of democracy is the maintenance of fundamental freedoms for the ordinary citizen: freedom of speech and of the press, freedom of association, freedom from arbitrary arrest for alleged offences unknown to the ordinary law. In both England and the United States these freedoms are the product of long constitutional struggles; they are embodied in the common law and additionally assured by such great constitutional documents as Magna Carta (1215), the Bill of Rights (1689), and the Declaration of Independence (1776). To invade these rights would therefore be to destroy the very foundations on which the English and American political systems have been built up.

In recent years there have been criticisms of the Anglo-American conceptions of democracy as being concerned mainly with political

liberty rather than with economic security. Such criticisms are somewhat wide of the mark, since the achievement of the fullest possible popular control of government has been a necessary condition precedent to the attainment of what is sometimes called "economic democracy." Critics also emphasise another conception of democracy which finds expression in the Soviet system. The Soviet state is built upon the conception of economic security for all who work, and its function is conceived as being the protection of that security. It therefore prohibits all activities and expressions of opinion which may be regarded as threatening the position and rights of the Soviet worker. Though this conception differs widely from the "liberal" idea of democracy which finds expression in Western Europe and in America, it is not necessarily antagonistic to it.

*Bibliography.* Aristotle's Politics, ed. Weldon, 1901; Elements of Politics, H. Sidgwick, 4th ed. 1901; Modern Democracies, Viscount Bryce, 1921; Grammar of Politics, H. Laski, 1925; Western and Soviet Democracy, R. Schlesinger, in Yearbook of World Affairs, 1947.

**Democrat.** Member of one of the two principal political parties of the U.S.A. Founded by Thomas Jefferson, third president, to promote political principles in opposition to those of Alexander Hamilton, it stood for direct popular control of the government, the protection of states' rights against encroachments of the federal government, extension of the suffrage and the fullest grants of personal liberties consonant with law. Until 1828 it was called the Democratic Republican party. It was almost continuously in power until it split over the slavery issue in 1860. Between 1860 and the election of F. D. Roosevelt in 1932, the Democrats secured only four presidential terms—those of Cleveland in 1884 and 1892, and of Woodrow Wilson in 1912 and 1916.

Latterly the party has favoured a low tariff in international trade, for revenue only; and has become much more internationally-minded. Roosevelt's New Deal revolutionised American political theory and practice, achieving unprecedented expansion of federal powers to promote social and economic welfare. The party's left wing, which supported Roosevelt's New Deal, is very far from its largely Southern right, which was hostile to many presidential policies.

**Democritus** (c. 460-357 B.C.). Greek philosopher. Born at Abdera in Thrace, he was the most notable exponent of the atomic theory of the universe, which has been revived by modern chemists and physicists. The atoms conceived by Democritus differed in size, weight, shape, position, and arrangement. Falling together by force of gravity, impinging one upon another, and flying off in various directions as a result of impact, these atoms produced a rotatory movement or vortex. Gradually all atoms found their proper combinations, and thus the universe was formed, the result of a 'fortuitous concourse of atoms.' Democritus was known as the laughing philosopher by reason of his optimistic outlook on life.

**Demologos.** U.S. warship, the first steam-propelled battleship ever built. Designed by Robert Fulton and launched Oct. 29, 1814, she was a twin-hulled structure, a 16-ft. paddle-wheel working in the space between them. She was 150 ft. long and 56 ft. beam, with a tonnage of 2,475. The gun-deck was protected by a bulwark of timber nearly five ft. thick, and the armament consisted of thirty 32-pounder guns intended to fire red-hot shot, together with two 100-pounder under-water guns in the bows, predecessors of the modern submerged torpedo-tube. She was destroyed by fire, June 4, 1829.

**De Monarchia.** Dante's treatise on government written in Latin about 1314. His argument is that God has ordained a universal monarchy to exist side by side with the universal church, and has bestowed this upon the Romans. The prince who Dante hoped would restore this universal Roman monarchy was Henry of Luxembourg, who was chosen emperor in 1306, entered Italy in 1310, and died in 1313. Eng. trans., P. H. Wicksteed, 1904 (in Latin Works of D. A., Temple Classics). See Dante; King.

**Demonetisation.** Financial term meaning that certain coins are declared to be no longer money or legal tender. Thus by the Coinage Act of 1889 all gold coins of the United Kingdom minted before 1837 were demonetised. In a somewhat different sense it is used when one of the precious metals—silver in the United Kingdom, for instance—is no longer coined at its intrinsic value. It is then called token money, and is only legal to a limited extent. See Coinage.

**Demonology** (Gr. *daimon*, spirit; *logos*, science). Branch of the study of religion, concerned with supernatural beings, below the rank of gods, which are regarded as cap-

Democritus, Greek philosopher  
From a bust in the Capitol Museum, Rome

able of influencing human life. Out of the generalised spirit-world of early animism emerged the conception of beings with special functions, such as disease-demons, corn-demons. In later developments they were sometimes numbered, such as the three fates, the four children of Horus. For the most part, however, they were individually nameless.

In some phases of primitive culture the physical universe is deemed to be pervaded by supernatural beings, which may be departed souls of men and animals, the offspring of *incubi*, *succubae*, and other obsessions, or discarnate spirits of unearthly origin. They include the spirits of wind, fire, and water, and legions of others, such as those which characterise the animism of E. Asia and negro Africa. Experience shows them to be friendly, hostile, wayward, or neutral, not necessarily of deliberate intention. In process of time the friendly were held to be innately benignant, and the hostile innately malignant.

With the growth of the idea of supreme beings, possessing personal names and definite qualities, polydemonism passed into polytheism. The nameless spirits hereupon came to be regarded as beings of lower rank, sometimes as the agents of the greater powers, sometimes as sharing the worship offered to them. Some of them represented the energies of nature, dethroned deities of older faiths, or those of subjugated or rival peoples.

Early animism knew nothing of the principle of dualism as applied to the moral government of the universe. The good and evil with which it was concerned were material rather than ethical. The notion of moral evil being directed by

demonic beings became associated with the monotheism of W. Asia. Out of this arose the definite distinction between angels and fiends which, by creating the separate study of angelology, relegated demonology to the consideration of evil spirits which, in popular usage, is its sole concern.

The Moslem world, with its jinn, afrits, and ghuils, developed out of the primitive animism of nomad Arabia, overlaid by elements derived from Jewish and Christian thought. Side by side with this Semitic demonology is to be placed that of the Aryan-speaking peoples, with their *genii* or guardian-spirits and familiars, their fates and valkyries, giants and elves, vampires and werewolves, goblins and trolls. The influence of many of these is still extant in popular superstition.

**DEMONIC POSSESSION.** The attribution of many mental and bodily ailments to the objective presence of intrusive demons is widespread in primitive thought. Their expulsion by ritual means is called exorcism. At the beginning of our era this belief partook throughout W. Asia of the moral aspect of demonism already mentioned. Its relationship to Christian teaching and practice is shown in works devoted to the history of N.T. times. See *Demonic Possession in the New Testament*, W. M. Alexander, 1902; *Primitive Culture*, E. B. Tylor, 4th ed., 1903; *Devils and Evil Spirits in Babylonia*, R. C. Thompson, 1904-5.

**De Morgan, AUGUSTUS** (1806-71). English mathematician. Born at Madura, India, the son of an army officer, he graduated at Trinity College, Cambridge, and was elected first professor of mathematics at the newly founded University of London in 1828. His influence on contemporary mathematics in England was far-reaching, and he had much to do with the foundation of the London Mathematical Society. His *Essay on Probabilities*, 1838; treatises on the *Differential and Integral Calculus*, 1842; and *Budget of Paradoxes*, pub. 1872, are among his most important works. De Morgan resigned his professorship in 1866, and died March 18, 1871. See *Memoir*, S.E. De Morgan, 1882.

**De Morgan, WILLIAM FRIEND** (1839-1917). British novelist. The son of Augustus De Morgan, he was born in London, Nov. 16, 1839, and educated at University College. After studying at the Royal Academy, he devoted himself to working in pottery and glass. It was not until he reached his 66th year that his first novel, *Joseph*

Vance, was written. It had an immediate success, and was followed by Alice for Short, 1907; Somehow

William De Morgan,  
British novelist  
Russell

Good, 1908; It Never Can Happen Again, 1909; An Affair of Dishonour, 1910; A Likely Story, 1911; and When Ghost Meets Ghost, 1913; and the unfinished The Old Madhouse,

published posthumously. De Morgan is weak in plot construction, but his characterisation is good, and his descriptions are true to life. He died Jan. 13, 1917.

**Demosthenes** (c. 383-322 B.C.). Athenian orator and statesman. Left an orphan at an early age, he was brought up under the care of guardians who played havoc with his patrimony. On reaching manhood he prosecuted the guardians, and obtained a verdict against them, though most of the estate was irrevocably lost. To equip himself for this trial, Demosthenes had studied under Isaeus, the great forensic orator, and his success seems to have encouraged him to seek a career in advocacy and in public life. His natural disabilities were great. It is said that to cure his stammer he practised speaking with his mouth full of pebbles and declaimed in front of the sounding waves of the seashore in order to accustom himself to the clamour of popular assemblies. His private speeches continued till 355 B.C.

#### Demosthenes as Statesman

By this time he had amassed a competence and was free to devote himself entirely to politics. As a statesman he stood head and shoulders above any man of his time. The great ideal of his life was the regeneration of Athens as leader of the Hellenic world, and the burden of his earlier speeches was that Athens must purify herself within, and also by a moderate and enlightened foreign policy win the confidence of the other Greek states. It was not long before Demosthenes saw danger ahead in the overweening ambition of Philip of Macedon. A number of aggressive acts made it clear that Philip was only waiting an opportunity to impose his will upon Athens and Greece.

From 351 onwards Demosthenes delivered a series of masterly speeches of which the most notable are the Olynthiacs and the Philipics, in which he endea-

voured to awaken his countrymen to the menace from the north. Though the word philippic has come to mean any speech of fierce abuse, these orations were instinct with sincerity. Too late the Athenians listened to his pleadings, too late they adopted the national military service he advocated; Philip had had time to mature his plans, and the defeat of Athens and Thebes at Chaeronea in 338 was the death blow of Greek independence. Demosthenes himself fought in the battle, but, it must be confessed, fled incontinently from the field. The majority of his countrymen, however, recognizing that behind natural physical cowardice lay the soul of a great patriot, forgave Demosthenes for his flight, and in 336 B.C. Ctesiphon proposed that a golden crown be

Demosthenes, Greek orator and statesman

From a statue in the Vatican, Rome

given to Demosthenes for his public services, the ensuing litigation evoking his oratorical masterpiece. (See Aeschines.)

The death of Philip in 336 encouraged in Demosthenes fresh hopes of shaking off the Macedonian yoke, but Philip was succeeded by his greater son Alexander and the Macedonian domination continued. In 324 Harpalus, the treasurer of Alexander, absconded with a large portion of his monarch's money and sought refuge in Athens. He indulged freely in bribery, and among those accused of taking a bribe was Demosthenes, an accusation probably due to his enemies. However, Demosthenes was condemned and

thrown into prison. Escaping, he lived abroad, until the death of Alexander in 323 emboldened the Greeks to make a bid for independence. The Athenians recalled their statesman from exile, and Demosthenes headed the movement. Greek hopes, however, were finally shattered at the battle of Crannon in 322, and to avoid falling into the hands of the Macedonians Demosthenes committed suicide. *Pron.* Dee-mos-then-eez.

*Bibliography.* Text, ed. F. Blass, 1885-89, S.H. Butcher, 1903, etc. Eng. trans. C. R. Kennedy, in Bohn's Classical Lib., 5 vols., 1852-63; consult also Demosthenes (an account of his life and works), S. H. Butcher, 1881; The Attic Orators from Antiphon to Isaeus, R. C. Jebb, 1893.

**Demosthenes.** Athenian general in the Peloponnesian war. In 413 B.C. he was sent with reinforcements to Syracuse during the disastrous Sicilian Expedition. Defeated at sea, the Athenian forces, in endeavouring to retreat by land, were compelled to surrender in a body, and Demosthenes was put to death by the Syracusans.

**Demotic** (Gr., belonging to the people). Cursive script used for general purposes in ancient Egypt. It was an abbreviated and modified form of the hieratic or priestly script, usually written from right to left, mostly in black. Well established by 700 B.C., it became the common means of correspondence and record, on papyrus or potsherd, in Ptolemaic times. Used in an epigraphic form on sepulchral and official stelae, it formed one of the three versions inscribed on the Rosetta and Canopus stones. It disappeared soon after the 4th century A.D. A few characters, introduced to eke out the Greek alphabet, survived in Coptic writing.

**Demotika** or **DIMOTIKA.** Town of Bulgaria, the ancient Didymotichos. Situated on the Maritza, on the frontier of S.E. Bulgaria, it is about 25 m. S. of Adrianople (Edirne). Important in the Middle Ages, it decayed under the Turks.

**Dempsey, JACK** (b. 1895). An Irish-American boxer. Born William Harrison Dempsey, he sprang to fame on July 4, 1919, by knocking out the world heavyweight champion Jess Willard. Dempsey held the championship seven years, his most sensational victory being in the fifth round against Georges Carpentier, July 2, 1921. Beaten on points over 10 rounds, after terrific battles with Gene Tunney, Sept. 23, 1926, and Sept. 22, 1927, he left the ring for the entertainment business.

**Dempsey, Sir Miles Christopher** (b. 1896). British soldier. He was born Dec. 15, 1896, and educated at Shrewsbury and Sandhurst. He was commissioned in the Royal Berkshire Regiment in 1915 and served in France and Iraq. Promoted lieutenant-col. in 1938, he distinguished himself at Dunkirk in the Second Great War, and was given command of the 13th corps in 1942. He led the British 2nd army with conspicuous success from the Normandy landings of June, 1944, until its disbandment the following June. On Sept. 3, 1945, he succeeded Gen. Slim as commander of the 14th army, later becoming c.-in-c. Allied Land Forces, S.E. Asia. In 1946, Dempsey became c.-in-c., Middle East, in succession to Gen. Paget, and the same year was promoted general. He resigned from the army in 1947, on his appointment as chairman of the Racecourse Betting Control board. He was created K.C.B. in 1944.

**Dempster, Thomas** (c. 1579-1625). Scottish scholar. A native of Aberdeenshire, he was educated at Pembroke Hall, Cambridge, Louvain, Rome, Douai, and Paris. He was professor of humanities at Toulouse, oratory at Nîmes, civil law at Pisa, and humanities at Bologna, where he died, Sept. 16, 1625. Knighted by Urban VIII, he edited Claudian, composed Latin poetry, and in 1613 edited the *Antiquitatum Romanorum Corpus Absolutissimum* of Joannes Rosinus. He was the author of *Historia Ecclesiastica Gentis Scotorum*, pub. at Bologna in 1627, ed. for the Bannatyne Club 1829.

**D.E.M.S.** The common abbreviation for *Defensively Equipped Merchant Ship* (g.v.).

**Demurrage** (Lat. *demorari*, to delay). Term used in shipping and other business circles for the money compensation for unexpected delays in unloading ships, wagons, etc. If a merchant, when unloading his goods, detains a ship longer than the stipulated time he pays demurrage to the owner at a certain sum per day. Similarly demurrage is paid, if necessary, by those

who detain railway wagons, barges, etc. See Freight.

**Demurrer.** In English law, an objection that the plaintiff's case, as disclosed on his pleading, shows no legal cause of action. Demurrers, as such, are now abolished.

**Demy.** Size of paper or of bound books. A demy sheet of printing paper measures 22½ ins. by 17 ins.; of writing or drawing paper, 20 ins. by 15½ ins. Books are sized approximately as follows: Demy folio, 17½ ins. by 11½ ins.; demy quarto or 4to, 11½ ins. by 8½ ins.; demy octavo or 8vo, 8½ ins. by 5½ ins.; demy 16mo, 5½ ins. by 4½ ins.; 18 mo, 5½ ins. by 3½ ins. See Paper, Sizes of. *Pron.* dem-eye'.

**Demy.** Name given to the scholars of Magdalen College, Oxford, because originally their allowance was half (*demi*) that of a fellow. In addition to the ordinary or junior demies, the equivalent of scholars elsewhere, there are senior demies, who pursue advanced branches of study. See Magdalen College.

**Denaby Powder.** British permitted explosive of the non-nitro-glycerine type, containing about 35 p.c. of ammonium nitrate sensitised by 13.5 p.c. trinitrotoluene. The reduced content of ammonium nitrate is compensated for by the addition of about 35 p.c. potassium nitrate, and 18.5 p.c. ammonium chloride is added to lower the explosion temperature. Denaby Powder No. 2 is supplied in sheathed form.

**Denain.** Town of France, in the dept. of the Nord. It stands near

the junction of the Escaut (Schelde) and the Selle, 5 m. S.W. of Valenciennes, and is connected with neighbouring towns by rly. Its growth is due entirely to the opening of the coal mines around it, since about 1850. Steel, machinery, and glass are manufactured. Here in 1712 the French marshal Villars gained a victory over Eugene of Savoy. Pop. 24,908.

**Denarius** (Lat. *deni*, ten each). Chief silver coin of ancient Rome. It was equivalent to 10, afterwards to 16, copperasses. It is the "penny" of the N.T. (in the American R.V. "shilling.") See As; £. s. d.

**Denazification Trials.** Trials of suspected Nazis in German courts, following the Allied occupation in 1945. See Nazism.

**Denbigh.** Mun. bor. and county and market town of Denbighshire, Wales. It is 29 m. W. of Chester, with a railway station. On an eminence in the Vale of Clwyd, Denbigh is engaged in the timber, butter, and poultry trades, and near by are slate, lime, and

Denbigh arms

other quarries. Here are the N. Wales mental hospital, free grammar and Bluecoat schools, and the ruins of a Carmelite priory. Denbigh castle, in which Charles I sought asylum in 1645, was built by Henry De Lacy. Market day, Wed. Denbigh gives its name to a co. div. returning one M.P. Pop. 8,100.

**Denbighshire.** Northern maritime county of Wales, with about 10 m. of coast-line on the Irish sea. Mountains occur in the S. (Moel Sych, 2,713 ft.), the E. is hilly, and towards the N. the surface becomes flat. The valleys of the Clwyd, Conway,

Denbighshire. Map of this maritime county of North Wales

and Dee (Vale of Llangollen) are noted for their picturesque scenery. Oats, barley, wheat, and rye are

Denbighshire arms

and sheep-rearing are important industries, and coal, lead, zinc, and fire-clay are among the mineral products. Prehistoric remains abound, and some of the oldest rocks in the British Isles occur. In the extreme E. of the co. a small area belongs to Flint. Denbigh is the co. town, Colwyn Bay the chief holiday resort. Two members are returned to parliament. Area 665 sq. m. Pop. 157,648.

**Denbighshire Series.** Grits and flags in the middle division of the upper Silurian system. They extend from Conway through Pentre-Voelas to a point midway between Rhayader and New Radnor. The Pen-y-glog and Moel Farna beds are contemporaneous with the Wenlock group; those of Nantglyn and Dinas Bran with the lower Ludlow shale. In the N.W. graptolites abound.

**Dendera, TENTERIS, OR TENTERA.** Village near the left bank of the Nile, between Kena (Qina) and Luxor. It is celebrated for the temple dedicated to the goddess Hathor, identified by the Greeks with Aphrodite. This well-preserved temple was begun by Ptolemy XIII, father of Cleopatra. Its architecture is of great beauty; built of sandstone, it is composed of two rectangles, the first with a façade with six sculptured columns, the second containing the sanctuary of the temple. There are numerous passages and treasure-hiding-places, and the walls bear a rich series of inscriptions. A small building on the roof was used for the worship of Osiris. Valuable excavations here were made by Petrie. Close by is a small temple of Isis, built under the emperor Augustus, and in the neighbourhood is a cemetery with tombs from the IV to the XI dynasties. Consult Denderah, W. M. Flinders Petrie, 1900.

**Dendermonde** OR TERMONDE. Town of Belgium, in the prov. of E. Flanders. It stands where the Dendre joins the Schelde, 25 m. S.W. of Antwerp. The chief church is the Gothic Notre Dame, with two

paintings by Van Dyck and a 12th century font, and the chief secular building the town hall, a 16th century edifice on the Grande Place, but both were seriously damaged by the Germans in Aug., 1914. The chief industry is the making of cloth, but the town is an agricultural centre of some importance.

Dendermonde began as a small place in the duchy of Brabant. With that duchy it was included in Burgundy, and later in the Spanish Netherlands. It was fortified, and in 1667 the citizens, by opening the sluices, drove back an attacking army of Frenchmen. Soon, however, the French took the fortress, which was recovered by Marlborough in 1706, and in 1715 it passed to Austria. In 1815 it was given to the new kingdom of the Netherlands; in 1830 to Belgium.

**Dendritic Structure.** Formation, resembling a fern growth, seen in specimens of certain alloys

Dendritic Structure. Example in a copper-phosphorus alloy, mag. 65

when a polished and etched section is viewed under the microscope. The alloys which exhibit this phenomenon are those which form solid solutions. If such an alloy is cooled from the molten state so slowly that equilibrium conditions are reached, the crystal grains formed will be of the same composition throughout and appear under the microscope like a

pure metal. If cooling is too fast the individual grains will not be homogeneous and a "cored" or "dendritic" structure will result. The formation of core alters the composition of the remaining liquid so that the next metal solidified forms a shell of different composition round the core and this process is repeated until the whole mass is solid. An example of this structure is the copper alloy shown in the illustration.

**Dendrobium** (Gr. *dendron*, tree; *bios*, life). Large genus of the family Orchidaceae. Chiefly natives of India, Malaya, and Australasia, they are all epiphytes, but differ greatly in habit—some having a creeping rhizome, others a few small pseudo bulbs, others again club-shaped stems. The flowers differ enormously in size, some minute, others very large; some solitary, others in many flowered sprays. The chief character of the genus lies in the lip (labellum) of the flower, which is contracted at the base, where it lies upon or grows to the foot of the column. See Orchid.

**Dene.** Name given to a deep, wooded dell or valley. It is common in English place-names, e.g. Tenterden, Marden, Rolvenden, and Biddenden, all in Kent.

**Dene-Hole** (A.S., valley-hole). Ancient excavation, chiefly in Essex, Kent, and the Somme valley. There are 72 within four acres near Grays, in Essex. A round shaft, 3 ft. across, was sunk through gravel, sometimes for 60 ft., until chalk was reached. A bell-shaped chamber, 16–22 ft. high, sometimes with trefoil branches, was then formed. The most reasonable theory is that they were chalk quarries, as mentioned by Pliny, or store chambers.

**Dengue, DANDY FEVER, OR BREAKBONE FEVER.** Acute disease of tropical and sub-tropical countries, particularly India, Asia Minor, Africa, and the West Indies. It appears to be conveyed by mosquitoes, and spreads very rapidly. The symptoms are those of high fever, with redness of the face and usually a rash on the skin, sore throat, headache, severe pain in the muscles, and pain and swelling of the joints. This condition persists for three or four days, when the temperature falls and the patient's condition improves. After another three or four days the fever and pains return, then gradually abate. Though causing severe emaciation and loss of strength, it is rarely fatal or permanently injurious. Pron. denggay.

Dendera. Isolated pylon of the Temple of Hathor. Behind is the Great Vestibule of the building

**Denham.** Parish and village of Buckinghamshire, England, lying 15 m. W.N.W. of London by rly. from Paddington or Marylebone. Denham golf club has a separate station. Film studios are the chief concern of the district. Pop. 2,609.

**Denham, Dixon** (1786-1828). British explorer. Born in London, Jan. 1, 1786, he served in the Peninsular and Waterloo campaigns, and made an expedition across the Sahara during 1822-23. In 1824 he explored parts of the coast of Lake Chad. In 1828 he was made governor of Sierra Leone, but he died there of fever on May 8, 1828.

**Denham, Sir John** (1615-69). English poet. He was born in Dublin, where his father was lord

chief justice, and educated at Trinity College, Oxford. During the Civil War he attached himself to the Royalist cause, and after the Restoration received a knighthood. In

Sir John Denham,  
English poet  
From an old print

1642 he brought out the successful tragedy of *The Sophy*, but he is chiefly remembered for his poem, *Cooper's Hill* (1642). Denham is buried in Westminster Abbey.

**Denia.** A town and seaport of Spain, in the prov. of Alicante. It stands on the slopes of a hill, facing the Mediterranean, 45 m. N.E. of Alicante, and is connected by rly. with Alicante and Valencia. Manufactures include textiles, esparto fabrics, and nails, and large quantities of fruit are exported. Founded as *Hemerokoskeion* by the Greeks, it afterwards became the *Dianium* of the Romans; it was enriched by the Moors, and has many remains of antiquity, including the famous temple of *Diana*, from which the town was named, and a mosque. It was besieged and captured by an Anglo-Spanish force in 1813. Pop. 12,612.

**Denikin, Anton Ivanovich** (1872-1947). Russian soldier. Born Dec. 4, 1872, he entered the army in 1887, and saw active service in the Russo-Japanese War, 1904-05. During the First Great War he was promoted general, but first came into prominence in 1917,

Anton Ivanovich Denikin

when he was made c.-in-c. Russian South-Western armies. After the Lenin-Trotsky *coup d'état* of Nov. he withdrew to Rostov and took part in the formation of the volunteer army under Alexeiev, after whose death, Oct., 1918, he succeeded to the command. In 1919 Denikin cooperated with Koltchak against the Bolsheviks, and at first had remarkable success. Early in 1920 his armies collapsed, and he came to England. After 1926 he lived mostly in France, but he died at Ann Arbor, Mich., U.S.A., Aug. 8, 1947.

**Deniliquin.** Municipality of New South Wales, Australia, in Townsend co. It lies between the Murray and Murrumbidgee rivers, and is the terminus of a rly. to Echuca in Victoria, 40 m. to S.S.W.

**Denim.** Cotton fabric for overalls, etc., usually in twill weave, with closely packed yarns, designed to withstand heavy wear.

**Denis, DENYS, or DIONYSIUS.** (d. c. 275). Patron saint of France. He was born in Italy, and was sent by Pope Fabian in the 3rd century as a missionary to Gaul. He became bishop of Paris, and built a church on an island in the Seine. At the instigation of the pagan priests he was beheaded with two companions by the Roman governor. Four hundred years later a church and a Benedictine abbey were erected on the site of his martyrdom. In the Middle Ages he was identified with Dionysius the Areopagite (q.v.). His festival is kept on Oct. 9.

**Denis, HENRI.** Belgian soldier. General Denis was minister of Defence when Germany invaded Belgium in May, 1940, and after King Leopold's capitulation he went with the cabinet to Bordeaux. At a meeting there on June 18, he declared in favour of remaining in France and following the French government to Vichy, rather than establishing a Free Belgian government in England.

**Denis, LOUISE MIGNOT** (c. 1710-90). Niece and companion of Voltaire. She had been left a widow in 1744, and when in 1758 Voltaire retired to Ferney, she kept house for him. A number of Voltaire's letters are addressed to her; after his death she married the *Sieur du Vivier*.

**Denis Duval.** Novel by W. M. Thackeray, uncompleted at his death. As much as had appeared in *The Cornhill Magazine* was published posthumously in 1867. Though but a fragment, the story, an historical one of the late 18th century, is of high merit.

**Denison.** City of Texas, U.S.A. In Grayson co., it lies near the Red river on the Oklahoma border, 70 m. N. of Dallas, and is served by rlys. Completed in 1944, the Denison dam is the largest earthen structure of its kind in the world, forming a lake with a shore line of 1,200 m. Army engineers took six years to construct it. It provides flood control for four states. Denison trades in vegetables, fruit, and farm produce, and makes textiles, cotton-seed oil, and machinery. Grape culture is being developed. The town was incorporated in 1873 and chartered as a city in 1891. Pop. 15,581.

**Denison.** Cape on the coast of Adélie Land (q.v.), Antarctica. It was discovered and named by Mawson, of the Australasian Antarctic expedition, 1911-14, which here established its main base.

**Denison, GEORGE ANTHONY** (1805-96). British divine. Was born at Ossington, Notts, Dec. 11, 1805.

Educated at Eton and Christ Church, Oxford, he became a fellow of Oriel, where he was at the heart of the High Church movement.

G. A. Denison,  
British divine

He obtained a living in 1838, and from 1851 until his death, March 21, 1896, he was vicar of East Brent, Somerset, and archdeacon of Taunton. Denison is remembered chiefly for his High Church views and practices, which led to a lawsuit before the privy council. Some attribute to him the institution of harvest festival services.

His elder brother was Viscount Ossington, the Speaker, and two other brothers attained eminence: Edward Denison (1801-54), bishop of Salisbury from 1839 until his death, and Sir William Thomas Denison (1804-71), governor of New South Wales, 1854-61, and governor of Madras, 1861-66.

**Denitrification** or **DENITRATION.** Biochemical term expressing the removal of nitric acid from a mixture or the removal of nitrates from the soil. All plants and animals require nitrogen for their growth; the larger ones cannot directly make use of the nitrogen in the air, but minute organisms, e.g. some bacteria, are capable of converting the nitrogen of the air into nitrates. These nitrates are used by plants for their growth, and the plants

provide nitrogen compounds for cattle, sheep, and other animals. Many leguminous plants have nodules on their roots, each nodule consisting of thousands or millions of such bacteria, amounting to a few tons per acre of a field of peas.

When the ground is properly cultivated there are enough bacteria for the needs of the leguminous plants and enough nitrates for many other plants. The bacteria need carbohydrates, which are supplied by the plants; but if the ground is not properly cultivated the bacteria diminish in number and the soil each year becomes less fertile. This process is denitrification; the remedy is the addition of nitrogenous fertilisers, such as sulphate of ammonia, or better cultivation by digging and hoeing, leaving fallow, or growing an occasional crop of peas or beans.

**Denizen** (Lat. *de*, from; *intus*, within). Term used in English law for an alien who has received from the crown letters patent of denizenship conferring some of the privileges of a British subject. See Alien; Naturalisation.

**Denizli**. Town of Asiatic Turkey, in the vilayet of Denizli. It stands in a valley, amid vine-clad hills, 50 m. S.E. of Alashehr, and is connected by rly. with Izmir. The town is famous for its gardens, and near it are the ruins of Laodicea. It has considerable trade in leather. Pop. of town, 15,787; vilayet, 285,225.

**Denman, THOMAS, 1ST BARON** (1779-1854). British judge. Born in London, Feb. 23, 1779, and educated at Eton and St. John's College, Cambridge, he became a barrister in 1806. With Brougham he defended Queen Caroline in 1820. Attorney-general in 1830, he became lord chief justice in 1832, and was made a peer in 1834. He retired 1850, and died Sept. 22, 1854.

His great-grandson Thomas, who became 3rd baron in 1894, was born Nov. 16, 1874, and educated at Sandhurst before serving in the South African War. During 1911-14 he was gov.-gen. of Australia. He became deputy speaker of the house of lords.

**Denman, GERTRUDE MARY, LADY** (b. 1884). British organizer. Daughter of the 1st viscount Cowdrey (*q.v.*), she was born Nov. 7, 1884, and educated privately. She married the 3rd Baron Denman in 1903. A member of the executive committee of the Women's National Liberal Federation, 1909-10, she was chairman

of the sub-committee of the Agricultural Organization society which introduced women's institutes into England and Wales during the First Great War, and chairman of the National Federation of Women's Institutes, 1917-45. In 1939 she was appointed hon. director of the Women's Land Army (*q.v.*), resigning in 1945 on the government's decision to withhold from members financial benefits

similar to those granted to the enlisted services.

**Denman Glacier**. Huge ice-flow on the coast of Queen Mary Land (*q.v.*), Antarctica. Emerging between Capes Jones and Harrison, it was discovered by the Mawson expedition, 1911-14. It descends N. between Mounts Sandow (4,000 ft.) and Amundsen, E.; and Mounts Strathcona and Barr Smith (about 4,320 ft.), W.

## DENMARK: THE COUNTRY & ITS PEOPLE

A. D. INNES and \*HENRY BAERLEIN

*This article gives a description of Denmark, afterwards dealing with its language, literature, industries, and history. For more detailed information see the articles on Copenhagen and other towns, and on the country's kings, statesmen, and men of letters*

Denmark comprises a northward projecting peninsula of the central European plain, Jutland (Danish *Jylland*), and an archipelago of several islands of which the most important are Zealand (*Sjælland*), Fünen, Langeland, Lolland, Falster, Moen, and the

Denmark arms

outlying island of Bornholm in the Baltic. The area of Denmark is 15,042 sq. m., excluding the area added as a result of the plebiscite in Slesvig, which was an outcome of the treaty of Versailles. Jutland is separated from Norway by the Skager Rak, from Sweden by the Kattegat, and from Germany by the Fehmarn Belt. The Danish Archipelago blocks the passage between the Kattegat and the Baltic, leaving only three narrow and comparatively shallow channels, the Sound (*Oresund*) between Sweden and Zealand, the Great Belt between Zealand and Fünen, and the Little Belt between Fünen and the mainland. The Sound is the most direct route for traffic to and from the Baltic; but the Great Belt, entirely within Danish sovereignty, is deeper, navigable by vessels drawing over 23 ft.

Denmark is a low-lying level country with little diversity of physical features except in the rocky island of Bornholm. In Jutland the highest elevation, Himmelberg, is only 560 ft. With the exception of Bornholm, which consists of old rocks, virtually the whole surface of Denmark is covered with deposits of boulder clay overlying cretaceous rocks. The soils are mainly sand and clay. About one-fifth is peat bog, moorland, and sandy waste. The W. coast of Jutland is low, unin-

dented, and fringed with sand dunes, behind which lie lagoons. These sandy wastes continue southwards into the N. Frisian Islands off the coast of Slesvig, and northwards to the curved spit known as the Skaw or Skagen. Shoal water and several reefs fringe the W. coast. The most notable are Horn Reefs, near which the naval engagement called the battle of Jutland was fought May 31-June 1, 1916.

The E. coast is somewhat higher, and, being faced with rather deeper water, is more accessible. Numerous inlets afford small safe harbours. Limfjord, which cuts in half the N. part of Jutland, is a series of salt lagoons covering an area of about 600 sq. m. Its continuity from sea to sea is of fairly recent occurrence. The waters are too shallow for navigation, but afford natural nurseries for young plaice and other fish. The indented coasts of the islands of the Danish archipelago afford numerous small harbours and have always been favourable to the development of seamanship. The climate is comparable to that of eastern Great Britain, but has a warmer summer and colder winter. Rainfall is not heavy, particularly in the E. There are considerable areas of beech forest.

Racially the Danes are Scandinavians of Teutonic stock, who early succeeded the allied Cimbric. In Greenland, the only colony of Denmark, Danes form a small minority confined to traders, pastors, and officials.

**CONSTITUTION.** The present constitution is based on the *grundlov* or charter of 1849, modified in 1915 and 1920. Denmark is a limited monarchy; King Frederick IX succeeded his father Christian X in 1947. The sovereign has executive power exercised

through his ministers. He is also head of the Evangelical Lutheran Church. The *Rigsdag* or diet embraces two houses: the *Folketing* (house of commons) and the *Landsting* (senate). All men and women of Danish nationality more than 25 years of age and permanently resident in Denmark possess the franchise and are eligible for election to the *Folketing*, which has 148 members; 117 members are elected by proportional representation in 23 districts, and 31 seats are divided among parties not obtaining sufficient returns at the district elections.

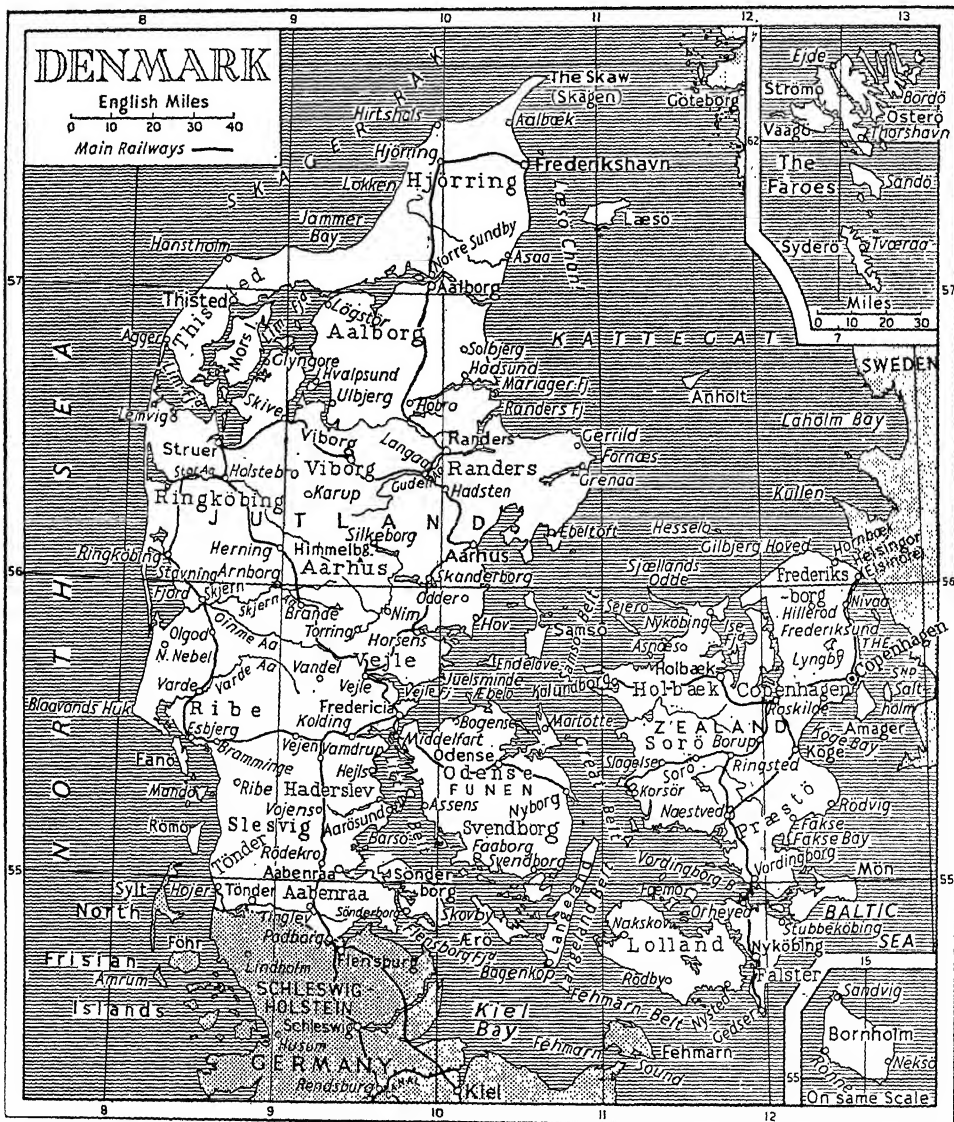

The term of the legislature is four years, but the king has power to dissolve the *Folketing* earlier. Members of the *Landsting* are elected indirectly by voters of 35 years of age by a complicated method of proportional representation; they sit for a term of eight years.

**EDUCATION, ETC.** Education was made compulsory in 1814 and the school age is from 7 to 14. The public schools, which exceed 3,700, are mostly free. Higher education is provided at the university of Copenhagen, founded 1479, which has five faculties and about 6,500

students, men and women; and the university of Aarhus, opened 1933, with about 1,000 students.

Social legislation was codified in 1933, including public assistance and insurance acts. There is a system of old age pensions payable under certain conditions to aged poor over 60 years of age. About 140,000 people are in receipt of pensions. In peace-time there is no capital punishment.

Military service before the Second Great War was compulsory for all males at the age of 20, conscripts serving one year in the active army, after which they

Denmark. Map of the little Scandinavian kingdom. Inset are maps of Bornholm and the autonomous Faroe Islands

served eight years in the reserve. The navy was for coast defence only.

**INDUSTRY, ETC.** Agriculture is the principal activity, occupying over half the population. The crops are barley, oats, rye, and a little wheat. Potatoes and beet-roots are also extensively grown. Hay, pasture grass, and lucerne must be regarded among the principal crops, since the growth of cereals is really secondary in importance to the dairy industry for which several of the crops are grown. Maize, oil cake, and other feeding stuffs are imported for this industry. Large quantities of butter and eggs are exported. The prevalent system of small holdings has done much to foster intensive agriculture and the farmers' co-operatives to rationalise marketing. The utilisation of the waste in butter-making has led to a great increase in pig-rearing and much export of high-grade bacon.

In the absence of coal, water power, and metallic ores, manufactures are not extensive. Much sugar is produced from home-grown beets, and there is a growing manufacture of margarine. The abundance of hides has led to glove and leather industries at Copenhagen, Randers, Odense, and elsewhere. China clay from Bornholm is used in the famous porcelain and terra-cotta works of Copenhagen. There are small manufactures of woollen and linen goods. Danish shipbuilders were among the first to fit oil engines to large merchant vessels.

#### Roads and Railways

Internal communications are well developed. Roads are numerous and kept in good repair. There are over 3,100 m. of railways, of which nearly half are owned by the state. The telegraph and, especially, the telephone systems are highly efficient.

The imports are mainly fuel, feeding stuffs, textiles, metals, and hardware, and the exports butter, eggs, bacon, and livestock. Under normal conditions imports come mainly from the U.S.A. (grain, etc.), Germany, and the U.K. (coal and manufactured goods), while exports go chiefly to Germany and the U.K.

Copenhagen is the chief port, and the only one that can receive large vessels. The new free port at Copenhagen dates from 1893: it is one of the busiest commercial centres in the Baltic. Aarhus, on the E. coast, is the largest town in Jutland. Aalborg on Limfjord is the chief centre in the N. Odense

is the principal town in Fünen. Frederikshavn is the port for Norway, and Esbjerg the chief port for Hull. Flensburg in Slesvig has a partly German community.

An estimate of the population on Jan. 1, 1945, was 4,024,000. About half the pop. is urban, and Copenhagen, the capital, had 890,130 inhabitants at the 1940 census. Nearly all Danes belong nominally to the Lutheran Church, except for some 22,000 Roman Catholics and 6,000 Jews.

The only colonial possession of Denmark is Greenland. The Farøe Islands, formerly governed as part of the home country, were granted autonomy in 1947. Iceland proclaimed its independence in 1944.

**LITERATURE, ETC.** The old language of the Danes occurs in Runic inscriptions of the Viking period, but Danish, as a distinct language, began to develop from the old Norse about the 11th and 12th centuries. Three dialects eventually developed, those of Skane, Zealand, and Jutland, the last named ultimately becoming the literary language of Denmark.

Danish literature was late in developing owing to the use of Latin and, later, German as means of literary expression. In the 12th century Saxo Grammaticus wrote his *Historia Danica*, which includes much folk-lore in addition to history. The *Kjaempeviser*, old Danish ballads, probably date from the 11th or 12th century, but were not published until the 16th century. *Rijmkronike*, a rhymed history of Denmark, published in 1495, was the first book printed in the country.

Christian Pedersen published an epoch-making translation of the Bible (1550) and some mythical stories of Charlemagne. H. J. Ranch was the first dramatist: his works include *The Crowning of Solomon* and *Samson's Prison*. A. Kristensen Arrebo, author of the *Hexaëmeron*, was the first poet of note. Thomas Kingo, of Scots descent, and Hans Brorson were writers of hymns half a century later. The beginning of modern Danish literature was marked by Ludvig Holberg, historian and dramatist, whose *Peder Paars* (1719) was a satire on contemporary Danish life. Hans Gram was a notable historian of that period.

Poetry then began to develop largely under the influence of the French school. Johannes Ewald wrote *Adam and Eve*, *Rolf Krage*, and *Balder's Death*. Johan Wessell, by his satirical play, *Love without*

*Stockings* (1772), did much to turn opinion once more towards Danish national sentiment. The reawakening of interest in national literature was helped by Peter Suhm, with his *History of Denmark* down to 1400; Knud Rahbek, critic, poet, and dramatist; Rasmus Nyerup, critic and historian, and Jens Baggesen, satirist and humorous poet.

The 19th century was marked by a romantic revival in Danish literature largely through German influence. To this school belonged Schack von Staffeldt, a German by birth, who nevertheless made the Danish language his own and excelled in the lyric; Adam Öhenschläger, Denmark's greatest poet, best known by his tragedy *Hakon Jarl* and the poem of the *Golden Horns*; Steen Blicher, a realistic story writer; the poet antiquarian and religious revivalist, Nikolai Grundtvig; the critic and playwright, Johan Heiberg; and the dramatist, Henrik Hertz.

#### Great 19th Century Writers

The most widely known name slightly later was that of Hans Andersen, whose fairy tales made him world-famous. A reaction against the narrowness of national sentiment in literature was signalled by Georg Brandes, the famous critic, who after bringing on himself a storm of abuse was eventually acknowledged as one of Denmark's greatest writers. J. Jacobsen, Sophus Schandorph, and Karl Gjellerup were among the adherents of the Brandes school. At the end of the 19th century, in opposition to Brandes, there grew up a new romantic school, devoid of exotic influences. The leaders were Holgar Drachmann, Henrik Pontoppidan, J. Jørgensen.

Great sculptors include H. W. Bissen, B. Thorwaldsen, and J. A. Jerichau. The Danish school of painting shows much Dutch influence. Among the best known painters are Jakob Carstens and Carl Eckersberg.

Danes have long been notable in the world of science. H. C. Oersted discovered electro-magnetism; J. F. Schouw wrote on geographical botany; J. J. S. Steenstrup was noted for his zoological work; Niels Finsen discovered the effect of light rays on certain skin diseases; Niels Bohr was a founder of nuclear physics. Danish Arctic explorers, whose work has been done principally in Greenland, include W. A. Graah, H. Rink, K. J. Steenstrup, C. F. Wandel, Mylius Erichsen, Einar Mikkelsen, and Knud Rasmussen.

**HISTORY.** The Danes first appear definitely on the stage of history towards the close of the 8th century, when Charlemagne was waging war upon the Saxons. During the 9th century they and their Norwegian kindred were harrying the coasts and estuaries of the British Isles and Western Europe (see Viking). In the 10th century the process of consolidation was advancing among the Scandinavian peoples; both in Denmark and in Norway the kingship was establishing itself; and the old irresponsible Viking raids became less active.

#### Canute the Great

Christianity began to make way among the Danes in the 10th century, in the time of Harald Bluetooth, who, after long struggles, established himself as king of Denmark. He was followed by Sweyn, Swegen or Sven Forkbeard, who, in 1013, made himself king of England, and who was followed in 1014 by Canute or Knut the Great. Canute ruled mightily and succeeded for the moment in uniting the crown of Norway with those of Denmark and England. On the extinction of his own family, the Danish succession was secured by his nephew Sweyn, the son of Estrid, Canute's sister, whose dynasty lasted for four centuries.

The next notable name is that of Waldemar the Great (1157-82). In the interval, when Denmark had been constantly torn by struggles for the throne between rival members of the house of Estrid, she had also been harassed by the savage Wendish tribes who occupied the S. shore of the Baltic. Waldemar and his son, Canute VI, turned their arms successfully against the Wends, and extended their dominions over Holstein, Mecklenburg, and Pomerania. A still further extension of dominion eastwards over Estonia won for Waldemar II (1202-41) the title of the Victorious; but in the middle of his reign most of the conquered dominions, with the exception of Estonia and the island of Rugen, recovered their independence.

After Waldemar's death a situation arose not unlike that in Scotland after the death of Robert Bruce. The kings were not strong enough to curb the nobility, and the nobles were more concerned to extort and assert privileges for themselves than to unite for the welfare of the State. Complete disruption was averted by the strenuous rule of Waldemar IV, called Atterdag (1340-75), who, at his death, left his dominions at least undiminished, and the authority of the crown considerably increased.

Waldemar had no son, but his daughter Margaret was the wife of Haakon VI, king of Norway. The Danes made her young son Olaf king, while Margaret herself was appointed regent. With Haakon's death in 1380 the young Olaf became king both of Denmark and of Norway, while Margaret was regent in both countries.

Olaf died in 1387. Margaret's own reign lasted till 1412, but the situation proved unmanageable in less capable hands. Under Eric, Norway and Sweden found themselves subordinated to Denmark, Denmark itself was ill governed, and the king met with no success in his struggles with the Hanseatic League. He was deposed in 1439, and was succeeded by his nephew, Christopher III (d. 1448).

Denmark and Norway elected Christian I of Oldenburg as king; the Swedes claimed the right of electing their own monarch. Christian at the same time acquired the succession to Slesvig and Holstein, which remained with the Oldenburg dynasty of Denmark until 1863, though held as fiefs of the German Empire. Christian I, John, and Christian II, each with temporary success, sought to recover the crown of Sweden. Christian II endeavoured to secure his position by a massacre known as the Bloodbath of Stockholm, Nov. 8, 1520, when many of the leading nobles, clergy, and Stockholm townfolk were slaughtered; but this piece of "frightfulness" met with its due reward in the revolt of the Swedes led by Gustavus Vasa, and the permanent separation of Sweden from Denmark in 1523.

#### The Counts' War

Christian was deposed in 1523, in favour of his uncle, Frederick of Holstein-Gottorp. On Frederick's death in 1533 there was a three years' struggle for the crown, known as the Counts' War, between his son Christian III and the deposed Christian II, who was favoured by the Church on account of the Lutheran proclivities of his rival. In the reign of Frederick II, the son of Christian III, a fresh attempt was made to recover the crown of Sweden. The treaty of Stettin in 1570 left Denmark still in possession of Norway and of Scania and other provinces in the Swedish peninsula.

In a long reign of 60 years, Frederick's successor, Christian IV, greatly advanced the internal prosperity of Denmark, but his excursions into foreign politics were unhappy. As a prince of the German empire he intervened on behalf of the Protestant states in the Thirty Years' War, but after a short

struggle was overwhelmed and forced to retire by the Imperialists, his place being shortly afterwards taken by the formidable king of Sweden, Gustavus Adolphus.

Jealousy of Sweden caused an outbreak of open hostilities in 1643, with the result that the peace of Bromsebro (1645) transferred to Sweden sundry provinces which had hitherto been retained by Denmark. The battle with Sweden was renewed by Christian's son, Frederick III, in 1657, when Charles X of Sweden, "the Pyrrhus of the north," was king of Sweden. An amazing campaign, in which Charles marched across the frozen seas into Jutland, brought Denmark to her knees, and she had to surrender Scania, though in 1659 the Danes and Norsemen succeeded in driving the Swedes from the footing they had won in Jutland and Norway.

#### Revolution of 1660

In 1660 the clergy and burghers united to carry through a revolution which swept away the excessive privileges enjoyed by the turbulent nobility, and at last concentrated the effective power under the direct control of the crown. But for this revolution it is doubtful whether the independence of Denmark would have survived the next half century. All the powers with interests in the Baltic—Russia, Poland, Brandenburg, and Denmark—shared a common jealousy of the power of Sweden. But Sweden, under Charles XI, was saved from being overwhelmed, partly by the ability of the young king, and partly by the intervention of Louis XIV.

When Charles XI died in 1697, Russia, Poland, and Denmark thought that their opportunity had come with the accession of Charles XII, but his military qualities made him more than a match for his enemies. By a sudden onslaught on Denmark, he compelled her to withdraw entirely from the alliance (1700). When Denmark ventured to renew the attack later, the reappearance of Charles on the scene threatened her first with the loss of Norway and then with perhaps still greater disasters, but she was saved by the death of Charles in 1718, and the struggles of the northern powers were brought to an end by the treaty of Nystad (1721).

Like other neutral countries, Denmark was inconvenienced by the naval claims of Great Britain when the supreme maritime power was at war. In 1780 she joined the Armed Neutrality, but without effect. In 1801 her indignation was

1. Fisher girl of Skonshoved. 2. A village bride. 3. Fisherman 4. Typical farmstead. 5. Lutheran prelate  
 6. North Danish woman. 7. Girls from Randers. 8. Modern thatched farm house. 9. Peasant girl spinning.  
 10. Woman from Fano. 11. Country couple in holiday dress

**DENMARK: HOMESTEADS AND TRADITIONAL COSTUMES OF THE COUNTRY**

roused by the action of Great Britain, which compelled the surrender of the Danish fleet (*see* Copenhagen, British Attacks on), and Denmark was constrained to join the circle of Napoleon's dependants; and by the congress of Vienna in 1815 she was deprived of Norway, which was handed over to Sweden.

Though Denmark had suffered considerably, her recuperation was rapid, and there followed a degree of political enfranchisement. Then, with the middle of the century, the Slesvig-Holstein question reached an acute phase. In the two provinces there was a Danish and a German party. The technical question of their precise relations to the Danish crown was, in fact, insoluble; the demands of the two parties were irreconcilable, and the complication became worse with the death of Frederick VII in Nov., 1863, and the passing of the crown to Christian IX. of Glücksburg.

Austria and Prussia united to enforce the separation of the duchies from the sovereignty of the new royal house of Denmark, overwhelmed the resistance of the Danes, and forced on Denmark in 1864 the treaty of Vienna, the result of which was the absorption of the duchies by Prussia—an unjust oppression which it was left to the peace conference at Versailles to correct. Denmark remained neutral during the First Great War. North Slesvig was officially reunited to the country in 1920.

**THE SECOND GREAT WAR.** In May, 1939, at the request of the Germans, the Danes signed with them a non-aggression pact for ten years. The Germans broke it, crossing the Danish frontier at dawn on April 9, 1940, and occupying strategic points in Copenhagen and elsewhere. Having no defences, the Danes offered no resistance, and by evening virtually the whole country was in German hands.

For three years the Germans tried to win over the Danes and to represent Denmark as a model protectorate, while exploiting the country's industrial capacity and plundering it of food. But passive resistance and active sabotage grew in strength. Ninety p.c. of the electorate voted in the general election of March, 1943, casting nearly two million votes (143 seats) for the anti-Nazi parties against less than 68,000 (representing 5 seats) for pro-Nazis.

Reprisals followed successful acts of sabotage, strikes followed

reprisals, deportations and executions followed strikes. At the end of Aug., 1943, the Danish government resigned—even the most pro-Nazi among them could not agree to the trial of saboteurs by German courts; and Gen. von Hanneken, German c.-in-c., assumed full powers. Sabotage continued, one of the most spectacular efforts being the destruction in June, 1944, of the Riffel Syndikatet factory at Copenhagen, third largest factory making automatic weapons in Europe.

No battles were fought on Danish soil, and Denmark suffered little from aerial activity. A pinpoint attack on Oct. 31, 1944, by 24 R.A.F. Mosquitoes wrecked two buildings of the university of Aarhus, used as Gestapo h.q. for Denmark and containing thousands of documents relating to the population and resistance.

#### Post-War Recovery

During the closing stages of the war, and subsequent expulsion of Germans from the new Poland and elsewhere, 345,000 Germans took refuge in Denmark; they remained a problem until the last of them were accepted into Germany, Feb. 15, 1949.

The unconditional surrender to F.-M. Montgomery on May 4, 1945, of German forces in N.W. Europe freed Denmark. Immediately the Danish resistance movement took charge, rounding up collaborators and disarming German troops. An all-party govt. under a Social Democrat premier was formed on May 5. Elections held in Oct. reduced Social Democrat representation from 66 to 48, and gave the Communists (forbidden in the previous election, 1943) 18 seats; but no party had a majority. A right wing govt. took office until in Oct., 1947, new elections increased Social Democrats to 57, reduced the Communists to 9, and a Social Democrat minority govt. was formed.

The fact that the Germans had maintained Denmark's agriculture for their own benefit gave her a sound basis for rapid recovery. She participated in the European Recovery Programme (*q.v.*), and was a signatory of the North Atlantic treaty, April 4, 1949.

**Bibliography.** Denmark and the Danes, E. C. Williams, 1932; Denmark in Word and Picture, ed. M. Edelberg, trans. W. E. Calvert, 1935; Denmark in History, J. H. S. Birch, 1938; Denmark: A Social Laboratory, P. Manniche, 1939; Danish Delight, M. Redlich, 1939; Denmark: Hitler's Model Protectorate, S. Gudme, 1942.

**Denmark Hill.** London suburb at the extreme W. of the borough of Camberwell, adjoining Brixton, with a rly. station. Ruskin lived here 1864-71 and his name is perpetuated in Ruskin Park (where Mendelssohn's Spring Song was composed); Sir Henry Bessemer lived and died in the mansion now known as Bessemer House. King's College Hospital was removed here in 1913 from Portugal Street, Lincoln's Inn Fields.

**Denmark Strait.** Wide channel between Iceland and Greenland. It connects the N. Atlantic with the Greenland Sea.

**Denomination** (*Lat. denominare*, to name). Word meaning originally a particular class of persons or things, one to which a special name has been given. Its most common use is for a religious body.

From it comes the word denominationalism, one much employed in controversies about religious teaching, and meaning the teaching of the special tenets of one body of Christians rather than those that are common to all. Denominational schools are those in which the religious teaching takes this form, and before the Education Acts of the 19th century a large number of elementary schools in England and Wales were of this type.

**Denominations, THE THREE.** Name applied to the Presbyterian, Congregational, and Baptist denominations. It was due to the fact that in 1727 they were organized in London into The General Body of Protestant Dissenting Ministers of the Three Denominations, and had the right of directly approaching the sovereign with an address on certain occasions.

**Denotation** (*Lat. denotare*, to mark out). In logic, the full extent of that which a word includes; all the objects of which a certain predicate can be used taken together. It was first used by J. S. Mill as opposed to connotation: the word white denotes all white things, but connotes the attribute whiteness. *See* Logic.

**Density** (*Lat. densus*, thick). The amount of matter in a given volume of a substance. Absolute density is the amount of matter in unit volume of a substance; relative density or specific gravity (*q.v.*) is the ratio of the mass of a given volume of a substance to the mass of the same volume of another substance usually taken as a standard. *See* Boyle's Law.

**Dent, EDWARD JOSEPH** (b. 1876). British writer on music. Born July 16, 1876, he was edu-

cated at Eton and King's College, Cambridge. Professor of music at Cambridge, 1926-41, he was one of the founders of the International Society for Contemporary Music. One of the foremost musical critics, his translations of opera libretti, *The Marriage of Figaro*, *Così fan Tutte*, *Don Giovanni*, *The Barber of Seville*, *Der Rosenkavalier*, etc., for Sadler's Wells Theatre, were distinguished for their scholarly yet easy and natural language as compared with the stilted and careless versions of the older translators. His publications include *Scarlati*, 1905; *Mozart's Operas*, 1913; *Foundations of English Opera*, 1928; *Life of Handel*, 1934; *Opera*, 1940; *A Theatre for Everybody*, 1945.

**Dent, J. M., & Sons.** London firm of publishers founded by Joseph Malaby Dent (1849-1926), with printing and binding works at Letchworth, Herts. They are publishers of the reprints known as *Everyman's Library*, started in 1906 under the editorship of Ernest Rhys.

**Dental** (Lat. *dens*, tooth). Name usually given to a sound formed or articulated by contact of the edge of the tongue with the teeth or their sockets (*alveoli*); such are *t*, *d*, *th* (in *thin* or *this*), *n*, *l*. The term is not strictly correct, since in the production of some sounds the tongue is not really brought against the teeth, which have little to do with the articulation. Hence various names have been given to these letters—point (*t*, *d*, *n*), lateral (*l*)—which again have been classified as inter-dental, post-dental, and alveolar. See *Phonetics*.

**Dental Cement.** Material for filling the cavities in decayed teeth. It is generally composed of a powder and a liquid which, when mixed together, react chemically to form a hard cement. Oxy-phosphate cement consists of a powder—zinc oxide—and a liquid—phosphoric acid. Oxy-chloride cement has zinc oxide as the powder and saturated zinc chloride solution as the liquid. Silicate cements have finely powdered quartz and kaolin as the basis. The powder and liquid are mixed to a paste just before placing the cement in the hollow tooth. See *Dentistry*.

**Dentalium** OR ELEPHANT'S TOOTH SHELL. Genus of marine mollusca. They have the shell in the form of a tube open at both ends and wider at one extremity than the other. Three species, each about 1½ ins. long, are found around the British coasts, especially off the N. of Scotland.

**Dentatus**, MANIUS CURIUS (3rd cent. B.C.). A Roman magistrate. He was consul in 290, 275, and 274, gained several victories over Samnites, Sabines, and other Italian tribes, and finally defeated Pyrrhus at Beneventum (275). Simple-minded, unselfish, and incorruptible, he consistently refused to enrich himself personally, and spent his closing years in the cultivation of his small farm.

**Dent Blanche** (Fr., white tooth). A peak of the Pennine Alps, W. of the Matterhorn and near Zermatt, Switzerland. It was first ascended by T. S. Kennedy and W. Wigram in 1862. Ascents, some of which are difficult, are made from Zinal, Ferpècle, Arolla, or Zermatt. Its height is 14,318 ft.

**Dent du Midi.** Mt. group of Valais, Switzerland. An outlier of the Pennine Alps (*q.v.*) between the Val d'Illiez and the Rhône, its highest point is Haute Cime, 10,696 ft. Other peaks are Dent Noire, 10,434 ft.; Dent Jaune, 10,457 ft.; and Cathédrale, 10,386 ft. It holds several glaciers, the largest being the Plan-Névé. The Haute Cime, ascended from Champéry, commands an imposing view of Mt. Blanc, the Alps of Valais and Berne, and of parts of the lake of Geneva. See *Chillon illus.*

**Dentil** (Lat. *denticulus*, little tooth). Small block of wood or stone, used as a repeating ornament in the hollow of a cornice (*q.v.*). A dentil-band is a style of cornice-moulding formed of a row

of dentils with the interstices partially or completely filled up. Another form of the word is *denticle*. See *Console*; *Corbel*; *Moulding*.

**Dentine.** Material which surrounds the central pulp of a tooth and lies beneath the enamel or hard outer covering. See *Teeth*.

**Dentist.** Practitioner of the branch of surgery which deals with the conservation and extraction of teeth and the adaptation of artificial teeth. No one may practise dentistry unless he is a registered dentist or is a doctor, except that a registered chemist may in emergency extract a tooth without any general or local anaesthetic, and in any public dental service any dental work may be carried out by an unqualified person under the direct supervision of a registered dentist. The register, which was instituted by an Act of 1878, is kept by the Dental Board.

The preliminary examinations recognized by the General Medical Council for admission to the register are the same as for medical students, and are of the university matriculation standard. The most generally favoured qualifications are those of the Royal College of Surgeons in England, the Royal College of Surgeons of Edinburgh, the Royal Faculty of Physicians and Surgeons of Glasgow, and the Royal College of Surgeons in Ireland. Licentiates of these faculties use the letters L.D.S. after their names.

## DENTISTRY: THE CARE OF THE TEETH

J. SIM WALLACE, M.D., D.Sc., L.D.S.

*With this article, which is preceded by one on the qualifications of a dentist and followed by one on dentition, should be read that on Teeth. See also Anaesthesia; Caries, etc.*

Dentistry may be said to have begun with civilization in Egypt. From the Ebers Papyri we gather that dental diseases such as gum-boils and painful erosions of the teeth were described, and some sort of medical treatment such as plasters and decoctions was advocated (4700-1000 B.C.). Similar knowledge was possessed by the Greeks, and from Aristotle (4th cent. B.C.) we learn that instruments for extracting and scaling the teeth were used. In Italy we find the first definite knowledge of mechanical or prosthetic dentistry. The Etruscans, 500-400 B.C., evidently restored missing teeth, for specimens of bridge-work have been discovered and preserved in the Corneto museum. These bridges were of a primitive kind, but inasmuch as the artificial substitutes were attached to the

neighbouring teeth with wire or gold bands, the essential principle of modern dental bridge work was recognized.

The Romans practised dentistry extensively, and modest fortunes could be made at this art in those days. Celsus writes at some length on the diseases of the teeth, and in describing the procedure for the extraction of a tooth advocates the filling of a hollow tooth with lead before it is removed. Filling the teeth for their preservation is not recommended until A.D. 850, when Rhazés, a Persian, advocated this now familiar operation. With the decline and fall of the Roman empire the art of dentistry in Europe appears to have become more or less extinct, but in N. Africa, the Arabians continued to practise it. With the Renaissance it revived, and towards the end of

the 15th century Giovanni d'Arcoli advocated the use of gold foil for filling teeth. It may be noted that Peter van Foreest in 1580 attributes harmful effects to the eating of sweets. In 1595 there is evidence that something like a gold-capped or other kind of gold crown had been made, as a boy with a gold tooth was exhibited.

In 1678 Anton van Leeuwenhoek (*q.v.*), the naturalist, constructed a powerful microscope, by the aid of which he laid the foundation of modern knowledge with regard to the minute anatomy of the teeth. The 18th century showed very marked progress. In 1700 Andry of Paris called attention to micro-organisms in the white matter surrounding the teeth. In 1728 Fauchard published his *Chirurgien Dentiste*. He advocated specialised training and may be said to have laid the foundations of the art of modern dentistry. He made important contributions to the art of dentistry, advocating the bow and drill—the earliest type of the modern dental engine—and conceived the idea of enamel teeth to take the place of the human or carved ivory teeth, which had hitherto been used as artificial substitutes. Later, in 1746, he advocated the principle of suction for the retention of upper dentures.

#### The Work of Hunter

In Britain dentistry advanced in quite another way. John Hunter published *The Natural History of the Human Teeth*, 2 vols., 1771–78. The anatomical and pathological specimens of the teeth which he prepared remain the admiration of those who visit his collection in the Royal College of Surgeons of England, and his work and knowledge form the basis of modern scientific dentistry. In regard to the hereditary nature of disease Hunter outlined the argument more fully developed later by Weismann, that acquired characters are not inherited. This was the doctrine which in the first years of the 20th century led more than any other to the discovery of the cause of the prevalence of dental caries and other dental diseases. In 1800 Humphry Davy discovered the anaesthetic effect of nitrous oxide gas, which is still the chief anaesthetic in dental surgery. Today, however, local anaesthetics such as novocain are also used for the extraction of teeth and for minor dental operations.

In the 19th century advances in the study of teeth and dentistry in Great Britain were made by various medical men, notably Richard Owen and John Tomes,

Dentistry. 1. Ancient Greek dental instruments. 2. Roman forceps and other appliances. 3. Modern instruments used for plastic fillings. 4. Operating equipment. 5. Operating chair controlled by automatic clutches. 6. Artificial teeth excavated at Saidon, probably Egyptian. 7. Ancient Greek artificial denture. 8. Etruscan dental appliance.

but the greatest progress in the art of dentistry took place in the U.S.A. Based on the works of Fauchard and other European pioneers, inventive ingenuity introduced many delicate dental instruments and new means of doing more skilful and better work. The use of vulcanised rubber for artificial plates, the dental engine, and the use of the rubber dam for the exclusion of moisture during operations may be noted.

#### Introduction of Anaesthesia

To Wells and Morton, two American dentists, we are indebted for the introduction of anaesthesia for dental and surgical operations.

Dentistry itself also became specialised into different branches, such as mechanical and surgical dentistry, and orthodontics, the science devoted to the malposition of the teeth, which has specially benefited by the finely made appliances, the credit for which largely belongs to the manufacturers. In 1839 the first dental journal, *The American Journal of Dental Science*, was published, and this was soon followed by others both in America and in Europe.

With regard to dental science,

more strictly so called, the names of W. D. Miller and G. V. Black should be noted, the former for his important work (written in German) on *Micro Organisms of the Human Mouth* (1889), and his excellent contributions on the pathology of dental caries. Although Black made many other useful studies, his outstanding work was *An Investigation into the Chemical and Physical Characters of the Teeth*, publ. in *The Dental Cosmos* (the leading American dental journal), vol. xxxvii, May–Sept., 1895. Notwithstanding all the progress of the 19th century, it had to be admitted that knowledge of the causation and prevention of dental diseases was still meagre. Nevertheless, the first decade of the 20th century surveyed this field more or less completely.

It has been demonstrated that the inherent structure of teeth of the civilized is no more degenerate or hereditarily predisposed to dental diseases than it was thousands of years ago when dental diseases were relatively rare. With regard to the causation of the irregularities of the teeth, the following points have been elucidated. The instinct

to gnaw must be regarded as the primary means of adapting the lower teeth to the upper teeth in correct relationship; interference with the child's instinct to gnaw prevents correct adaptation. This may result either from mouth-breathing or from withholding articles which might be gnawed by the child. A general cause of crowding is emaciation, including emaciation of the tongue round which the dental arches are moulded. This results usually from persistent disregard of the hygiene of the mouth and alimentary canal. Malposition can also result from persistent thumb-sucking.

Crowding due to somewhat imperfect development of the jaws is also made likely by the withholding from the child with teeth of food which would stimulate mastication. The most common cause of marked irregularities of the teeth, however, is habitual mouth-breathing, brought on as a rule by continuous or frequent infection of the mucous membranes of the nasal breath-way where such mucous membrane has had its vitality reduced by cold and damp air.

#### Causes of Dental Caries

The leading points noted with regard to the causation of dental caries are that the relative tendency of sugary and starchy foods to lodge unduly varies, according to the form in which they are taken, their concentration, and their combination with other articles of diet. Thus they may be soft, bland, and adhesive so that they favour caries; or, on the other hand, they may not be adhesive, but may stimulate mastication and the self-cleansing processes of the mouth.

Furthermore, such food as lodges in the crevices of, or between, the teeth may be impermeable to the saliva, whose function it is to a large extent to prevent foodstuffs harming the teeth. The food which lodges may also be impermeable by the acids formed by the bacteria adhering to the enamel in the crevices of the teeth. The fact that children who lived in sugar-cane plantations, and were much addicted to eating sugar-cane, had remarkably good teeth, was for a long time regarded as conclusive evidence that the once popular theory that sugar was harmful was erroneous. But in the light of present-day knowledge, this fact in no way invalidates the idea that sweets as usually con-

sumed in civilized countries tend to be harmful.

Pyorrhoea alveolaris is not essentially different in its causation from dental caries; but in pyorrhoea the stagnation at the crevice formed by the tooth and the gum must be complete, and not periodical as in caries, and starchy and sugary food, where it lodges, is rather inimical to the alkalinity which favours the formation of tartar. The natural method of preventing pyorrhoea is the stimulating of efficient mastication of firm or fibrous food, acid in itself, which not only helps the mechanical cleaning of the mouth but also precipitates and disintegrates the mucous coating which, if it at places stagnates, favours the deposition of tartar. (See Pyorrhoea.) Damage to the protective dental enamel by too harsh cleaning also opens the way to infection.

Chemical experiments have shown the necessity of a well-balanced diet in the maintenance of healthy teeth. Particularly essential is the inclusion of sufficient foodstuffs providing calcium and vitamin D in the diets of both children and expectant mothers. The administration of calcium in tablet form is frequently required; though it cannot cure, it may prevent the spread of caries. But the science of dietetics, more especially with regard to the feeding of children, has been shown to require considerable reformation, while the estimation of the value of foodstuffs solely from nutritive and caloric values is often unsatisfactory and misleading. Today, the fact that the hygiene of the mouth is most important for general bodily welfare is widely appreciated. Moreover, medical officers of health and school doctors throughout the country have already taken steps to cope with dental troubles, some by instituting school clinics for treatment, others by inculcating preventive measures which are more permanently beneficial and involve little expense.

#### Oral Hygiene and Preventive Medicine

The influence of the teachings of the dental profession on the science of physiology is so far not great. Yet it has been claimed, no doubt with truth, that when physiologists recognize and teach medical students the functions of the mucous and salivary glands in the light for which they are indebted to the dental profession, the decrease in diseases of the teeth and concomitant and consequent diseases will then consti-

tute the greatest triumph of preventive medicine.

As the state recognizes its duty to prevent disease, the duties of the medical officer of health include the following: "He shall inquire into and ascertain by such means as are at his disposal the causes, origin, and distribution of diseases within his district, and ascertain to what extent the same have depended on conditions capable of removal or mitigation."

*Bibliography* Le Chirurgien Dentiste, ou Traité des Dents, P. Fauchard, 2nd ed., 1746; Review of the Progress of Dental Science and Literature from the Earliest Ages, A. Densham (Royal Society of Medicine Proceedings), 1909; Science and Practice of Dental Surgery, ed. N. G. Bennett, 1914; The Physiology of Oral Hygiene and Recent Research, J. Sum Wallace, 1929; Short History of Dentistry, L. Lindsay, 1933; What is Wrong With British Diet? H. Campbell, 1936.

**Dentition.** Arrangement of the teeth in animals. Teeth, homologous throughout the series, are present in almost all divisions of the vertebrates, from the fishes upwards, with the exception of the modern birds. The invertebrates have no true teeth, the notched jaw processes in some arthropods, which serve the purpose of dividing or grinding food, being structurally quite different.

In the fishes, teeth are usually present in large numbers, and are not confined to the jaws, but occur in some forms throughout the body. They are the most primitive scales. Unlike mammalian teeth, they are all of more or less uniform character. When worn out, they are replaced by others and not by growth from beneath. They may be either of pointed form or consist of rounded plates.

In the amphibians the teeth are fewer in number. In these and most reptiles they are fixed to the bones of the jaw. The fangs of venomous snakes are loosely attached, and can be folded back when not in use. No existing species of birds possesses teeth, but they are present in certain fossil types. The notches in the beaks of some birds are not teeth. The mammalia exhibit teeth of divergent types specialised to suit different kinds of diet; and many genera are classified according to their dentition, teeth being well preserved in fossils.

The total number of teeth possible in most mammals is 44, 11 on either side in each jaw, consisting of three incisors, one canine, four premolars and three molars. This

is usually expressed briefly in a dental formula, thus  $\frac{3113}{3113}$ . But the full typical number is rarely found, and the dentition of the Marsupials, the false group called the Edentates, and Cetaceans departs widely from the type and cannot be reduced to such a regular dental formula. The following formulae indicate the diversity of dentition in various genera: Man  $\frac{3113}{3113}$ , Old World monkey  $\frac{3123}{3123}$ , dog  $\frac{3123}{3123}$ , cat  $\frac{3111}{3111}$ , horse  $\frac{3143}{3143}$ , sheep  $\frac{3033}{3133}$ , opossum  $\frac{5134}{5134}$ . See Teeth.

**Denton.** Urban dist. and market town of Lancashire, England. It is 6 m. S.E. of Manchester, with a rly. station. Felt hat making is the chief industry. Two large reservoirs here form part of Manchester's water supply. Market day, Fri. Pop. 23,500.

**D'Entrecasteaux.** Group of islands off the E. end of New Guinea (territory of Papua), belonging to the Australian Commonwealth. The chief are Ferguson, Normanby, and Goodenough, with several islets; total area, 1,084 sq. m. Of volcanic origin, they are mountainous, rising to some 7,000 ft.; there are volcanoes and hot springs. Tin and some gold are found. They are named after Bruni D'Entrecasteaux, the French explorer, who discovered them (1792).

**Dentz, HENRI** (d. 1945). French soldier and administrator. He was military governor of Paris when the German army marched in on June 14, 1940. French high commissioner in Syria from Dec. 7, 1940, he sued on July 11, 1941, for cessation of hostilities in Syria between Vichy and Allied forces. Failing to surrender under the armistice terms 75 British and Indian officers, Dentz and other Vichy officers were interned on Aug. 7. He was soon released,

and returned to France, where on April 17, 1945, he was put on trial as one of the Vichy collaborators. He was condemned to death, but on Oct. 24 the sentence was commuted to life imprisonment. Dentz died on Dec. 13.

**Denudation** (Lat. *denudare*, to make bare). Process by which the earth's surface is being sculptured, its general level lowered, and the materials produced by this sculpturing and lowering carried away. Evidences of denudation are widespread. Isolated pyramid of tabular shaped mountains composed of horizontal sedimentary strata, must long ago have been parts of plateaux. The floor of the continental margins of the ocean is littered with deposits brought from the lands. Granite is a rock of deep-seated origin, so that great denudation has taken place wherever it is now found at the surface. The agents of denudation are weathering (*q.v.*) and erosion (*q.v.*).

**Denver.** Capital of Colorado, U.S.A., and coterminous with Denver co. The administrative and commercial centre of the Rocky Mt. state is on the S. Platte river, E. of the base of the main range of Rockies, a mile above sea level, with no larger city for 500 m. in any direction. It is served by rlys., and has 30 mountain parks connected by 100 m. of boulevard. It is the emporium for the gold, silver, and coal mining districts of Colorado, has smelting works, refineries, foundries, machine shops, and flour mills, and makes wagons, harness, leather goods, and rubber goods. Denver has the biggest cattle market in the West.

There are some 200 federal bureaux and a coinage mint. There is an R.C. cathedral. Educational institutions include the university of Denver (1864) and the medical school of the university of Colorado. The state capitol is of native granite with a dome finished in gold. An Athenian civic centre contains the chief administrative buildings; local government is by a mayor and council. Settled in 1857, the city and co. received a fresh charter in 1904. Magnificent views of the Rockies, a low humidity, and plentiful sunshine help to make it a tourist centre. Pop. 322,412.

**Denza, LUIGI** (1846-1922). Italian composer. In 1876 he produced his opera *Wallenstein*. The most famous of his songs was *Funiculi, Funicula*, composed in 1880 on the opening of the

funicular rly. up Mt. Vesuvius. He died Jan. 26, 1922.

**Deodand** (Lat. *Deo dandum*, to be given to God). In English law, an animal or article that, having caused the death of a human being, was forfeited to the king. The article or animal was forfeited to God, or to the gods, but in England this came to mean the crown. A horse, or wagon, or knife could be deodand. Lawyers drew a distinction between deaths caused when the article was at rest and deaths caused when it was in motion. In the former case only the part held responsible for the accident, *e.g.* the wheel, was deodand, but in the latter case the whole was. The practice was abolished by 9 and 10 Vict. c. 62 in 1846.

**Deodar** (*Cedrus deodara*). Evergreen tree of the family Coniferae. It is a native of the W. Himalayas.

Deodar. Example of the *Cedrus deodara* of the Himalaya Mountains

Similar in most points to the Cedar of Lebanon—of which some authorities say it is a geographical form—it differs in its more pyramidal outline, its longer leaves, and the more pendulous habit of its leading shoots and branchlets. It attains a height of from 150 ft. to 200 ft.

**Deodoriser** (Lat. *de*, away; *odor*, smell). Substance which masks offensive smells. The more important are formaldehyde, peroxide of hydrogen, volatile oils, camphor, turpentine, naphthalene, carbolic acid, chloride of zinc, potassium permanganate, charcoal. They are distinct from disinfectants, which destroy the cause of the smell.

**Deogarh.** Town of India, in the state of Bihar. Containing a famous group of temples

Denver, Colorado. View looking up Seventeenth Street, one of the principal thoroughfares of the city

dedicated to Siva, it is a centre of Hindu pilgrimage. Another Deogarh was the capital of the former Bamra state, now in Orissa, and there is a third in Udaipur, Greater Rajasthan.

**Deoxidation.** Chemical operation involving the removal of oxygen from a compound. More commonly known as reduction, it is the chemical reverse of oxidation. The deoxidising agent may be the luminous tip of the Bunsen flame, or charcoal, or other chemical means. *See* Chemistry; Oxygen.

**Department** (Fr. *départir*, to divide). Word used in France for the areas into which the country has been divided since the Revolution. At first 83, their number was afterwards increased, and in 1939 there were 90. Three departments were created when Savoy and Nice were annexed in 1860, while three others, Bas-Rhin, Haut-Rhin, and Moselle (Alsace-Lorraine), were lost to France between 1871 and 1919, and then recovered. Most departments are named after their chief river or rivers, e.g. Seine, Loire, Cher, Lot, Garonne, etc.; a few after some other physical feature, e.g. Côtes du Nord, Pas-de-Calais. Each department is governed by a prefect, assisted by a council, and is divided into *arrondissements*. In 1947 the French colonies of Guadeloupe, Guiana, Martinique, and Réunion were given the status of departments of the mother country.

Finland, Greece, Italy, and several South American countries are divided into departments.

**Departure, ANGLE OF.** Term in ballistics to denote the angle which the line of departure of a projectile makes with the line of sight, or horizontal plane. The prolongation of the line of departure is the actual path of the projectile after it has left the muzzle, and is known as the trajectory.

**Depew, CHAUNCEY MITCHELL** (1834-1928). American lawyer and orator. Born at Peekskill, N.Y., April 23, 1834, after graduating at Yale he was called to the N.Y. bar, 1858. Prominent in state politics, attorney to numerous rlys., and from 1898 chairman of the whole Vanderbilt system, during 1899-1911 he represented N.Y. in the senate. He was

Chauncey Depew,  
American lawyer  
Elliott & Fry

the chosen orator on many national occasions, notably on the unveiling of the statue of Liberty in N.Y. harbour, 1886, and at the Chicago World's Fair, 1892. He died April 4, 1928. Orations, Addresses, and Speeches were edited by J. D. Champlin, 8 vols., 1910.

**Dephlegmation.** Process of removing water from alcohol to increase its strength. Formerly this was accomplished by shaking the alcohol with quicklime or potassium carbonate, these agents having the power of absorbing water. The term is now applied to the process in which the rectifying column of stills is used in preparing alcohol. The dephlegmator separates the "phlegma," or watery portion, from the alcohol, owing to the differences in the boiling points of alcohol and water. *See* Alcohol.

**Depilatory** (Lat. *depilare*, to pull out hair). Preparation for removing hair from parts of the body where it is not wanted. The basic preparation is barium sulphide, 5·0; prepared chalk, 10·0; made into a thin paste with water and applied. The hair will grow again, but the treatment can be repeated. Contrary to popular belief, hair thus treated becomes in time weakened and tends to disappear. Hair is also discouraged by the use of hydrogen peroxide which weakens and bleaches it, thus rendering it less apparent. Electrolysis often represents the best attack. The cure for really abnormal hair growth on the chin and cheeks of women is the surgical removal of part of the adrenal glands, which lie above the kidneys.

**Dépit Amoureux** (Lovers' Quarrels). Five-act comedy by Molière. It was first produced at Béziers, 1656, the scene being laid in Paris. The part of Albert was acted by Molière.

**Deploy** (Fr. *déployer*, to unroll). Military term meaning to extend a body of troops from close formation to a line of small depth in open order. In actual combat, deploy is a section movement, but strategically the term refers to the movements of armies from a central base to one or more theatres of operations. In the Second Great War, Allied armies based in Britain were deployed to fronts in Africa, the Far East, and the continent of Europe. *See* Tactics.

**Depolariser.** Material added to the solution in a voltaic cell to counteract the effect of polarisation, i.e. of counter electro-motive force due to the accumulation of hydrogen on the negative plates

and to other causes. The material varies with different types of cell and consists of an oxidising solution or a solid, e.g. a solution of chromic acid may be used for a Bunsen cell or powdered manganese dioxide for a Leclanché cell.

**Deponere** (Lat. *deponere*, to lay aside). In Latin grammar, term incorrectly applied to a class of verbs, the form of which is passive, but the meaning active; such are *vescor*, I eat; *aversor*, I turn away. In reality, these are middle or reflexive verbs, *vescor* meaning I feed myself, *aversor*, I turn myself away. When this middle form (expressing the action of the subject upon itself) came to be used for the passive (expressing that the subject is acted upon by someone or something else), it was said that such verbs as *vescor* "laid aside" the passive meaning which in reality they never had.

**Deportation** (Lat. *de*, from; *portare*, to carry). Term meaning to remove anyone forcibly from a country, used mainly in connexion with aliens (*q.v.*). Where an alien is convicted of an offence, a magistrate or judge may recommend him, after being punished, to be deported as an undesirable alien. Orders for deportation are made by the Home office.

**Deposit** (Lat. *deponere*, something put down). In English law, one of the forms of bailment. It arises where goods are deposited with a bailee to be kept for the bailor without payment. The depositary is said to be liable only for damages to or loss of the goods by gross negligence. Deposit is also used in English law to mean a sum of money paid to a person, generally the vendor of real estate, as security that the contract shall be carried out. *See* Bailment.

**Deposition.** Process by which rock waste is accumulated either on dry land or on the bed of a lake or ocean. On the land, deposition is largely confined to the lower levels, where rivers in times of flood gradually build up plains from the sediment which they carry. Rivers flowing into tideless or almost tideless seas drop the sediment they carry in suspension, and often build extensive deltas, e.g. the Mississippi, Nile, Rhine, and Ganges. But it is on the ocean floor, along the continental margins, that the most extensive deposition takes place, the layers of sediment there built up often attaining great thickness. The pressure of the upper layers, together with the cementing of the grains by mineral matter brought by water which slowly finds its way

through the whole mass, gradually alters the lower layers into hard sedimentary rocks, so called because they have been built up of particles which have settled down. Uplift may once again raise the layers above sea level. See Coast; Denudation.

**Deposition.** Term used in English law for the official record of evidence given verbally before a court or an officer thereof, and intended for use thereafter.

**Depot** (Fr. *dépôt*). Building or site where supplies are stored, especially food, medical stores, ammunition, or vehicles for military purposes, e.g. supply depot, ordnance depot. In war, depots are formed at the places of embarkation, or other bases of operations, and at points along the line of communication from base to front. The term is also applied to the barracks where in time of peace recruits receive their first training, where soldiers take their discharges, and where reservists join on mobilisation. In the U.K. each regiment and arm of the service has its own depot, the location of which is shown in the Army List.

**Depot Ship.** Originally a floating barracks to accommodate naval ratings awaiting drafting to the fighting ships of the fleet. Nowadays the term is more commonly applied to the store and workshop ships equipped to repair, munition, and store submarines and destroyers. The depot ship also provides recreational facilities for the flotilla crews. Units of the Royal Navy operating in the Pacific during the Second Great War were served by a variety of depot ships known as the Fleet Train (q.v.).

**Depreciation** (Lat. *de*, down; *pretium*, price). Term used, chiefly in a commercial sense, for a fall in the value of anything, such as securities, precious metals, and other commodities. It is also used for the decline in the value of machinery, buildings, and other business assets due to wear and tear, and sometimes to special causes, such as a new invention which renders certain machinery obsolete. Every business should make an adequate allowance for depreciation before arriving at its net profit. The percentage to be set aside for depreciation varies according to the nature of the firm's assets.

**Depressed Area, or DISTRESSED AREA.** District in which many of the employable inhabitants have either never been employed or have remained unemployed over

a long period. A world-wide period of industrial depression began in the U.S.A. in 1929, reaching its culminating point in Great Britain during 1931-32. The principal depressed areas were Cumberland, Durham and Tyndeside, South Wales, and Scotland; the Rhondda Valley had 281 people in every 1,000 unemployed for more than a year.

In 1934 Government investigators in these districts recommended industrial and labour transfer, land settlement, and public works schemes. Under the Special Areas Act, Nov., 1934, these became officially Special Areas; two commissions were appointed to implement the government's plans, and a £2,000,000 fund for the purpose was established. The commissioners had power to acquire land compulsorily for holdings for the unemployed, develop occupational centres, and acquire derelict sites for new industries. A scheme for cottage homesteads for elderly unemployed men with families of adolescents living in special areas was approved in Dec., 1936; each homestead consisted of a detached house and half an acre of land. The distribution of Industry Act, June, 1946, authorised the government to offer inducements to industrialists to establish new industries in these areas, renamed Development Areas. See Trading Estates.

**Depressed Classes.** Officially known as scheduled castes, the depressed classes in India were also called untouchables because contact with them (even only by shadow in some parts of India) was pollution for the Brahmin. Out of the 260 million Hindus in India, about 50 million were outside the four main castes: Brahmin (priest), Kshattriya (soldier), Vaisya or Bania (trader), Sudra (artisan). Members of the scheduled castes included sweepers, washermen, workers in leather, dancing girls, etc. Like the caste Hindus, they remained at death in the lot in which they were born. They could not enter the temples, attend the schools, or draw water from the wells used by the caste Hindus. The British government, Christian missionaries, and reforming Indian organizations worked long to remove these disabilities. In British India, no school with a government grant could exclude pupils from the scheduled castes. Industrialisation and increased communications mitigated their hardships in the large cities. Bombay, Oct., 1946, and Madras, Feb.,

1947, removed the disabilities of the depressed classes. The 1950 constitution embodied the constituent assembly's enactment of 1948 which had abolished untouchability in any form.

**Depression.** In meteorology, a system of closed isobars. At the centre, the barometer is lower than in the surrounding parts, the isobars enclosing the "low" being more or less circular or oval. As in a cyclone, the surface winds blow counter-clockwise round the centre in the N. hemisphere, bending in towards the low pressure region. The wind direction is reversed in the S. hemisphere. Depressions may be 1,000 m. in diameter: some may be deep (large pressure gradients), and some shallow (small pressure gradients). In the middle latitudes depressions generally move in an E. or N.E. direction, the rate of travel varying from hundreds of miles in a day to virtually nil.

Formerly it was believed that depressions were due to local heating at the centre, resulting in a rise of warm air with a reduction in weight and therefore of pressure at the base. The wind circulation followed. It has since been shown that in the free upper air depressions tend to be cold rather than warm, and that in a well-marked surface depression pressure "lows" also occur 5 m. up, i.e. in the lower part of the stratosphere.

Present day theories attribute the formation of a depression to interaction between warm and cold air masses. This is based on the fact that depressions originate in a comparatively straight front separating the cold air from the warm air. In the simplest case the warm air, flowing in a direction opposite to that of the cold air, climbs over the colder air ahead along a gently sloping surface, termed the "warm front" of the depression. At the same time the cold air in the rear undercuts the warm air, hence the "cold front." As the bulge of warm air grows, the pressure falls at the apex of the bulge. Now the cold front moves forward more rapidly than the warm front and eventually overtakes it, pushing the remaining warm air off the ground. The depression is then said to be "occluded" and decay sets in, completing the life-cycle.

The rainfall, a feature of depressions, is confined chiefly to the regions along the fronts. As the warm front approaches, cirrostratus, altostratus, nimbostratus is the sequence of observed cloud

types. The sky has a dirty look and the sun is blurred. Precipitation gradually increases as the cloud base lowers, and eventually becomes continuous and steady until the front has passed. The rain belt at the ground may extend for 200 m. in advance of the warm front. On the other hand, the passage of the cold front is not so easily distinguishable by cloud observation. Owing to instability in the air above, cumulonimbus clouds develop, often producing thunderstorms, heavy rain, or hail showers. The low cloud and rain are, however, confined to narrow belts of 20-30 m. across. In extreme cases the front arrives in a line-squall. *See* Cyclone; Meteorology; Weather; Wind.

**A. J. Drummond, F.R.Met.S. Depretis, AGOSTINO (1813-87).** Italian statesman. Born Jan. 31, 1813, as a young man he fell under the influence of Mazzini and became a member of Young Italy. In 1848 he was elected deputy for the party of the Left. He opposed Cavour and voted against the entry of Piedmont into the Crimean War. Later he became reconciled to Cavour, who in 1860 sent him to Sicily to counteract the extremist policy of Garibaldi. He entered the government in 1862 as minister of public works, and in 1866 became minister of marine, in which position he incurred much of the blame for the defeat of Lissa. In 1873 he became leader of the Left, in 1876 prime minister, and, with an interval of thirty months, directed the entire policy of Italy until his death, July 29, 1887.

**Deprived Children.** *See* Homeless Children.

**De Profundis** (Lat., out of the depths). Opening words of Psalm 130. One of the 15 gradual psalms, or "songs of degrees," of the Jewish pilgrims to Jerusalem, it was from the earliest times a penitential psalm throughout the Christian Church. It is recited by Roman Catholics as a prayer for the dead, and at funerals, and in the daily office for Wednesday. In the Church of England it is one of the psalms for Ash Wednesday. Oscar Wilde's apologia with this title, written in prison, was pub. in full only in 1949.

**Deptford.** One of the 28 London boroughs. It is on the W. side of Greenwich, with which it is closely associated, the older part of Deptford being in the latter borough. Formerly it had a dockyard, where Raleigh docked his Golden Hind, and where Peter the Great studied navigation; and

here was Sayes Court, some time the home of Evelyn, the diarist. Here are the Royal Army Victualling Yard, the Goldsmiths' College, the Haberdashers' girls' and boys' schools, and S. Nicholas' church, where Marlowe, the poet, was buried, and where may

be found specimens of Grinling Gibbons's carvings. The church was badly damaged by fire bombs during the Second Great War. On Nov. 25, 1944, a German rocket fell on a store in New Cross Road, killing 149 and injuring 299, probably the worst single air raid incident of the war. Deptford returns one M.P. Pop. 106,891.

**Depth Charge.** An anti-submarine weapon evolved by the mine design dept. of the British Admiralty for use by the Royal Navy in the First Great War. The standard type consists of a thin-walled, metallic, drum-like case filled with 300 lb. of amatol. Through the centre runs a tube containing a tetryl priming and the firing mechanism. The latter includes a hydrostatic valve, which can be set to operate the fuse and ignite the charge at practically any prearranged depth of water. When the set depth is reached, the increased pressure of the water upon a diaphragm in the valve releases a spring and causes the detonator to operate.

Depth charges are either dropped overboard from a rack at the stern of the vessel, or discharged from a double mortar called the Y-gun, which can project charges on either side of the ship for a distance of 150 yds. When anti-submarine vessels carry out a concerted attack on a submerged submarine, the charges are dropped in a pattern over the sea, set to explode at various depths. The minimum depth is always somewhat below that to which the submarine is estimated to have dived; the effect of an explosion below a submarine being more violent than one above it.

Towards the close of the Second Great War the Royal Navy developed a depth charge weighing a ton and fired from the torpedo-tube of a destroyer. A new projector, known as the hedgehog, was also put into service: it resembled a huge mortar and was capable of throwing 24 charges to a distance of 200 yds. ahead of the ship. Charges thrown by the hedgehog exploded only on contact with a submarine, but, owing to the terrific power of torpex, the explosive with which they were filled, their effect was lethal.

When employed by high speed vessels, such as destroyers, the depth charge was the most potent anti-submarine weapon. The under-water explosion was so powerful that a submarine in the immediate vicinity was almost certainly destroyed. Even at a distance the concussion strained plates or damaged the controls sufficiently to compel the submarine to surface, where it fell an easy prey to gunfire. Any vessel dropping depth charges had to be moving at a speed that enabled it to be some distance away before the concussion was felt.

Ordinary depth charges were carried under the wings of Catalina flying-boats and other aircraft of the R.A.F. and Fleet Air Arm operating anti-submarine patrols. They were dropped on submerged submarines in the same manner as bombs. *See* Hedgehog.

**Deputy** (Lat. *deputare*, to prune, late Lat., to select). Strictly speaking, an authorised agent. A general deputy is empowered to perform the whole of another's office; a special deputy, a particular part. In the U.K., recorders, county court judges, and registrars, returning officers, and some other public officials are allowed to

Depth Charge. Mechanical thrower for hurling a depth charge (seen in position) well clear of the ship

appoint deputies. The word is also used of a member of a representative assembly, e.g. the French chamber of deputies. The deputy of a coal mine is an officer who tests the timbering and ventilation and generally looks after the safety of the miners. The manager of a common lodging-house is known as the deputy.

**De Quincey, THOMAS** (1785–1859). British author. Born at Manchester. Aug. 15, 1785, son of a linen merchant, his early days were spent in the rural suburb of Greenhay. Shy, delicate, impressionable, and dreamy as a child, his earliest recollections were of the death of his sister Elizabeth when he was five, followed by his father's death a year or two later, and of a dream about a favourite nurse. Educated at a day school at Salford, and at grammar schools at Bath, Winkfield (Wilts), and Manchester, he displayed an extraordinary proficiency in Greek. In July, 1801, he ran away from Manchester, and, with an allowance of a guinea a week, wandered about the mountains of N. Wales. Then, forfeiting his allowance, he made his way to London, slept in an empty house in Greek Street, Soho, and met in Oxford Street the Ann of his Confessions, who spent her last sixpence on a glass of wine to revive him from a fainting fit, one result of his hardships being an aggravation of his inherited tendency to an internal trouble which led him later to the opium habit.

#### Student and Essayist

Reconciled to his relatives in 1803, he matriculated at Worcester College, Oxford, where for four years he pursued his studies in Greek and Latin, English literature and German metaphysics. After he had passed a remarkably good written examination, he left the university without taking a degree. Profoundly influenced by Coleridge, to whom he sent anonymously £300 as an unconditional gift, and by Wordsworth, he became an intimate member of the Lake school. For nearly 20 years from 1809, when Wordsworth left it, he made Dove Cottage, Grasmere, his headquarters.

Three years after his marriage to Margaret Simpson, daughter of a salesman, by whom he had three daughters and five sons, his patrimony of £150 a year was seriously diminished, and from that time until his death he was an indefatigable contributor to magazines—to The London, to which Talfourd introduced him; to Blackwood's, his sponsor in this case being John Wilson (Christopher North); to

Tait's, and others. In 1819–20 he was editor of The Westmorland Gazette. In 1828 he took up his residence in Edinburgh, whence, after losing two of his sons and his wife, he removed with his daughters to Mavis Bush, a cottage at Lasswade. He died at his lodging in Lothian Street, Edinburgh, Dec. 8, 1859, and was buried by the side of his wife in the West churchyard.

With the exception of a novel, Klosterheim, 1832, and The Logic of Political Economy, 1844—he

*Thomas de Quincey*

was a student of Ricardo—all he wrote appeared first in periodicals. In The London, Sept. and Oct., 1821, he wrote two anonymous articles, The Confessions of an English Opium-Eater,

reproduced in volume form, 1822, and almost re-written in 1856. To Blackwood's, Feb., 1827, he contributed the essay On Murder Considered as One of the Fine Arts, to which in 1854 was added a notable postscript. In the same magazine appeared his studies of Kant and Samuel Parr, sketches of the Caesars, The Revolt of the Tartars, and papers on Style, Rhetoric, The Philosophy of Herodotus, the mystical Suspiria de Profundis (Sighs from the Depths), and The English Mail Coach. In Tait's appeared his recollections of Lakeland and its poets, and a study of Joan of Arc. To the Encyclopaedia Britannica he contributed articles on Goethe, Schiller, Shakespeare, and Pope. In his essay on Pope is his memorable distinction between the literature of knowledge and the literature of power.

#### Master of Imaginative Prose

His critical faculty is displayed to advantage in the essay On The Knocking at the Door in Macbeth, his humour in Sortilege and Astrology, his quality as a dreamer in the Suspiria and the Confessions. His intellect was acute and logical, but his habit of always aiming at artistic effect and his discursiveness lessen the value of much of his work, which lives chiefly by virtue of its style, for above all else De Quincey was a master of imaginative and melodious prose as well as of narrative. His writings were issued in collected form at Boston, U.S.A., 20 vols., 1851–59; at Edinburgh, 14 vols., 1853–60, supervised by the author.

An affectionate husband and father, and generous to a fault, De Quincey's ornate prose was in striking contrast to his simplicity of life, as his lack of method in money matters was in contrast to his acute understanding of political economy. He never freed himself from his love of wandering, but his battle against opium, and his industry in defiance of physical infirmity, testify to a far stronger will than that of his fellow-dreamer Coleridge. He was a great walker, and, in congenial company, a fascinating talker, with a voice of singular charm. The best descriptions of his personal appearance are those by Carlyle, Hood, and J. R. Findlay.

W. F. Aitken

**Bibliography.** Collected Writings, ed. D. Masson, 14 vols., 1889–90; Uncollected Writings, with Preface and Annotations, J. Hogg, 1890; Posthumous Works, ed. with Introduction and Notes, A. H. Japp, 2 vols., 1891–93; Thomas De Quincey, His Life and Writings, A. H. Japp, new ed. 1890; Life, D. Masson, 1881; Personal Recollections, J. R. Findlay, 1886; Memorials, ed. A. H. Japp, 2 vols., 1891; De Quincey and His Friends, J. Hogg, 1895; De Quincey, H. S. Salt, 1904.

**Deraa.** Town of Syria. It is situated about 40 m. E. of the S. end of the Sea of Galilee, and is a junction on the Hejaz rly. The Hejaz Arab army here cut off the retreat of the Turks from the S. before Allenby's offensive, and occupied the town Sept. 28, 1918.

**Dera Ghazi Khan.** District and town of W. Punjab, Pakistan, in Multan division. They are situated between the Indus and Baluchistan. The dist., whose area is 9,364 sq. m., yields wheat, millets, rice, pulses, cotton, and indigo. The town suffered considerably from Indus floods until a stone embankment was built in 1891. Pop. dist., 581,350, five-sixths Mahomedans; town 21,500. Baluchis form 42 p.c. of the total pop.

**Derain, ANDRÉ** (b. 1880). French painter. Born at Chatou, near Paris, June 10, 1880, he showed interest in engineering during his youth, but encouraged by Vlaminck he studied art at Julian's and later worked with E. Carrière. Influenced by Picasso and Braque, he developed his own style, interpreting landscape in the classic manner, attempting in his later compositions to reconcile the classic and medieval traditions. His colour showed the influence of Giotto and Cimabue. His portraits and still lifes were well represented in the modern galleries of London, Paris, New York, and Moscow.

**Dera Ismail Khan.** Dist. and town of Pakistan, in the North-West Frontier province. They are named after the son of a Baluchi chieftain, who settled in the district in the latter part of the 15th century. The area of the district is 3,780 sq. m. Less than a quarter of the district is under cultivation, but camels are bred. The town is situated  $4\frac{1}{2}$  m. W. of the Indus. The chief tribes are Pathans and Jats, Mahomedans forming 90 p.c. of the pop. Pop. dist., 298,131; town, 42,150.

**Derajat.** Name given to the plain lying between the Indus river and the Sulaiman range in the West Punjab and N.-W. Frontier provs. of Pakistan. It is so called from the three Deras situated in it—Dera Ismail Khan, Dera Fateh Khan, and Dera Ghazi Khan. This region came under Baluchi rule in the 15th century, and passed into British possession in 1849. The Derajat is 325 m. long, 50 m. wide.

**Derbend.** Town and port of Russia, in Daghestan A.S.S.R. It is on the Caspian Sea, and is connected by rly. with Makhach-Kala and Baku. Madder, fruit, and tobacco are cultivated, and arms, silk, and woollen goods manufactured. The remarkable burying-ground has Kufic inscriptions. The town was incorporated with Russia in 1813. Pop. 23,000.

**Derby.** County, mun., and parl. borough and county town of Derbyshire, England. It stands on the W. side of the Derwent, 129 m. N.W. of London, and is well served by main line rlys. Although an old and historic town, its modern importance dates

Derby borough arms

from the establishment here, 1844, of the shops of the Midland rly.

Derby is the seat of a bishop. The chief churches are All Saints', famous for its magnificent tower, 210 ft. high, and its internal adornments and tombs; S. Peter's, a Decorated Perpendicular building; S. Alkmund's, S. Werburgh's, and S. Andrew's, the work of Sir Gilbert Scott. The Roman Catholics have a fine church dedicated to S. Mary Magdalen, and there are many Nonconformist places of worship. The grammar school is one of the oldest in England; there are a technical school, a school of art, etc. The royal infirmary and the art gallery, with a fine collection of old Derby ware, should be mentioned; while the few old

buildings include a chapel (14th century) on S. Mary's Bridge. The almshouses founded by Bess of Hardwick were pulled down in 1920. In the Arboretum grounds is the Headless Cross, a memorial of the plague of 1665.

In addition to the rly. works, which cover over 200 acres, the industries include the manufacture of silk, lace, net, and hosiery. There are engineering works, saw-mills, and tanneries, and works for making chemicals, paint, etc., while Crown Derby china is made at works in the Osmaston Road. The town has a service of trolley-buses, a theatre, several music halls, cinemas, etc. Near by is a racecourse. Derby is governed by a mayor and council. There are two parliamentary constituencies, Derby North and Derby South, each returning one M.P.

At Little Chester the Romans had a station, but the town really originated in Anglo-Saxon times. Made a fortified town, it was one of the five burghs held by the Danes from 873, until recovered by the English in the 10th century. It gave its name to the county, and has since then, as the co. town, been a place of importance. In 1715 the first silk mill in England was opened here, and about 1750 the porcelain known as Crown Derby was first made. It received its first charter in 1206; this gave the burgesses the local monopoly of dyeing cloth. Derby was first known to the Saxons as Northworthige, altered to its present name by the Danes. Market day, Fri. Pop., est. 131,500.

**Derby, EARL OF.** English title borne since 1485 by the family of Stanley. There were earls of Derby in Norman times, belonging to the Ferrers family, and variously called earl of Derby, of Notting-

ham, of Tutbury, or of Ferrers. They were distantly related to the Shirleys (see Ferrers, Earl). They held it until about 1266, when one of them lost his lands and honours for rebelling against Henry III, and Henry's son, Edmund, earl of Lancaster, received them. The title was held for a time by members of the royal family; hence Henry IV, before his accession, was sometimes called Derby.

Thomas, Lord Stanley, was made earl of Derby by Henry VII in 1485, although he had no connexion with Derbyshire. When James, the 10th earl, died in 1736, the direct line became extinct, and the title passed to Sir Edward Stanley, a descendant of the 1st earl. The most notable member of the family was Edward, the 14th earl, thrice prime minister, who, like his three successors, is described on the next page. In 1948, Edward (b. 1918) became the 18th earl. An eldest son is called Lord Stanley. Knowsley, near Liverpool, was a family possession from 15th cent.

Derby. Busy street known as the Cornmarket. Upper picture, Irongate and the fine tower of the church of All Saints

**Derby, THOMAS STANLEY, 1ST EARL OF (c. 1436-1504).** English soldier. The son of Thomas, Lord Stanley, and a great-grandson of Sir John Stanley, the founder by a rich marriage of the family fortunes, he first appeared in public life during the Wars of the Roses.

Thomas, 1st Earl of Derby  
after Holbein

He married Eleanor, a sister of Warwick, the king-maker, and like him alternated between York and Lancaster. He served Henry VI, Edward IV, and Richard III, but is better known for his connexion with Henry VII, whose mother, Margaret Beaufort, was his second wife. To the last he remained undecided between Richard and Henry, and at Bosworth held aloof with his forces from the fight. On the issue being decided he hailed Henry as king, and was made earl of Derby. He died July 29, 1504.

**Derby, EDWARD GEOFFREY STANLEY, 14TH EARL OF (1799-1869).** British statesman. Born at Knowsley, March 29, 1799, he was the eldest son of the 13th earl, then Lord Stanley. He was educated at Eton and Christ Church, Oxford, and won the chancellor's prize for Latin verse.

He entered the house of commons in 1820 as M.P. for the small bor. of Stockbridge, and soon made a reputation as a speaker. He was then a Whig. In 1826 he was returned for Preston, where the Stanley influence was supreme, and in 1827 he was made under-secretary for the colonies. Soon in opposition again, he strenuously supported the Reform bill of 1832. In 1830 he had become chief secretary for Ireland in Lord Grey's ministry and, having been beaten at Preston, had become M.P. for Windsor, and in 1832 for North Lancashire. Meanwhile, he was managing the affairs of Ireland, then in a critical condition, and was having his famous verbal duels with O'Connell.

In 1833 Stanley entered the cabinet as secretary for war and the colonies, in which office he carried the bill for freeing the slaves.

In 1834 Stanley, with others, left the Whig government. He remained a private member until 1841, when he became colonial secretary under Peel, from whom he separated when the Corn Laws were repealed. In 1844 he entered the house of lords, being called there as Baron Stanley, and acted as the leader of the party soon known as the Conservative. In 1851 he succeeded to the earldom.

In 1852 Derby became premier for the first time. He held the office, however, for less than a year, being defeated on the budget, and for six years he was leader of the opposition. In 1858 his second term as premier began, but this too was brief, as in June, 1859, the franchise bill having proved unacceptable, he resigned. Seven more years as leader of the opposition followed, then in 1866 Derby became prime minister for the third time. His govt. passed the Reform Act of 1867. In 1868, then in failing health, he resigned. He died at Knowsley, Oct. 23, 1869.

Derby stands in the line of the great British statesmen who were also scholars. He was greater, however, as an orator, and richly endowed with the gift of making prompt and apt replies. Bulwer Lytton called him the Rupert of Debate.

**Derby, EDWARD HENRY STANLEY, 15TH EARL OF (1826-93).** British politician. The eldest son of the 14th earl, whom he succeeded in 1869, he was born July 21, 1826, and educated at Rugby and Trinity College, Cambridge. From 1848-69 he

Edward, 15th Earl of Derby

was Conservative M.P. for King's Lynn. In 1852 he was under-secretary for foreign affairs in his father's first ministry; in the second (1858-59) he was secretary for the colonies, president of the board of control, and first secretary for India, and in the third (1866-68) foreign secretary.

Derby's Toryism was never extreme; in some matters, notably his dislike of war and his interest in education, he was in sympathy with quite another school of thought, and he avowed his admiration for J. S. Mill's teaching. Invited in 1855 to join the Liberal cabinet, he refused to desert his party, and in 1874 was made foreign minister for the

second time. In 1878 came the inevitable breach with the Tories. Derby, who could not support an aggressive policy with regard to Russia, resigned, and in 1879 joined the Liberals. In 1882 Gladstone made him colonial secretary, and he remained in office until 1885. He died at Knowsley, April 21, 1893, and having no sons was succeeded by his brother (*v.i.*). His Speeches and Addresses appeared in 1894.

**Derby, FREDERICK ARTHUR STANLEY, 16TH EARL OF (1841-1908).** British politician. Younger son of the 14th earl.

Derby  
Russell

he was born in London, Jan. 15, 1841, and educated at Eton. After serving in the Grenadier Guards, 1858-65, he was Conservative M.P. for Preston, 1865-68, N. Lancs., 1868-85, and Blackpool, 1885-86.

Created Baron Stanley of Preston in 1886, he held office as civil lord of the admiralty, secretary for war and for the colonies, and president of the board of trade. Lord Stanley was gov.-gen. of Canada, 1888-93; first lord mayor of Liverpool, 1895-96; mayor of Preston, 1901-02; and first chancellor of Liverpool university. Made G.C.B., 1880, and K.G., 1897, he succeeded his brother in the earldom in 1893, and died June 14, 1908.

**Derby, EDWARD (GEORGE VILLIERS STANLEY, 17TH EARL OF (1865-1948).** British politician.

Born April 4, 1865, he was educated at Wellington College and served for some years in the Grenadier Guards. He entered the house of commons in 1892,

Edward, 17th Earl of Derby  
Russell

and during the earlier part of the South African War was chief press censor and private secretary to Lord Roberts. In 1895, then Lord Stanley, he joined the Conservative govt. as a lord of the treasury and in 1900 became financial secretary to the war office, becoming P.M.G. 1903. He succeeded to the earldom in 1908. In 1915, as director-

general of recruiting, he originated the scheme named after him. He was under-secretary at the War office, then war secretary 1916-18. Ambassador to Paris 1918-20, he was again at the war office 1922-24. A patron of the turf, he won the Derby with Sansovino in 1924, Hyperion in 1933, and Watling Street in 1942, the first of his family to succeed for over a century. He died Feb. 4, 1948. One of his sons was Oliver Stanley (q.v.). See Derby Scheme.

**Derby China.** Glazed earthenware originally made at Derby in 1750. This was improved upon by

Derby China, vase with landscape view  
Victoria & Albert Mus.

William Duesbury, who bought the Chelsea china works in 1769, and the Bow factory in 1776, carrying both on for a time. Subsequently he closed them, beginning to manufacture Chelsea-Derby china in 1784. His china has a hard, fine, remarkably transparent body, is well designed and beautifully decorated, and shows great variety. The bright blue borders of his dinner and tea services are characteristic. He also produced small enamelled and gilt figures, and others of a larger size in a beautiful soft paste, chalk white biscuit-ware, recognized as of the highest merit. These figures rarely bear the crown, D, and crossed sticks with which Crown Derby services and decorated pieces are usually marked.

The works were closed down in 1849, but the Derby china tradition is still carried on by the Royal Crown Derby Porcelain Co. founded in 1877. See Chinaware; Pottery.

**Derby Scheme.** Method of obtaining recruits for the British army during the First Great War. Towards the end of 1915 the numbers of recruits were below the point essential to the conduct of the war. The government deciding to adhere to the voluntary system, Lord Derby, as director-general of recruiting, devised the scheme known by his name. All men between 18 and 41 were invited to enlist, and the recruits were then ranged in 46 age groups, 23 of married and 23 of unmarried men. They were to be called to the colours in groups beginning with the younger men, the unmarried being called first.

The campaign began in Oct., 1915. Men who came forward "attested" and technically joined the army, but then returned home, wearing the "Derby armet," until called up. The total number who offered themselves under the scheme was 2,829,263, of whom 1,679,263 were married. Moreover a number of the attested men were either indispensable to civilian work or unfit. The result was a net addition to the army of only about 850,000 men. According to the National Register 2,182,178 remained un-attested, of whom 1,152,947 were single. Compulsion was therefore seen to be inevitable, and the necessary bill was introduced into parliament on Jan. 5, 1916.

**Derbyshire.** A Midland county of England. The surface, flat in the S., and undulating and rugged towards the middle and E., is highly picturesque in the N.,

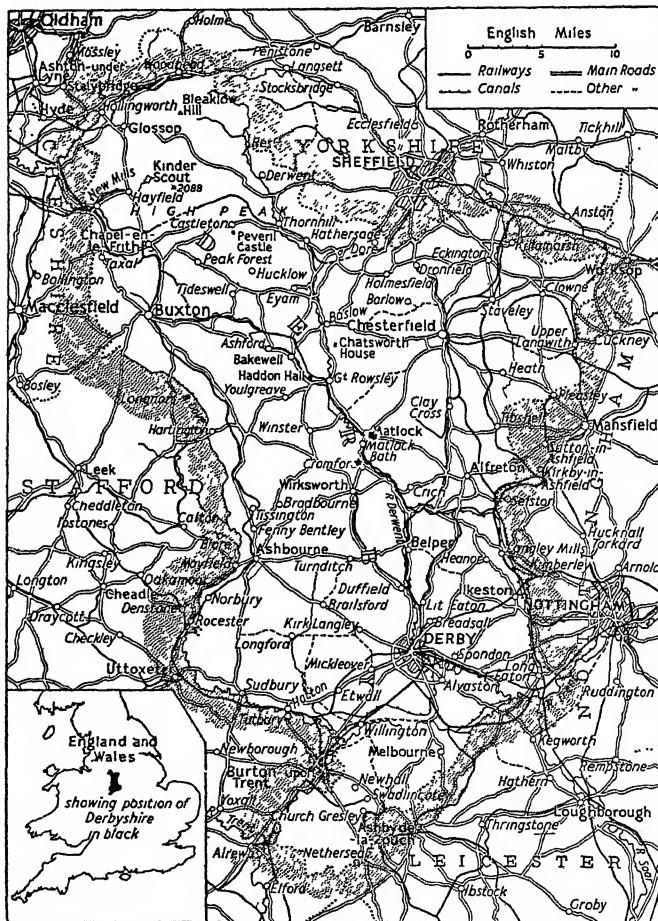

where the Pennine Chain terminates in the Peak district, the watershed between the rivers Mersey and Trent. The valley scenery of the Derwent and Dove is famous, as are the springs of Matlock, Buxton, and Bakewell. Much of the county

Derbyshire arms

is on a coalfield; other mineral products include limestone, gypsum, ironstone, fireclay, gannister, fluorspar, lead, and zinc. Permanent pasture makes up four-fifths of the cultivated area. Textile manufactures comprise silks, cotton, worsted, and hosiery; malting and brewing are considerable interests, and iron-foundries employ many workers.

The co. is well served by main line rlys. and by the Trent and Mersey, Derby, and other canals.

Derbyshire. Map of this midland county of England, famous for its natural beauties, medicinal springs, and varied industries

Derby is the co. town, and others of importance are Chesterfield, Ilkeston, Alfreton, and Glossop. Chatsworth and Haddon Hall are within the co. Seven M.P.s are elected, apart from two for Derby, and one for Chesterfield. Area, 1,012 sq. m. Pop. 757,374.

LITERARY ASSOCIATIONS. Beresford Dale is described in Cotton's continuation of Izaak Walton's *Compleat Angler*. Jane Austen writes of Chatsworth as Pemberley in *Pride and Prejudice*, while Sir Walter Scott centres his *Peveril of the Peak* in the Peak district. The county is the Stonyshire of George Eliot's *Adam Bede*. Derbyshire farms and moors figure in novels by R. Murray Gilchrist, and Kinder Scout supplies some of the scenery of Mrs. Humphry Ward's *David Grieve*. *Consul's Feudal History of the County*, J. P. Yeatman, G. R. Sitwell, and C. J. S. Foljambe, 1886, etc.; *Victoria History of the County*, ed. W. Page, 1905, etc.; *Odd Corners in Derbyshire*, W. T. Palmer, 1944.

**Derby Stakes.** Principal horse race in the U.K., or in fact in the world. Inaugurated in 1780 by the twelfth earl of Derby, it has

Derby Stakes. The 1949 finish, the first decided by a photo-finish camera. The winner was Nimbus (centre)

been held every year since, and takes place normally on Wed. of the Epsom summer meeting, except that in the war years 1915-18 and 1940-45 a substitute event was decided at Newmarket. The race is for three-year-olds, colts and fillies, and the course is 1½ m. on a left-hand turn, including the famous Tattenham Corner.

Record time, 2 min. 33 4/5 sec., is attributed to the 1936 winner Mahmoud. The smallest winner was Little Wonder (1840), who stood 14 hands 3¼ ins. On two

son, a suffragette, was fatally injured in causing the king's horse Anmer to fall at Tattenham Corner. The first woman owner to win an Epsom Derby was Mrs. G. B. Miller in 1937. S. Donoghue rode seven winners, counting substitute races: 1915, 1917, 1918, and 1921, 1922, 1923, 1925.

In 1867 the marquess of Hastings lost £120,000 through laying against Hermit. Snow fell before that race, and during the race in 1839. When St. Amant won in 1904 a terrific thunderstorm broke

occasions the horse first past the post has not been awarded the race: Running Rein in 1844 was later discovered to be a four-year-old, and the race was given to Orlando; and in 1913 Craganour was disqualified for bumping and boring, the race going to Aboyeur. During that same race Emily Davi-

over the course. In Sansovino's year (1924) the runners were fetlock deep in mud. The 1949 race was the first to be decided by the Photo-finish Camera (*q.v.*).

**Derceto.** Greek name of an Assyrian goddess, identified with Astartē (*q.v.*). She is represented in the form of a mermaid. Semiramis (*q.v.*) was supposed to be her daughter. *Pron.* Der-see-to.

**Dereham** OR EAST DEREHAM. Market town and urban dist. of Norfolk, England. It is on the railway, 122 m. N.N.E. of London and 22 m. W.N.W. of Norwich, and is an agricultural centre, the chief industries being the manufacture of agricultural implements and malting. The church of S. Nicholas is a fine Perpendicular building containing the tomb of William Cowper, whose residence here is commemorated by the Cowper Memorial Church of the Congregationalists. Borrow was born at Dimpling Green, 1½ m. to S., and Dereham is the "pretty, quiet D—, thou pattern of an English county town" of Lavengro. Here is a branch of Dr. Barnardo's Homes. Market day, Fri. Pop. 6,214.

**Derelict** (Lat. *de*, from; *relinquere*, to leave). Term used in two connexions in English law. (1) A vessel abandoned by its crew at sea. By the Merchant Shipping (Safety and Load Line Conventions) Act of 1932 the master of any British ship on meeting a dangerous derelict must send information to ships in the neighbourhood and to authorities prescribed by the Board of Trade. Warnings of the presence of derelicts on shipping routes are regularly broadcast to ships; radar enables derelicts to be detected in poor visibility. Derelicts are frequently destroyed by warships. The points at which derelicts are sighted at different dates are sometimes marked upon the monthly pilot charts of the admiralty, and serve to give some indication of the surface drifts of the oceanic waters. (2) Lands over which the sea used to come which have been suddenly, not gradually, left high and dry by the sea receding therefrom.

**Derg.** Lough or lake of Eire in the S. of co. Donegal. It contains numerous small islands, on one of which—Station Island—is the cave of S. Patrick's Purgatory, largely resorted to by pilgrims. On Saints' Island there are monastic ruins. The lake has an area of 25 sq. m.

**Derg.** Lough or lake of Eire, forming part of the boundaries of counties Tipperary, Clare, and Galway. An expansion of the Shannon river due to the hard rocks of the Killaloe gorge, it is 24 m. long and from 1 m. to 2 m. broad, greatest depth, 120 ft.

**Dermatitis** (Gr. *derma*, skin). Inflammation of the skin. The condition presents a variety of forms and may be due to numerous causes. The more important are certain predisposing diseases; application of irritant substances such as mustard or croton oil; trade processes, as among persons handling paraffin, tar, dyes, bichromate of potash, etc.; too long exposure to X-rays; irritation from parasites, as in scabies; sunburn, frostbite, and allergy.

**Dermoid Cyst.** Sac in which dermal structures, such as hair, skin, and teeth, may develop. It occurs most frequently as a tumour in the ovary.

**Derna.** Town in Cyrenaica, N. Africa. It stands on the Mediterranean, 140 m. E.N.E. of Benghazi. It passed from Turkish to Italian ownership after the war of 1912. During the Second Great War Derna was taken from the Italians by British Imperial troops on Jan. 30, 1941, in their advance to Benghazi. Recaptured by Germans and Italians on April 7, it fell to the British 8th army on Dec. 19 in a winter offensive. Rommel in the German advance upon Egypt reoccupied Derna on Feb. 3, 1942, and it was finally liberated on Nov. 16 in the course of Gen. Montgomery's triumphant advance to Tripoli. In normal times there is trade in hides and wool. Pop. 21,547.

**De Ros, BARON.** Premier barony of England. The title dates from 1264, when Robert de Ros, one of the barons who revolted against Henry III, was summoned to parliament. His son William was one of the candidates for the Scottish throne after the death of Margaret, the Maid of Norway. The 4th baron fought at Crecy, the 7th was lord high treasurer, the 8th was killed fighting in France, and the 10th lost all his possessions in the Wars of the Roses.

In 1508 the 11th baron dying without sons, the title passed to George Manners. His son Thomas was made earl of Rutland. In 1587 the barony passed to Elizabeth, wife of William Cecil, earl of Exeter, reverting to the earl of Rutland in 1618. In 1632 it passed to Catherine, wife of George Villiers, duke of Buckingham. It was in abeyance 1687–1806, and then was granted to the wife of Lord Henry Fitzgerald. Una Mary Ross (b. 1879), succeeding her mother in 1943, became 26th baroness. *Pron.* De Ross.

**De Rougemont, LOUIS** (1847–1921). Name of a Swiss whose real name was Henri Louis Grin. Born at Gressy, Nov. 9, 1847, as a young man he travelled in England and Australia, and in 1898 caused a sensation in London by an account of his enforced exile of 28 years among the blacks of the Cambridge Gulf region. His story, accepted in good faith, began to appear in *The Wide World Magazine*. The same year, before the British Association at Bristol, he read two papers on his adventures, which were afterwards discredited, though later discoveries tended to confirm some of his observations. He died June 9, 1921.

**Déroulède, PAUL** (1846–1914). French author and politician. He was born in Paris, Sept. 2, 1846, was called to the bar in 1870, and served as a soldier in the Franco-Prussian War. His *Chants du Soldat*, 1872, and *Nouveaux Chants du Soldat*, 1875, attained extraordinary popularity. In 1877 his poetic drama, *L'Hetman*, achieved success; but production of his drama *La Moabitte*, 1880, was forbidden by the censor.

A strong nationalist, Déroulède founded the *Ligue des Patriotes*, suppressed by the government in 1889, in which year Déroulède was elected a deputy as a supporter of Boulanger. In 1899–1900 he was tried for high treason and banished from France for planning a *coup d'état* against the parliamentary constitution. He returned in 1905, and died Jan. 30, 1914.

**Derrick.** Term applied to a kind of crane, and also to the staging erected for oil-drilling. On

Derrick. Main derricks on a large liner  
S. C. Cobb

board ship a derrick is a stout pole swung from a mast for lifting heavy weights. A derrick crane is a fixed crane, usually constructed of timber, consisting of a jib, vertical mast, and two raking timber backstays, weighted or made fast to prevent the crane from overturning. The range of horizontal movement is limited by the backstays, which prevent the crane from revolving in a complete circle. The word is derived from a hangman named Derrick, in allusion to the gallows-like appearance of a crane. *See* Crane.

**Derris.** Root of *Derris elliptica*, a woody climbing plant of the family Leguminosae, native of Malaya, Burma, Java, Sumatra, and the Philippines. Used as an insecticide and, by the natives, as a fish poison, it contains the active principle rotenone (tubotoxin). For derris powder, *see* Insecticide.

**Derry.** This is a shortened form of the name of the Irish city Londonderry (*q.v.*).

**Dervish** (Pers. *darwish*, poor; Arab. *faqir*, fakir). Persian, Turkish, or Arab devotee. Some are

Dervish. Typical Egyptian dervish with his begging bowl and rosary

strict Mahomedans; others combine nominal adherence to the Koran with Hindu mysticism and pantheism. Some live like the monastic orders of Christendom; others like hermits.

Their devotional exercises (*zikrs*) include invocations, bodily torture, and a frenzied, whirling dance said to symbolise the eternal existence of the Deity. At the close of the dance they fall into a cataleptic trance. The Rufaiyeh or howling dervishes mutilate the body; to the Muradiyeh belong the fakirs of

Derwent Valley Water Board. Ladybower Reservoir, opened by King George VI in 1945. It has a capacity of 6,300 million gallons

the Indian bazaars. The Kalanderiyeh or wandering dervishes regard constant travel as obligatory. The Maulawiyeh or Maulivehs, known as dancing dervishes, lacerate the body and swallow live coal, glass, and serpents; it was said in 1948 that the last of these had died in Istanbul. The modern order of the Senussi, which has spread over Arabia and N. Africa, is strictly Mahomedan. *See* Mahdi.

**Derwent.** River of Cumberland, England. It rises near Scafell and flows N. through Borrowdale to Derwentwater, N.W. to Bassen-thwaite, thence W. to the Solway Firth at Workington. Its length is about 35 m.

**Derwent.** River of Derbyshire, England. It rises in the High Peak and flows in a S. direction for about 60 m. past Chatsworth, Matlock, and Derby to the Trent. For the Derwent Valley Water Board, *see* below.

**Derwent.** River of Yorkshire, England. It rises on the moors of the N. Riding, which it drains, and flows mainly S.W. to form the boundary with the E. Riding. Having passed through the Carrs and by Malton, it joins the Ouse at Barmby. Its length is about 70 m., and it is navigable as far as Malton. A canal connects it with Poekington.

**Derwent.** River of England, forming part of the boundary between Northumberland and Durham. It flows for 30 m. N.E. to the Tyne at Derwent Haugh.

**Derwent.** River of Tasmania. It rises in Lake St. Clair and flows S.E. through a deep mt. valley to Hobart. Its length is 130 m.

**Derwent Valley Water Board.** Authority incorporated in 1899, with representatives of the corporations of Derby, Leicester, Nottingham, and Sheffield, and of Derbyshire county council. The

first instalment of its scheme was completed in 1912: the construction of masonry dams to form the Derwent and Howden reservoirs to impound the headwaters of the rivers Derwent and Ashop; an aqueduct from the former reservoir to the Ambergate service reservoir, with branches to Derby, Leicester, and Nottingham; and filters at Bamford. By 1930 the board had diverted the waters of the Ashop and Alport into the Derwent reservoir, thereby increasing the available supply to 20 million gallons per day.

In 1935 work began on the third instalment, the construction of the Ladybower reservoir, the largest earth embankment in the British Isles. It is 1,250 ft. long and 135 ft. high, and has a capacity of 6,300 million gallons. The reservoir was opened by King George VI on Sept. 25, 1945. Its construction had entailed the submerging of the picturesque village of Ashopton, and the 17th century Derwent Hall. Several miles of roads in the valley were also submerged; and two large viaducts of reinforced concrete were built to carry 5½ m. of new roads, together with water mains and post office cables, over arms of the reservoir.

**Derwentwater.** Lake of Cumberland, England. It is an expansion of the Derwent river; its

Derwentwater. Friar's Crag, a promontory on this Cumberland lake

length is 3 m.; greatest breadth, 1½ m.; and extreme depth, 72 ft. The wooded islets which stud its surface and the steep crags around its shores, combined with the surrounding mts., produce a fine scenic effect. At the S. of the lake are the Falls of Lodore, on which Southey wrote a poem. Near them occasionally rises to the surface the remarkable floating island. The lake abounds in pike, perch, and trout.

**Derwentwater**, JAMES RADCLIFFE OR RADCLIFFE, 3rd EARL OF (1689–1716). A Jacobite hero.

James, 3rd Earl of Derwentwater  
After Kneller

Eldest son of the 2nd earl and a kinsman of the Stewarts, he was born June 28, 1689. A leader in the rebellion of 1715, he surrendered at Preston, was attainted, and was beheaded

on Tower Hill, Feb. 24, 1716. The aurora borealis is called locally "Lord Derwentwater's Lights," because it shone brilliantly on the night of his death. He is a famous figure in ballads, e.g. Lord Derwentwater's Good Night. F. J. A. Skeet wrote his life, 1929.

**Derzhavin**, GABRIEL ROMANOVITCH (1743–1816). Russian poet. Born at Kazan, July 3, 1743, the descendant of an ancient Tartar family, he became a soldier in 1760. He entered the government service later, and in 1782 established his fame as a poet with *Felitsa*, written in honour of the empress Catherine. In 1791 he was made secretary of state, in 1800 imperial treasurer, and in 1802 minister of justice. He retired the following year, and died July 21, 1816. Derzhavin was the greatest Russian lyric poet of his time.

**Desaguadero** (Span., outlet). River of Argentina. Between Mendoza and San Luis prov., it forms the N. part of the Rio Salado.

**Desaguadero**. River of Bolivia. It issues from Lake Titicaca, on the borders of Peru, flows S.E., and empties into Lake Poopo; length about 190 m., partly navigable.

**Desaix de Veygoux**, LOUIS CHARLES ANTOINE (1768–1800). French soldier. Born in Auvergne, Aug. 17, 1768, he entered the army as a boy and first came into prominence in Moreau's retreat in the Black Forest in 1796, when he held out for two months against the Austrians in the ruined fortress

of Kehl. He added to his reputation in Italy in 1797 and won further glory by the conquest of Upper Egypt in 1799. Returning to Europe, he joined the French forces in Italy. His timely appearance at Marengo on June 14, 1800, secured victory for Napoleon, but Desaix was killed in the battle.

**Desborough**, WILLIAM HENRY GRENFELL, BARON (1855–1945). British politician and sportsman. Born Oct. 30, 1855, he was educated at Harrow and Balliol College, Oxford. Liberal M.P. for Salisbury. 1880–82 and 1885–86. Liberal Unionist for Hereford 1892–93, and Conservative for Wycombe from 1900, he was raised to the peerage in 1905. Chairman of the London Chamber of Commerce, the Thames Conservancy Board, the Central Chamber of Agriculture, and many other bodies, he was said at one time to be serving on 115 committees.

He excelled at cricket, rowing, and fencing, and was reputed to be the only man who was ever president of the O.U.B.C. and the O.U.A.C. For many years a steward at Henley Regatta, he became president of the M.C.C., and of the Lawn Tennis Association. As a young man he swam across Niagara, and stroked an eight across the Channel. His two eldest sons, Julian Grenfell (*g.v.*) and Gerald William Grenfell, were killed in the First Great War. There was no heir when Lord Desborough died Jan. 9, 1945.

**Descant** (Lat. *dis*, apart; *cantus*, song). In music, originally the old method of counterpoint in contrary motion. The canto fermo being usually in the tenor, the descant was above it, and so came to apply to the part for soprano or highest voice. In singing in church today a descant is a superimposed counterpoint rendered by the trebles of the choir, both popular and effective as an enrichment of hymn tunes.

**Descartes**, RENÉ (1596–1650). French philosopher and mathematician. He was born at La Haye in Touraine, March 31, 1596, and brought up at the Jesuit College of La Flèche in Anjou. Dissatisfied with his teachers and the learning to be obtained from books, he resolved to search for truth in himself and in the great book of nature and the world. After graduating in law at Poitiers in 1616, he led an unsettled life. He served in the army as a volunteer under Maurice of Orange and Tilly, perhaps took part in the siege of Rochelle, travelled exten-

Descartes  
After Franz Hals

sively, and at the age of 33 withdrew to Holland, where his *Discours de la Méthode plus la Dioptrique, les Météores et la Géométrie*, qui sont les *Essais de cette Méthode* (1637) and *Méditations de Prima Philosophia* (1641) were published. These works at once made him famous, but at the same time led to bitter controversy. He was invited to England by Charles I, to France by Richelieu, and in 1649, after spending 20 years in detachment in various Dutch cities, he accepted an invitation to Stockholm from Queen Christina of Sweden. But the climate proved too severe for him, and he died, Feb. 11, 1650. His remains were removed to France in 1666 and interred at Ste. Geneviève du Mont in Paris. They were transferred to S. Germain-des-Près in 1819.

Descartes reasoned as follows: All presuppositions and traditional opinions must be abandoned as possibly untrustworthy. I can doubt everything except the fact that I doubt—in other words (doubt being a kind of thought), the fact that I think. But this very act of thinking proves my existence. In the words of his famous saying, *Cogito, ergo sum* (I think, therefore I am). Again, the notion of an infinite, perfect being (God) exists in my mind; since I am myself finite, this idea must have been implanted there by an infinite being who must therefore exist. This is known as the "ontological argument."

Descartes' four main principles are: To consider nothing as true which is not evidently known to be such by presenting itself so clearly and distinctly to the mind that it is impossible to doubt it; to divide each difficulty into as many parts as possible; to conduct one's thoughts in order,

beginning with what is simplest and easiest to understand, and gradually ascending to the knowledge of the most complex; to make the enumeration so complete and the reviews so general that one can feel sure that nothing has been omitted.

Descartes stands at the head of the school of mathematicians which linked up the mathematics of the Renaissance with modern mathematical writings. While a soldier at Breda, his attention was turned to the study of geometry by the exhibition of a placard conveying a challenge to all the world to solve a certain problem. He solved it, and in 1621 resigned his commission to study pure mathematics. The invention of analytical geometry dates from the publication of Descartes' *Géométrie*. He was the first to perceive that a point in a plane could be completely determined if its distances from two fixed lines drawn in that plane were known—hence the term Cartesian coordinates. His *Géométrie* consists of three books, the first two treating of analytical geometry, the third containing an analysis of the algebra then current. The chief interest of his discourse on Optics (*La Dioptrique*) lies in its statement of the law of refraction. The latinised form of his name, *Cartesius*, gives the adjective Cartesian.

*Pron.* Day-cart. *See* Coordinates; Geometry; Mathematics; Ontology; Philosophy.

*Bibliography.* *Oeuvres*, ed. C. Adam and P. Tannery, 13 vols., 1897-1911; *Philosophical Works of D.*, Eng. trans. E. S. Haldane and G. R. T. Ross, 2 vols., 1911-12; *Studies in Cartesian Philosophy*, W. Smith, 1902; *Lives*, E. S. Haldane, 1905; G. Milhaud, 1921; H. Gouhier, 1924; *Correspondence with Huygens*, ed. L. Roth, 1926; *The Philosophy of D.*, A. Boyce Gibson, 1932.

**Descent** (Lat. *descendere*, to come down). Word employed in genealogy to denote lineage or derivation from some particular ancestor. Lineal or direct descent is unbroken line from parent to child during two or more generations. Collateral descent indicates descent from a relation of the person from whom descent is claimed, e.g. a man is a lineal descendant of his grandfather, but the collateral descendant of his grandfather's brother.

**Descent of Man**, THE. Work by Charles Darwin applying his doctrine of the evolution of species to the origin of man. It was first published in 1871, and in a second

revised edition in 1874. It consists of two parts, the first on the pedigree of mankind, the second on sexual selection in the animal kingdom generally. *See* Darwin.

**Deschanel**, PAUL EUGÈNE LOUIS (1856-1922). French statesman. He was born at Schaarbeck,

Paul Deschanel,  
French statesman

Brussels, Feb. 13, 1856, having Victor Hugo as his godfather. Educated in Paris at the Lycée Condorcet, in 1877 he was secretary to Jules Simon, French premier. In 1878 he was sub-prefect at Dreux, and was elected a deputy for Eure-et-Loir, 1885. He attracted attention by speeches on the liberty of the press and a scheme of budget reforms. In 1893 he was wounded in a duel by Clemenceau.

A vice-president of the chamber in 1896 and 1897, Deschanel was president May, 1898-April, 1902. In 1905 he was made chairman of the standing committee on foreign affairs. He voted in favour of the separation of Church and state and was an ardent apostle of cooperative copartnership.

Again president of the chamber in 1912, during the First Great War Deschanel delivered speeches that had an inspiring effect on the morale of the nation. He was elected president of the republic at Versailles in 1920, in succession to Poincaré. On May 23 he fell out of a moving railway train, and on Sept. 16 he resigned. He died April 28, 1922.

A member of the Academy from 1899, Deschanel wrote many political works and biographies, notably Gambetta, 1920.

**Deschutes**. River of Oregon, U.S.A. Rising on the E. slopes of the Cascade range, it flows 320 m. N.N.E., through deep cañons, to the Columbia river at Fultonville, 12 m. above the Dalles.

**Desdemona**. Leading female character in Shakespeare's tragedy *Othello*. The daughter of Brabantio, a prominent senator of Venice, and clandestinely married to Othello, she is murderously smothered by her husband, who is falsely persuaded by Iago that she has been unfaithful.

**De Selincourt**, HUGH (b. 1878). English author. Born June 15, 1878, he was educated at Dulwich and University College, Oxford. He was dramatic critic of The

Star, 1910-12, and literary critic of *The Observer*, 1911-14. Cricket was one of his favourite subjects, and *The Cricket Match*, 1924, a fictitious description, is generally ranked among the best books ever written on any game.

**Desert** (Lat. *desertum*). Region in which few forms of life can exist owing to exceptional drought or exceptional cold or both. Desert conditions obtain in most places where the mean annual rainfall is less than 10 ins., because unless water is provided by other means life cannot be supported. It is noteworthy that the great hot deserts of the world (Sahara, Kalahari, Colorado, Atacama, West Australian) are on the W. of continents. Others are situated either in the interior, e.g. the Gobi in Asia, or in Arctic and Antarctic latitudes where the intense cold checks precipitation and makes life difficult.

Deserts may result from any of the following conditions: (a) persistent anticyclone (e.g. Sahara); (b) cold current on the W. edge of a large land mass (e.g. Peruvian); (c) mountain system shutting off moisture-laden winds (e.g. Gobi).

It is incorrect to describe deserts as wildernesses of sand, or monotonous plains. Many large areas in deserts are covered by drifting sand which is formed by the wind into an endless succession of dunes, but deserts are also often crossed by great mountain masses and have many bare, rocky tracts. In hot deserts great diurnal changes of temperature are experienced, causing the surface layer of exposed rocks to expand in the heat of the sun and to contract when the sun sets. This produces splitting, and fragments fall to the ground, the reduction to sand being accomplished by the agency of the wind. Except where there are underground supplies of water, as in oases, there is little vegetation in deserts, and all desert plants, such as the cactus and thorny scrub, have to root deeply in order to reach moisture. *See* Climate; Dust Bowl.

**Desertas**. Four small rocky islands in the Atlantic, S.E. of Madeira, to which they are administratively attached. They are called Bugio, Chao, Deserta Grande, and Sail Rock, and are uninhabited, being visited only by fishermen and herdsman.

**Deserted Village**, THE. Poem by Goldsmith, published May 26, 1770. In it he emphasises the

depopulation of country places and laments the increase of luxury. Full of tender feeling and human sympathy, it is one of the poet's most delightful works, and the source of a number of familiar quotations. There have been many attempts to identify the place described—Sweet Auburn—but it is evidently an imaginative blend of the poet's memories of Ireland and his observations in rural England.

**Desertion** (Lat. *deserere*, to abandon). Term meaning in general going away secretly and without permission, abandoning someone who has a claim upon one.

In a military sense the offence consists in being absent from a unit with the intention of either not returning or of escaping some important duty, such as foreign service. In Great Britain the offence of desertion is now dealt with under the Army and Air Force Act (*q.v.*), the penalty being penal servitude if the offender is on active service, otherwise imprisonment for a first offence and penal servitude for later offences. The death penalty was abolished in 1930.

A soldier is posted as a deserter after having been absent from his unit for 21 days; but he is not necessarily charged with desertion. His intention not to return to his unit must be proved before he can be convicted. The retention of his uniform or the act of surrendering to the civil or military authorities is usually accepted as evidence that an absentee did not intend to desert.

A seaman or apprentice in the mercantile marine who deserts his ship is liable to forfeit all his property on board and all his wages. If desertion takes place abroad, he may be imprisoned for twelve weeks. In the U.K. a seaman or apprentice who has deserted may be taken back to his ship by the master, mate, or owner with or without the assistance of the police, and out of the U.K. he may be arrested by any of the above without a warrant.

Desertion by a husband or wife for at least three years is a ground for judicial separation or divorce. A wife whose husband has deserted her may apply to a magistrate's court for a separation order or maintenance order. A man persistently neglecting to maintain his wife or child may be prosecuted.

**Desert Rats.** Nickname given to units of the British army during the Second Great War. The 11th Hussars were among the

British forces stationed in Egypt at the outbreak of the Second Great War, and became famous for their desert patrols, earning the nickname. Later the 7th armoured division, which included the 11th Hussars and formed part of the famous 8th

Desert Rats badge

army, adopted the jerboa, or desert rat, as a divisional sign and became generally known as the Desert Rats. *See* Eighth Army; North Africa Campaigns.

**Deshoulières, ANTOINETTE** (1638–94). A French poet. Born in Paris, Jan. 1, 1638, she married de Boisguerin, Seigneur Deshoulières, and was a prominent figure in literary circles in France in the time of Louis XIV. She wrote some indifferent tragedies and a number of madrigals, ballads, and idylls, the sole merit of which is a certain grace of diction. She died in Paris, Feb. 17, 1694.

**Desiccation** (Lat. *desiccare*, to dry up). In chemistry, the drying up of substances by removing water from them. There are various ways of doing this, and frequently an apparatus called a desiccator is used. The substance may be heated, thus increasing its vapour pressure; the air may be exhausted by air-pump, or dry air may be used. Certain chemicals, *e.g.* sulphuric acid and calcium chloride, are used for this purpose. Some forms of life are difficult to desiccate, and often survive the most complete applications of the process.

The process of removing water from foodstuffs, *e.g.* fruit and vegetables, with the object of reducing their bulk while maintaining their essential properties, is known as dehydration (*q.v.*).

**Design** (Lat. *designare*, to mark out). Plan or sketch for a completed work of art; and in a wider and more modern sense, for every branch of art as applied to industry. It has been said that design is to the graphic arts what verse form and rhyme are to poetry. The most common designs are those based on simple geometric forms, *e.g.* the formalised motifs upon Greek vases, but the term applies also to abstract compositions as in those of Paul Klee (*q.v.*).

Many schools have been established for the teaching of design. So far as the improvement of art products goes, these institutions

serve a similar purpose to that of the trade guilds of the Middle Ages, but, unlike them, do not concern themselves with control and regulation of trade. Their chief use is to counteract one of the inevitable consequences of the introduction of labour-saving machinery by giving to every worker a thorough theoretical and practical knowledge of his manual art. The international exhibitions of 1851 (London), Paris (1855), and Philadelphia (1876) gave an appreciable momentum to technical education in the U.K., France, and the U.S.A.; but greater benefits have accrued from the multiplication in most countries of technical institutes, polytechnics, and schools of art and design, the effects of which can be observed in the designs of many articles manufactured for the home. *See* Industrial Design.

**Design.** In theological argument, the evidence of divine creating intelligence contained in the organized form of the creature. It is held that just as the examination of the structure of a watch leads us to infer the existence of a watchmaker, so an examination of the universe, which exhibits natural arrangements adapted to certain ends, leads us to infer the existence of a divine and intelligent creator.

**Desire** (Lat. *desiderium*, longing.) A state of unsatisfied longing; a wish. The word is used in psychology both in these senses and more particularly for the tension which is set up when an instinctual disposition is roused by some appropriate stimulus and remains ungratified. Desires may be either conscious or unconscious. For theory of unconscious desire, *see* Unconscious. For disguises under which desires penetrate into consciousness during sleep, *see* Dream.

**Desman** (*Myogale*). A small insectivorous mammal, placed between the moles and the shrews. There are two species, both aquatic in habit, one found in Russia and the other in the Pyrenees. They vary from 10 to 16 ins. in length, have webbed feet, long trunk-like snouts, and scaly tails. They live in burrows beside the water, and their skins are valued for fur.

**Desmids** (Gr. *desmos*, chain). Single-celled microscopic Algae of the family Desmidiaceae. Almost exclusively they inhabit fresh water (mostly stagnant), where they often form a green scum on the surface. They are unattached—except temporarily—

Desmids. Specimens of *Micrasterias denticulata*. The actual length of each is about one hundredth of an inch  
J. J. Waid, F.E.S.

and have the power of independent motion. Some often combine to form thread-like colonies, but there is no real union of the plants. Multiplication takes place vegetatively by an individual dividing into two plants. There is also a process of conjugation between two plants whose protoplasm unites and forms a new desmid.

**Des Moines.** River of Minnesota and Iowa, U.S.A. It rises in the S.W. of Minnesota and traverses the centre of Iowa state in a S.E. direction, joining the Mississippi  $2\frac{1}{2}$  m. below Keokuk, after a course of 500 m.

**Des Moines.** Capital of Iowa, U.S.A., and co. seat of Polk co. It stands on both sides of the Des Moines river, 345 m. W. of Chicago, is served by eight rlys., and has several airports and bridges. One of the earliest U.S. cities to plan its development, it has a grand civic centre on the waterfront. Drake university and the American Institute of Business are in the city. Fort Des Moines is to the S. The chief products are meat, flour, clothing, iron and steel, bricks, tiles, and motor accessories; the surrounding district yields maize, and hogs are bred. Des Moines was settled 1843, incorporated as a town 1851, chartered as a city 1857, and has been governed by a commission since 1907. Pop. 159,819.

**Desmond, EARL OF.** Irish title borne until 1583 by the family of Fitzgerald. The earldom was created in 1329 for Maurice Fitz Thomas or Fitzgerald. The earl's second wife, Katherine Fitzgerald (d. 1604), was the old countess of Desmond, who certainly lived to be 104, and was reputed to have died at 140. In 1583 the title became extinct in the 15th earl, Gerald Fitzgerald, the "rebel earl," but several shadowy claimants appeared. It was conferred in 1619 on Richard Preston, Lord Ding-

wall, and at his death in 1628 passed by special remainder to George Feilding, who succeeded as earl of Denbigh in 1674. Since then the earldom of Desmond, conjoined with that of Denbigh, has been held by the Feilding family.

**Desmond, ASTRA.** British singer. She was educated at Nottingham high school and Westfield College, and was a pupil of Marchesi in Paris and of Grezebach in Berlin. From 1920 she appeared regularly at leading concerts and festivals, and was especially associated with Elgar's works, in which her mezzo-soprano voice was at its best. She also gave recitals of folk-songs of European countries. In 1923 she took part in the first broadcast performance of Stravinsky's *Oedipus Rex*, and she was long a popular broadcaster.

**Desmond, FLORENCE** (b. 1907). British actress. Born in London, May 31, 1907, she was trained as a dancer and first went on the stage in a London pantomime in 1916. Later she appeared in a number of revues, e.g. *On with the Dance*, 1925; *Charlot's Masquerade*, 1930; *Streamline*, 1935, and made an outstanding reputation on the stage, screen, and radio by brilliant satirical impersonations of theatrical and film stars.

**Desmond, SHAW** (b. 1877). Irish author. Born in Ireland, Jan. 19, 1877, he was educated by monks there, and left school at 15 to work in London. Secretary and director of public companies, he gave up his business career for literature and journalism in 1909, sailed round Cape Horn in a windjammer, an experience which provided material for his successful travel-book *Windjammer*, 1932; and travelled 7,000 m. in Africa. He founded the International Institute for Psychical Research, 1934, and many of his books dealt with spiritualist experiences. One of his best-known novels was *Paradise Row*, 1945.

**Desmoulin, CAMILLE** (1760-94). French revolutionist. Born at Guise, Picardy, March 2, 1760, he became an advocate, but, hindered by an impediment in his speech, turned to political authorship. On hearing of the dismissal of Necker, July 12, 1789, he harangued a Paris crowd with the exhortation, "To arms!" His words marked the beginning of the Revolution. Two days later the Bastille fell. The issue of a republican pamphlet, *La France Libre*, and of *Desmoulin's* weekly journal, *Les Révolutions de France et de Brabant*, Nov., 1789-July, 1791, stimulated

the revolutionary movement. Influenced at first by Mirabeau, and later by Danton, Desmoulin was active in the overthrow of the Girondists. With Danton, like whom he sought to moderate the Terror, he was guillotined April 5, 1794. Eight days later his wife, falsely convicted, suffered the same fate. His life was written by J. Claretie, 1908; P. Compton, 1933.

**Desna.** River of Russia. Rising in the region of Smolensk, in R.S.F.S.R., it flows S.E. to Bryansk, then in Ukraine S.S.R. flows S.W. to Chernigov, and falls into the Dnieper near Kiev. It is navigable for nearly half of its course of 560 m. It supplies fish in abundance, and is an important commercial waterway.

**Despard, CHARLOTTE** (1844-1939). British social reformer. She was born at Ripple Vale, near

Charlotte Despard, British social reformer

Dover, a sister of the 1st earl of Ypres (q.v.). For many years president of the Women's Freedom League, she was a leader in the agitation for women's suffrage. On several occasions, 1907-13, she was imprisoned for her activities, and during and after the First Great War continued to advocate the rights of women in England and Ireland. She died Nov. 10, 1939.

**Despenser, HUGH LE** (1262-1326). English courtier. Son of the justiciar of England, who was killed at Evesham, he was born March 1, 1262, and served with Edward I in Scotland. His friendship with Edward II made him hated, and in 1321 the barons obtained a sentence of banishment against him. This was repealed the following year, and Despenser was enriched by many estates from the crown. The barons rallied to the queen, the mortal enemy of Despenser, and on her return from France in 1326 the king, retreating westward, left Despenser to hold Bristol. The town was against him: he surrendered, and on Oct. 27, 1326, was beheaded as a traitor outside Bristol.

**Despiau, CHARLES** (1874-1946). French sculptor. Son of a plasterer, he was born, Nov. 4, 1874, at Mont-de-Marsan, Landes. At 17 he went to Paris and studied at the École des Arts Decoratifs and the Beaux Arts. Rodin noticed

his work, and invited him to act as assistant in carving marbles in his studio. Despiau learnt from Rodin the refinements of his craft. With Petite Landaise in 1904 he showed the full promise of his talent, but public appreciation was slow. He was compared with Maillol, and his portrait busts were remarkable for intensity of expression. He executed a war memorial for his native town. An exhibition of his work was held in London in 1938. His death was announced Oct., 1946.

**Despoblado** (Span., desert). Treeless, uninhabited plateau of S. Bolivia. On the Chilean and Argentine borders, its estimated altitude is 10,000 ft. to 12,000 ft.

**Despotism.** Term used for a harsh and unpopular form of government. It is derived from the Greek *despotes* (master of the house), and came by analogy to be used for the arbitrary rule of a single man. Gradually an exclusively reproachful idea became attached to the word, and now it is used for any form of government which is oppressive and not in accord with the popular will, whether the despotism of a monarch, a dictator, or a group of people who have secured supreme power in the state. See Democracy; Sovereignty.

**Dessaix, JOSEPH MARIE, COUNT** (1764-1834). French soldier. Born at Thonon in Savoy, Sept. 24, 1764, he became a doctor of medicine. In 1789 he joined the revolutionary army and was soon fighting in Italy and elsewhere. He took part in politics and under Napoleon rose to be a general, and held a command in several of the great battles. In 1814 Dessaix joined Napoleon on his return from Elba, but little more was heard of him until his death, Oct. 26, 1834.

**Dessalines, JEAN JACQUES** (1758-1806). Emperor of Haiti. He was born in Guinea, and taken

as a slave to Haiti, where he became the property of a Frenchman, whose name he adopted. In the revolt of 1790 he took a leading part, and later was made governor of the S. portion of Haiti. On the French being forced to leave the island, he became governor and in 1804 emperor, as Jean Jacques I. He was killed in a revolt, Oct. 17, 1806.

**Dessau.** Town of E. Germany, cap. of the former state of Anhalt. It is on the left bank of the Mulde, near its confluence with the Elbe, 69 m. S.W. of Berlin. Until 1918 it was the residence of the dukes of Anhalt, the chief of whose palaces stands in extensive grounds and contains valuable pictures and antiquities. The Schlosskirche, the most interesting of the churches, has two paintings by Lucas Cranach. The industries of Dessau are sugar refining, making textiles, production of leather and tobacco, and a trade in agricultural produce. Here also was the chief works of the Junkers aircraft and aero-engine company. The 3rd armoured division (U.S. 1st army) entered Dessau on April 21, 1945, towards the end of the Second Great War. Pop. pre-war, 120,732.

**Dessye.** Town of Abyssinia, in the province of Shoa. In April, 1941, the Italian army retreating N. from Addis Ababa made a stand here, but was routed by the South African 1st Brigade, which entered the town on April 26. See East Africa Campaign.

**Desterro.** This city of Brazil is now usually called Florianopolis (*q.v.*).

**Destinn, EMMY** (1878-1930). Czech soprano. She was born at Prague, Feb. 26, 1878, her real name being Kittl, and studied under Lachner and Marie-Loewe.

**Destinn** (part of whose name she adopted). From her operatic début

in Berlin in 1898 she at once achieved popularity. Her consummate artistry carried her from triumph to triumph, and she appeared regularly in Germany, England, France, and the U.S.A. She sang in the first production of *Madame Butterfly* (*q.v.*) at Covent Garden, 1905, and in the *Girl of the Golden West* in New York, 1910. After the First Great War she used the name Destinnova. She died Jan. 29, 1930.

**Destroyer.** Abbreviation of the original term, torpedo-boat destroyer, for a useful category of warship. The type first appeared in 1893, and later grew in size and altered its characteristics until it became, in effect, a small cruiser, often called upon to perform duties formerly devolving upon cruisers. In the Second Great War destroyers were the hardest worked ships in the Royal Navy. The largest and fastest acted as a screen for the battle fleet, while the smaller ones escorted convoys in conjunction with frigates and corvettes. In consequence of its high speed and manoeuvrability, the destroyer was also an ideal anti-submarine vessel.

Early British destroyers such as the Havock and Daring, built by Yarrow and Thornycroft respectively in 1893, were of under 250 tons displacement, with a maximum speed of 27 knots. Designed to counter the numerous flotillas of torpedo-boats in the French and Russian fleets, they proved so successful that in a short time they were in every navy. They soon displaced the torpedo-boat as a weapon of attack, and for several years, until the arrival of the submarine, torpedo tubes were regarded as their primary weapon.

At the beginning of the First Great War British destroyers had reached a displacement of 1,000 tons and a speed of 35 knots. One experimental ship, the Swift, displaced 2,170 tons. Armament of

Destroyer. Diagram showing features of a C class destroyer (1,710 tons displacement). A, dual-purpose 4.5-in. guns; B, 40 mm. Bofors A.A. guns; C, 20 mm. Orlikon guns; D, depth charge thrower; E, torpedo tubes; F, depth charge rails. 1, Jackstaff; 2, forecabin; 3, steam capstan; 4, breakwater; 5, forward blast screen; 6, signal deck; 7, D.F. coil; 8, pelorus; 9, compass; 10, bridge; 11, searchlight; 12, direction tower; 13, anemometer; 14, aerial; 15, tubular steel mast; 16, lattice mast; 17, gangways; 18, Bofors gun platforms; 19, mainmast; 20, director tower; 21, torpedo loading davit; 22, after gun platform; 23, after blast screen; 24, upper deck; 25, stern; 26, motor dinghy; 27, motor cutter; 28, anchor; 29, bow

Courtesy of Thornycroft & Co

the later vessels, except the Swift, consisted of 4-in. guns with a few smaller pieces and either one or two pairs of torpedo tubes. As the result of war experience, the ideal type found in service for many years after 1918 was of 1,100-1,400-tons armed with four 4-7-in. guns and from six to ten 21-in. torpedo tubes. Destroyers with these characteristics took an active part in the Second Great War, which did not produce any considerable variation from standard design until near its close.

Three new types were evolved at length: the C class, of 1,710 tons, with four 4-5-in. guns in single mountings, four 40-mm. and two 20-mm. anti-aircraft guns, and five torpedo tubes; the Weapon class, of 1,980 tons, with six 4-in. guns in twin mountings and several 40-mm. anti-aircraft guns, and ten torpedo tubes; and the Battle class, of 2,325 tons, with four 4-5-in. guns in twin mountings, twelve or fourteen 40-mm. anti-aircraft guns, and ten torpedo tubes. Designed speed was 34 knots in the two former types, 36 knots in the last.

Normal organization of destroyers in the Royal Navy is in flotillas of eight, each flotilla being commanded by a captain (D). In a fleet, four flotillas are grouped together under a rear-admiral, whose flag is usually flown in a light cruiser. All British destroyers carry a hedgehog mortar and depth charge throwers in addition to guns and torpedo tubes. In the past some were fitted for minelaying; and in the U.S. navy some modern destroyers were reclassified as light minelayers or fast minesweepers when fitted for these duties. A recent type of American destroyer is of 2,400 tons, with a speed of over 35 knots and is armed with six 5-in. and twelve 40-mm. guns and ten torpedo tubes.

Destroyers have proved a fine training ground for seamanship. Two distinguished British admirals in the Second Great War, Viscount Cunningham and Lord Tovey, first came to the front in the First Great War as daring destroyer captains. During 1939-45 the Royal Navy lost 138 destroyers, excluding a few irreparably damaged, and the U.S.A. 69.

**Destructor.** A specially designed furnace in which waste in the form of domestic and trades' refuse is destroyed with the least possible nuisance. Fryer took out a patent in 1876 for such a furnace, and also coined the word destruc-

tor. Since matter is indestructible, the word is a misnomer and the title refuse-disposal station appears to be superseding it. The word incinerator usually denotes a small, privately-owned refuse burning outfit, e.g. at hospitals, institutions, and camps.

Satisfactory disposal of civic waste is a duty thrust upon municipal authorities by civilization and remains a continual problem in the interest of public health. Refuse-composition differs considerably from district to district, with the seasons, etc. Average quantities made per 1,000 of population may be put at 15 to 20 cwt. a day. Its calorific value is anything from 2,500 to 6,400

Destructor. Diagram showing cross section: 1, refuse collecting vehicle; 2, feeding platform; 3, feeding door; 4, cell; 5, firegrate; 6, clinkering door; 7, ashpit; 8, clinkering floor; 9, ashpit; 10, air blower

B.Th.U., with moisture content 12-33 p.c. and even more.

It is usual to separate marketable articles before the refuse is delivered into the furnace. Bottles, "cullet," and non-ferrous metals are removed by hand from a conveyor belt. Articles like sacks, carpets, and rags are often collected separately from the main refuse. The reclamation of tins and iron articles is carried out by electro-magnetic machinery, while fine dust and cinders are removed by raking crude refuse across a grid, or passing it through revolving screens. Paper separation is carried out by suction plant. After separation the "tailings" proceed to the furnace for burning. A forced draught is usually necessary to promote combustion; it may be provided by a high chimney shaft, air blowers, or steam jets.

A development of the standard type of furnace is shown in the accompanying illustration. Feeding takes place from the top back

or the front of the plant. An installation consists of cells capable of burning 10-15 cwt. of refuse per hour. Unorthodox types of plant are (1) rotary kiln, in which refuse is incinerated while making its passage through an inclined rotating oven; (2) vertical shaft, like a vertical retort with a funnel at its top for the introduction of refuse, combustion taking place on its way down to a clinker door at the lower end; (3) revolving grate, in which refuse is delivered into an iron brazier, which is subsequently tipped over after the material has been destroyed, the clinker being discharged into a hopper underneath.

The heat produced during combustion is often utilised by passing it to steam boilers, usually of the water-tube type. Steam so generated may drive salvage plant or be used in jets, or for sewage pumping. In some cities electricity is generated on a large scale by destructor-fired boilers. The incombustible constituents of the tailings are reduced to an innocuous clinker. This after treatment may be used for the

manufacture of asphalt, concrete blocks, etc.; also as a medium for sewage filter beds, and for hard core generally. Flue dust, always present, is intercepted by traps and dust catchers. It has several uses, being employed for lightening heavy soil, as a lawn fertiliser, or in conjunction with carbolic acid as a disinfecting powder.

A.M.I.W.E., Assoc.I.E.E.

**Desulphurisation.** In metallurgy, the removal of sulphur from ores. Some of the most important metalliferous ores of the world are represented by the pyrites, which are compounds of metals with sulphur. Gold, silver, copper, nickel, iron, and some other metals are obtained, more or less, from these compounds. Before the metal can be extracted from such ores the sulphur must be removed. In former times this process was accomplished solely by the process of roasting or calcining, but of late years the operation has been

largely effected by direct smelting. See Calcination; Copper; Gold; Iron; Nickel; Pyrites; Silver.

**De Tabley**, JOHN BYRNE LEICESTER WARREN, 3RD BARON

*Warren De Tabley*

(1835-95). British poet. Born April 26, 1835, he was the son of the 2nd baron, whom he succeeded in 1837, this title dating from 1826.

The 1st baron had inherited estates in Cheshire, where was his residence, Tabley House. The 3rd was educated at Eton and Christ Church, Oxford, was called to the bar and entered the diplomatic service, but his main interest was literature. His early works, *Præterita*, 1863, *Eclogues and Monodramas*, 1864, *Studies in Verse*, 1865, and *Philoctetes*, 1866, achieved no wide popularity, but recognition came in 1893 with *Poems, Dramatic and Lyrical*. He died Nov. 22, 1895.

**Detaille**, JEAN BAPTISTE ÉDOUARD (1848-1912). French artist. Born in Paris, Oct. 5, 1848, he studied under Meissonier, and after travelling in Spain and the East, took part in the Franco-Prussian War of 1870. This gave him his opportunity, and he became famous as a painter of military life. *Le Rêve* (The Dream), well known through engravings, and now in the Luxembourg, is one of his most popular works. He died Dec. 23, 1912.

**Detective**. A non-uniformed member of a police force. Plain-clothes detectives are an important branch of the police organizations of most countries. Their duties are mainly to assist in the detection of the authors of crimes, in contrast with that of the prevention of crime which falls upon the uniformed police. There are two chief methods of detective organization, one centralized, by which the activities of detectives are controlled from headquarters, and the other by which each district or town has its own detective force. The former is the Continental system in the main, and the latter the British and American systems. In the U.K. the organizations of the various detective forces are run on very similar lines to that of the Criminal Investigation Department (*q.v.*), or C.I.D., of New Scotland Yard.

The general trend of detective work in all countries is towards

nationalisation as opposed to localisation of effort, and it has been suggested that there should be an international detective force. In practice the latter almost obtains between the U.K. and the Continent. Such a force has become necessary since the increase in means of rapid communication between countries.

In the U.S.A. the detectives of the Federal Bureau of Investigation, which has its headquarters in Washington and branch offices in large cities, cover not only matters of internal security but many other crimes, *e.g.* bank robberies, kidnapping, theft of government property and of motor vehicles. Each state and all large centres of population maintain their own police and detective service.

In Berlin, after 1876, when the detective system was reorganized, there were specialised detective groups which dealt exclusively with one type of crime each. There was a special murder commission for all murder cases. High specialisation, however, did not prove so successful as the decentralised British system. In Paris and France generally the organization of the C.I.D. was more nearly followed after 1913.

Throughout the U.K. and the Continent and in the U.S.A., detectives are usually promoted from the uniformed force. Experience has shown that a man does not become an efficient detective without previous training as a uniformed constable. Sir Howard Vincent, who tried the experiment at New Scotland Yard in 1878, stated that it proved unsatisfactory. See Bertillon Measurements; Criminology; Police; Police Staff College; Scotland Yard.

**Detective Fiction**. The detective story, long or short, is one in which the main interest lies in the investigation and solution of a crime mystery by scientific detection, professional or amateur. E. A. Poe, with *The Murders in the Rue Morgue*, 1841, and other stories, is generally regarded as the father of the detective story. Later in the 19th century Émile Gaboriau (*The Mystery of Orcival*), F. du Boisgobey, and Gaston Leroux (*The Mystery of the Yellow Room*) in France, and Conan Doyle in England, with his stories of Sherlock Holmes, helped to formalise this type of fiction into an art of its own, with its own rules and conventions. As such it became widely popular as the 20th century progressed. E. C. Bentley with *Trent's Last Case*, 1912, a classic

of detective fiction, and G. K. Chesterton with his fantastic stories of Father Brown, set new literary standards for the art; and between the two Great Wars it became highly developed in the hands of such writers as (in England) Dorothy L. Sayers, J. J. Conington, G. D. H. and M. Cole, Agatha Christie, F. Wills Crofts, H. C. Bailey; in America, Ellery Queen and S. S. Van Dine; in France, Simenon. Many other established writers have made at least one excursion into the art. Usually Conan Doyle's practice was followed of using the same strongly characterised detective for an illimitable number of problems, *e.g.* Sayers's Lord Peter Wimsey, Christie's Hercule Poirot, Van Dine's Philo Vance, Simenon's Maigret.

The true detective story is in effect an entertaining challenge to the reader to solve the given problem earlier than the hero, for in the best examples of the art all clues, as well as all "red herrings," are laid fairly before the reader as before the fictional detective, and the correct solution is inherent in the initial statement of the problem, no reliance being placed on chances or surprises in the plot. This appeal to the brain distinguishes the detective story proper from the mere "thriller," which appeals first to the emotions. Nevertheless detective fiction is essentially romantic and "escapist," possessing the old virtue of romance that the hero is always on the side of the angels and, moreover, always triumphs.

**Detector**. In warfare, device employed to give warning of the presence of poison gas or to locate mines and submarines. Chemically treated strips of paper were prepared during the Second Great War to detect the invisible and odourless German gas arsine, which turns white paper a dull brown. Half-sleeves and sheets of metal were painted with gas-detecting paint which would have disclosed by reddish spots the presence of liquid gas. Gas paint was also applied to the sleeves of gas capes, tops of pillar boxes, etc.

Electronic detecting devices located buried land mines. In an electro-magnetic detector invented by a Polish officer, the circular shoe at the end of a long arm was swept over the ground at a height of about 4 ins. and a steady note was transmitted to an operator with earphones; the presence of a mine was indicated by the note becoming shrill. The Germans and

Italians defeated the detector for a time by putting their mines in a wooden box. Marine acoustic mines were located and exploded by the hammer-box detector; this sent pulsations through the water, which depressed the firing diaphragm of the mine, causing it to detonate at a safe distance from the vessel.

The mine detector, carried in front of a vehicle on a boom, locates underground pipelines and cables. Sub-surface flaws in castings or forgings are revealed by electronic detectors employing

foreign influence or control. See Defence Regulations.

**Deterding, SIR HENRI WILHELM AUGUST** (1866-1939). Anglo-Flemish industrialist. He was born in Amsterdam, and as a comparatively young man made a fortune. A naturalised British subject, he became director-general of the Royal Dutch Petroleum Company, 1896, a position he retained until his death. One of the most influential figures in the oil industry in Europe and in the U.S.A., where he owned 375 sq. m. of oilfields, he was also

containing oxygen, sodium, and sulphur, for instance:

$-\text{CO}-\text{CH}_2$  has an attraction for water; a chain such as  $\text{CH}_3-\text{CH}_2-\text{CH}_2-\text{CH}_2-\text{CH}_2$  has an attraction for fatty or greasy particles, and a detergent containing such a group and such chains can break up dirty or greasy compounds so that they can be washed or wiped away. Detergents are used in the treatment of textile materials, in the preparation of drugs, cosmetics, and emulsions, and in electroplating.

**Determinant.** A convenient notation for representing certain algebraic functions or expressions. Determinants were first suggested as a result of the solution of a system of simple algebraic equations. In the solution of three simple equations of the form  $ax + by + cz = d$ , for example, the elimination of  $y$  and  $z$  gives us for the coefficient of  $x$

$$a(b_1c_2 - b_2c_1) + a_1(b_2c - b_1c) + a_2(b_1c - b_2c)$$

which is usually written in the determinant form

$$\begin{vmatrix} a & a_1 & a_2 \\ b & b_1 & b_2 \\ c & c_1 & c_2 \end{vmatrix}$$

Consult Theory of Determinants, T. Muir, 1882.

**Determinant.** An aggregate of hypothetical biophores whose presence, according to Weismann (1834-1914), determines the characters of a cell. Weismann supposed determinants to be grouped into ids which he identified with granules of chromatin to be seen in the nuclear reticulum and sometimes in chromosomes. According to his theory, both parents contribute different kinds of determinants to the fertilised egg. As this egg grows into a new individual by cell division, the successive nuclear divisions result in the distribution of the determinants to the various cells, so that each comes to have a collection of biophores which cause it to assume its special characteristics. The theory is antiquated, but the term is still used in a general way to denote that heritable matter which causes a character of an individual to appear.

**Determinism.** The theory that all events are consequences of antecedents which account for them in every particular. In philosophy and psychology it means the belief that human behaviour, and in particular moral decisions, are decided by the heredity, past

Detector. Supersonic flow detector for revealing sub-surface flaws in castings or forgings. Left, the instrument: A, cathode ray unit; B, control unit; C and D, thumb screw and adapting wedges for flat surface; E, receiver socket; F, transmitter socket. Right, (top) below) oscillograms from cylindrical forging: (top) reflection from central bore; (below) reflection also from a flaw

supersonic frequencies. Flaws and defects can be detected 10 ft. from the unit. The magnetic airborne detector, invented during the Second Great War by U.S. scientists as an aerial U-boat detector, was suspended on a cable below an aircraft and free from any magnetic influence from it. Delicate electrical instruments detected any submerged metallic object and transmitted a signal to the receiver in the aircraft. This device was used after the war for locating minerals under the earth.

**Detention Orders.** Powers given to the British executive, in both Great Wars, to detain persons without trial when necessary in the national interests. In the Second Great War, Defence Regulation 18B authorised the Home secretary to detain anybody on reasonable belief that he was of hostile origin or associations or had been recently concerned in acts prejudicial to the public safety; or even if he was a member of certain organizations subject to

a director of the Shell Transport and Trading co. He was knighted 1920, and died Feb. 4, 1939.

**Detergent.** Cleansing agent depending for its effect on surface tension (*q.v.*) and interfacial tension (*q.v.*) in breaking up or altering oils and fats and emulsions of these and water or aqueous liquids. Soaps are detergents consisting of sodium and potassium salts of fatty acids; as fats and oils are required for food, synthetic detergents are made from other sources. These not only avoid the use of fats; they are more efficient and convenient to use, and hundreds are on the market under trade names. Some are mixtures of specially chosen alkaline substances, but at least 500 detergents are esters (*q.v.*) of organic sulphonic acids.

These esters consist of long chains, at one end of which is a group often containing carbon, sulphur, oxygen, sodium, and hydrogen; the remainder has perhaps a dozen groups of  $\text{CH}_2$  or something similar. The group

history, and character of the individual, taken with the circumstances in which he finds himself. (as antithesis is Free Will (q.v.).

**Detinue** (Lat. *detinere*, to hold back). In English law, an action for the wrongful detention of chattels. An order can be made for the delivery of the property to the true owner, and for damages for detention, or for damages alone—being the whole value of the property. The owner must demand the property before he can claim in detinue. *Prom. detty-new*.

**Detmold.** Town of W. Germany, in the *Land* of North Rhine-Westphalia. It stands on the Werre, 48 m. S.W. of Hanover, at the E. edge of the Teutoburger Wald. Until 1918 it was the residence of the princes of Lippe-Detmold, whose palace, a 16th century Renaissance building, is the chief edifice. Near it is the new palace (17th century) in a large park. There are several churches, a natural history museum, schools, etc. The chief industries are cigar making and brewing, while marble and gypsum are worked in the vicinity. Pop. 17,800.

**Detonating Fuse** or **CORDEAU DETONANT** (Lat. *detonare*, to thunder.) Appliance for the instantaneous transmission of detonation to one or more explosive charges, and also for purposes of demolition. By 1879 a detonating fuse was in use in the French army. It was prepared by filling a lead tube with nitro-hydrocellulose in powdered form and then subjecting it to wire-drawing until the diameter was reduced to 4 mm. Its rate of detonation was about 4,000 metres per sec., but it was somewhat sensitive to impact and difficult to manufacture.

An Italian fuse prepared in a similar way used ballistite in place of the nitro-cellulose. Gunpowder is occasionally added to the ballistite. When ignited with a flame this fuse burns at the rate of 4 mins. per metre, but when detonated its velocity is 5,000 metres per sec.

The modern detonating fuse may be said to have had its birth when the French experimented with tin tubes filled with cast picric acid, the diameter being subsequently reduced by wire-drawing. Lead tube could not be used owing to the formation of lead picrate, a highly sensitive compound, and tin tubes were somewhat brittle, and inclined to deteriorate on storage. The rate of detonation was 6,900 metres per sec. At present a detonating

fuse is generally charged with trinitrotoluene or penta-erythritol tetranitrate, the former usually filled into lead tubes and the latter into tubes of woven fabric. A lead tube of 1 in. diameter is charged by drawing the molten explosive into it by means of a vacuum. The tube is then drawn down to either a round or oval section, the diameter being either 4 or 5 mm. The finished product is quite pliable. The initiation of a detonating fuse is effected with a detonator which may be fired with a length of safety fuse or electrically, the velocity of detonation being about 6,000 metres per sec.

The appliance is frequently used to transmit detonation to a distant charge instantaneously, this fuse being simpler to lay and often more reliable than electric connexions in warfare. It can be used to destroy obstacles, as a turn of the fuse round a wooden post or iron stake is sufficient to cut right through it on detonation. Industrially it is used for firing a number of charges simultaneously, and for the detonation of charges in bore holes; it is much more effective with insensitive explosives than an ordinary detonator. In testing high explosives their velocity of detonation is frequently measured with the help of this fuse, which eliminates the necessity of an expensive and delicate chronograph.

**Detonation.** Phenomenon of chemical transformation. Whereas explosives like gunpowder, gun-cotton, cordite, etc., when lit by a flame in the open air, burn quietly and at different rates, others, such as mercury fulminate and lead azide, explode with great violence when ignited. The explosion is accompanied by intense shock (pressure) waves; in a column of explosive the shock wave forms an explosive front which travels through the mass at a velocity from 3,000 to 9,000 metres per second. The temperature in the shock wave may rise to about 10,000° C. This wave is known as a detonation wave and the explosion resulting as a detonation. Explosives which detonate on heating or by a violent blow are known as primary or initiatory explosives. High explosives are usually detonated under the influence of the shock from a primary explosive (detonator). Several experimental methods are used for measuring the velocity of detonation, which is influenced by the physical state, density, and degree of confinement of the explosive. (See Explosives.)

Detonation is also the name given to the "pinking" sound heard during the running of petrol engines in certain conditions. When a spark passes at the plug, combustion is initiated and proceeds outward in an approximately spherical wave. The hot combustion products expand rapidly and compress the remaining mixture until it is raised in temperature to ignition point, when the whole explodes, setting up waves which strike the cylinder walls with great force. These waves may set up pre-ignition by overheating the plug. Detonation is distinguished from pre-ignition in that it takes place *after* the spark has passed. It is accentuated by high compression ratios, and may be reduced by high turbulence and special shaping of the combustion chamber.

**Detonator.** Small charge of a violent explosive suitable for convenient handling and possessing the necessary properties for initiating detonation in other explosives. Fulminate of mercury was solely employed for this purpose until comparatively recent times, but now it is being displaced to some extent by lead azide. Both these sensitive explosives can be detonated by heat or percussion, and communicate detonation to any high explosive. Detonators consist of copper cylinders, closed at one end, into which the composition is pressed, and for commercial use are made of various sizes, in which the weight of the charge varies to suit different explosives, the internal diameter being arranged to accommodate one end of a length of safety fuse.

Modern detonators frequently contain a high explosive such as tetryl or trinitrotoluene in the closed end, and a layer of fulminate above it. Owing to the sensitive nature of the ingredients, detonators are generally filled by machinery operated by a worker from behind a screen. In use, the detonator is embedded in the charge and ignited by a safety fuse to which it is crimped, by the heating of a thin wire embedded in the composition in the case of electric detonators, or by percussion in the case of projectile fuses. With very insensitive explosives the detonator is frequently placed in a small charge of more sensitive material, which is called a primer; this in turn is in contact with the main charge, so initiating the train of detonation.

A generally accepted series of detonators of standard strengths

is numbered 1 to 10, containing the following amounts of a filling composed of 80 p.c. mercury fulminate and 20 p.c. potassium chlorate.

Number	Charge (gm.)
1	0.3
2	0.4
3	0.54
4	0.65
5	0.8
6	1
7	1.5
8	2
9	2.5
10	3

The less sensitive explosives require detonators with the higher numbers. See Fuse.

**Detroit.** River between the U.S.A. and Canada. Issuing from Lake St. Clair, it forms part of the E. boundary of Michigan and the W. of Ontario, and flows S. into Lake Erie. Navigable by the largest vessels, it is 27 m. long and 3 m. wide at greatest. Forming one of the finest harbours on the Great Lakes, it is probably the world's busiest inland waterway. There are many ferries, and beneath it a rly. tunnel from Detroit, Mich., to Windsor, Ont. The name is derived from Fr. *étroit*, narrow.

**Detroit.** Fourth largest city of the U.S.A. It is in Michigan, the co. seat of Wayne co., and extends 26 m. along the N.W. shore of the Detroit river, facing Windsor in Canada, with which it is connected by rly. tunnel under the river. The city is 18 m. above Lake Erie, near the S.W. end of Lake St. Clair. The world's greatest inland waterway in volume of tonnage, the river (v.s.) forms a safe and sheltered harbour. Detroit is 272 m. E. of

Chicago and 690 m. W. of New York, and the terminus of several rlys., e.g. Michigan Central, New York Central, Canadian Pacific.

Although visited by La Salle in 1643 and again in 1670, Detroit was not settled until 1701, by Antoine de la Mothe Cadillac, a French colonial governor, as a trading station in New France. It became British in 1760, afterwards alternately American and British, and finally American in 1813. Receiving its city charter in 1824, it was the state capital until 1847, when the seat of administra-

tion was removed to Lansing. Government is by mayor and council. There are Episcopal, R.C., and Methodist bishops.

World famous as the centre of the U.S. motor industry, the factories of Detroit include those of Cadillac, Chrysler, Ford, and Packard. In 1946 it was estimated that the industry would soon produce 5,000,000 cars annually. A shipbuilding centre, Detroit also makes iron and steel goods, structural and decorative ironwork, foundry and machine shop products, machine tools, and electrical appliances, and trades in flour, grain, and dairy products. It covers 142 sq. m. and was planned and built in concentric semi-circles, with a checker-board development of streets. Notable buildings include those of Ford and General Motors, Penobscot building, U.S. government building, and Henry Ford hospital, one of the finest in the country. Educational institutions include Wayne university, the university of Detroit, the Detroit college of surgery and medicine, the Detroit college of law and Detroit teachers' college. The city possesses a renowned institute of art.

During the Second Great War, Detroit, where America's first all-metal planes were produced, became a centre of the aircraft

Detroit, Michigan. Skyscrapers of the city seen from the Canadian shore of the Detroit river

industry. The plants of Ford, General Motors, and Chrysler were converted for war purposes, and Willow Run and other homes of assembly-line mass production sprang up here. In 1941 the city turned out the majority of the 4,838,561 passenger cars and trucks made in the U.S.A. Pop. 1,625,452.

**Dettingen.** Village of Bavaria, It stands on the Main, 10 m. N.W. of Aschaffenburg, and on the rly. to Frankfort-on-the-Main. The battle fought here in 1743 was the last in which an English king took part.

**Dettingen, BATTLE OF.** Fought June 27 (N.S.), 1743, between the English and Hanoverians on one side and the French on the other. Supporting Austria in the war of the Austrian Succession that began in 1742, an English army, under Lord Stair, advanced on Aschaffenburg-on-the-Main, near which point, but on the other side of the river, a French army had already arrived. Unable to induce the Austrians to combine in engaging the enemy, Lord Stair decided to withdraw to Dettingen, but reached it to find himself anticipated by the French, who had outmarched him along the opposite bank and crossed the river. Battle was now inevitable.

King George II, who had arrived, was in command of the army of 42,000 English, Austrians, and Hanoverians. The French, numbering about 50,000, under the duc de Noailles, held the bridges and were protected by guns from the other side of the Main, and also by the marshy ground in front. Impatient, however, at the allies' delay in opening battle, the French commander abandoned this advantage of position and flung his cavalry against the British infantry. Despite initial successes won over them, the infantry stood firm, and the English king then led his own foot forward and decisively defeated the French, who were routed with a loss of over 3,000, as compared with about half that number on the allies' side. To celebrate this victory Handel composed his *Dettingen Te Deum*.

**Deucalion.** In Greek mythology, son of Prometheus and king of Phthia in Thessaly. When Zeus, shocked at the impiety of mankind, determined to destroy the human race, Deucalion was advised by his father to construct a ship for himself and his wife, Pyrrha. Zeus sent a flood which overwhelmed all living creatures except Deucalion and Pyrrha, whose vessel, after nine days tossing on the flood, stopped on the top of Mount Parnassus. When the waters had subsided, Deucalion consulted an oracle as to how the earth could be repopulated, and he and his wife were bidden to throw the bones of their mother over their shoulders. Taking this to refer to mother earth, they threw stones behind them, which became men and women. By Pyrrha, Deucalion was the father of Hellen, the founder of the Hellenic race who inhabited ancient Greece.

**Deus ex Machina** (Lat., a god from a machine). In Greek drama, gods and goddesses were introduced upon the stage on a cradle or scaffolding lowered from the top by ropes, in order to bring the plot to a dénouement. The intervention of superhuman agency was apt to be too frequently employed, Euripides in particular being regarded as an offender. The expression is currently used to denote anyone who brings unexpected relief from an embarrassing situation.

**Deus Misereatur** (Lat., God be merciful). First words in the Vulgate of the 66th psalm (67th in the English Prayer Book). In 1552 this psalm was appointed to be sung as an alternative canticle to *Nunc Dimittis* (*q.v.*) at evensong, and still may be, unless used among the psalms for the day. It did not appear in the medieval vespers or compline. It is also sometimes used as an alternative to the 128th psalm in the marriage service.

**Deuterium**. The isotope of ordinary hydrogen formed by combination of a neutron and a proton. It is often referred to as heavy hydrogen, for its mass is twice that of the ordinary hydrogen atom; about one in every 5,000 hydrogen atoms is of this variety. The existence of deuterium was discovered by Urey, using a spectrograph, and the earliest method of preparation was by electrolysis of water. The ordinary hydrogen is liberated as a gas and the deuterium is left behind in the liquid. After numerous repetitions of the process, water containing a strong concentration of heavy hydrogen is obtained (heavy water). Deuterium atoms are of great value in "atom smashing," for they provide an "atomic bullet" twice as heavy as an ordinary hydrogen nucleus without an additional nuclear charge. See Nuclear Physics.

**Deuteronomy**. The fifth book of the Pentateuch, or rather Hexateuch. The title, taken from the Septuagint (Deut. 17), means "second Law," and is due to a wrong rendering of Hebrew words which really mean "a copy of this law." The Hebrew title is "Words" or "These are the Words." Deuteronomy contains one of the three chief codes of Hebrew law (Deut. 12-26 in particular). This is preceded by a retrospective and hortatory address by Moses (Deut. 1-11), delivered in the land of Moab, and is followed by an account of the last

days of Moses (Deut. 27-34). In the latter section are incorporated two long poems, the Song of Moses (Deut. 32), and the Blessing of Moses (Deut. 33). Of these the Blessing of Moses is a much earlier composition. See Hexateuch.

**Deutsche Allgemeine Zeitung**. German newspaper. It took this name after the First Great War, having been the Norddeutsche Allgemeine Zeitung. Founded 1861, it was from 1862 Bismarck's organ; during 1920-24 it was owned by the Ruhr industrialist Hugo Stinnes, then by the republican government, then by magnates. Of Liberal National outlook, it was one of the few non-Nazi papers tolerated by Hitler; it did not actively oppose him.

**Deutsche Rundschau**. German monthly magazine, on the pattern of The Contemporary Review, etc. Founded 1874 by Julius Rodenberg, it had Theodor Storm, Count Moltke, Anastasius Grün, Heinrich von Sybel, and other great Germans as contributors. After the First Great War Rudolf Pechel edited it, with contributors such as Thomas Mann and Ivan Bunin. Suppressed by the Nazis, it was one of the first German periodicals resurrected in 1946, again under Pechel.

**Deutschland**. German pocket battleship, later renamed Lützow. Originally the name-ship of the "pocket-battleship" (*q.v.*) class to which the Admiral Scheer and the Admiral Graf Spee belonged, she displaced nearly 15,000 tons; had a complement of 926; six 11-in. and eight 5.9-in. guns, and eight 21 in. torpedo tubes. She seized the U.S. freighter City of Flint (*q.v.*) in Oct., 1939, and sank the British auxiliary cruiser Rawalpindi (*q.v.*) off Iceland in Nov. During the intense naval activity off Norway, she was beached 50 m. W. of Trondhjem on April 25, 1940. In June, 1941, as the Lützow, she was reported damaged by the R.A.F. when trying to escape into the Atlantic. Torpedoed by midget submarines in Alten Fjord, Sept., 1943, she was sunk by the R.A.F. at Swinemünde, April 16, 1945.

**Deutschland über Alles** (Ger., Germany over all). National song in praise of German supremacy. It was written in 1841 by A. H. Hoffmann von Fallersleben and published in 1848 in a collection of German folksongs. It is commonly sung to the tune of the Austrian Hymn to the Emperor, composed by F. J. Haydn, 1797.

**Deutzia**. Flowering shrub. Member of the family Saxifragaceae, it is of oriental origin. In Britain it is a favourite greenhouse plant, bearing masses of white flowers, while *D. scabra* flourishes out-of-doors.

**Deux Sèvres**. Department of France. In the W. of the country, the dept. of Vendée separates it from the sea. It is divided into three regions, the Marais, the Plaine, and the Gatine. On the whole it is flat, although there are hills in the centre. The chief rivers are the Sèvre of Niort, the Sèvre of Nantes—hence the department's name—the Charente, and the Thouet. In the S. the soil is very fertile, elsewhere it is less so. Considerable crops of wheat, oats, and potatoes are grown, and horses and cattle are reared. Beet, flax, vegetables, and fruit are also cultivated. Niort is the capital. The dept. has an area of 2,337 sq. m. Pop. 312,756.

**De Valera**, EAMON (b. 1882). Irish statesman and *taoiseach*.

Born in New York of a Cuban-Spanish father and an Irish mother, he was brought to Ireland at the age of three. He was educated by the Christian Brothers at Charleville (now Rathluire), co. Limerick; at Blackrock College; and at the old Royal University of Ireland, where in 1904 he graduated in mathematical science. For a time he considered becoming a priest, but decided that his vocation lay in schoolmastering. Becoming an Irish language enthusiast, he joined the Gaelic League (*q.v.*), 1908, and married his Irish teacher, Janie O'Flanagan.

He was soon caught up in the rising tide of Irish nationalism, and in 1913 joined the Irish Republican Brotherhood, a powerful secret society under the ban of the R.C. hierarchy. After the insurrection of Easter, 1916—in which his "troops" holding Boland's mill in Dublin were the last rebels to surrender—he was sentenced to death by a British military court, the sentence being commuted to one of penal servitude for life. Imprisoned in Dartmoor and elsewhere in England, he was released in 1917 on being chosen Sinn Féin candidate for E. Clare; and although almost entirely unknown to the public, he

Eamon De Valera,  
Premier of Eire,  
1932-48

was elected president of the Volunteers and of Sinn Féin.

Arrested next year and removed to Lincoln gaol, he made with two companions a sensational escape; returned in secret to Dublin; was elected president of Dáil Éireann (*q.v.*), the illegal Irish parliament; formed a "ministry" which included Arthur Griffith (*q.v.*) and Michael Collins (*q.v.*); and escaped to the U.S.A., where for 18 months he collected funds and vainly tried to obtain official recognition for the Irish republic.

In 1921, at the election after the Government of Ireland Act had parted six of the Ulster counties from the rest of the country, he was elected Republican representative to Westminster for both S. Down and E. Clare, but did not take either seat. Despite the signing in London on Dec. 6 of the Anglo-Irish Treaty, De Valera, who did not attend the final negotiations, refused to recommend the Treaty to the Dáil which, nevertheless, on Jan. 7, 1922, approved it by 64 votes to 57. Civil war soon broke out, was quelled by the firing squad, and under the leadership of W. T. Cosgrave (*q.v.*) the Irish Free State government settled down to constructive tasks.

In 1926, on being repudiated by the I.R.A. and Sinn Féin, De Valera formed a new party, Fianna Fáil, and the following year, taking the oath of allegiance to the British crown as required of all deputies by the treaty, entered the Dáil at the head of a party holding 44 seats as against Cosgrave's 46. When in 1932 Fianna Fáil came to power, De Valera realized his ambition to abolish the oath. In 1937 he dispensed with the governor-generalship, reconstructed the senate, and introduced a new constitution (in which the name Éire appears for the first time to designate the 26 Southern Irish counties), establishing a two-chamber parliament consisting of Dáil and senate, with a president and *taoiseach*.

He was president of the League of Nations council in 1932 and of the assembly in 1938. During the Second Great War—when both Allied and Axis diplomats continued to function in Dublin—he pursued a much-criticised policy of neutrality. His party was returned with an absolute majority in the Dáil in 1944; but though still the strongest after the 1948 elections was in a minority. De Valera, having set his face against coalition, was voted out of office Feb. 18.

H. L. MORROW

**De Valois, NINETTE** (b. 1898). Anglo-Irish choreographer. Born at Blessington, co. Wicklow. June 6, 1898, her real name being Edris Stannus, she was a pupil of Cecchetti (*q.v.*) and danced in the Lyceum pantomime of 1914, appearing annually at that theatre until 1919. A member of the Diaghilev company 1923–26, she then became choreographic director to the Old Vic productions of opera and ballet, 1926–30. With the establishment of a permanent ballet school at Sadler's Wells, 1931, she achieved a unique position as director of contemporary English ballet. Her chief choreographic works include *The Gods Go A-Begging*, *Job*, *The Rake's Progress*, *Checkmate*, *Promenade*. She published *Invitation to the Ballet*, 1937. In 1947 she was created C.B.E.

**Devaluation.** Term formerly used for the lowering of the amount of gold in the standard coin of a country, resulting in a decrease of its purchasing power abroad. It has, since the issue of gold coins virtually ceased, come to mean the lowering of the credit value of the currency of one country in terms of the currency of another, e.g. of the £ in terms of the \$, 1949.

**Devanagari** (town-writing of the gods). Name given to the form of the Indian alphabet usually employed in writing Sanskrit. It consists of 50 letters, 36 consonants and 14 vowels, and there are numerous combinations of signs. It is of Semitic origin and acquired predominance in India in the 11th century A.D. It was officially adopted by the Indian govt. as the script for Hindi in 1949.

**Developer.** Substance used in photography for rendering visible the latent image formed by the action of light on the sensitised plate or paper. Most chemicals used for this purpose are hydrocarbon derivatives, and a complete developing solution commonly contains, together with the reagent, sodium carbonate as an accelerator, a bromide as a preservative. See *Hydrokinone*: *Metol*; consult also *Developing*, C. I. Jacobson, rev. ed. 1944.

**Development Area.** Name applied after the Second Great War to any region of Great Britain formerly known as a Special Area or a Depressed Area (*q.v.*).

**Development Commission.** Body established by the Development and Road Improvement Funds Acts of 1909 and 1910. It normally consists of eight commissioners (appointed by royal

warrant) of whom the vice-chairman is paid. The Act of 1909, as affected by subsequent legislation, empowers the Treasury, on recommendation of the development commissioners, to make advances by grant or loan to govt. depts., public authorities, universities, colleges, schools, institutions, or associations not trading for profit, for the following purposes in Great Britain: agriculture and rural industries, reclamation and drainage of land, construction and improvement of fishery harbours, improvement of fisheries. The commissioners derive their funds from an annual sum voted by parliament. The offices are at 6a, Dean's Yard, London, S.W.1.

**Development Council.** See N.V.

**Devenish.** Island in the lower Lough Erne, N. Ireland, famous for its remains. It is 2 m. from Enniskillen. The remains include a fine round tower, a cross in good condition, and the ruins of an abbey and of the church of S. Molaise. The whole is preserved by a public authority.

**Deventer.** Town of Holland, in the prov. of Overijssel. It stands at the junction of the Yssel and the Schipbeek, 66 m. E.S.E. of Amsterdam. An old place, it has the Gothic Groote Kerk, with its 11th century crypt, the Berg Kerk of the early 13th century, and the town hall. The weigh house, a 16th century edifice, is used as a school, and there are some fine old private houses. The Brink is a fine square, and a 17th century Renaissance building is now the police headquarters. The town library has some valuable manuscripts, and until 1876 Deventer had a famous school, its Athenaeum. The chief industries are the making of a kind of gingerbread, called Deventer Koek, the manufacture of carpets, and iron founding. It also has a trade in agricultural produce. Tramways connect it with Zutphen. Deventer belonged to the bishopric of Utrecht before passing about 1600 to the Netherlands. Here Groot, the founder of the Brothers of the Common Life (*q.v.*), was born and Erasmus was educated. On April 11, 1945, the Canadian 3rd division captured Deventer from the Germans, who had destroyed the road and rly bridges over the Yssel. Pop 40,309.

**Devers, JACOB LOUCKS** (b. 1887). American soldier. Educated at West Point military academy, and commissioned in the field artillery 1909, Devers was an artillery

instructor at Fort Sill, Oklahoma, during the First Great War, and later an instructor at the military academy. He was sent to the Panama zone in 1939 in charge of mechanisation of the defences. Promoted lieutenant-general in 1942, he was commander of the U.S. forces in the European theatre of operations in May, 1943, and deputy commander in the Mediterranean in Dec. He led the Allied landings in S. France on Aug. 15, 1944, and in Sept. was given command of the 6th army group. Devers was promoted general March 13, 1945; on May 5 received the surrender of the German 1st and 19th armies; and on Aug. 4 became commanding general U.S. army ground forces.

**DEVI OR MAHADEVI.** Hindu goddess, wife of Siva. She is sometimes represented as a beautiful woman riding on a tiger, sometimes as black-skinned, with a terrible and hideous countenance, streaming with blood, encircled with snakes, hung round with skulls and human heads. Human sacrifices were offered and orgiastic rites performed in her honour.

**Deviation** (Lat. *de*, from: *via*, way). In navigation, effect of the ship's metal hull and machinery on the mariner's compass. If the structure of the hull did not affect the compass, the needle would point to the magnetic pole; actually the attraction of the hull diverts the needle from true position. To overcome this, the compass is placed well above the main deck, with magnets and soft iron around it. A table then gives the deviation for various positions of the ship's head.

**Device** (late Lat. *divisa*, division, drawing). Heraldic term for a motto with its pictorial or emblematic design. Unlike a crest, the device is personal and need have no connexion with the armorial bearings of its user. It is not borne upon the shield or crest and has no heraldic value. The term is frequently misapplied, however, to a crest or charge.

**Devil** (Gr. *diabolos*, accuser, slanderer). Name given generally to evil spirits, but more particularly to Satan, the Hebraic prince or chief of the powers of darkness.

Among the Jews, the idea of a personal enemy outside the human race appears to have arisen very early. The story of the Creation in the opening chapters of Genesis is free from the traditions of a conflict between good and evil which are to be found in other early cosmogonies; but the idea

appears in the story of the first human beings in the Garden of Eden. Here the evil spirit assumes the form of a serpent inviting Eve to disobey the divine command. This association of the serpent with the powers of evil had been general among primitive races, and is probably due to the dread inspired by the silent movements and deadly attacks of the reptile.

After the Eden story, there is no clear reference to a personal devil until the post-exilic period, the allusions to evil or lying spirits indicating rather a state of mind or temporary tendency than anything personal and exterior to the individuals concerned. But after the Exile Jewish writers concentrate the hostile influence in a great personality whom they call Satan, or the adversary. He is described as opposing God and yet as in some degree subservient to him. Thus in the Book of Job he is represented as asking the divine permission to test the genuineness of the patriarch's religion. This view is probably due to influence of Persian thought upon the Hebrew exiles. The Parsee, or ancient Persian religion, taught that the universe was created by two rival powers, Ormuzd and Ahriman, or light and darkness, the latter being inferior but not subordinate to the former.

#### Fallen Angel Theory

The Jewish and Early Christian tradition of the origin of Satan is that he was originally one of the angels, and became the leader of a party which revolted against God's supremacy. He and his party were then attacked by Michael and the other angels and defeated.

After being cast out of Heaven Satan is represented as not merely the opponent of God but as the malignant enemy of man. He acts chiefly by tempting man to indulge his natural and evil propensities in defiance of the known will of God. In N.T. times he was believed to have power over the bodies of those who abandoned themselves to evil. There are many records of persons possessed by devils and thereby made lunatic or diseased (see Demonology: Demonic Possession).

The various names given to the devil in Holy Scripture are significant of the various conceptions of his attitude and power at different epochs. He is most generally styled Satan or the adversary, and the devil or the slanderer. The Hebrew name Abaddon, perdition, becomes in the N.T. Greek Apollyon, the destroyer. Beelzebub, the Lord of Flies, was an adaptation of the

name of a Philistine deity: but it is doubtful if Belial, worthlessness, was used in a personal sense by the O. T. writers. The name Dragon is applied to the devil eight times in the book of Revelation and is probably a development of the older idea of the serpent. The name Lucifer is often applied to Satan; but it occurs in only one place in the Bible (Is. 14, v. 12) and obviously refers to the king of Babylon.

While rationalism rejects entirely the belief in a personal devil, the widest and most varied beliefs on the subject prevail in the Anglican and Nonconformist Churches. The R.C. Church teaches officially that a malignant intelligent being called the devil was, with other spirits, originally created good by God, but became evil by its own acts; that the devil subsequently tempted man to evil, and that man fell; and that the devil continues to tempt mankind to evil, and must be resisted.

**Devil's Advocate** (Lat. *advocatus diaboli*). Name given in the Roman Catholic Church to the person appointed to bring forward all the objections that can be stated to the proposed canonisation of a saint. His official title is *promotor fidei* (promoter of the faith), and the office was created in the 16th century. The term has come to be applied to anyone arguing, though not necessarily believing, the worst that can be alleged against a person or cause.

**Devil's Beef Tub.** Name of a deep hollow in Dumfriesshire, Scotland. In hilly country, about 5 m. N. of Moffat, it is also known as the Marquess of Annandale's Beef Stand. Scott made it the scene of an exciting escape in *Redgauntlet*.

**Devil's Bridge.** Hamlet of Cardiganshire, Wales. It is 11½ m. by rly. E.S.E. of Aberystwyth. It derives its name from a double bridge spanning the Mynach: the lower bridge was erected by the monks of Strata Florida Abbey in the 11th century, the upper in 1753. There is also a modern iron bridge. Waterfalls are seen on all sides of the river gorge.

**Devil's Bridge.** Famous bridge in Switzerland. It is in the canton of Uri, on the route from the Reuss valley to Airolo, Italy, via the St. Gotthard pass. It crosses the Reuss between Goschenen and Andermatt at an alt. of 4,593 ft. The new bridge, built of granite, in 1830, has a single arch, 100 ft. above the stream. The old bridge, 20 ft. below, destroyed by the torrent in 1888, was the scene of the defeat

Devil's Bridge in the St. Gotthard Pass where the road crosses the torrent of the Reuss

of the French by the Austrians and Russians in 1799. A monument commemorates the event.

**Devil's Causeway.** Folk-name for a Roman road in Northumberland, England. Stone-paved, 22 ft. broad, it ran from Bewclay, on the road misnamed Watling Street,  $1\frac{1}{2}$  m. N. of Hadrian's Wall, for 50 m. or 60 m. through Hartburn, Long Framlington, and Lowick to Berwick. A road from High Rochester, the ancient Bremenium, joined the Causeway at Thruxton.

**Devil's Coach Horse** (*Staphylinus olens*). Popular name for a rove beetle of the family Staphylinidae, common about paths and gardens in most of Great Britain. It is about an inch long, dull black, with short wing-cases. When alarmed it curves its abdomen over its back in a threatening manner, usually emitting a fetid odour from glands at its hind end. Beetle and larva prey upon insects.

**Devil's Disciple, THE.** Burlesque melodrama by Bernard Shaw. The scene is laid in New England during the American War of Independence, and the play traces the exploits of Dick Dudgeon, a dare-devil young unbeliever who is moved to noble action in spite of his professions. First produced at the Kennington Theatre, Sept. 26, 1899, it has often been revived.

**Devil's Dyke.** Name of several prehistoric entrenchments and natural formations in Great Britain. The best known, 5 m. N.W. of Brighton, Sussex, is an early British hill-fort whose name has been transferred by recent usage to a naturalcombe close by. An area

of 190 acres was purchased by the town of Brighton, 1928. One in Cambridgeshire, 7 m. long, from Reach to Wood Ditton (Dyke-town), also called Devil's Ditch, crosses Newmarket racecourse and the Icknield Way. There are three in Norfolk, and one near Andover, Hants. The Deil's Dyke, 50 m. long, from Loch Ryan, Wigtownshire, to Solway Firth, was a rampart against the Galloway Picts. See Grim's Dyke.

**Devil's Island** (Fr. *Île du Diable*). One of three isls. called Îles de Salut (isles of health), belonging to the French department of Guiana, South America, and lying 27 m. N.W. of Cayenne. It was a notorious settlement for French convicts, Alfred Dreyfus having been among the celebrated prisoners there. Transportation to Devil's Island ceased in 1946.

**Devil's Parliament.** Name sometimes given to the parliament of 1459. Assembled at Coventry by Henry VI, its chief work was the attainting of the duke of York and his chief followers.

**Devil's Punch Bowl.** Popular name of Highcomb Bottom, a wooded glen near Hindhead, Surrey, England. It is described in Baring-Gould's novel, *The Broom Squire*. A stone at the summit commemorates the murder of a sailor in 1786. The name is also given to a dark lough near the summit of Mangerton, co. Kerry, Eire.

**Devil's Sonata.** Name given to a sonata for violin written by Giuseppe Tartini (1692-1770). He declared that he wrote

this sonata after waking from a dream in which the devil had played it to him. It is also known as *Il Trillo del Diavolo*, *The Devil's Trill*.

**Devis, ARTHUR WILLIAM** (1763-1822). British painter. Born in London, Aug. 10, 1763, he studied at the R.A. schools. Appointed draughtsman to the East India Company, he travelled extensively in China and India. On his return to England, 1795, he painted a number of historical pictures, many of them popular through engravings. His *Death of Nelson*, in the Painted Hall at Greenwich, was executed from studies made on board the *Victory* after Trafalgar. Devis died Feb. 11, 1822.

**Devise** (late Lat. *divisio*, division). Term used in English law for a gift of land by will. See *Inheritance*; *Will*.

**Devitrification** (Lat. *de*, from, away; *vitrum*, glass). Change which takes place when glass is improperly cooled after manufac-

Devil's Punch Bowl. View from Gibbet Hill of the top of the Devil's Punch Bowl, where it is skirted by the Portsmouth road

ture. The glass becomes white like porcelain owing to the formation of crystalline matter in place of amorphous glass. Devitrified glass can be restored to the transparent condition by reheating and normal cooling. In geology, devitrification is a change in the structure of glassy volcanic rocks which has resulted from the development of minute granules, filaments, crystallites, and other rudimentary crystalline forms. It is accom-

panied by an increase of density of the rock, as is well seen in such types as obsidian and tachylite. See *Rock*.

**Devizes.** Mun. bor. and market town of Wiltshire. It stands on the Kennet and Avon canal, 86 m. W. of London by railway. It is an agricultural centre,

Devil's Coach Horse, popular name for the cocktail beetle

Devil's Dyke. Natural amphitheatre, amid the Downs, five miles N.W. of Brighton, Sussex

having an important corn market. Agricultural implements are made; bacon, brewing, snuff, and tobacco

Devizes arms

provide other industries. For about four centuries before 1750 it was a centre of cloth manufacture. The chief building is the church of S. John, a beautiful cruciform building, with fine Norman chancel-arch and a massive tower. There are a market cross, presented by Henry Addington (Viscount Sidmouth) when M.P., some old wooden houses, and the museum of the Wiltshire archaeological society, which contains prehistoric objects from barrows in the county.

Devizes is supposed to mean on the borders (Lat. *ad divisas*), and it originated when Osmund, bishop of Salisbury, built a castle here about 1082. Bishop Roger in 1132 replaced it by a stone one which Leland says was the strongest castle in Europe. This was destroyed by Cromwell. Devizes became a chartered town in the 12th century, and from 1295 to 1867 sent two members to parliament. It is governed by a mayor and council, and gives its name to a co. division returning one M.P. Market day, Thurs. Pop. 6,381.

**Devlin**, JOSEPH (1872-1934). Irish politician. He was born in Belfast, where he was educated. He was Nationalist M.P. for Kilkenny, 1902-06, and for W. Belfast, 1906-22. As general secretary of the United Irish League and president of the Ancient Order of Hibernians, he was a force among Irish Nationalists. He sat in the parliament of N. Ireland for co. Antrim, W. Belfast, 1929, and Central Belfast, 1933. He died Jan. 18, 1934.

**Devolution** (Lat. *devolvere*, to roll down). Act of handing over something to another person. In politics it is used for a particular kind of home rule, federal devolution, as it is called. In 1904 a scheme of devolution for Ireland was discussed without result.

The word was much to the fore in British politics immediately after the First Great War, when a demand was put forward for federal devolution, i.e. separate legislatures for England, Scotland, and Wales. Two schemes were discussed at a parliamentary conference, 1919, but no action taken.

The word is also used for the descent of kingdoms or property

which devolve by law upon some person. The war between France and the Dutch republic in 1667-68 is known as the War of Devolution, because it arose out of a dispute as to how certain lands devolved.

**Devon** or **DEVONSHIRE**. South-western maritime co. of England. It lies between the Bristol and the English Channels, its area being 2,611½ sq. m. It is third only to Yorkshire and Lincolnshire in size among the counties of England. It contains an extensive moorland in Dartmoor, and also fertile regions with a climate

ure, such as Seaton, Sidmouth, Exmouth, Teignmouth, Torquay, Paignton, in the S., and Lynmouth, Ilfracombe, Westward Ho!, Clovelly, in the N. From Hartland Point fine coastal views are obtained. The county includes Lundy Island.

The chief rivers of Devon are the Tamar, on the Cornish boundary, the Exe, Teign, Dart, and Tavy, all flowing through lovely valleys, and the Taw and Torridge, falling into the Bristol Channel. Most of them rise on Dartmoor, whereon are the highest points in the county (High Will-

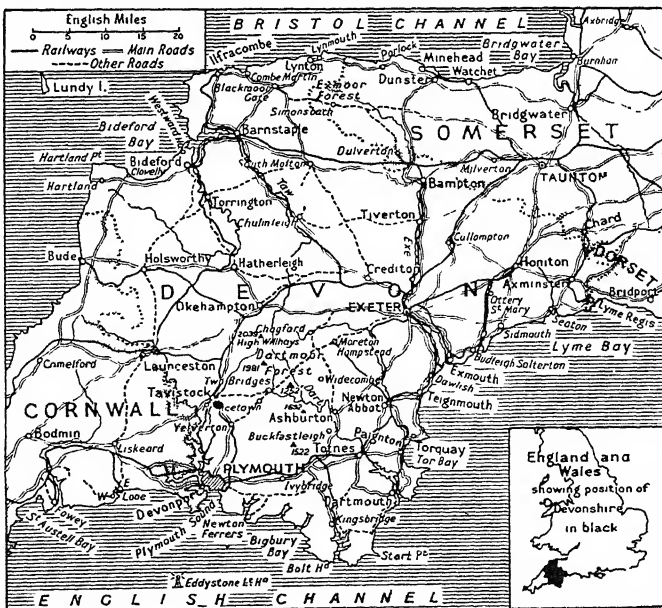

hays, 2,039 ft.). Red earth is characteristic of the S. part of the co. The county is mainly pastoral, but minerals are found, including tin, copper, iron, granite, and china clay. A number of the inhabitants are fishermen, engaged especially in catching pilchards, herrings, and mackerel. The county cider, cream, and

Devizes. Market place in this busy agricultural centre of Wiltshire

remarkably mild and a vegetation unusually rich. Most of the county is hilly and the coast-line is irregular. It is dotted with places visited for health and pleas-

cattle are celebrated. Chief towns are Exeter, the co. town; Plymouth, which includes Devonport, the largest; Torquay, Barnstaple, Tiverton, and Bideford. At Credi-

Devon. Map of the West of England county whose cider, cream, and cattle are known the world over

ton was born in 680 S. Boniface, apostle of Germany. The pleasant market town of Okehampton lies under the N.W. edge of Dartmoor. Devon, which is served by two rlys., sends six members to parliament, in addition to one for Exeter, one for Torquay, and two for Plymouth, and is in the diocese of Exeter. Pop. 732,968.

Before the Norman conquest Devon was part of Wessex, and its inhabitants then were a mixture of Saxons and Celts. Norman lords built castles in the county and its S. coast was frequently attacked by the French. Devon men soon won a reputation for seamanship, but the great time in the county's history came with the discovery of the American continent and the commercial rivalry with Spain. Many of the great English adventurers—Raleigh, Gilbert, Hawkins, Drake—were Devon men.

**LITERARY ASSOCIATIONS.** William Browne of Tavistock (d. c. 1643) wrote his *Lidford Journey*. Herick was rector at Dean Prior 1629-47 and 1662-74. Charles Kingsley, born at Holne, set many scenes of *Westward Ho!* in and about Bideford, and Blackmore's *Lorna Doone* country of Exmoor passes into Devon at Tiverton. The Wessex of Hardy's novels extends from Dorset into Devon. S. Baring-Gould wrote about the county in many of his stories, Eden Phillpotts made Dartmoor the scene of a series of novels, and John Trevena used the same background. The *Victoria History* of the co. appeared in 1906. See *Dartmoor*.

**Devon.** River of Scotland. It rises in the Ochil Hills and traverses parts of four counties—Perth, Kinross, Clackmannan, and Stirling—before entering the Forth at Cambus. There is a fine waterfall in the vicinity of the village of Crook of Devon.

**Devon, or North Devon.** An island of the N. American archipelago. Part of the N.W. Territories of Canada, it is N. of Baffin Island, S. of Ellesmere Island, and E. of Bathurst and Cornwallis Islands. Its N.W. extremity is called Grinnel Land. There is a harbour at Dundas, but permanent ice occurs in places.

**Devonian.** Rock system of the Palaeozoic era, intermediate between the Silurian and Carboniferous systems. In S.W. England the beds were deposited under marine conditions, but in Wales, central England, Scotland, and Ireland they were laid down in a series of large lakes. The marine

Devonian of Devon and Cornwall consists of mudstones, shales, slates at Delabole, grits, and sandstones, with limestones (Devonshire marble) in the Torquay and Plymouth areas. With these are associated pillow lavas and tuffs. The deposits are of shallow-water types to the N. and deeper sea types to the S.

The lake deposits of Devonian age are referred to as the Old Red Sandstone (O.R.S.) facies. Many beds represent areas of torrential deposition; they are coarse conglomerates and sedimentary breccias. A reddish brown colour due to iron oxide staining is characteristic. The O.R.S. is famous for its fossil fish remains. Land plants also made their first important appearance. In N. England and in Scotland there was much volcanic activity. In the Cheviots lavas and ashes followed by the intrusion of a granite and dykes are to be found. In the midland valley of Scotland volcanic rocks of various types pierced by ancient (now denuded) vents occur. The Lorne district of Argyll contains

Devonport. Royal Naval Barracks, which accommodate over 2,000 officers and men

Valentine

lava flows, tuffs, and agglomerates. Masses of granite were emplaced about the same time at Glencoe, Ben Cruachan, Rannoch Moor, Ben Nevis, Peterhead, Aberdeen, etc. In the southern uplands are the granites of Loch Doon, Dalbeattie, etc. In the Lake District the Shap, Skiddaw, and Eskdale granites are of this period. Many intrusions of more basic rock (gabbro, etc.) also occur.

Deposits of marine Devonian are better developed in Belgium and Germany than in England. They continue E. into Russia, where they are locally (near Tikhvin) poorly consolidated blue clays, the upper surface of which has been converted to bauxite. Deposits of O.R.S. type are also present. In E. Greenland, O.R.S. beds are important. Marine and deltaic deposits of this age occur in eastern U.S.A., where remains

of tree-fern forests have been found in the sandstones. Elsewhere in America the Devonian strata are mainly marine; in places they contain oil.

**Gilbert Wilson, M.Sc., Ph.D.**

**Devonport.** Former co., mun., and parl. bor. of Devon, England, now a part of Plymouth (*q.v.*). A fortified seaport and naval station on the Tamar estuary, 224 m. S.W. of London, on two railways, it was known as Plymouth Dock until 1824. It was one of the "three towns" (Stonehouse and Plymouth being the other two) amalgamated Nov. 9, 1914. R. F. Scott, the Arctic explorer, was a native. Devonport has its own M.P. Market days, Tues., Thurs., Sat. Pop. 84,690.

Devonport is the seat of naval and military governors; the official residence of the port admiral and lieutenant-governor are at Mount Wise. The government establishments which line the Hamoaze or Tamar estuary, 4 m. long, include barracks, naval and military hospital, naval barracks, dockyard, and gun wharf. The

dockyard at Keyham, an extension first developed in 1844, was established in 1691. There are four docks, from 660 ft. to 745 ft. long and 95 ft. wide, and seven smaller ones, the accommodation for large ships being much superior to that at Portsmouth. The Royal Naval Engineering College is also at Keyham. Famous vessels built here in-

clude the *Royal Sovereign* (1786); the battleships *Ocean* (1898), *Bulwark* (1899), and *King Edward VII* (1903), and the battle cruisers *Indefatigable* (1909) and *Lion* (1910).

In the Second Great War, an aircraft carrier, a cruiser, six submarines, and two floating docks were built at Devonport dockyard, where also over 200 destroyers damaged in the battle of the Atlantic (*q.v.*) were repaired. The dockyard played a major part in the naval preparations for the invasion of the Continent in June, 1944. It suffered extensive damage from air raids, but the repair organization made it 90 p.c. efficient within two months of the last and heaviest attack.

**Devonport.** Suburb of Auckland, N. Island, New Zealand. It stands on the N. shore of Waitemata harbour, communicating by

ferry with Auckland, 2 m. distant, and is mainly a residential district. Callopie dock, now the property of the British Admiralty, is a naval arsenal. Pop. 9,900.

**Devonport, EAST AND WEST.** Town of Tasmania, on the N. coast. It stands at the mouth of the Mersey river, 80 m. N.W. of Launceston, and was formerly known as Formby and Torquay. It has a steamer service to Melbourne and rly. to Launceston and Hobart. Pop. 5,151.

**Devonport, HUDSON EWBANK KEARLEY, 1ST VISCOUNT (1856-1934).** A British politician. Born Sept. 1, 1856,

he was educated at Craleigh. He entered business and became the head of the firm of Kearley and Tonge, provision merchants. During 1892-1910 he was Liberal

Viscount Devonport, British politician Russell

M.P. for Devonport. In 1905 he was made parliamentary secretary to the Board of Trade, resigning in 1909 to become first chairman of the new Port of London Authority, from which post he retired in 1925. He was created a baronet 1908, baron 1910, and viscount 1917. During the First Great War he was Food Controller 1916-17. He died Sept. 5, 1934, and was succeeded by his son, Gerald Chester Kearley (b. 1890).

**Devonshire.** Name of a British breed of cattle. In colour deep red, sometimes flecked with white, the Devon, though not among the largest, is one of the most beautiful and economical breeds. The actual origin of the breed is not known, but it is certain that it owes its perfection largely to the Quartlys of Molland, in N. Devon, who, from 1700 to about 1850, were constantly improving it.

Devon cattle are as profitable a beef-producing breed as any in England, their beef being of prime quality and the bone small. As dairy cattle they are noted for quality; their milk produces the world-famous clotted cream and the best butter. See Cattle illus.

**Devonshire, EARL AND DUKE OF.** English titles borne by the family of Cavendish, the earldom since 1618 and the dukedom since 1694. It must be distinguished from the older earldom of Devon borne by the family of Courtenay. From 1603 to 1606, Charles Blount, Lord Mountjoy, who suppressed

Tyrone's rebellion in Ireland, was earl of Devonshire.

William, Baron Cavendish, created an earl in 1618, was a son of Sir William Cavendish and the famous Elizabeth—Bess of Hardwick. William Cavendish, 4th earl, was made marquess of Hartington and 1st duke of Devonshire (v.i.) in 1694. His grandson, the 3rd duke, was lord-lieutenant of Ireland in 1737-44. The 4th duke, William Cavendish (1720-64), was made prime minister in 1756-57, because his nominal leadership enabled Pitt and Newcastle to work together. The 5th duke (1748-1811) married Georgiana Spencer, whose beauty has been immortalised by Gainsborough and Reynolds.

Succession in the direct line was broken in 1838 when the 6th duke died unmarried. He was succeeded by a cousin, William Cavendish, earl of Burlington, whose long life (1808-91) was largely devoted to furthering the application of science to industry. The 8th duke, separately noticed below, was his son, the Liberal statesman better known as Lord Hartington.

His nephew, Victor Christian Cavendish (1868-1938), was born May 31, 1868, and educated at Eton and Trinity College, Cambridge. Succeeding to the title in 1908, he was governor-general of Canada, 1916-21, and colonial secretary in 1922. A principal guarantor of the British Empire Exhibition, 1924, he had to bring his public career to an end through ill health. He died May 6, 1938.

His son, Edward William Spencer Cavendish (b. 1895), succeeded as 10th duke. Born May 6, 1895, he was educated at Eton and Trinity College, Cambridge. He was under-secretary for the Dominions 1936-40, for India and Burma 1940-42, and secretary for the Colonies 1943-45. In 1947 he became grand master of English freemasonry.

The ducal states in Derbyshire, with Chatsworth and Hardwick Hall, came from Bess of Hardwick. Lismore Castle and the Irish estates came through the marriage of the 4th duke with the heiress of Richard Boyle, earl of Burlington and Cork. The valuable estates in Furness, which include the ground on which Barrow stands, came with the earldom of Burlington. The duke owns much of Eastbourne, and Bolton Abbey, Yorks. An eldest son is known as the marquess of Hartington.

**Devonshire, WILLIAM CAVENDISH, 1ST DUKE OF (1640-1707).** British statesman. Born Jan. 25,

1640, he became a courtier at the Restoration, afterwards passing some time in travel. For a period

he was in the navy and saw active service against the Dutch. In 1661 he entered the house of commons, and from 1675 was hostile to the policy of Charles II, and a bitter opponent of the Roman Catholics and the court party. He succeeded to the earldom in 1684, and in 1687 was one of the seven Whig peers who invited William of Orange to England. By raising the standard of rebellion at Derby on William's landing, he substantially assisted the transfer of the crown, and henceforth under William and under Anne he was one of the leading men of the realm. In 1694 he was made a duke, and died Aug. 18, 1707. A man of varied parts, a scholar and a critic of poetry and the fine arts, Devonshire was responsible for the building of Chatsworth. In politics consistently Whig and the champion of Protestantism, he was remarkable for his impartiality. His personal courage was considerable and involved him in several duels.

**Devonshire, SPENCER COMPTON CAVENDISH, 8TH DUKE OF (1833-1908).** British statesman. Born on July 23, 1833, he was the eldest son of the 7th duke. Educated privately and at Trinity College, Cambridge, he entered the house of commons as Liberal M.P. for N. Lancashire in 1857, and, as the marquess of Hartington, sat there until 1891. From 1885 he represented the Rossendale division of Lancashire.

Devonshire  
Bassano

As a representative of the Whig aristocracy, Lord Hartington became a lord of the admiralty in 1863, was soon made under-secretary for war, and in 1866 entered the Cabinet as secretary. In 1868 he became postmaster-general, and in 1871 secretary for Ireland. In 1875, when Gladstone retired, he acted as leader of the Liberals in the house of commons, until Gladstone's return in 1880. His supe

William, 1st Duke of Devonshire after Riley

session, however, did not prevent him from serving under Gladstone, and from 1880 to 1885 as secretary for India, and then for war, he was one of the Liberal leader's chief lieutenants. He did not share the eagerness for reform of some of his colleagues, notably Chamberlain, but in 1886, when Gladstone turned to home rule, these two stood out as the chief dissentients from that policy. Under their guidance the Liberal Unionist party was formed, and the opposition of Hartington to home rule was not the least cause of its defeat.

In 1886 Hartington declined to become prime minister, Lord Salisbury offering to serve under him, but he gave steady support to the Conservative ministry of 1886-92. In 1895, having been duke of Devonshire since 1891, he took office as lord president of the council under Lord Salisbury, and that post he held until 1903. Then came another landmark in his career, his opposition to Chamberlain's scheme of tariff reform, and he resigned office. He died at Cannes, March 24, 1908. Without a vestige of enthusiasm, the duke yet had a sane belief in liberal principles and a high sense of public duty. His great position and his love of racing tended to make office irksome to him. Late in life he married the widow of the 7th duke of Manchester. Having no children he was succeeded by his nephew, Victor Cavendish. *Consult* Lives, H. Leach, 1904; R. Holland, 1911.

**Devonshire**, GEORGIANA CAVENDISH, DUCHESS OF (1757-1806). English beauty and society leader. The eldest daughter of the first Earl Spencer, she was born June 9, 1757, and married the 5th duke of Devonshire in 1774. Her accomplishments were as remarkable as her beauty. She received Dr. John-

son at Chatsworth, wrote verses, and was the friend of the prince of Wales, Fox, and Sheridan. At the Westminster election of 1784 she canvassed for Fox, and is said to have bartered kisses for promises of votes. She died March 30, 1806, and was buried in All Saints' Church, Derby. Her portrait was painted by Gainsborough, Reynolds, and Angelica Kauffmann. *Consult* The Face Without a Crown, I. Leveson-Gower, 1944.

**Devonshire Club**. A London social club, founded in 1875 as a resort for the Liberals. It is no longer primarily a political club. The house at 50, St. James's Street was formerly known as Crockford's. It was built in 1827 and has richly decorated rooms and some memorials of Crockford's.

**Devonshire House**. A former historic mansion in Piccadilly, London, between Stratton and

Devonshire House, Piccadilly, London, demolished in 1926

Berkeley Streets. The town residence of seven dukes of Devonshire, it was famous during Georgian and Regency times as a centre of fashion and Whig politics. The site was originally occupied by Hay Hill Farm. Berkeley House, built here in 1665 by Lord Berkeley of Stratton, was purchased by the first duke of Devonshire in 1697. Destroyed by fire in 1733, the mansion was rebuilt by William Kent. In 1919 it was sold to a firm of London contract-

ors for more than £1,000,000, the 9th duke reserving the antiquities, Adam mantelpieces, etc.. The iron entrance gates, designed by Inigo Jones and formerly at Chiswick, were taken down and incorporated in the boundary railings of Green Park, opposite, in 1921. The mansion was demolished and a block of offices, flats, and shops built on the site

in 1926. During 1947-49 the lease of the site was held by the J. Arthur Rank (g.v.) organization.

**Devonshire Regiment**. English regiment, originally the 11th foot, raised by the duke of Beau-

Devonshire Regiment badge

fort in 1685 to counter the rebellion following the duke of Monmouth's landing in Dorset. The regiment fought in Marlborough's campaigns, suffered heavily at Almansa (1707), and gained distinction at Dettingen (1743) and Fontenoy (1745). It served throughout the Peninsular War; at Salamanca (1812) it came out of action with only four officers and 67 men. The regiment took part in the Boer War and won a V.C. at Wagon Hill, 1900. The Devonshires raised extra battalions in the First Great War and were represented at Neuve Chapelle, Loos, the Somme, the Aisne.

During the Second Great War, the Devonshire Regiment served in Malta, North Africa, and Italy. Units were converted to anti-tank regiments, R.A., and from June, 1944, fought through France, Belgium, the Netherlands, and Germany. One infantry bn. served throughout the Burma campaign; another became an airborne bn. of the 6th airborne div. The motto of the Devonshire Regiment is *Semper Fidelis* (always loyal); the depot is at Exeter.

**De Vries**, HUGO (1848-1935). Dutch botanist. Born at Haarlem, Feb. 16, 1848, he became a professor in the univ. of Amsterdam. He produced a theory of evolution by mutation which has proved fertile in results. He died May 21, 1935. *See* Mutation.

**Dew**. Condensation of atmospheric moisture on solid objects. On a still, clear night the temp. of the earth's surface is lowered by radiation. This causes a cooling of the air in contact with the earth, and if the temp. of the earth falls to, or below, the temp. at which the air is incapable of holding its water-vapour without precipitation, i.e. the dew-point, some of the invisible water-vapour is changed to liquid, drops of which form on cold, exposed surfaces, e.g. grass, stones, or the ground. The amount of dew deposited depends upon the amount of water-vapour in the air, for if the air is quite dry there can be no condensation from it. Part of the mois-

Georgiana, Duchess of Devonshire, with her child  
From a painting by Sir J. Reynolds

ture in dew formed on the ground comes either from the ground itself or from plants.

Dew-point is thus the temperature at which the atmosphere is said to be saturated. It can be obtained from readings of the dry and wet bulb thermometers by reference to tables. *See* Atmosphere; Hygrometer.

**Dewar, Sir James** (1842-1923). British physicist. Born at Kincardine-on-Forth, Sept. 20, 1842,

Sir James Dewar,  
British physicist  
*Lafayette*

he was educated at Edinburgh university, and here became assistant to Lord Playfair. He became Jacksonian professor of experimental philosophy at Cambridge in 1875, and Fullerton

professor at the Royal Institution two years later. His brilliant investigations into the liquefaction of gases, dating from 1874, and the properties of matter at extremely low temperatures, have proved of the greatest importance. He was the first to liquefy and afterwards solidify hydrogen and to show the great increase in electrical conductivity of metals at very low temperatures. By making use of charcoal as an absorbing agent he was able to separate hydrogen, neon, and helium from the air, and create the highest known vacuum. With Sir Frederick Abel, Dewar in 1889 discovered cordite. In 1902 he was president of the British Association. Knighted in 1904, he died March 27, 1923. His *Collected Papers*, ed. by his wife, appeared in 1927.

**Dewas.** Name of two former states of Central India, now forming part of Madhya Bharat (Malwa union). Although they had separate administrations, they shared the capital, Dewas. They had treaty engagements with the British govt. The states were founded by brothers in the third decade of the 18th century. The ruler of each was a raja. The area of the senior branch was 449 sq. m., and of the junior branch 419 sq. m. Pop. senior branch, 89,479; junior branch, 83,000; nearly all Hindus.

**Dewberry** (*Rubus caesius*). Name for a species of bramble. It is so called because the fruit has a dew-like bloom on it. *See* Bramble.

**D'Ewes, Sir Simonds** (1602-50). English antiquary. Belonging to a good Suffolk family, he was born Dec. 18, 1602. Educated at

Bury St. Edmunds and S. John's College, Cambridge, he became a barrister, but soon turned to his life work of delving into the records of the past. He transcribed a great deal, and his manuscripts, now in the British Museum, are historically valuable. His *Journals of all the Parliaments of Queen Elizabeth* was edited by his nephew in 1682. D'Ewes died April 18, 1650.

**De Wet, Christian Rudolf** (1854-1922). Boer soldier. Born in the Smithfield district, Orange Free State, Oct. 7, 1854, he became a farmer. Noticed for his services in the war of 1880-81, he was from 1885 to 1897 a member of the Volksraad of the Orange Free State. When war broke out with Great Britain in 1899 he was given a command and won early successes in Natal. In 1900 he became commander-in-chief of the O.F.S. army. His skill in the guerrilla warfare of 1900-02 made him much the most formidable

Christian De Wet,  
Boer soldier  
*Russell*

opponent of Britain in the field, and time and again he dashed suddenly upon a convoy and as suddenly disappeared, usually with the spoil. Elaborate plans for his capture were of no avail. De Wet accepted the peace of 1902, and afterwards visited England, Europe, and America. From 1907 to 1914 he was a member of the legislative assembly and minister of agriculture. O.F.S. In 1914 he joined the rebellion; at Doornberg, on Nov. 7, he had a success, but four days later he lost heavily in men and material. His followers, including two sons, surrendered, but the old chief himself eluded his pursuers until captured at Waterburg on Dec. 1. His sentence was a fine of £2,000 and imprisonment for six years, but he was released at the end of a year. He died Feb. 3, 1922. *See* South African War.

**Dewey, John** (b. 1859). American psychologist and philosopher. Born at Burlington, Vermont, Oct. 20, 1859, he was educated at the state university. After holding professorships at the universities of Minnesota and Michigan, he went as professor of philosophy to Chicago, where he was also director of the school of education until 1904. Professor of philosophy at Columbia 1904-31, he then became

emeritus professor. Dewey was a representative of pragmatism, a conception of thought and knowledge in which most stress is laid on practical value. His chief works include: *Study of Ethics*, 1894; *Studies of Logical Theory*, 1903; *How We Think*, 1909; *The Quest for Certainty*, 1929; *Art and Experience*, 1934; *Logic*, 1938; *Freedom and Culture*, 1940.

**Dewey, Thomas Edmund** (b. 1902). American lawyer. Born at

Owosso, Mich., March 24, 1902. he was educated at Michigan and Columbia universities. Admitted to the New York bar, 1926, he was chief assistant attorney, southern district of New York, 1931-33, and special prosecutor of the investigation of organized crime, New York, 1935-37. District attorney of New York county, 1938-41, he became governor of New York in 1942. He stood unsuccessfully as Republican candidate for the U.S. presidency against F. D. Roosevelt in 1944, and against H. S. Truman in 1948 when his defeat was one of the great political surprises of the century.

**De Wint, Peter** (1784-1849). British painter. He was born of Dutch descent at Stone, Staffs, Jan. 21, 1784, and studied under John Raphael Smith, the engraver, and at the Academy schools. Confining himself mainly to water-colour, he first exhibited at the Academy in 1807; and in 1812 became a member of the Water Colour Society. His vigorous and luminous landscapes are painted wholly in "wash." He died June 30, 1849. *Consult* *Masters of English Landscape Painting*, ed. C. Holme, 1903; *Peter De Wint*, M. Hardie, 1929.

**Dewlap.** Loose fold of skin that hangs from the necks of cattle. It is, therefore, that which laps up the dew, although this derivation of the word is doubted. It is used for a like fold of skin in dogs and other animals.

**Dew-Pond.** Name applied to ponds, generally on chalk downs, which have no visible means of replenishment other than rain, and maintain their supply of water during hot weather, when ponds at lower levels have dried up. The name arose out of the idea that these ponds were replenished

Thomas E. Dewey,  
American lawyer

at night by dew, the supply being sufficient to maintain the balance between evaporation and precipitation. Extensive experiments on the South Downs have shown that although the grass around is wringing wet with dew, none of it passes into the pond close by. It has been stated that straw placed under the foundations of a pond will so tend to cool the water that dew will be deposited. This could take place only if the whole of the water fell in temperature below dew-point. The surface of the water would first cool, and then by convection would sink and give place to warmer water, and experiment showed that the short summer nights would not allow of the whole of a pond passing below the dew-point.

The rise in the level of such ponds corresponds with the existence of

**Dewsbury.** Mun., co., and parl. borough of the W. Riding of Yorkshire. It stands on the river Calder, 182 m. N.W. of London and 8 m. S.S.W. of Leeds, and is well served by railways. The Aire and Calder navigation gives water communication with Hull.

Dewsbury arms

is All Saints', an Early English building restored and rebuilt in the 18th century, and retaining some of its old glass. Other buildings are the town hall, technical school, etc. The chief industries are the making of blankets, shoddy cloth, and carpets, while around are coal mines. Dewsbury is governed by a mayor and council, and sends one member to parliament. Pop. est. 46,220.

**Dexter** (Lat., right). In heraldry, the right side of an heraldic shield. In describing a shield it is assumed to be carried by its owner, so the right side is to the left for the spectator. See Coat of Arms; Heraldry.

**Dextrin.** White or yellowish-white substance prepared from starch. It is soluble in water, and possesses adhesive properties similar to those of gum arabic. It is also known as British gum or starch gum. Dextrin is prepared by heating starch previously moistened with an acid, or by subjecting starch to the action of diastase. Payen's process for preparing commercial dextrin consists of moistening starch with weak nitric acid, making the mass into balls, drying, reducing to powder, and then subjecting to a temperature of 100°–125° C. in a hot-air oven. Dextrin is also prepared in the form of a syrup. The pure product is made by dissolving commercial dextrin in water, and precipitating the dextrin by means of alcohol. Dextrin is used in place of gum arabic by calico printers for thickening colours, as a dressing for crêpe, for stiffening surgical bandages, in making confectionery, and as an adhesive for postage stamps and envelope flaps. Photographers use it for mounting prints.

**Dextrose** OR GRAPE SUGAR. Substance found in nature as honey and in fruits and plant sap. It is called grape-sugar from its presence in ripe grapes, dextrose because it turns polarised light to the right (dextro-rotation), and sometimes glucose from its sweet taste. It may be made in splitting up starch by sulphuric acid. Water and acid are heated to boiling point and the starch-milk run in, the course of the conversion being followed by the iodine reaction which indicates the point at which the transformation of the starch into dextrose is complete. The liquid is neutralised with chalk and filtered; the filtrate is then made colourless by passing it through animal charcoal, after which it is evaporated in vacuum pans to the correct consistency. This process may be carried out under pressure, if desired.

In the U.S.A. hydrochloric acid is used to effect conversion, the starch, suspended in cold water, being pumped into large cylindrical vessels containing the heated acid. Commercial dextrose is a valuable sweetening agent in the manufacture of confectionery, preserved fruit and jams, wines, liqueurs, and is a substitute for malt in beer-making. Dextrose is widely used in medicine, being given either by mouth or by injection in some conditions of carbohydrate shortage. It is readily absorbed without further digestive action.

**Dey** (Turk. *dai*, Mother's brother). Turkish title. Originally a Turkish form of address for elderly men, it became the title of the commander of the janissaries. The ruler of Algeria was called dey, and those of Tunis and Tripoli deys or sometimes beys.

**Dhadi.** A former state of the Punjab, India, feudatory to the Jubbul state, now in Himachal union. Area 7 sq. m.; pop. 282.

**Dhak** (*Butea frondosa*). Tree of the family Leguminosae, a native of India, it has velvety trefoil leaves, and sprays of large orange-red flowers, which appear before the leaves. The natives wound the bark, from which flows a red astringent juice, which hardens by evaporation into a brittle ruby-coloured gum, variously known commercially as butea kino, gum butea, and Bengal kino. It is employed for tanning leather, which becomes dark in the process. An orange or bright yellow dye is also obtained from the flowers, but it is not permanent. Fibres from the

Dew-Pond. The pond near Chanctonbury Ring, on the South Downs, Sussex

night-fogs or early-morning mists. Precipitation is also greater on the higher ground at which the ponds occur, a factor which is amplified by the tendency of the wide shelving margins of the ponds to collect water. Analyses of pond-waters show that they contain a quantity of sodium chloride, brought in with mists from the sea. A pond can receive replenishment if a few stunted bushes are allowed to grow on its windward bank so that they drip into the pond. The only real dew-pond is one in which a few reeds or grasses grow, which, by projecting above the surface and by being good radiators, cause dew to be deposited upon them; and this trickles down into the pond. See Dew.

**Bibliography.** Natural History of Selborne, Gilbert White, 1789, ed. R. Kearton, 1902; A Short Practical Treatise on Dew-Ponds, H. P. Slade, 1877; Neolithic Dew-Ponds and Cattleways, A. J. and G. Hubbard, 2nd ed. 1907; Dew-Ponds: History, Observation and Experiment, E. A. Martin, 1915; Dew-Ponds in Fable and Fact, A. J. Pugsley, 1939.

bark serve as a substitute for oakum; and the seeds yield "moodooga oil," used as a native remedy for worms.

**Dhaleswari.** River in India, in Assam. Rising in the Lushei hills, it flows N. for 180 m. and joins the Barak at Siyaltek, in Cachar.

**Dhami.** Formerly a Simla Hill state, Punjab, India, now in the Himachel union. Its area is 28 sq. m.; pop. 5,114, nearly all Hindus.

**Dhamnoo** (*Grewia elastica*). Tree of the family Tiliaceae, a native of the Himalayas. Its strong and elastic wood is used by natives for making bows. It provides admirable shafts for horsed vehicles, and is used for many purposes where elasticity is required.

**Dhar.** Former state of Central India, now in Madhya Bharat. It took its name from the city of Dhar, which in the 9th century became the capital of Malwa under the Paramara rajputs and for centuries occupied a prominent position in India. The chief was a raja. The Lat (pillar) mosque, so called from an iron pillar supposed to date from the beginning of the 13th century, was built in 1405. Area, 1,800 sq. m.; pop. 253,210, two-thirds Hindus.

**Dharmasala.** Hill station of E. Punjab, India, and chief town of a district in Kangra. It lies on a spur of the Dhaola Dhar, at an alt. ranging from 4,500 ft. to over 7,000 ft., and has more rain than Simla. The station was destroyed by an earthquake in 1905.

**Dharwar.** District and town of India, in the S. of Bombay state. The district is noted for the excellence of its cotton, which is the chief article of export. Other products are millet, rice, wheat, pulse, oil-seeds, and sugar-cane. Dharwar fort is said to date from the beginning of the 15th century. The town has rly. communication with Goa. Area, 4,604 sq. m. Pop. dist., 1,201,016, five-sixths Hindu; town, 49,505, nearly three-quarters Hindu.

**Dhaulagiri.** Mt. peak of Nepal. In the Himalayan range, its height is 26,828 ft.

**Dhenkanal.** A former Indian state, now merged in Orissa. It has considerable iron deposits. Area 1,463 sq. m.; pop. 324,212, nearly all Hindus.

**Dhobi, DHOBY, OR DHOBYMAN.** Indian caste of washermen. They number some two millions. Among the higher landowning castes they are remunerated by a fixed share of the produce of the soil. They are the only caste who use the donkey. In some provinces they

practise calico-printing and dyeing; some have become cultivators. The word dhobi is also used for the garments, etc., washed, and Mahomedans who are washermen are also called dhoymen.

**Dhobi Itch** (*Tinea cruris*). Skin affection so named because of the view commonly held in the East that clothes are infected by the washerman, the dhobi. The condition occurs as itching, sheet-like patches on the inner side of the thighs and on the perineum and scrotum, and is caused by the fungus *Epidermophyton*. It is almost confined to males, and, though a tropical affection, is now common in Europe. Treatment with an ointment consisting of 3 p.c. salicylic acid and 5 p.c. of benzoic acid in a simple base is usually effective.

**Dhole.** Name of a wild dog found in India, especially in the Himalayas. It looks somewhat like a chow. Of gregarious habits and great strength and courage, dholes frequently hunt tigers and other big game animals.

**Dholka.** Town of Bombay state, India, in the district of Ahmadabad, with which it is connected by rly. (39 m.). Reputed one of the oldest towns in Gujarat, it contains many ruins of palaces, mosques, and mausoleums. Dholka was ceded to the British in 1804. Pop. approx. 16,500.

**Dholpur.** Town and former state of India, since 1949 part of Greater Rajasthan. Its earliest treaty with the British government was made in 1779. The town, situated on the Great Indian Peninsular rly., is supposed to date from the 11th century. Area, 1,173 sq. m. Pop., state, 286,901, nearly all Hindu; town, 25,400, two-thirds Hindu.

**Dhow.** Long, fast-sailing Arab vessel, once much used for gun-running and slaving. It has only one mast with a very long yard-arm carrying a large triangular sail. There is usually a high poop. Dhows are most frequent in the Persian Gulf. See *illus.* under Boat, p. 1242.

**Dhrangadra.** Town and former state of India, now part of Saurashtra. Less than one-fifth of the total area is cultivated, the state consisting for the most part of rocky ground, from which a good building stone is quarried. Long-staple cotton is raised and by-products of salt are made. The capital is served by rly., which connects it with Wadhwan and Halrad. Area, 1,167 sq. m. Pop.

of state, 94,417, mostly Hindu, Jains, and animists; town, 16,000, two-thirds Hindu.

**Dhrol.** Former state of India, now part of Saurashtra. The cultivated area is small, the crops including cereals and sugar-cane. The chief was a Rajput, with the title Thakur Sahib. The town of Dhrol has a pop. of 8,500, two-thirds Hindu, the rest Mahomedans. Area of state, 283 sq. m.; pop. 33,617, mostly Hindu, Jains, and animists.

**Dhuleep Singh** (1838-93). Maharaja of Lahore. Son of Ranjit Singh, he was proclaimed Sept. 18, 1843, his mother acting as regent. Deposed on the annexation of the Punjab by the British in 1849, he was granted a pension of £40,000, and left India for England, adopted Christianity, and settled at Elvedon, Suffolk. In 1886, having lodged claims against the British government in regard to certain estates in India and the return of the Koh-i-noor diamond, which were rejected, he sailed for India, but was detained at Aden in connexion with a proclamation to the Sikhs. At Aden, he renounced Christianity, reverting to Sikhism. Pardoned by Queen Victoria in 1890, he made his home in Paris, where he died, Oct. 22, 1893.

Prince Dhuleep Singh

**Dhulia.** Town and district of Bombay, India, in Khandesh division. It is connected by a branch line with Chalisgaon on the Great Indian Peninsula rly., and is the centre of a cotton trade. Pop. 41,200, three-quarters Hindu.

**Dhurwai.** Former state of Central India, now part of the Vindhya union. Its area is 15 sq. m.; pop. 2,030, nearly all Hindu.

**Diabase** (Gr. *dia*, through; *basis*, going). Dark coloured, compact, crystalline rock. The term is used in America for dolerite (*q.v.*) and altered dolerites. It is still used in Europe for dolerites of pre-Tertiary age. In Great Britain the term has lost its age significance, but is applied to dolerites that have become altered or decomposed.

**Diabetes.** Disease which may take either of two forms in human beings. In *diabetes mellitus* the body chemistry of carbohydrate together with that of protein and fat is disturbed. It is characterised

by inability to utilise sugar owing to a failure of the secretion of the ductless "islands of Langerhans" in the substance of the pancreas. The sugar content of the blood thereupon rises, and sugar and acetone bodies deriving from ill metabolised fat are passed out in an increased volume of urine. The thirst of which the patient complains is due to the excretion of this sugar, as apparently it cannot be excreted without a good deal of water.

Diabetes is more common amongst Jews than Gentiles, and there is some factor of heredity. It is more often found in men than in women. The exciting cause of acute diabetes is not known, but it is common in those who are large eaters, overweight, or with high blood pressure. The onset of the disease may be acute or insidious. Loss of energy, fatigue, pruritus may be complained of. In severe cases thirst is troublesome, much fluid being drunk and much urine passed. Constipation is usually present. Boils and carbuncles are a frequent complication. Gangrene may occur in the elderly owing to the degeneration of the arteries associated with this condition. Many diabetics die of tuberculosis or bronchial pneumonia.

Fehling's solution and Benedict's solution are popular reagents in the routine examination of the urine of the diabetic for sugar. But to be of value they must be used accurately, and the amount of sugar present in the urine of a diabetic patient yields real information only when the complete picture of the case is considered.

The treatment of diabetes was revolutionised by the isolation in 1922, by Banting and Best, of insulin—the extract of the islands of Langerhans. This allows the blood sugar to be kept within normal limits, and the liver and muscle to obtain plenty of glycogen. It is destroyed in a digestive tract and so is given by injection. Its precise action is not yet understood, but it enables the diabetic to eat more widely and to lead a life approximating to normal.

If the blood sugar is lowered to too great a degree by too large a dose of insulin, such symptoms may develop as sweating, tremor of the hands, numbness of the face and tongue, and double vision, which may pass into unconsciousness. Mild symptoms are relieved by giving a little sugar, but if the patient is unable to swallow, glucose may have to be given intravenously. Conversely, diabetic

coma may be due to the absence of insulin in severe or untreated cases. In all cases of diabetes the aim of the physician is to correlate the amount of insulin given, exercise taken, sugar found in the blood and in the urine, and carbohydrate, fat, and protein eaten, as may be wisest for the individual patient.

*Diabetes insipidus* is an increase in the secretion of urine without the presence of any abnormal matter. It is due to interference with the internal secretion of the posterior part of the pituitary gland. The onset may be sudden, following emotional shock, or may develop slowly. It is characterised by intense thirst and the passing of large quantities of urine, which leads to broken sleep and broken health. The disease runs a long course, recovery being rare. Extracts of the pituitary gland are used in treatment without much success.

Hilary Ledgerwood, M.B.

**Diablerets** (Fr., little devils). Mountain mass of Switzerland. On the borders of Berne, Valais, and Vaud, it is at the W. extremity of Bernese Alps. Its height is 10,650 ft., and it was first ascended in 1850. There are several peaks, including the Oldenhorn, 10,250 ft., and glaciers, the chief being the Diableret and the Zanfleuron, 2½ m. long. See Bernese Oberland.

**Diabolo**. Game played with a double-coned top spun upon a string stretched between two sticks held one in each hand. The top is repeatedly thrown in the air and caught again on the string while spinning. Its ancestor was the Chinese Koney Grey, a species of double humming top. In 1712 Le Diable, as it was then termed, had a vogue in France. About 1906 the game was revived, mainly by a French engineer, Gustave Phillipart, who, with the help of C. B. Fry, invented a more scientific top or "devil." Throughout 1907–08 the game enjoyed a vogue in Great Britain, and there was a lesser revival in the 1930s.

**Diad.** Cytological term for two chromatids lying side by side. During meiosis, homologous chromosomes which are longitudinally split pair to form tetrads of chromatids. Each tetrad divides during the first meiotic division into two diads, each consisting of two chromatids. See Cytology.

**Diadochi**. Name given to the lieutenants and successors of Alexander the Great (q.v.).

**Diaghilev**, SERGE PAVLOVICH (1872–1929). Russian impresario. Born March 19, 1872, he went to

St. Petersburg (Leningrad) at an early age. Forming his own ballet company, he gave his first season in Paris 1908–09. At that time

western Europe was accustomed to conventional ballet as exemplified by the Petipa productions at the St. Petersburg Imperial school, but Diaghilev realized the art in different terms; it was ballet as an *ensemble* that became his obsession. Paris and London acclaimed Scheherazade, Spectre de la Rose, Firebird, and other revolutionary works. Pavlova, Nijinski, Karsavina, Lopokova, Massine, were among his dancers; his composers included Stravinsky, Tchecherepnin, and de Falla, while among designers were Bakst, Picasso, and Derain. After the First Great War, ballets such as *Le Tricorne*, *Les Biches*, *Les Noces*, expressed the experimental, feverish movement of the period. When Diaghilev died, Aug. 19, 1929, Russian ballet as the world had known it died with him. See Ballet; Consult also Diaghilev: His Artistic and Private Life, A. Haskell, 1935; Serge Diaghilev, S. Lifar, 1945.

**Diagnosis** (Gr. *dia*, between; *gnonai*, to know). Term used in medicine for the finding out, by correlating signs and symptoms, of the condition from which a patient is suffering. Symptoms are departures from the normal, complained of by the patient; signs are physical facts obvious to the doctor. X-ray examination and the resources of the pathologist's and physiologist's laboratories help to provide both the general and the detailed information on which accuracy of diagnosis depends.

**Diagoras** (fl. c. 464 B.C.). Greek athlete of Ialysus in the island of Rhodes. He gained many victories in boxing at the Olympian, Isthmian, Nemean, and Pythian games, and his prowess is celebrated by Pindar. Another Diagoras, a Greek philosopher of Melos, sur-named the Atheist, a pupil of Democritus, was exiled from Athens in 411 B.C. on a charge of impiety.

**Diagram** (Gr. *diagramma*, something marked out). Figure composed of lines, serving as an illustration. It can be used to represent symbolically the results of any action or process in physics, such as the rise or fall of potential, of heat, or of pressure, and in

Serge Diaghilev, Russian impresario

general the variations which occur in functions. A working diagram is frequently supplied to indicate how different parts of a machine are to be made and assembled. A circuit or wiring diagram shows the connexions in electrical apparatus, e.g. a radio receiver, etc.

**Dialect** (Gr. *dialekto*, discourse). Term used with two different shades of meaning. It is sometimes applied to the collective language of one people as opposed to that of another people, but more commonly to a provincial or local section of a language, distinguished by certain peculiarities and spoken by a limited number of the whole population. Thus Greek may be called a dialect of the primitive Indo-European language, but as spoken by the Greek nation it is a language of which the dialects are Ionic, Doric, Aeolic, and others. The Romance languages are dialects of Latin; English, Danish, Dutch, German of the Teutonic group, but from another point of view are languages.

#### Dialect in England

In England the term dialect is generally applied to the local peculiarities of language and pronunciation found in different parts of the country; thus, we speak generally of north-country and more particularly of Cumberland, Yorkshire, Lancashire, and other dialects. A Londoner has some difficulty in understanding the language of a Cumberland dalesman, but when the peculiarities of a dialect are so numerous and pronounced that it is quite unintelligible to outsiders, it ceases to be a dialect and becomes a language. The main characteristics of a dialect in the restricted sense are the interchange of vowels and consonants, as in hame for home, zum for some, vour for four, the southern dialects in general exhibiting a preference for the softer sounds; grammatical differences, such as housen (houses), shippen (sheep), childer (children), thinken (plural); different words used in different parts for the same thing, as gar (to make), gey (very), brock (badger), cleg (horse-fly), fash (to trouble); voice-pitch; and accent.

Speaking generally, dialects are older than languages. In early times, as different tribes parted from the original stock and set out to find new homes, local surroundings and circumstances and the distribution of their members over an increasing area tended to produce a larger number of dialects. Migration, social upheavals, island and

mountain life, all contribute to the formation of dialects. But when one dialect has established a predominance over others, as being spoken by a more powerful or linguistically more vigorous section which impresses its individuality on other sections, it forms a centre of culture and is recognized as the literary standard and general means of communication amongst the educated. Thus, the Tuscan dialect, owing to the influence of Boccaccio, Dante, and Petrarch, has become the literary language of Italy. The remaining dialects are then relegated to a subordinate position and become *patois*, confined chiefly to the uneducated, and restricted to the expression of the requirements of everyday life. These dialects are valuable as preserving many relics of old words and grammatical forms no longer to be found in the written languages. Now and again they reassert themselves; thus, the Latin or Romance languages owe their origin not to the literary Latin of the Augustan age, but to the popular dialects of vulgar Latin. See Language.

**Dialectic** (Gr. *dialektikē*, the art of discussion). Introduced by Socrates and developed by Plato, it came to mean the art of methodical scientific inquiry, akin to, though differing from, logic. By the followers of Socrates it was degraded into sophistry. Aristotle distinguished dialectic proofs, leading to probable conclusions, from scientific proofs, leading to certain conclusions. See Logic; Sophists.

**Diallage** (Gr. *diallagē*, change). Variety of the mineral augite or diopside. It is grass-green, brown, or grey in colour, with metallic lustre and foliated appearance. It is a characteristic mineral of the gabbro family of rocks, with optical properties similar to those of augite (*q.v.*).

**Dialling**. In coal mining, making use of what is essentially a mariner's compass in planning the underground workings of a mine. See Mining.

**Dialogue** (Gr. *dialogos*). Conversation of a more or less formal character between two or more persons; generally applied to such conversation in dramatic or other fictional writing. In drama it is the means by which the story is developed and the individuality of the characters illustrated, more especially from the Elizabethan period, when the explanatory chorus ceased to be used. The use of dialogue for moral and didactic purposes dates back to Plato, most

of whose philosophical writings are cast in this form.

One of the earliest of literary forms, it developed in various ways; it plays a part in the Vision of Piers Plowman, and was utilised for conveying moral lessons and religious instruction in the old mystery plays and moralities, which were frequently nothing but moral teaching conveyed by means of dialogue between personified qualities. Dialogue plays an important part in aiding the novelist to impart reality to his characters.

**Dialysis** (Gr., separating). In chemistry, the separation of crystalloids from colloids. The chemist Thomas Graham (1805-69) found that if a mixture of colloids and crystalloids, in solution, is placed on one side of a bladder or a piece of parchment paper, and pure water on the other side, virtually the crystalloids alone pass through the semi-permeable membrane into the water. A repetition of the process will completely separate the colloids and the crystalloids. This process, called dialysis, is often used in medical examinations of poisoning cases. The more common deadly poisons are crystalloids, and can be readily separated from the large admixture of colloids with which they are usually associated in the intestines. See Osmosis.

**Diamantina**, DIAMANTINE, OR MÜLLER'S CREEK. River of Queensland and S. Australia. It is 350 m. long, flowing S.W. through Queensland into South Australia, debouching as the Warburton into Lake Eyre. In dry seasons it is a series of water holes.

**Diamantina** (formerly Tejuco). City of Brazil, in the state of Minas Gerais. It is 170 m. N. of Ouro Preto, and the terminus of a branch rly. to Curralinho. In a mountain valley, at an alt. of 3,700 ft., it is the centre of the diamond fields, and an industrial town, manufacturing cotton, cigars, and leather, and carrying on diamond cutting. Pop. 8,000.

**Diameter** (Gr. *dia*, through; *metron*, measure). In geometry, a straight line through the centre of a circle (or conic) joining two points on its boundary. The two points are diametrically opposite. See Geometry.

**Diamond**. One of the red suits in a pack of playing cards; or any card belonging to that suit. The suit has generally been associated with money or commerce; in early Spanish packs the diamonds appeared as gold pieces, in Germany as bells, in France as paving tiles; and fortune tellers regard a collec-

tion of the diamond suit as indicating worldly success. The ace of diamonds is sometimes nicknamed the earl of Cork. The nine of diamonds, which is Pope in the game Pope Joan, is known as the Curse of Scotland, but there is no agreement as to the origin of this name.

**Diamond.** A naturally occurring mineral composed essentially of carbon, crystallising in the isometric system. The finer stones are greatly prized as gemstones, and represent the greater part by value of diamonds sold. Most of the world's production by weight, however, is of off-colour and flawed stones (bort, ballas, carbonado) and is used in industry as an abrasive on account of its extreme hardness.

The discovery of the structure of diamond was one of the first successes of X-rays; it is composed of two similar face-centred cubic lattices superimposed so that any one point of one lies between four points of the other arranged at the corners of a tetrahedron. The crystals commonly show octahedral, hexoctahedral, and other forms; the faces are frequently rounded and striated. Twin-crystals are common and the crystals are often distorted. Diamond

is brittle and has a perfect cleavage and conchoidal fracture. It is the hardest known mineral; specific gravity, approx. 3.52. Crystals range in size from "dust" to giant pebbles such as the S. African Cullinan diamond (3,025½ carats. The unit of measure of diamonds is the metric carat—142 carats equal 1 oz.).

Pure diamond is colourless, but variations from this standard are common, and may be caused by impurities. Diamond burns readily at white heat in the presence of oxygen to form the gas carbon dioxide; the variety carbonado yields a slight ash. Diamond is resistant to acid and alkalis, but is destroyed when heated with sodium carbonate. It is the high refractive index and dispersion that make the fine-coloured and flawless stones sparkle attractively.

For gem purposes, purity of colour is desirable and the value of the stones varies accordingly. The perfect stone, of great rarity, is pure white and devoid of all flaws. In addition to diamonds of varying degrees of whiteness, coloured diamonds are found. Colour may be given in the order

of rarity thus: ruby red, rose pink, blue, emerald green (Brazil), bottle green (S. Africa). Brown in the delicate coffee-tinted Brazilians is esteemed, but otherwise is a drawback. A pale citron is also prized, but other shades of yellow, which may merge into the ochres, are not. Many stones are opaque or cloudy owing to minute fissures or air bubbles. Where a diamond by reason of discoloration is unsuitable for use as a gem, it can be used for one of many industrial purposes (*v.i.*).

Diamond occurs chiefly in alluvial deposits, commonly associated with minerals found in granitic rocks. In Brazil, the Ural Mts., and parts of the U.S.A., it occurs in quartzose conglomerates; it is also reported in pegmatite from India. S. African diamond occurs disseminated in cylindrical pipes of serpentine breccias ("blue ground") piercing carbonaceous shales—the original rock appears to have been a peculiar peridotite. These pipes are believed to represent volcanic rocks and the diamond is thought to be genetically connected with the eruptive flow.

The largest producer by weight

Diamond. 1. Mining operations: Native machine drillers at work in a chamber in the "blue ground" S. Africa. 2. Head frame of Dutoitspan Diamond Mine, Kimberley, showing the waste sorting and primary crushing plant. 3. Grease tables, that is, flat wooden tables covered with a quarter of an inch of pure grease. They are mechanically shaken as the diamond concentrate passes over them; the diamonds adhere to the grease, the remainder passes to waste. 4. Industrial diamonds: these diamond drilling crowns or bits are studded with industrial diamonds

is the Belgian Congo; a high proportion of its output, however, can be used for industrial purposes only. Other countries which yield diamonds are Angola and Sierra Leone, where a gemstone weighing 770 carats was found in 1945. The most valuable diamonds come from the Union of S. Africa (including S.W. Africa). The Gold Coast and Brazil come fifth and sixth. Alluvial discoveries have been made in China, the Malay Archipelago, Borneo, Australia, British Guiana, Arkansas, and French Equatorial Africa.

Owing to the irregularity of the shape of many stones and their "faults," they frequently suffer loss on being cut; the Cullinan diamond was cut into two large, seven smaller, and 96 tiny brilliants, the biggest weighing 516½ carats. Diamond-cutting is a difficult art, not only because of the hardness of the stones, but owing to the judgement needed in deciding upon the shape, so as to minimise faults and obtain the utmost play of fire by the arrangement of the facets. The art was perfected at Amsterdam and Antwerp, but is now also established in London, S. Africa, the U.S.A., and Palestine.

**INDUSTRIAL DIAMONDS.** Stones which have a poor colour or other impurity are classified as industrial diamonds. The better class are polished for inclusion in diamond tools. Those with cleavage or other faults that preclude their being cut and polished are known as crushing bort and are crushed to varying degrees of fineness to provide abrasives and diamond dust. This dust itself helps to cut and polish diamonds and other stones. In 1945, 80 p.c. by weight of the total world diamond production was used for industry. Diamond tools are used on grinding wheels made of such hard substances as corundum. Drilling bore-holes for sampling with a hollow cylinder crown studded with diamonds is common practice. Non-core drilling for blast holes utilises the industrial diamond (both types illustrated in Fig. 4, p. 2692). Other uses are the machining and turning of soft metals. Surface finishes of these metals achieve an average height of one micro-inch or less. Engraving on metals, glass, or plastics is carried out with a diamond engraver. Hardness testing of metals requires a diamond. Diamond dies, themselves drilled by a needle coated in diamond dust, are used for drawing wire. The diamond is the cutting agent in the ordinary glass cutter.

Attempts have been made to produce diamonds synthetically by the electric furnace and high pressure. Early experiments were conducted by Moissan and Hanay, and during the Second Great War intensive research was carried out by the German scientists Gunthe, Geselle, and Rebentisch, without success. Imitation diamonds, a kind of glass or "paste," are made for inclusion in the cheaper qualities of jewelry.

**HISTORIC DIAMONDS.** The most celebrated diamond is perhaps the Koh-i-Noor, which was presented to Queen Victoria by the East India Company and now forms part of the British regalia. The Orloff, said to have formed the eye of an Indian idol, was sold to Prince Orloff, from whom it passed to Catherine II of Russia. The Regent or Pitt diamond was found in India and purchased by Pitt, governor of Madras, for £20,400, and sold to the duke of Orleans in 1717. The Hope diamond is the largest and most perfect of the blue stones. The Star of the South, found in Brazil in 1853, was bought by the gaekwar of Baroda for £80,000. From S. Africa have come the Excelsior (1893), the Jubilee (1895), and the Cullinan (1905). The Vargas, found in Minas Gerais, Brazil, in 1938, was sold to a Dutch firm for 700,000 guilders. See Crystallography; Gem.

**Diamond Hardness.** The hardness of metals, expressed in accordance with a special scale. The measurement is made by pressing the point of a diamond pyramid under a known load into the smooth, flat surface of the metal. The length of the diagonal of the square-shaped impression is measured under a microscope and hence the hardness compared to an international scale may be computed. Diamond is used because of its own exceptional hardness. See Brinell Hardness; Vickers Hardness.

**Diamond Jubilee.** Celebration of a sixtieth anniversary. The term is an extension of jubilee, which marks the fiftieth anniversary. The most famous diamond jubilee was that of Queen Victoria's accession to the throne of Great Britain, celebrated on June 22, 1897, when the queen drove in state from Buckingham Palace to St. Paul's Cathedral to return thanks to God. The accompanying procession was notable, as compared with that on the occasion of her jubilee ten years earlier, for its stress on Imperial unity.

**Diamond Necklace.** Valuable necklace which gave rise to an incident of some historical importance at the court of Louis XVI. Two Parisian goldsmiths collected a number of precious stones which they made into a necklace, one story being that this was intended as a gift from Louis XV to his mistress, Madame du Barry. However, it was not so used, and about 1784 they tried to sell it to Marie Antoinette, the queen of Louis XVI, but without success.

Countess de Lamotte persuaded Cardinal Louis de Rohan that she was all-powerful with Marie Antoinette. Her story of intimacy with royalty was known to be believed by many persons, among them the jewellers, who offered the necklace to the countess, hoping in this way to sell it to the queen. She told Rohan and he bought it, making the purchase in the name of the queen. The countess sent to him for it, and having secured it, sent her husband with it to London to sell the stones separately.

The jewellers soon required the cash for the promissory notes they had received from Rohan, and, not receiving this, told the queen of the matter. She denied either having ordered or having received the necklace, and in Aug., 1785, Rohan and the countess were arrested. Rohan was acquitted, although exiled from Paris, but the countess was severely punished. She escaped from prison, and in some Memoirs accused the queen of the plot. The part played by the queen in the affair remains a mystery. Consult Miscellanies, T. Carlyle; Historical Mysteries, A. Lang; The Diamond Necklace, F. Funck-Brentano, Eng. trans. H. Sutherland Edwards, 1911.

**Diamond Sculls.** Race for amateur single scullers rowed annually at Henley regatta. Instituted in 1844, its full title is the Diamond Challenge Sculls.

**Diamond Wedding.** Sixtieth anniversary of a wedding. The term is derived from the idea that diamonds were the most suitable gift for such an occasion. See also Golden Wedding.

**Diamorphine, DIACETYLMORPHINE, or HEROIN.** White, crystalline powder used in medicine as the hydrochloride. It is a drug of addiction and its use is subject to the provisions of the Dangerous Drugs Acts. It is prepared by the action of acetic anhydride upon anhydrous morphine.

**Diana.** In Roman mythology, an Italian deity identified with the Greek Artemis (q.v.).

**Diana, DUCHESS OF MONTMORENCY AND ANGOULÊME** (1538-1619). Natural daughter of Henry

Diana, Duchess of Angoulême

From a contemp. print

II. of France. She was born in Piedmont, her mother being Filippa Duca, and was educated in France. At the age of 15 she was married to a son of the duke of Parma, who was killed six months later. In 1557 she married Francis, son of the constable de Montmorency, and when widowed a second time, 1579, refused to marry again. Her counsels and influence helped to bring about the reconciliation of her half-brother, Henry III, with Henry of Navarre. She died Jan. 3, 1619.

**Diana OF POITIERS** (1499-1566). Duchess of Valentinois and mistress of Henry II of France. Daughter of Jean of Poitiers, she was born Sept. 3, 1499, married at 15 to the grand seneschal of Normandy, and widowed at 32. About 1536 she became the mistress of the Dauphin, later Henry II. After his accession she was created duchess of Valentinois, and in effect became the ruler of his court, to the discomfiture of Catherine de' Medici, the queen. On Henry's death, 1559, Catherine compelled Diana to retire to her château at Anet, where she died.

After Primataccio

**Diana Monkey** (*Cercopithecus diana*). West African monkey, belonging to the guenon group. It has black fur, with a long white beard, throat and chest, and a white crescent above the eyebrows. The body is about 18 ins. long,

Diana Monkey, a native of West Africa

and the tail is about half as long again. This monkey, though gentle

and easy to tame, is not often to be seen in menageries owing to its delicate constitution.

**Diana of the Crossways.** Novel by George Meredith. After appearing serially in *The Fortnightly Review*, it was published in volume form in 1885. The story increased the author's fame, partly owing to the belief that the heroine was modelled on Sheridan's granddaughter, the Hon. Caroline Norton. Similarities exist, and lent fresh colour to a baseless calumny that Mrs. Norton betrayed a political confidence to *The Times*. In the third edition, the novelist stated that *Diana of the Crossways* was to be read as fiction.

**Dianthus** (Gr. *Dios anthos*, flower of Zeus). Generic name of hundreds of species of such popular flowering plants as carnations, pinks, and sweet williams, of the natural order Caryophyllaceae. Natives of Britain and the whole of the E. Hemisphere, foreign varieties were introduced into England at various times between the period of Roman occupation and the 18th century. Originally certain species of the genus *Dianthus* were noted for their "clove" perfume, but hybridisation has eliminated this from many of the garden forms.

**Diapason** (Gr. *dia pasōn chor-dōn*, through all chords). (1) Musical term used with reference to pitch. Diapason normal was the standard pitch adopted in France in 1859. It signifies that middle A has 435 vibrations per sec. English pitch is slightly sharper, having 439 vibrations. The oboe always gives the A for orchestral tuning. (2) Diapason is also used for a series of organ foundation stops, 8 and 16 ft. Open diapasons have metal pipes open at the top; stopped diapasons, wooden pipes closed at the top. The latter are of 8 ft. tone, but of 4 ft. length, the stopping lowering the pitch an octave. The lengths mentioned represent the length of the deepest open pipe. Pron. diapayson.

**Diapente** (Gr. *dia pente*, through five). Medicine in old pharmacy containing five ingredients. It was last officially recognized in the Edinburgh Pharmacopoeia, 1744, and was composed of gentian, bayberries, aristolochia root, myrrh, and ivory dust, made into a confection with honey. Diapente, composed of gentian and various spices, is used in veterinary medicine as a tonic for horses.

**Diaper** (late Gr. *diaspros*, quite white). Term used in Gothic architecture for a small, conven-

Diaper. Example of Saracenic diapering from the Alhambra

tional pattern, geometrical or floral in design, used in decorating plain stone surfaces. It was seen on Gothic buildings, but it attained its greatest variety and beauty in Mahomedan ones. In textile fabrics the word is used for cotton or linen material woven with an all-over pattern of regular geometrical design. Heraldically, diapering is the decoration of a plain surface, or field, with an all-over background pattern, not sufficiently obtrusive to be mistaken for a charge.

**Diaphoretic** (Gr. *diaphorein*, to carry through). Drug which increases perspiration. Diaphoretics are used to stimulate the excretory functions of the skin and thus lessen the work thrown upon the kidneys.

**Diaphragm.** In anatomy, a large, transverse, and dome-shaped muscle which divides the body into its two main cavities, the chest or thorax and the abdominal cavity. It is attached behind to the bodies of the 1st, 2nd, and 3rd lumbar vertebrae and to ligamentous arches which pass between the 1st lumbar vertebrae and the last rib. Laterally it is attached to the deep surfaces of the six lower costal cartilages, and in front it is attached to the ensiform cartilage which forms the lowest part of the sternum or breast-bone. The upper surface of the diaphragm is in apposition with the lungs and heart, the lower surface with the liver, stomach, and other visceral organs. The muscle is pierced by three openings, through which pass the oesophagus or gullet, the aorta, or main

blood-vessel of the body and the large vein known as the inferior vena cava. The diaphragm is the principal muscle of respiration, its contraction and descent enlarging the vertical measurement of the chest, and thus assisting in the process of inspiration, while its fibres are relaxed during the movement of expiration.

**Diaphragm** (Gr. *diaphragma*, partition). In physics, term used for the membrane through which liquids are diffused, as in dialysis. In electrolysis, it denotes the porous cell through which displacements of ions take place. In acoustics, it signifies a vibrating disk, which in a telephone also is called a diaphragm. In astronomy, it is the assemblage of lines, sometimes known as spider lines, used at the focus of a telescope to assist precision of determination when celestial objects pass into the telescope's field of vision. In photography, it means the relative size of the effective opening in the lens through which image-forming rays pass. Its area can usually be adjusted by a contracting ring (iris), by interposition of strips of metal carrying holes of various sizes (Waterhouse stops), or by rotating between the lens components a metal disk punched with a series of such holes.

**Diarbekir** OR **DIYARBEKIR**. Vilayet of Asiatic Turkey. It is a mountainous region, traversed by the Upper Tigris, but there is good soil in its valleys, producing grain, rice, and tobacco, and cattle are extensively raised. It contains copper mines which have never been properly developed. Pop. of Vilayet 257,321.

**Diarbekir** OR **DIYARBEKIR**. City of Turkey, capital of the above. The ancient Amida, it is called by the Turks Kara Amid or Black Amid, from the basaltic rocks in the neighbourhood. It stands on the right bank of the Tigris. It has been held in turn by Persians, Greeks, Romans, Arabs, and Turks: it was con-

Diaphragm. Diagram showing position of this muscle in the human body

quered by the Arabs of the Bekr, hence its more modern name, in 640, and taken by the Turks in 1515. Interesting remains include its citadel, on a hill 1,950 ft. high. Once a busy commercial centre, it still has an export trade in wool, mohair, sheep, goats, and ores. It is the seat of a Greek bishop and of the Catholic Patriarch of Antioch. There is rly. connexion with Samsun on the Black Sea. Pop. 41,260.

**Diarmid MacMurchada** OR **DERMOT MACMURROUGH** (d. 1171). King of Leinster. Having alienated the neighbouring chieftains by his crimes, he offered allegiance to Henry II of England in return for help in the recovery of his lands. Henry allowed him to recruit in England, and Strongbow, earl of Pembroke, came to his assistance, eventually marrying his daughter. On Diarmid's death Henry went to Ireland to claim the submission of the people, and thus began the English conquest of Ireland.

**Diarrhoea** (Gr. *diarrhōia*, flowing through). Passage of fluid or semi-fluid evacuations from the bowels. The pathological cause is increased activity of peristalsis or the rhythmic movements of the intestine. This causes the fluid contents of the small intestine to pass rapidly through the system instead of staying in the large intestine long enough for the fluid to be absorbed. The commonest exciting cause is the eating of indigestible or unsound food. Other causes are inflamma-

tion of the intestine; specific diseases such as typhoid, dysentery, and cholera; tuberculous or syphilitic ulceration of the intestine; irritant poisoning as by arsenic or powdered glass.

Diarrhoea due to indigestion is often best treated by a dose of castor oil to remove offending material from the bowel, followed by some bismuth preparation to soothe the bowel lining. But the diagnosis of simple indigestion should be beyond doubt, especially in children, in whom appendicitis has many varying manifestations. The specific diseases demand their specific treatment for the relief of the associated diarrhoea.

**Diary** (Lat. *diarium*, daily allowance or journal). Day by day record of transactions or occurrences. Primarily designed for the use or interest of the diarist, the diary has in a few instances come to be a valuable contribution to posterity's understanding of the period which it covers. Such are the diaries of Pepys and Evelyn, neither of which was published until more than a century after the diarist's death. To these two is due much intimate knowledge of the life of England during the latter part of the 17th century. Similar light on the life of the latter half of the 18th century, as lived by a country parson in Somerset and Norfolk, is provided by the diary of the Rev. James Woodforde, covering the years 1758-1802, and not published until 1924-31.

Wesley's journal throws light on aspects of life in the 18th century, while the diary of Mme. D'Arblay (Fanny Burney) covers the close of that and the earlier part of the 19th century. Notable literary diaries in the 19th century are those of Sir Walter Scott, Thomas Moore, and Henry Crabb Robinson; remarkable political and social journals are those of C. G. F. Greville and Thomas Creevey. The Notes from a Diary, by Sir M. E. Grant-Duff, published 1897-1905, also call for mention. The French diaries of Marie Bashkirtseff and the Goncourt brothers had considerable vogue towards the end of the 19th century. In the 20th century came "W. N. P. Barbellion's" Journal of a Disappointed Man, a diary of an unusual kind, published during the writer's lifetime; the revealing Journals of Arnold Bennett (3 vols.); and the many volumes of James Agate's Ego.

Diaries covering brief periods such as Diary of the Besieged Resident in Paris, by Henry

Diarbekir, Turkey. The ancient black basalt city walls which have protected Diarbekir since Roman times

Labouchere, 1871; that from which Lieut.-Colonel Charles à Court Repington quoted in his book, *The First World War*, 1920; or W. L. Shirer's *Berlin Diary*, 1941, are valuable for the light they throw on contemporary events. The Second Great War saw a spate of books in diary form describing writers' war experience.

In another sense a diary is a book which looks ahead instead of backward; in which a blank space is left for entries of forthcoming business and other engagements on each day of the year. See *Calendar*; *Memoirs*.

**Diary of a Nobody**, THE. Series of sketches, written by George Grossmith the elder and Weedon Grossmith and illustrated by the latter, first published in *Punch* in 1892 and in book form in 1894. A merciless satire on middle-class respectability, the diary is that of Charles Pooter, who lives at Highbury and works in the City; and presents his family, his neighbours Gowing and Cummings, and a host of minor characters like Padge (who says nothing but "That's right"), with side glances at the manners, conventions, art, etc., of the period.

**Dias De Novaes**, BARTOLOMEU (d. 1500). Portuguese navigator. His great feat was the discovery of the Cape of Good Hope. With two ships, he set sail in the summer of 1487, and after touching the Gold Coast in May, 1488, rounded the most southerly part of Africa. This he first named Cape of Storms, and later, in consultation with King John, Cape of Good Hope. His discovery opened the way for the voyages of Vasco da Gama. Dias was in command of a ship under Cabral, the discoverer of Brazil, when he was lost in a storm, May 29, 1500. Consult *Life*, A. Baldini, trans. W. J. Monson, 1935.

**Diaspora** (Gr. *diaspeirein*, to scatter). Term used for the dispersion of the Jews which took place some centuries before Christ. See *Jews*.

**Diaspore** (Gr. *diaspeirein*, to scatter). An orthorhombic mineral occurring in platy crystals; chemically, hydrogen aluminium oxide,  $\text{HAlO}_2$ . Diaspore is widely distributed and associated with corundum in emery rock, bauxite, atterite and aluminous clays, alkaline pegmatites, and xenoliths. The name alludes to the decrepitation of the mineral on heating.

**Diastrase** (Gr. *diastasis*, separation). Ferment contained in malt which has the property of convert-

ing starch into dextrin and sugar. It is contained in malt extract, and when this is added to starch paste a clear liquid results. A purer form is prepared by adding alcohol to a cold infusion of barley malt, the flocculent precipitate being separated and dried in a vacuum. The power of converting starch is destroyed entirely if diastase is heated to 75° C. for a short time. The dietetic value of malt extract depends partly upon its diastatic action, partly upon the nutritive carbohydrates it contains. It is also used in laundries for dissolving starch from linen collars and cuffs. See *Alcohol*; *Brewing*.

**Diastolē** (Gr., drawing apart). Phase of the heart-beat during which the heart muscle is in a state of relaxation, and the chambers of the heart dilate and fill with blood. In assessing blood-pressure the diastolic reading is the measure of the degree of rest which heart and vessels obtain. See *Blood*; *Systole*.

**Diatom** (*Diatomaceae*). Family of microscopic single-celled plants of the class *Conjugatae*, equally abundant in fresh and salt water. The cell-wall contains much silica, and consists of two transparent valves, each with a rim and one overlapping the other. Each diatom may be attached to another plant or some other body by a gelatinous stalk, or be unattached and free-swimming. As a rule, diatoms are

Diatom. Highly magnified specimens of these unicellular algae

propagated by division of one individual into two; but sometimes there is asexual conjugation. Over 10,000 species are known.

**Diatomite**, OR **DIATOMACEOUS EARTH**. Chemically a hydrous form of silica. Deposits are compacted accumulations of minute siliceous shells of diatoms (*v.s.*). When algae die they sink to the bottom, where the organic parts decay and the siliceous parts accumulate to form beds of varying thicknesses. All the chief

economic deposits were formed during Tertiary times.

The largest today are in California; other producers are Denmark, Japan, Algeria, and U.S.S.R. When dry, diatomite resembles chalk in appearance, but is light, porous, absorbent, chemically inert, and has a low thermal conductivity. Its most extensive application in industry is for filtration of sugar, mineral oils, sewage, etc. It is also used as an insulator against heat, cold, and sound; a filler in paints, rubber, plastics, etc.; a carrier for nitroglycerine explosives; a mild abrasive, and in certain concretes.

**Diatonic** (Gr., through the tones). In music, the successive notes of any given scale, major or minor, no two notes of the same letter appearing, and the intervals between the various notes being always the same, whatever the keynote. Thus, starting on any note, the intervals in a major scale will always be tone, tone, semitone, tone, tone, tone, semitone.

**Diaz**, ARMANDO (1861-1928). Italian soldier. Born at Naples, Dec. 5, 1861, he went to the military school,

Armando Diaz, Italian soldier  
Russell

entered the Italian army in 1881. He was on active service in Abyssinia in 1896. In 1916 he commanded the 23rd army corps in the Carso battles of the First Great War, and in 1917, following the defeat of Caporetto, he replaced General Cadorna as generalissimo and held up the Austro-Germans on the line of the Piave. In 1918 he defeated the Austrians along their whole front. Created Duca della Vittoria (duke of Victory), 1921, he died Feb. 29, 1928.

**Diaz**, BARTHOLOMEU. Anglicised form of the name of the Portuguese navigator described in this work as Dias De Novaes, Bartolomeu.

**Diaz**, PORFIRIO (1830-1915). Mexican president. Born at Oaxaca, of Spanish parentage, Sept. 15, 1830, at first educated for the church. In 1849 he began to study law. In 1854 he joined the revolt against the dictator Santa Anna, and then fought under Benito Juarez as an anti-clerical in the civil war. Successes in the field brought him to the rank of general by 1861; he fought

against the French in 1862, and commanded the Mexican army against the emperor Maximilian.

In 1867, after retaking Mexico City, he declined to serve under President Juárez.

On Lerdo's becoming president in 1872 Díaz led the opposition, entered Mexico City in triumph, 1876, was made provisional president, and elected president for four years in 1877. In 1884 he was re-elected, and so again for each term up to 1910, the constitution which had limited the president's tenure of office being amended. The long rule of Díaz brought order to Mexico. The country became comparatively pacified, foreign capital was invested, education advanced, trade increased. It was a sheer dictatorship, and at 80 Díaz was too old to enforce his commands, while his ruthless rule had made many enemies. In 1911 a revolution led by Madero drove him to resign. He left Mexico, to die in Paris, July 2, 1915, after having seen most of his work for his country brought to nothing. *Consult Life, C. Beals, 1933.*

*Porfirio Díaz*

**Díaz de la Peña, NARCISSE VIRGILE** (1808–76). French painter. Born at Bordeaux, of Spanish parentage, Aug. 20, 1808, he worked in the porcelain studios at Sèvres and studied art under Souchon. He became associated with the Barbizon group. He died at Mentone, Nov. 18, 1876. He is represented at the Louvre, in the Wallace Collection, London, and in many American galleries.

Díaz de la Peña, French painter

**Diazo-compounds** (Gr. *di*, twice; *azote*, nitrogen). In organic chemistry, bodies derived from aromatic hydrocarbons and containing two atoms of nitrogen in a characteristic grouping. They are prepared by adding nitrous acid to a cooled solution of a primary amine, or a solution of potassium or sodium nitrite to an acid solution. *See Chemistry.*

**Diazo-Dye-Printing.** System used in copying plans and drawings whereby a sheet of paper coated with a diazo-compound is exposed to powerful light in contact with the document to be reproduced and then developed by exposure to fumes of ammonia or by sponging. The result is a highly coloured positive image.

**Dibdin, CHARLES** (1745–1814). British song writer and entertainer. Born at Southampton, March 4,

*Charles Dibdin*  
After Drummond

1745, he was a choir boy at Winchester, and at 15 came to London. His pastoral operetta, *The Shepherd's Artifice*, produced in 1764, was the first of a long series of musical entertainments written by himself, in which he acted. In 1789 he started his "table entertainments," or *The Oddities*, for which he wrote *Tom Bowling* and other popular sea songs. His total output amounted to more than 70 dramatic sketches, over 600 songs, *A History of the Stage* (1800), novels, and an autobiography (1803). He died July 25, 1814, and is buried at Camden Town.

**Dibon.** City of the Amorites (Numb. 21). Situated on the E. side of the Dead Sea, on the Wadi Moabijb, it is represented by the modern village of Dhiban. It is best known from the discovery in it in 1868 of the Moabite Stone of King Mesha, about 900 B.C.

**Dibrugarh.** Town of Assam, India, in the Lakhimpur division. It is situated on the left bank of the Dibru river, just above its confluence with the Brahmaputra, and is the highest point reached by steamers from Calcutta. It is a centre of the tea industry and the headquarters of a district. Pop. 16,000, three-quarters Hindus.

**Dice** (plural of die). Small cubes made of ivory, bone, or hard wood, marked on each side with dots from one up to six, and so arranged that the one, or ace, is opposite the six, the deuce, or two,

Dice. Cubes used in the game

opposite the five, and the tray, or three, opposite the four. Among the earliest vehicles for gambling in use among the Greeks, dice spread afterwards over the whole world.

Dice. Beggar boys gambling with dice, from the painting by Murillo *Old Pinakothek, Munich*

Dice are said to have been invented, together with chess (*q.v.*), by Palamedes, son of Nauplius, king of Euboea, though Herodotus attributes both inventions to the Lydians. One to five dice may be employed, but two are most usual. A favourite mode of gambling with them is the simple throw of one player against another, at which large fortunes have been lost and won, especially in England under the Regency. The cubes are thrown from a dice-box on to the surface of a table. Some dice-boxes are carved inside with a succession of steps to minimise any attempt at trickery. Sharpers load the cube with lead so as to cause a high number to come uppermost.

Dice with different markings are used for the game of crown and anchor (*q.v.*); and for poker dice, in which the faces bear ace, king, queen, knave, ten, and nine, ranking as in playing cards.

**Diceto, RALPH DE** (d. 1210). English chronicler. A cleric, he was dean of St. Paul's in the time of Henry II. He was employed by that king on public business, but his fame rests on his writings. These include two chronicles; one, valueless historically, deals with the history of the world from the Creation. The other, *Imagines Historiarum*, deals with the history of England and is of high value for the time in which Ralph lived, i.e. the reigns of Henry II and Richard I.

**Dicey, ALBERT VENN** (1835–1922). British lawyer and writer. A younger brother of Edward Dicey, he was educated at Balliol College, Oxford. He was called to

the bar, but devoted himself to lecturing. During 1882-1909 he was Vinerian professor of English law at Oxford, and became a fellow of All Souls. Dicey's masterly *Law of the Constitution*, 1885, is an authoritative and indispensable work. He published *Lectures on the Relation between Law and Public Opinion in England during the 19th Century*, 1905. England's Case against Home Rule, 1886, is one of the best works on the controversy. Dicey died April 7, 1922. His *Memorials* were edited by R. S. Rait, 1925.

**Dicey, EDWARD** (1832-1911). British journalist. Born May 15, 1832, he was educated at Trinity College, Cambridge. He became a barrister, but took to journalism. Cool judgement and forceful style soon brought him reputation; he wrote for the *Daily Telegraph* and was editor of the *Observer*, 1870-89. His chief books are *England and Egypt*, 1881; *The Story of the Khedivate*, 1902; *The Egypt of the Future*, 1907. He died July 7, 1911.

**Dichloro-Diphenyl-Trichloroethane**, or D.D.T. Organic chemical compound made from chlorine, ethyl alcohol, and benzene. It is a white powder soluble in oil but insoluble in water. First formulated in Germany in 1874, D.D.T. is the active ingredient of a new kind of insecticides, but was not produced on any scale until 1937, when it was developed in the research laboratories of a British firm of dyestuff manufacturers. As a trial, the insecticide was used in Dec., 1943, by the British military authorities to combat a severe outbreak of typhus in Naples. Over 1,300,000 people were treated with the powder, and within three weeks the epidemic was completely under control. British troops invading the Continent in 1944 were provided with D.D.T.-impregnated shirts, which protected the wearers against lice for two months, even after regular washing.

The main uses of D.D.T. are against the lice which spread typhus and bubonic plague, and the mosquito which causes malaria; but it is also in wide domestic use. Treating wool with 0.1 p.c. of its weight of D.D.T. dissolved in oil makes cloth moth-proof, however many times it may be washed. Consult D.D.T.: The Synthetic Insecticide, T. F. West and G. A. Campbell, 1946.

**Dichroism.** Uniaxial minerals (tetragonal, hexagonal) may show two variations in quality or quan-

tity of colour when rotated in polarised light, and are said to exhibit dichroism. This phenomenon is due to the unequal absorption by the mineral of light vibrating in different planes. Dichroism can be observed under the petrological microscope when the polariser is in position. A dichroscope, important for the determination of certain gems, consists of a cleavage rhomb of Iceland spar (calcite) in a tube with an aperture at one end and a lens at the other. When a transparent crystal in front of the aperture is viewed through the lens, two images are seen side by side, each formed by rays vibrating at right angles. See Pleochroism.

**Dick, SIR WILLIAM REID** (b. 1879). Scottish sculptor. Born at Glasgow, Jan. 13, 1879, he was educated at the Glasgow school of art. From 1908 he exhibited regularly at the Royal Academy. His most famous works include the bronze eagle on the R.A.F. memorial, Thames Embankment, London; equestrian groups on

Sir Wm. Reid Dick,  
Scottish sculptor

Unilever House, London; the lion on the Menn Gate, Ypres; Livingstone statue, Victoria Falls, S. Africa; statues of George V at Westminster and Windsor. He designed the Roosevelt Memorial, London, and the Godiva statue, Coventry. He was R.A., 1928, pres. of the Royal Society of British Sculptors, 1933-38, and was knighted 1935.

**Dickebusch.** Village and lake of Belgium, in the prov. of W. Flanders. The former is 3 m. S.W. of Ypres, and was in British hands throughout the First Great War. It came into prominence in April, 1918, in the German drive for the Channel ports, but by May 11 a French advance north of Kemmel village had removed all danger of a break-through to Dickebusch. See Ypres, Battles of.

## DICKENS: THE GREAT NOVELIST OF MID-VICTORIAN ENGLAND

Coulson Kernahan

*An appreciation of the life and writings of a great novelist who retains his hold on the affections of the English-speaking world. See also the entries on his books and characters and the periodicals—All the Year Round, Household Words—with which his name is associated*

Charles Dickens was born at Mile End Terrace, Landport, Portsea, Feb. 7, 1812, and was baptized Charles John Huffham (or Huffam). His father was a clerk in the Navy Pay Office, his mother the sister of a fellow clerk. In 1814 the family moved to London, and in 1816 to Chatham. In that old waterside town, with its seafaring and longshore men, the highly imaginative boy spent seven "receptive" years. When he was eleven his parents left for London, where they were soon in difficulties. Charles became a household drudge, being sent even on pawning errands. Later, a small, sickly child, he was working in a blacking factory at 6s. a week, and, he tells us, "miserably unhappy."

To such straits did Dickens senior come that, his proffered composition being refused by the creditors, the family settled down in the Marshalsea prison, Charles being handed over to the care of an old lady in Camden Town. What such "care" meant may be realized when Dickens says: "I know that, but for the mercy of God, I might easily have been, for any care that was taken of me, a little robber or a little vagabond."

At twelve Dickens was sent to school in Camden Town. Thence he passed to a solicitor's office, but he had other ambitions than to follow law. For example, he was for a time drawn towards the stage as a career. By studying shorthand he qualified as a reporter, and in 1832 entered the gallery of the house of commons as representative of the True Sun, afterwards joining the staff of the *Mirror of Parliament* and the *Morning Chronicle*. In Dec., 1833, his first published sketch appeared in the *Monthly Magazine*. This was *A Dinner at Poplar Walk*, later included in *Sketches by Boz* as *Mr. Minns and His Cousin*. A year later he adopted the pseudonym of Boz.

The first of the *Sketches of London* were printed in the *Evening Chronicle*, 1835. In 1836 they were issued in volume form as *Sketches by Boz*, and Dickens abandoned reporting for literature. The first monthly number of *Pickwick* appeared on March 31, 1836, and two days later he married Catherine Hogarth, daughter of George Hogarth, manager of the *Morning Chronicle*. Dickens's struggling days were now ended, and happiness and brilliant success were his. His

**CHARLES DICKENS: SOME PORTRAITS AND HOMES OF THE GREAT ENGLISH NOVELIST**

domestic life was less fortunate. Incompatibility of temper as years went on made itself increasingly felt, until in 1838 husband and wife separated, after she had borne him ten children. For the rest of his life his sister-in-law Georgina Hogarth kept house for him.

Pickwick, by the time the first six numbers had appeared, was an unparalleled success, and in 1836 Dickens accepted the editorship of Bentley's Miscellany, the first number of which appeared in Jan., 1837. Oliver Twist ran serially in this publication until 1839, when Dickens resigned, having meanwhile been at work upon Nicholas Nickleby and occasional plays. The Old Curiosity Shop and Barnaby Rudge both appeared in Master Humphrey's Clock, which was a weekly serial designed as a regular vehicle for his work, but discontinued in 1841.

In 1842 Dickens visited America, publishing on his return his highly critical American Notes. The first part of Martin Chuzzlewit was issued early in 1843, and A Christmas Carol in Dec. In 1844 Dickens visited Italy, where he finished The Chimes. Amateur theatricals were always a joy to him, and in 1845, in distinguished amateur company, he played Bobadil in Every Man in his Humour at Miss Kelly's Theatre.

#### First Editor of Daily News

The Daily News was started in 1846 with Dickens as its first editor. He resigned within three weeks, after gathering round him an extraordinary array of talent. Dombey and Son was finished in 1848, and in 1849 the first monthly part of David Copperfield was published. His fame was now at its zenith, Dickens being the idol of the public, hailed as a warm-hearted champion of the poor and of right against wrong, and identified as a passionate, if not constructive, advocate of social reform. In 1850 he founded his own weekly journal Household Words. Bleak House followed in monthly parts, 1852-53. Hard Times ran as a Household Words serial, 1854; and the monthly parts of Little Dorrit appeared 1856-57. From 1857 he lived at Gad's Hill Place, near Rochester, Kent.

In 1855 he started a series of public readings. In 1859 Household Words was incorporated in a new journal, All the Year Round. This serialised A Tale of Two Cities, 1859. The Uncommercial Traveller, 1860 and Great Expectations, 1860-61. The Christmas numbers of both periodicals were famous. In 1861, 1862, and 1863

Dickens gave numerous public readings; and in 1864 the first part of Our Mutual Friend was issued.

A year later he was in a terrible railway accident at Staplehurst, Kent. Outwardly uninjured, he worked strenuously at the business of extricating the dead and dying. The shock to his nervous system—unrealized at first—proved eventually to be serious. He occupied himself in the five years between the accident and his death in giving readings in the U.K. and in America; and in 1869 began the book he was never to finish, Edwin Drood. But his health was failing. Resolutely determined never to give anything but his best to the public, Dickens—broken in nerve,

*Charles Dickens.*

and a martyr to insomnia—strained outworn strength beyond endurance, and collapsed.

He died at Gad's Hill Place at 6.30 a.m., June 9, 1870. He died as he had lived, the grateful and affectionate servant of the generation for which he had toiled so strenuously, and is buried in the Poets' Corner, Westminster Abbey.

Dickens stands essentially for everything that is English—some may be inclined to add "and middle class." His personality, his sentiment, his humour, are unmistakably English. He combined in himself the qualities, as well as some of the defects, of both sexes. He had not only the strength of English manhood, but not a little also of the wit, tenderness, and sentiment of English womanhood. His most pronounced literary vice, an occasional tearfulness—attributable to what Birrell calls "sentiment, that odious onion"—was due to what was womanlike in him.

G. K. Chesterton wrote that even the average Briton who has never read Dickens knows more about him through his characters than the same average Briton knows about the modern fiction writers whose works he has devoured. Even Chesterton's non-Dickens reading Briton thinks Dickens, talks Dickens, if unconsciously, and would find himself at a loss to apprehend much that he hears or reads were he without the secondhand knowledge of Dickens with which Chesterton credits him.

So real are the characters which Dickens created that to meet one

of them in the street might, for the moment, and until we were recalled to ourselves, occasion us no surprise. It would come almost as natural to say: "Here's Mr. Pickwick!" or "Isn't that Pecksniff?" as so to speak of actual acquaintances. Pickwick, Pecksniff, Micawber, and many another are more than characters out of books. They are integral parts not only of our literature, but also of our life and our language.

#### Unique Place as Novelist

As a novelist, Dickens cannot be classified, for he holds a place in fiction, and in his readers' affection, entirely his own. As a creator of character he stands unrivalled and alone. No other novelist has given us a portrait-gallery of like extent. As the generations come and go there will always be readers whose preference is for novels depicting the life and the day they know. But for the vividness, the variedness, the humour and the sympathy with which he pictures life and character, especially of the middle and poorer classes, of mid-Victorian times, the novels of Charles Dickens will endure while our language lasts.

The standard biography of Dickens was written by his intimate friend of over 30 years, John Forster, published 1872-74, and often reprinted and re-edited, notably by J. T. W. Ley in 1928. It is one of the classics of English biography, and a monument to friendship, and from its pages the admirers of the novelist first learned the details of his early hardships and struggles. But the work suffered from the defects of its virtues by omitting or glossing over many details of Dickens's personal life and character. Recent biographical researches have tended to concentrate on the facts behind Dickens's separation from his wife, and especially on the novelist's relations with the actress Ellen Ternan, to whom he left £1,000 in his will. It is now generally assumed, though by no means proven, that Ellen Ternan became his mistress. A selection of Dickens's letters, much over-edited by his sister-in-law and his daughter, appeared 1880-82. An infinitely more definitive and revealing collection, ed. W. Dexter, was published by the Nonesuch Press, 1938.

The life and work of Dickens have consistently attracted the pens of notable writers, among whom are Swinburne, Gissing, Chesterton, Quiller-Couch, R.

Straus, André Maurois, Stephen Leacock, Bernard Darwin, Hugh Kingsmill, George Santayana, George Orwell, J. B. Priestley. As the central figure of a novel *This Side Idolatry*, by E. Bechhofer Roberts, 1928, the novelist is treated with a deliberate lack of sympathy, though the work possibly had its uses as a corrective. More just re-estimates were offered in Dame Una Pope-Hennessy's *Charles Dickens, 1945*, and Hesketh Pearson's *Dickens, 1949*.

Meanwhile there is no evidence of any decline in Dickens's great popularity, except perhaps among the self-styled intelligentsia. At one period during the 1930s the competition of popular newspapers to increase their circulation led to the flooding of the market with complete sets of Dickens's works as free gifts. Yet during the Second Great War, when his works gradually went out of print and became unobtainable, it became clear that public demand was as great as ever and secondhand editions were greatly enhanced in value. The adaptation of some of the novels as broadcast plays in serial form, notably *Bleak House* in 1942, was a popular move on the part of the B.B.C.; and film adaptations, e.g. *David Copperfield*, 1935, *A Tale of Two Cities*, 1936, *Great Expectations*, 1946, Nicholas Nickleby, 1947, and *Oliver Twist*, 1948, offer further proof of Dickens's universal appeal.

**Dickens, Sir Henry Fielding** (1849-1933). British lawyer. The 6th son of Charles Dickens, he was born Jan. 16, 1849, and educated at Wimbledon and Trinity College, Cambridge. Called to the bar 1872, he took silk in 1892, and one of his most famous cases was the litigation between the insurance companies and the

Sir Henry Dickens,  
British lawyer

insured arising out of the earthquake in Jamaica in 1907. He became common serjeant of the City of London in 1917, was knighted in 1922, and retired in 1932. He died as the result of

being knocked down by a motor-cycle in Chelsea, Dec. 16, 1933. His *Reminiscences* were published the following year.

**Dickens Fellowship.** Society founded in 1902 to perpetuate the memory of Charles Dickens and

disseminate the spirit of his work. Branches throughout the English-speaking world hold meetings for lectures, readings, and social purposes. The *Dickensian*, a quarterly magazine founded by the fellowship as a monthly in 1905, is entirely devoted to the life and work of the author. The headquarters is Dickens House, 48, Doughty Street, London, W.C.1, purchased and equipped as a Dickens museum and opened to the public by the fellowship in 1925. Here *The Pickwick Papers* was finished and several of the earlier masterpieces were written.

**Dickinson, Emily** (1830-86). American poet. Born Dec. 10, 1830, she suffered an unfortunate love affair in 1853, and from that date began to develop as a poet in whose mystic experience few could fully share. She retired from public life, and died May 16, 1886. When a selection of her work appeared in 1892 she was acknowledged as one of America's greatest poets, though it was not until later that she became generally appreciated. Emily Dickinson's highly concentrated style has been likened to that of Emily Brontë. Her *Complete Works* was published in 1925 by her niece Martha Dickinson Bianchi, who published further poems in 1929 and had written a *Life* in 1924.

**Dickinson, Goldsworthy Lowes** (1862-1932). British philosopher. The son of a painter, he was born Aug. 6, 1862, and educated at Charterhouse and King's College, Cambridge, where he was a member of a brilliant group. Elected a fellow of his college, 1887, he was librarian, 1893-96, and then lecturer in history. He died Aug. 3, 1932. A lucid and penetrating thinker, Dickinson exploited the Socratic method of inquiry and revealed a sympathy with classical aesthetics. Some of his ideas anticipated the League of Nations. His works include *The Greek View of Life*, 1896; *Letters of John Chinaman*, 1901; *European Anarchy*, 1916; *The Magic Flute*, 1920. His *Life* was written by E. M. Forster, 1934.

**Dicksee, Sir Francis Bernard** (1853-1928). British painter. Born in London, Nov. 27, 1853,

he was educated at Henslow's school, first exhibited at the Academy in 1876, and became

Sir Frank Dicksee,  
British painter

R.A. 1891. A painter of narrative and historical subjects, his work was greatly admired by a public which appreciated obvious poetic sentiments in a realistic form. His execution was smooth and competent, and his pictures bore such titles as *The Love Story*, *Too Late*, *Funeral of a Viking*, *Daughters of Eve*. Two were bought under the Chantry bequest for the Tate gallery: *Harmony*, 1877, and *The Two Crowns*, 1900. He became president of the R.A. in 1924, was knighted the next year, and died Oct. 17, 1928.

**Dicotyledons** (Gr. *di*, double; *cotyledon*, cup-shaped cavity). Class of flowering plants which, with the class *Monocotyledons*, constitute the *Angiosperms*. The *cotyledons* are the first seedling-leaves present even in the embryo plant within the seed, and may be flat and typically leaf-like in appearance, e.g. wheat, or swollen with food-reserves, e.g. bean. On germination, the seed food-reserves are used up, and the *cotyledons* may either remain below ground and wither, or rise above the soil and form the first green leaves of the young plant.

Dicotyledons always have two seed-leaves, *monocotyledons* only one; and there are other major differences between the two classes. Most dicotyledons have broad, net-veined leaves, stem vascular tissue arranged concentrically in a cylinder, and flower parts in fours or fives; whereas *monocotyledons* generally have sword-shaped, parallel-veined leaves, vascular tissue scattered in small bundles throughout the stem, and flower parts in threes or sixes.

**"Dictaphone."** Proprietary name for a machine which automatically records on a wax cylinder anything spoken into the mouthpiece of the flexible speaking tube. A finger grip on the speaking tube controls the movement of the cylinder, which runs during actual speaking only, and is stopped during pauses. The speaker, to hear what he has said, presses over a small lever, which "back spaces" the recorder carriage, and listens at the mouth-

piece. When the lever is brought forward again to the "dictate" position, the recorder is moved forward to clear the matter already given, and dictation is resumed. The cylinder can be removed to a transcribing machine and the speaker's words heard by a typist, etc. The Dictaphone electronic machine employs electrical recording through a microphone (which serves as a loud speaker when listening). Some models record telephone conversations, interviews, etc.

"Dictaphone": a recording machine. Words spoken into the flexible tube are recorded on the wax cylinder; this, when filled, is transferred to a transcribing machine  
*Courtesy of the Dictaphone Co., Ltd.*

**Dictator.** Magistrate in the Roman republic, appointed only in time of exceptional difficulty and danger. It lay with the senate to determine whether the necessity for a dictator existed, while it was usually one of the two consuls who designated the actual person to be invested with the extraordinary powers. The dictator was assisted in his duties by a lieutenant of his own choice called *magister equitum* (master of horse). In 202 B.C. the old dictatorship was abolished, and was not revived until the time of Sulla, who in 81 was appointed "dictator for drawing up laws and arranging the constitution." His office, however, differed entirely from the old dictatorship. Caesar also frequently assumed the title. In 44 Antony finally abolished the office. Notable dictatorships were those of Fabius Maximus Cunctator in the 2nd Punic war, Sulla, and Julius Caesar.

In modern times the word has been loosely applied to rulers who obtained brief leases of power, e.g. in the South American republics—Bernardo O'Higgins, dictator of Chile, 1817–23. While Adolf Hitler in Germany and Benito Mussolini in Italy each bore a title meaning in English leader, they were popularly referred to abroad as dictators; as were, by their opponents, Joseph Stalin of the U.S.S.R., and Francisco Franco of Spain.

**Dictē.** Ancient name of Lasithi, a mountain over 7,000 ft. high in east Crete. In Hesiod, the birthplace of Zeus is given as the Dictæan

Cave; in Lucian, Zeus led to this cave the maiden Europa. The cave was excavated by D. G. Hogarth in 1900, when proof was found that it was the place traditionally associated with the legend. Dictæus was a Latin adjective for Cretan.

**Dictionary** (Lat. *dictio*, saying, word). List of words, sometimes including proper names, arranged either in purely alphabetical or etymologically alphabetical order, in which words are classed under the same root. Each word is accompanied by an explanation of the meaning, its derivation, and pronunciation, quotations from literature illustrative of its uses being frequently added. The name is supposed to have been first used by John Garland (13th century). There are several terms in use to express works of a similar nature, but differing in certain particulars. The aim of a Thesaurus (storehouse) is to include all the words of a language. A Glossary contains a list of glosses (obscure or antiquated words). A Vocabulary is generally limited to the words, or one special work, of a particular author.

In England the name lexicon is usually reserved for a dictionary of foreign languages, especially Greek and Latin; the German *Konversations-Lexikon* (Brockhaus, Meyer) is rather an encyclopedia. An Idioticon (individual) deals with special forms and idioms; an Onomasticon with proper names.

The term dictionary may be extended to cover all branches of knowledge. There are dictionaries of biography, etymology (deriva-

tion of words), geography (gazetteer), history, law, philosophy, of synonyms and quotations, and rhyming dictionaries; concordances (complete lists of the words in a work, with references to every passage in the text where they occur). The most extensive range of subjects is covered by the encyclopedia, which deals with the whole circle of knowledge.

Earliest Greek and Latin word books were mainly collections of unusual words and phrases, often limited to one particular author. The nearest approach to a modern dictionary is the work of Valerius Flaccus (time of Augustus), *On the Meaning of Words*, of which an abridgement is extant. The lexicon of Suidas (11th century) is partly biographical, partly lexicographical, and specially valuable for its quotations from the works of authors now lost. In the 9th century Arabic and Jewish scholars compiled dictionaries of Arabic and Hebrew. The great Arabic *Kamus* (ocean) belongs to the 14th century. The revival of learning in the West, due to the Greek scholars who left Constantinople after its capture by the Turks, led to the desire for works dealing with linguistic difficulties, and the introduction of printing rendered possible the satisfaction of this desire. Of this nature are the polyglot dictionary of Calepino (1502) in seven languages; the Latin (1531) and Greek (1572) Thesaurus of Robert and Henry Stephanus (Estienne); the glossaries of Du Cange to medieval Latin (1678) and Greek (1688); Forcellini's Latin Lexicon (1771); the Italian *Vocabolario della Crusca* (1612); Dictionary of the French Academy (1694, 8th ed., 1st vol. (1878–1921).

The first real English dictionary was Samuel Johnson's (1755), in which the use of words was for the first time illustrated by quotations; it is still of value. The Oxford New English Dictionary, projected as early as 1857, was issued volume by volume 1884–1928, its principal editor being Sir James Murray (1837–1915). The Universal English Dictionary (ed. H. C. Wyld) first appeared in weekly parts 1931–32. Webster's New International Dictionary (American) appeared in 1911. Famous foreign works are the French series known as Larousse, and in the U.S.A. the Century Dictionary. Among popular small dictionaries are Nuttall's, Chambers's, and the Concise Oxford. See Concordance; Encyclopedia.

**Dicycle.** Machine differing from a bicycle in that the two wheels, between which the rider balanced himself, were parallel instead of being placed one in front of the other. Invented by E. C. F. Otto about 1879, it met with little success.

**Didachē** (Gr. teaching). Short title of an early Christian treatise called in full *The Teaching of the Twelve Apostles*. Various dates from A.D. 65 to A.D. 160 have been assigned to this work which was lost until Philotheos Bryennios, the Greek metropolitan of Nicomedia, discovered it in 1883. The first part consists of *The Two Ways* (of Life and of Death), and includes a collection of counsels on Christian virtues; the second provides a series of rules for baptism, fasting, and the Eucharist; and the third treats of the Christian ministry. The bulk of the *Didachē* was re-issued as the *Apostolic Constitutions* in the 3rd century. The origin of the work has been a matter of controversy. The first part may possibly be a revised edition of a Jewish book of instructions for proselytes; much of it is word for word identical with the Epistle of Barnabas. Several editions have been issued with English translations since 1833. *Pron.* Did-a-kee.

**Didcot.** Town of Berkshire, England. It is 5 m. S. of Abingdon and is a rly. junction for Oxford. The church is possibly 13th century. Near, at Harwell, is a station for atomic research. Pop. 1,660.

**Diddler, JEREMY.** Character in J. Kenney's farce, *Raising the Wind*, 1803. He is an artful swindler who obtains money and credit by imposing upon the credulous. The name has come to be used as a term for swindler.

**Didelphia** (Gr. *di*, two; *delphos*, womb). Sub-class of mammalian animals. It comprises those in which the female is usually furnished with a pouch for carrying the young, such as the kangaroos and opossums. The term is synonymous with marsupial (*q.v.*).

**Didelphyidae.** Family of pouched mammals, comprising the true or American opossums. With the exception of the yapok, a tropical web-footed water-opossum (*Chironectes*), they are of nocturnal habit, mostly arboreal, some of them with the pouch rudimentary or wanting, and constitute the genus *Didelphys*. Found chiefly in Central and S. America, the common or Virginian form ranges into the U.S.A. Fossil opossums called *Peratherium*, found in eocene N. America and Europe—

including Hampshire—disappeared in oligocene times. They were succeeded by the living didelphyids, which developed in pleistocene S. America.

**Diderot, DENIS** (1713–84). French scholar. Born at Langres, in Champagne, Oct. 5, 1713, and educated by the Jesuits, he declined to study law or medicine, and, early thrown on his own resources, turned to literature, working for many years as a bookseller's hack. In 1749

After Greuze

his *Lettre sur les Aveugles*, a philosophical treatise, displeased the authorities, and he was imprisoned for three months at Vincennes. For more than 20 years after this he was chiefly occupied, as joint editor with D'Alembert, with that immense undertaking, the *Encyclopédie*. In later years he was assisted by Catherine II of Russia, whom he visited in 1773.

After Voltaire and Rousseau, Diderot was the greatest intellectual force in the France of his age, but his interests were too wide to allow perfection in any one form of literature. His best known writings are *Le Paradoxe sur le Comédien*, a discussion of the actor's art in which he laid the foundations of the serious drama of ordinary life; his satire *Le Neveu de Rameau*; and two works of fiction, *La Religieuse* and *Jacques le Fataliste*. These were all published posthumously. But his name will always be most closely associated with the *Encyclopédie* (17 vols., 1751–65, and numerous supplements), which under his directorship became a formidable instrument of the most advanced thought of the time. He died July 30, 1784.

From a bibliographical point of view the student of Diderot is faced with huge difficulties. In France, the official hostility to his work made Diderot often reluctant to publish. Instead, he confided his MSS. to friends, who were not always worthy of the trust he reposed in them. As a result, much of his copy was grievously tampered with, and some of his books, notably *Jakob und sein Herr*, 1792, and *Rameaus Neffe*, 1805, appeared first in German translations. See *Encyclopédistes*; consult also *Diderot and the Encyclopaedists*, John Morley, repr. 1891.

**Didius Salvius Julianus, MARCUS.** Roman emperor from March 28 to June 1, A.D. 193. When the praetorian guards, after the murder of Pertinax, put the throne up for auction, Didius was the highest bidder, and thus secured it. On the approach of the rival claimant Septimius Severus, he was murdered by the soldiery.

**Dido or ELISSA.** Legendary founder of Carthage. She was the daughter of Mutgo or Belus, king of Tyre, and the wife of Sichaeus. Sichaeus was murdered for his wealth by Pygmalion, successor of Belus, but Dido secured possession of her dead husband's treasures and with a few followers set sail for Africa. There she purchased from the inhabitants some land on which she built a citadel, the nucleus of the city of Carthage. Iarbas, a neighbouring king, sought her in marriage, but Dido, wishing to remain true to the memory of her husband, stabbed herself. According to Virgil, Dido fell in love with Aeneas when he landed in Africa, and committed suicide after he had deserted her. See *Aeneas*.

**Didon, HENRI** (1840–1900). French preacher and writer. He was born at Touvet, March 17, 1840, and entered the Dominican order in 1858. Ten years later he became famous as a preacher in Paris. During 1880–87 he was engaged in writing a *Life of Christ* (Eng. trans. 1891). He died at Toulouse, March 13, 1900.

**Didot.** Name of a French family of printers and publishers. The founder, François (1689–1757), opened business in Paris in 1713 at the sign of the Bible d'Or. Of his successors, François Ambroise (1730–1804), his son, published the celebrated Dauphin edition of the classics and the 64-volume collection for the Comte d'Artois; Firmin (1764–1836), grandson, invented the word stereotype and utilised the process to issue inexpensive editions of standard works; Ambroise Firmin (1790–1876), great-grandson, translated Thucydides, 1833, wrote a monograph on Aldus Manutius, 1875, and with his brother Hyacinthe (1794–1880) published a number of encyclopedias and a new edition of H. Stephanus' (*Estienne's*) *Thesaurus of the Greek Language*, 1831–65.

Firmin Didot,  
French printer

**Didsbury.** District of Manchester, England. It consists of two eccles. districts, Christ Church and S. James's, in the S. of the city. It has a railway station, and is connected with the centre of Manchester by tram and bus. It is largely residential. There is a training college for the Methodist ministry. Pop. 23,581. *See* Manchester.

**Didymium.** Name given to a substance separated from the cerium-group of metals by Mosander in 1841. Originally believed to be an element, it was in 1885 separated by Welsbach into two elements, praseodymium, atomic number 59, and neodymium, atomic number 60. The term is, therefore, dying out. *See* Neodymium; Praseodymium.

**Die.** Word used in various senses. In coining and engraving, it is an engraved plate block, or stamp for impressing a design or figure upon blanks, planchets, paper, or other material. In coining the dies are countersunk to produce impressions in relief on both sides of the blank.

In punching machines a die is a plate or block for supporting materials to be punched, with a hole cut in it of the same size as the punch, through which pass the pieces of punched metal.

In screw-cutting it is a block of metal provided with an internal screw thread formed with cutting edges and clearance spaces for cutting screw threads on bolts, rods, etc. A screw-cutting die may comprise one or more pieces held in a stock. In forging a die is a pair of metal blocks which impart a pre-determined shape to metal swaged between them. Die is also the singular of dice (*q.v.*). *See* Die-Sinking.

**Diebitsch, HANS KARL FRIEDRICH, COUNT (1785-1831).** Russian soldier. Born in Siberia, May 13, 1785, the son of a Prussian officer in the Russian army, he entered the same service, 1801, and fought at Austerlitz, Eylau, Friedland, and in the campaigns of 1812 and 1814. In the Turkish war of 1828-29 he was commander-in-chief of the Russian forces. His conduct of his army across the Balkans brought him the additional name of Zabalkanski (beyond the Balkans) and the rank of field-marshal. He died June 10, 1831.

**Diedenhofen.** German name for the town in Alsace-Lorraine better known as Thionville (*q.v.*).

**Diego Garcia.** Island of the Indian Ocean, a dependency of Mauritius. In lat. 7° S. long. 72° E.,

it is the southernmost of the Chagos group, has a good harbour, and exports coconut oil, copra, and guano. Length, 12½ m.; breadth, 6½ m. Pop. 501, mostly negroes from Mauritius.

**Diego Suarez.** Port of Madagascar, near the N. extremity of the island. It has a good harbour, and is the headquarters of the French military colony. Meat preserving is an industry. Following the British landings on Madagascar in the first days of May, 1942, Diego Suarez was captured on May 6, and next day the French naval and military commanders surrendered, whereupon the British fleet entered the port. During the attack on the port, two French submarines and an auxiliary cruiser were sunk. Pop. 12,237.

**Die-Hards.** Nickname of the Middlesex Regiment (*q.v.*). Originally the 57th foot, the regiment was at the battle of Albuera, May 16, 1811, when the colonel, though severely wounded, cheered on his men with the words "Die hard, 57th." Over 400 men of the regiment were killed in the action.

The nickname die-hards was applied in 1918 to the Conservative party section of Lloyd George's coalition government which desired a return to party politics. At first few in numbers and small in influence, they eventually found themselves in a majority of three to one and were then able to bring about the collapse of the coalition.

**Dielectric Heating.** A means of obtaining uniform heating throughout the bulk of a slab of material. Its action is dependent upon the power-factor of the substance, which, in practice, forms the dielectric of a condenser to which a high-frequency electric field is applied.

**Dielectrics.** Electrical insulating materials used, *e.g.*, to insulate the plates of a condenser or the copper core of a cable.

The dielectric constant of a material is defined as the capacity of a condenser with the material as dielectric to the capacity of the same condenser with air as dielectric. The development of plastics has produced a number of new dielectric materials which are particularly useful for high-frequency radio work. The dielectric constants of typical materials at a temperature of 18° C. are as follows:

Amber	2.8	Ebonite	2.8
Sulphur	4.1	Flint-glass	7-10
Rubber	2.2	Polystyrene	2.2
		(or Distrene)	

Paraffined paper	2	Polythene	2.3
------------------	---	-----------	-----

The dielectric (or breakdown) strength of an insulating substance is measured by the value of the applied voltage gradient which causes a discharge to pass through the material. It is the particular property of an insulator which determines its suitability or otherwise for high-tension work.

**Dieppe.** Town and seaport of France. It stands where the Arques falls into the English Channel, by rly. 105 m. from Paris and 30 m. N. of Rouen, in the dept. of Seine Inférieure. It has a good, safe harbour, divided into an outer and an inner, and in 1939 was fitted with ample docks, quays, and all modern appliances. From here a regular service is normally maintained with Newhaven, 64 m. away, and other ports.

Dieppe is also a watering-place and a fishing town. For visitors there are a fine promenade, casino, good bathing, golf links, and other attractions. The chief buildings are the restored church of S. Jacques, the churches of Notre Dame de Bon Secours and S. Remy (the last damaged in the Second Great War), and the castle, with its massive defences. Other industries, in addition to the shipping, are the making of tobacco, cotton

Dieppe, Normandy. Pre-war view of the harbour; between this French port and Newhaven there is, in normal times, a regular cross-Channel service

spinning, and shipbuilding. There is a large fish market.

Dieppe was a place of some importance in Normandy, when the latter and England were united. A fortified town, it was besieged several times in the wars between England and France. Many French seamen were born here. It lost its prosperity after the revocation of the edict of Nantes (1685), as many of its inhabitants were Huguenots. It was burned down by the English in 1694 and remained in a state of partial decay until the 19th century, when increasing traffic and its attractions as a watering place gave it new life. Pop. 21,170.

**DIEPPE RAID, 1942.** The Germans occupied Dieppe in the Second Great War soon after the opening of their offensive of June, 1940, and converted it into a fortress, with the sea approaches covered by coastal batteries. On Aug. 19, 1942, a reconnaissance in force was carried out by Allied troops. This had as its objects: (1) testing the ability of the Allies to land a large force and tanks on a heavily defended sector of the coast; (2) testing the German defences on the N. coast of France; (3) discovering the strength of the Luftwaffe in Western Europe; (4) destruction of wireless stations, batteries, and German military equipment. The German commander in the west, von Rundstedt, believed this combined operation was the spearhead of an invading force, while in reality it was a rehearsal for the landings in N. Africa in Nov.

The attacking force, supported by the R.A.F. and the Royal Navy, numbered about 7,000 and consisted mainly of Canadians, with men of British and Fighting French commando units, and U.S. rangers. Five landings were made at dawn; but the convoy carrying the units to land near Berneval accidentally encountered German shipping a few miles off the coast and, reaching the beach nearly half-an-hour late, had to land in broad daylight in the face of heavy opposition from the aroused garrison. The six heavy guns of the battery at Berneval were never silenced, and kept up a steady fire on the men on the beaches and the ships offshore. The Canadians at Puys were unable to storm the strong-points on the eastern cliff above Dieppe, and these inflicted heavy casualties on the troops on the beaches.

The battery at Varengeville being destroyed by British commando troops, tanks were landed at Pour-

ville and Puys. The main beach at Dieppe was under heavy fire from the cliffs, the tobacco factory, and the casino. Some tanks got into the town, where a fierce battle raged round the casino, which had been converted into a formidable fortress. No artillery was landed, and what artillery fire was provided came from naval vessels, but this was scarcely effective. The German posts even withstood fire from the few tanks that did manage to overcome traps and obstacles.

Meanwhile the R.A.F. maintained an umbrella over the area, so that few German aircraft could penetrate to the beaches. By 10 a.m. German reinforcements were arriving, and the withdrawal began, covered by bitter rearguard actions, the R.A.F. and the Royal Navy. Fighting raged for nine hours; nearly half the attacking force became casualties, the courage of the Canadians refusing to admit the superiority of German reinforced concrete.

As well as providing much needed experience, the Dieppe raid fitted into the pattern of Allied offensive strategy in western Europe. The German high command now knew that the Allies could land powerful forces on the Channel coast; and the Russian campaign had set limitations on the German strength in the west, aggravating the problem of the defence of "fortress Europe." When the Allies landed in N. Africa in Nov., 1942, the Germans had to face the threat of attack in the south and at the same time be on guard against more and bigger "Dieppes," followed by invasion.

On Sept. 1, 1944, Dieppe was liberated by the same Canadian regiments as had suffered such heavy casualties during the 1942 raid. The town was largely undamaged, but the port and harbour installations had been destroyed. *Consult We Landed at Dawn, A. B. Austin, 1943; Rehearsal For Invasion, W. Reyburn, 1943.*

David Le Roi

**Diesel, RUDOLF (1858-1913).** German engineer and inventor of the heavy-oil internal-combustion engine bearing his name. Born in Paris of German parents, Diesel studied engineering at technical colleges in Paris, Augsburg, and Munich. He patented the design of his engine in 1892, and built the first full-scale model in 1895. Diesel disappeared on Sept. 29, 1913, while crossing from Antwerp to Harwich. Not until after his death was his engine fully developed and the value of the invention realized.

**Diesel Engine.** Heavy-oil internal-combustion engine invented by Rudolf Diesel. It was known before Diesel's invention that if a charge of air is heated to a sufficiently high temperature, by rapid compression or otherwise, a spray of fuel oil injected into the charge will ignite and continue to burn as long as sufficient oxygen remains to support combustion. For very rapid combustion, however, two conditions must be satisfied: (1) the oil must be injected in a fine spray, i.e. it must be atomised; (2) each small particle of oil must be surrounded by air, i.e. either the spray must penetrate the charge of air or the air itself must be in a state of turbulence.

In Diesel's engine the air in the cylinder was compressed to 500-600 lb. per sq. in. and the fuel was injected by compressed air at 1,200 lb. per sq. in. The rate of fuel injection was adjusted so that combustion took place at approximately constant pressure, the point at which the fuel was cut off being arranged automatically to suit the load on the engine.

Since 1895, when the first Diesel engine was built, developments have been rapid, and engines of up to 12,000 h.p., with 6 to 8 cranks, have been installed in sea-going vessels. In 1910 the first ship to be fitted was the single screw coaster *Vulcanus*, with a six-cylinder engine developing 390 h.p. at 140 r.p.m. The first ocean-going ship was the *Selandia*, in which two sets of 8-cylinder engines developed a total h.p. of 2,340. In 1938, 20 p.c. of the world's tonnage was driven by Diesel engines. The main advantages are increased cargo space and considerably reduced fuel consumption as compared with steam-driven vessels. For a given size of engine the power can be increased by supercharging, the supercharger usually being driven by turbines actuated by the exhaust gases from the engine.

These engines are particularly adapted for efficient working on the two-stroke cycle. The types of engine in use are: (1) single-acting four-stroke; (2) double-acting four-stroke; (3) single-acting two-stroke; (4) double-acting two-stroke. All are in use for marine propulsion, particularly for large units. In the two-stroke engine valves and valve gears, including camshafts and drives, are either completely eliminated or greatly simplified, but effective scavenging of the exhaust gases by the incoming charge of air presents problems. Since the h.p. of a

Diesel Engine: original form. 1. Sectional view; fuel oil is delivered by pump to A, and sprayed in by compressed air; B, air inlet valve; C, cam and lever for valve operation. 2. Details of fuel pump and air-spray inlet

modern two-stroke engine is 60 p.c. greater than that of a four-stroke engine of the same size and speed, the complications in design to solve these problems have proved well worth while, though care is necessary with the cooling arrangements.

The use of compressed air for injection of fuel has been superseded by direct or airless injection of the fuel, the pressure of injection varying from 12,000 lb. per sq. in. in largest engines to about 2,000 lb. per sq. in. The development of reliable fuel pumps operating at these pressures accelerated the change-over and made higher speeds practicable. Mechanical efficiency is also improved by the elimination of the air compressor. These engines, however, do not operate on the true Diesel cycle. Much of the combustion takes place at constant volume; maximum pressures are higher. These engines are now commonly known as airless injection or compression ignition engines.

Diesel rly. engines have the advantages of low fuel consumption, absence of boiler, and consequent saving of water, all of value in countries where long periods of running are the rule and water is scarce. They can be started up from cold, saving time and additional stand-by expenses; and no fuel is consumed during stoppages.

Disadvantages are that the engine is essentially a constant speed unit; and is not self-starting, so that compressed air must be provided for starting. The first disadvantage is overcome either by change speed gearing and hydraulic clutches or by allowing the engine to drive a dynamo and using electric motors for the axle drive. Both methods are in use on Continental and American rlys. With airless injection much higher speeds are now practicable (up to 2,000 r.p.m.); the size of engine for a given h.p. may be reduced and engines of greater power may be accommodated in the limited space available.

Oil engines have been installed in power stations to work in parallel with existing steam plant in order to take temporary peak loads. They can be started up quickly and have no standby losses when not working.

Oil engines working on the compression-ignition cycle (usually single-acting four-stroke) have proved attractive propositions for commercial road vehicles and largely superseded petrol engines in the heavier goods and passenger types with engines running at 1,200-1,600 r.p.m. Their advantages are: (1) use of cheaper fuel; (2) the fuel does not give off inflammable vapour; (3) specific fuel consumption (lb. per hr. per h.p.) at full load is appreciably lower (about two-thirds); (4) specific fuel consumption of the oil engine does not increase greatly at the lighter loads, whereas that of the petrol engine increases rapidly as the load decreases. The Diesel engine has the disadvantage of a comparatively low mean pressure (about 90 lb. per sq. in.) in the cylinder, whereas 180 to 200 lb. is possible with petrol engines, which can also operate at much higher speeds (up to 4,000 r.p.m.). Size and weight of the engine being greater than with a petrol engine of corresponding power, the oil engine is not adapted for high speed motor cars;

but improvements in light materials of high strength and in injection devices are reducing this disadvantage.

Oil engines of the airless injection type commonly drive cement mixers, excavators, mobile cranes, grabs, farm tractors, etc.

A. T. J. Kersey

**Diesel Fuels.** Oils used in Diesel and other compression ignition engines. Large, slow, and medium speed engines of the industrial and marine type generally are not critical of fuel quality and utilise fuel oils (q.v.) with viscosities ranging from 100 to 1,000 seconds Redwood No. 1 at 100° F. High speed engines for road transport, which run on light oil of the gas oil (q.v.) range, are much more sensitive to the ignition properties of the fuels, which should have a cetane number (q.v.) of 50 or more.

**Diesel Index.** The product of the specific gravity of a Diesel fuel (expressed in American Petroleum Institute units) and its aniline point (in degrees F.), divided by 100. This is a rough guide to the ignition quality of the fuel. See Cetane Number.

**Die-Sinking.** Art of making the dies or tools by means of which metals are fashioned into definite forms by pressure applied either by a falling hammer or by some mechanical arrangement of levers or screws. It is an ancient art, and was apparently known to the Greeks 800 B.C. For many generations it was concerned solely with the production of coins and medals, and it was not until the 15th century that a German locksmith first used dies for the production of other metal objects, the first articles made by this process being door hinges.

In the old process of die-sinking, which is still in use to a limited extent, a short round bar of steel is taken, which, if the object for which the die is to be made is an ordinary silver coin, will be 2-3 inches in diameter, and 3-5 inches long. On one end a perfectly true face is turned, the turner using a powerful magnifying glass to secure the desired perfection. An exact copy of the design to be produced, made in lead pencil by the artist, is then transferred to the true face by first coating the latter with a film of wax and then pressing the pencil drawing upon the prepared face.

The engraver will then grave the faint lines of the design through the wax in order to fix them and follow by cutting out the whole design in the solid steel in intaglio,

i.e. by incising or recessing or *sinking*. These incised or sunk parts of the design are those which in the finished coin will stand up in relief. The cutting is done by small, fine, and hard steel chisels, and is a process calling for great skill.

The die so made will rarely be the one used for the production of the coin, as dies quickly become worn. A copy of the original die is therefore made by stamping the design by means of the original die, properly annealed and hardened, into a block of soft steel called the puncheon, which in its turn is hardened and then used in a similar manner to make working dies.

The modern mechanical process is a particular application of the well-known copying lathe. A model three or four times as large as the design required is made in wax, and by means of delicate mechanism a fine drill revolving rapidly is made to follow the surface of the model and thus to cut out the design, of the proper dimensions, pantographically, in a soft steel block or hub, from which working dies are made in the usual way. Vast numbers of dies are made by processes of cutting or sinking analogous to those described, usually with drills, shaping machines or milling cutters, for the production of buttons, spoons, forks, metal pans and cups, silver plate, ornaments, etc.

**Dies Irae** (Lat., day of wrath). Opening words of a Latin hymn, said or sung as a sequence in the Roman Catholic Church on All Souls' Day and at funeral masses. Evidence favours the authorship of Thomas of Celano, a 13th century Franciscan. The first 17 stanzas are double-rhymed triplets and the last two four-rhymed couplets, with two unrhymed lines at the end. No hymn has been so often translated, and more than 200 English renderings are in existence, the best known being that of J. M. Neale, used in the Church of England. Scott paraphrased part of it in the Lay of the Last Minstrel, and Goethe introduces the hymn in Faust. The subject of the Dies Irae is the Last Judgement, and its deeply emotional nature—terror of the day of wrath gradually merging into hope of salvation and eternal rest—has inspired many composers, notably Gounod in his *Mors et Vita* and Mozart in his *Requiem*.

**Diestian.** Lowest geological formation in the Pliocene deposits of Belgium and the Netherlands. It indicates an age when those

lands as well as S.E. England were contemporaneously submerged. Its marine sands contain numerous fossils traceable from the Netherlands through Antwerp, Boulogne, and Folkestone to Lenham, on the edge of the Kentish chalk. These Lenham beds represent a vast English Diestian deposit which, except for them, has entirely disappeared. The name is derived from Diest, a town 20 m. N.E. of Louvain, Belgium.

**Diet.** Regulation of personal feeding with a view to correct balancing of constituents, and the maintenance of health. (For problems of diet, see under Food and Nutrition.)

Knowledge of food values and of the preparation of food substances becomes especially important during ill health and recovery therefrom. No longer does a meal for the sick consist of a piece of white fish, a white vegetable covered with a white sauce, and a white milk pudding; care is taken to provide a colour scheme that interests the eye, flavours that pique the appetite, and difference in the texture of the foods offered. As few pathological conditions do not require an appropriate diet, all well organized hospitals and clinics have a trained dietician on the staff.

In a disorder of metabolism like diabetes the carbohydrate intake must be balanced against the blood sugar curve of the patient and his insulin dosage; diet in a wasting disease such as tuberculosis must be rich in material for the rebuilding of tissue; diseases due directly to vitamin deficiencies like scurvy and rickets demand food to make good the recognized lack. Impaired liver function necessitates the absence of fat and raw milk from the diet; impaired kidney function is helped by a protein intake.

**Diet.** In constitutional history, an assembly of those responsible for the government of a country, or the estates as they are sometimes called. The word has come to be used for the various assemblies known in Germany as Tag, Reichstag, Landtag, and others. The nearest English equivalent is parliament, although diet does not carry necessarily the idea of an elected assembly.

The chief diet was that of the Holy Roman Empire, the Reichstag or imperial diet, consisting of three colleges or estates; its famous meeting at Worms (*q.v.*) was in 1521. Another was the Reichstag of

the German Empire of 1871–1918, and there were local diets in the various states of Germany and the provinces of Austria-Hungary, while the term was also used for the parliaments of Poland and other countries. The Germanic Confederation of 1815–66 had its diet or Bundestag. The word diet in this sense, and also in that of a special course of food, is derived from Gr. *diaita*, late Lat. *diaeta* (mode of life), which, popularly associated with Lat. *dies* (day), came to bear the sense of a day's ration; a day set apart for certain business, and hence a meeting for transacting such business. See Bundestag; Estates; Landtag; Reichstag.

**Dietetics.** This practical application of the science of nutrition is dealt with under Food and Nutrition.

**Diethylene Glycol Dinitrate.** Liquid explosive which has been used as a substitute for nitroglycerine in propellants. It is a viscous colourless liquid, slightly soluble in water; has a low vapour pressure (0.007 mm. at 22.4° C.), and freezes at –11.5° C.; is miscible at ordinary temperatures with nitroglycerine, ether and acetone, and methyl alcohol; is much less sensitive than nitroglycerine, and rapidly gelatinises collodion cotton. It is made by nitration of diethylene glycol, which can be readily synthesised from ethylene. This makes it of high potential value in propellant manufacture if insufficient fats are available for glycerol.

**Dietl, EDUARD** (1890–1944). German soldier. He was born July 21, 1890, at Aibling, Bavaria. In the First Great War he served with distinction and in 1919 fought the Bavarian Socialist government. A convinced Nazi, Dietl commanded a battalion of mountain troops in 1931, and in 1938 took part in the invasion of Austria. As major-general, he was in the attack on Poland in 1939, and in 1940 played a great part in the Norwegian campaign, being responsible for taking Narvik, and holding in Nazi propaganda a position second only to that of Rommel. In 1942 he had become colonel-general and was in command of the Lapland army. He was killed in an air accident near Vienna, June 23, 1944.

**Dietrich, MARLENE** (b. 1902). German-American film actress. Born in Berlin, Dec. 27, 1902, she sprang to fame in the German film *The Blue Angel*, with Emil Jannings, in 1930. She went to

Hollywood, where in a series of films designed to enhance her blonde appearance she became the most famous of the screen's glamour stars, her popularity rivalling that of Greta Garbo (*q.v.*). Films in which she appeared included *Shanghai Express*, *Song of Songs*, *The Blonde Venus*, *Seven Sinners*, *Destry Rides Again*, *The Spoilers*, *Kismet*.

**Dietrich, Otto** (b. 1897). German politician. He was born Aug. 31, 1897, and became a journalist in the Ruhr. In 1931 he was made head of the press organization of the Nazi party, and in 1933 vice-president of the national press chamber. Goebbels secured his dismissal, March 30, 1945. For inciting Germans against Jews and directing the anti-Jewish campaign, he was sentenced to 7 years' imprisonment by a U.S. military tribunal at Nuremberg, April 14, 1949.

**Dietsch.** Term used by the Dutch Nazi party before the Second Great War as a common name for a "greater Netherlands" embracing the Flemish peoples of the Netherlands and Belgium. The movement had the support of Hitler until he invaded the Netherlands in May, 1940.

**Dieu et Mon Droit** (Fr., God and my right). Watchword or parole given to his army by Richard I at the battle of Gisors in 1198. After the defeat of the French he took the words for his motto, to emphasise the fact that he disowned any vassalage to France, but held his right from God alone. The phrase was adopted by Henry VI and has remained the motto of his successors on the English throne, being still inscribed on the royal standard.

**Dieulafoy, AUGUSTE MARCEL** (1844-1920). French archaeologist and engineer. Born at Toulouse, Aug. 3, 1844, he served as a civil engineer in Algeria and Haute-Garonne. At Susa he unearthed, in 1884-86, the palace of Darius I and Artaxerxes Mnemon. His wife, Jane Dieulafoy, who accompanied him, published the journals of their expeditions. His works include *L'Art Antique de la Perse*, 1884-89; *Le Château Gaillard et l'Architecture Militaire*, 1898; *La Statuaire Polychrome en Espagne*, 1903; *La Mausolée d'Halicarnasse*, 1911. He died in Paris, Feb. 26, 1920.

**Diez, FRIEDRICH CHRISTIAN** (1794-1876). German philologist. Born at Giessen, March 15, 1794,

and educated there, from 1830 he was professor of Romance languages at Bonn. The founder of Romance philology, he did for the Romance languages what Grimm did for the Teutonic and Bopp for the Indo-European languages generally. His two great works are *Introduction to the Grammar of the Romance Languages*, 1836; and *Etymological Dictionary of the Romance Languages*, 1853. He died May 29, 1876.

**Differences.** A term used in mathematics. Finite differences are the differences which occur successively in the terms of an algebraic series. The method which deals with them is called the calculus of differences or the theory of finite differences. Consider a series consisting of the terms, 1, 4, 9, 16, 25, etc., of which it was desired to discover the subsequent terms. The first differences of the series are obtained by subtracting from each term the term immediately preceding it. A new series then arises: 3, 5, 7, 9, etc. If this is treated in the same way we arrive at the second differences of the original series. In the example chosen the second differences form the series 2, 2, 2, 2. This series suggests a law of formation of the original series and enables us to continue it.

**Differencing.** In heraldry, a method adopted for distinguishing armorial bearings of various members of a family, or of arms assumed by feudal dependants or clients. It goes much farther than cadency, but takes many forms. Sometimes the tinctures are varied, sometimes the lines of demarcation or the outlines of the ordinaries are varied, these from plain being given as indented, wavy, nebuly, and so on. Some differences are merely temporary, or personal; thus a bishop may add a crosier or a mitre to his paternal arms. *See* Cadency; Heraldry.

**Differentia.** In logic, the essential quality which distinguishes one species from the other species of the same genus or one individual from another.

**Differential Calculus.** In mathematics, the study of the rules and processes for obtaining the differential coefficients of functions of variable quantities. *See* Calculus.

**Differential Equation.** An equation involving differentials—i.e. infinitesimal differences between consecutive values of a continuously varying quantity. It can be defined more strictly as a relation between one or more func-

tions and their differential coefficients. *See* Calculus; Equation.

**Differentiation.** Biological term signifying the process as the result of which tissues of living creatures become distinct from each other. In non-cellular forms there is little differentiation of structure or function. The whole organism performs all the functions necessary to life. In cellular organisms, however, different cells become set apart for different duties, so that quite low in the scale of creatures we find special organs of generation, locomotion, and so forth. *See* Cell; Evolution.

**Differentiation.** In geology, the production of different types of igneous rock from the same parental magma or melt. Various processes have been invoked to account for this phenomenon. The one most commonly accepted is crystal sinkage. When molten rock-matter cools slowly in the earth's crust, the first minerals to form are those having the highest melting point. These are rich in magnesium, iron, and lime, but poor in silica and alkalis. They have a relatively high density, higher than the fluid which surrounds them. In consequence they may sink through the liquid, which becomes enriched in those constituents which are not removed. The original melt is thus split into two (or more) fractions, one of which is made up of fluid plus the heavy early formed crystals, while the other lacks the constituents of the crystals which sank. Intrusion as dykes or sills, or extrusion as lavas through a volcano, of the two fractions would yield rocks of differing constitution but derived from the same parental source. Many geologists believe that, in the earliest days of the earth's history, the light granitic crust which now forms the main mass of the continents, and rests on a heavier and more basic substratum, was produced by processes similar to those outlined.

**Diffraction.** A term used in physics. If plane waves generated in a pool of water are incident upon a vertical board which contains a narrow vertical slit, the waves emerging from the farther side are not limited to a narrow beam but spread out approximately as circles with the slit as centre. This result is in support of Huyghen's assumption that each point on a wave-front can be treated as a source of secondary waves, *e.g.* in the figure, each point, a, b, c, d, etc., in the wave-

front  $W F$  gives rise to secondary wavelets which combine to form at a later instant the wave-front  $W' F'$ . These wavelets mutually interfere except at the points  $a^1, b^1, c^1, d^1$ , etc., where they touch the wave-front. As in Huyghen's construction, if the number of slits is increased the emerging wave-fronts become more nearly straight.

Diffraction. Diagram to illustrate the term. See text

This departure from rectilinear propagation, or diffraction, depends upon the length of the waves in relation to the size of the object or opening. The phenomenon is met with more frequently in everyday life with sound than with light waves, since the former are of longer wave-length and thus more comparable with the size of ordinary objects. Study of diffraction, however, led to the conception of rays of light, which forms the basis of geometrical optics. Shadows cast by light are usually sharp; but if a straight edge is set up parallel to a narrow illuminated slit and the shadow cast is received on a screen just behind the edge, the shadow will not be sharp. Instead a number of alternate bright and dark parallel bands will be seen outside the geometrical shadow, while within it the light will shade off gradually. These light and dark bands are known as diffraction bands and may be obtained in many other circumstances, e.g. when a needle (or wire) is illuminated by light from a parallel slit.

**Diffraction Grating.** A device in which a number of similar obstacles are arranged at equal distances apart, and (in a plane grating) all in one plane. A plane wave-front falling on such a grating sets up secondary wavelets at the spaces between the bars; the wavelets either reinforce or destructively interfere with one another. For use with light waves the grating consists of parallel lines (up to 40,000 per inch) ruled on glass or on speculum metal; when white light is employed the diffracted beams will give rise to a series of spectra on a suitably placed screen. The employment of a plane grating in

conjunction with a spectrometer allows very accurate measurement of wave-lengths of spectral lines. Concave gratings are also utilised. Diffraction gratings for sound experiments to obtain acoustic spectra may be constructed from metal strips or wires fixed in a framework parallel to one another and at a constant distance apart.

**Diffusion** (Lat. *diffundere*, to spread by pouring out). The intermingling of gases. If two bottles of the same size, one containing hydrogen and the other carbon dioxide, are placed mouth to mouth with the hydrogen bottle on top, after a time it will be found that half the hydrogen has travelled into the lower bottle and half the carbon dioxide has ascended into the upper one—although carbon dioxide is twenty-two times as heavy as hydrogen. A gas diffuses into a space already filled with another gas just as if this gas did not exist in the space.

If two liquids which will mix are introduced into a bottle so that the denser is below and the lighter above, then, as with gases, diffusion will take place. The rates at which liquids diffuse are, however, all extremely slow when compared with those of gases, and differ greatly.

In metallurgy, diffusion has several practical applications, for the carburising and case hardening of mild steel is brought about by introducing carbon into the surface and allowing it to diffuse towards the interior under the influence of high temperature. In annealing, a heterogeneous structure may be rendered more uniform in composition by this process. In powder metallurgy, diffusion is relied upon to give a uniform material resembling in structure and properties a wrought alloy of the same composition.

**Digamma** (double gamma). Sixth letter of the old Greek alphabet, formed by placing one gamma ( $\Gamma$ ) above another ( $\Gamma$ ). Its original name was Vau, and its sound approximately that of English W. In the Latin alphabet the form, but not the sound, was preserved as F. It gradually disappeared in Greek, but its influence may be seen by comparing Greek *oikos* with Latin *vicus* (English, -wick), *Hestia* with *Vesta*, *Hesperus* with *Vesper*.

**Digastric Muscle** (Gr. *di*, double; *gaster*, belly). Muscle attached to the mastoid process (a bony protuberance which lies behind the ear) and to the inner side of the lower jaw. A tendon passes

from the centre of the muscle to the hyoid bone in the upper part of the front of the neck. Its action, when the posterior part is fixed, and the hyoid bone is depressed, depresses the lower jaw, and, when the lower jaw is fixed, raises the hyoid bone.

**Digby.** Town of Nova Scotia, Canada, capital of Digby co. It is on Annapolis Basin, an inlet of the Bay of Fundy, 150 m. W. of Halifax, with which it is connected by rly. The harbour is virtually landlocked, and the chief occupations are herring fishing and curing. Pop. 1,657.

**Digby, Sir Everard** (1578–1606). English conspirator. Born May 16, 1578, the son of a large landed proprietor, he became a Roman Catholic, and in 1603 was knighted by James I. Catesby, needing money, persuaded Digby to join the Gunpowder plot in Oct., 1605, and to prepare a rising in the Midlands. When the plot failed, Digby rode off with some of his accomplices to Holbeche, Staffordshire, where he was captured. He was imprisoned for two months in the Tower, and then tried. He pleaded guilty, and was executed in S. Paul's Churchyard, Jan. 30, 1606. See Fawkes, Guy; Gunpowder Plot.

**Digby, Sir Kenelm** (1603–65). English author, naval commander, and diplomat. Born July 11, 1603. the son of Sir Everard Digby, he was educated at Gloucester Hall (Worcester College), Oxford. In 1623 he was knighted, and in 1625 he married the celebrated

Kenelm Digby  
After Van Dyck

Venetia Stanley. In 1628, in command of a privateering expedition, he defeated a French and Venetian squadron off Alexandretta. As a Roman Catholic, he incurred the suspicion of the Long Parliament, 1642–43, was imprisoned, and was exiled to France, where he became chancellor to Queen Henrietta Maria. This office he continued to hold after the Restoration, in spite of the fact that, on a visit to England, 1654–56, he had carried on negotiations with Cromwell. He died June 11, 1665, and was buried in Christ Church, Newgate. Of his numerous scientific and philosophic writings the best known are *Observations* (1643) on Sir Thomas Browne's *Religio Medici*,

and Two Treatises: Of Bodies, and of Man's Soul, 1644. He was one of the earliest F.R.S. Consult Sir Kenelm Digby and his Venetia, E. W. Bligh, 1932.

**Digestion** (Lat. *digerere*, to carry apart, divide). Process by which food is reduced by organs to a chemical condition in which it can be absorbed and used by the body tissues as a source of energy and structural formation and repair. See Food and Nutrition.

Indigestion is the condition known as dyspepsia (*q.v.*).

**Digger.** Agricultural implement for turning up the soil. It has either a wheel fitted with blades like ploughshares, which lift and turn over the earth as the machine is drawn along, or a series of blades which go into the ground and are drawn out with a twist. Single-furrow ploughs with short breasts for wide broken work, which throw over the soil with a spade-like motion, are also called diggers. The term is further used for an apparatus which digs up potatoes. In this case a broad iron blade goes into the ground under the potato plant and lifts it up, while a revolving wheel with a series of forks throws the potatoes to the side, a wooden screen hanging out from the machine on a rod preventing the potatoes from being thrown too far.

The colloquial term digger signifying an Australian was introduced during the First Great War and is still occasionally heard.

**Digges**, LEONARD (d. c. 1570). English mathematician. Born at Barham, Kent, and educated at University College, Oxford, he devoted his time and ample means to scientific pursuits. He anticipated the discovery of the telescope. His works are *A Prognostication Everlasting Containing Rules to Judge the Weather*, 1553; *Tectonicon, Briefly Showing the Exact Measuring and Speedie Reckoning all Manner of Land, Squares, Timber, Stone, etc.*, 1556; and the posthumous *Geometricall Practise Named Pantometria*, 1571; and *Arithmetical Militare Treatise Named Stratoticos*, completed by his son, who was also a distinguished mathematician.

**Digit** (Lat. *digitus*, a finger). Name for a single numeral, as 0, 1, 2, up to 9; or as a measure, a finger's breadth. In astronomy a digit represents the twelfth part of the diameter of the sun or moon. See Arithmetic; Decimals.

**Digitalis** (Lat., of the finger). Genus of biennial and perennial herbs of the family Scrophularia-

ceae, of which the foxglove (*Digitalis purpurea*) is a familiar example. Natives of Europe, N. Africa, and W. Asia, they have crowded leaves forming a rosette in their first year, but later develop a tall, flowering stem, with bell-shaped, tubular flowers adapted for fertilisation by bees. Another variety, *D. lanata*, the glucosides of which have been a subject of study is a plant about 3 feet tall and found in Central Europe.

The leaves of the foxglove contain several powerful principles which render them valuable in certain forms of heart disease. The dried, powdered leaves may be administered, or the infusion or tincture prepared from the leaves. Several active principles have been extracted, some in crystalline form. Digitalis acts upon the heart by increasing the force of its beat and slowing its action; the degree of the latter effect varies according to the type of abnormal condition of the heart. In some forms of irregular heart action it tends to reduce and sometimes abolishes the irregularity.

Digitalis accumulates in the body, and, if taken for longer periods, may set up symptoms of poisoning—nausea, loss of appetite, vomiting, slow pulse, irregular heart beat, faintness, giddiness; patients vary greatly in their susceptibility to the drug and the kind of symptoms they develop.

The patient should be kept lying down, external warmth applied, and brandy or hot coffee administered. When the symptoms are due to taking a single large dose, the stomach should be washed out or an emetic given, unless there has been profuse vomiting. See Foxglove.

**Digitigrade Animals** (Lat. *digitus*, finger, toe; *gradi*, to walk). Term applied to animals, such as the dog, which walk on their toes, as contrasted with plantigrades, such as the bear, which walk on the whole undersurface of the feet.

**Dihedral** (Gr. *di*, double; *hedra*, seat). Angle between any two surfaces. In aeronautics, the angle at which both port and starboard wings of an aeroplane or glider are inclined upwards or downwards to the transverse axis. If the inclination is upward, the dihedral is positive. See Aeronautics; Angle (and illus.).

**Dijon.** City of France, capital of the dept. of Côte-d'Or. It stands under the Côte d'Or mts., where the Ouche and the Suzon rivers meet, and also on the Burgundy Canal, 210 m. by rly. S.E. of Paris. It was once the capital of Burgundy. There is little left of the palaces of the dukes, but some of their fine tombs remain. The cathedral of S. Bénigne, once an abbey church, dates from the 13th century. Notre Dame, with its wonderful W. front and an old clock, is noteworthy, as are S. Michel and S. Jean.

The hôtel de ville houses one of the most complete collections of paintings, etc., outside Paris; here are also antiquities and the city's archives. Other buildings are the palais de justice, where the parliament of Burgundy sat, and an exchange, once a church. There are remains of the Chartreuse, built by Philip the Bold for a mausoleum. Dijon has a university, founded 1722, with faculties of law and science. It is the rly. junction where the route from Paris to Marseilles reaches the Rhône valley, has a trade in wine and agricultural produce, and

Dijon. General view of the French city looking west from the church of S. Michel. The twin towers in the distance are those of the cathedral

manufactures tobacco and flour. Its liqueur is famous.

Dijon was a Roman settlement, but the years of its glory were about 1360-1477, when the dukes of Burgundy lived there. It was afterwards the residence of the princes of Condé. The Germans met with a stout resistance here in 1870-71. Dijon was occupied by the Germans, June 18, 1940, but later included in Vichy France. The airfield and rly. were bombed by Allied air forces. French troops occupied Dijon, Sept. 11, 1944, the Germans retreating towards the Belfort Gap. Pop. 100,664.

**Dikoa** or **DKWA**. Town of Nigeria, in the district (formerly native state) of Bornu. It lies 26 m. S. of Lake Chad. The former palace of Rabah is now the government house. The sultan of Bornu resides in the town, and the inhabitants are Mahomedans.

**Dilapidation** (Lat. *di*, apart; *lapis*, a stone). Term used in general for the act of allowing a building to fall into decay or ruin. In ecclesiastical law its plural, dilapidations, has a significance of its own. A rector, vicar, or other incumbent, being legally a tenant for life, is bound to maintain and keep in proper repair his rectory, vicarage, or other official residence, and all buildings belonging to the house or glebe. In the Middle Ages a rector, but not a vicar, was also responsible for the chancel of the church. Later this was generally chargeable to church rates or voluntary gifts. Since 1940 the repair of the chancel is provided for by a special fund administered by the diocesan authority. Under Church Assembly Measures 1924 and 1929 the rest of the incumbent's responsibility for dilapidations is covered by a similar fund to which he contributes.

**Dilatancy**. Term applied by Osborne Reynolds, F.R.S. (1842-1912), in considering arrangements of particles (such as atoms), the alteration of which would alter their shape or bulk. The dilatancy of a grouping of granular masses or particles would be due to the increase of space between these rigid particles when the grouping was changed.

**Dilemma** (Gr. *dilēmma*, double assumption). In logic, a form of contradiction in which it is shown that the proposition to be contradicted can be correct only under one of two equally impossible suppositions. An example of one kind of dilemma is: if A exists, then either B or C exists; but neither B nor C exists, therefore A does not

exist. In ordinary language, a state of things in which only two courses of action are open, both equally undesirable. The "horns" of the dilemma are the two assumptions, from either or both of which an unacceptable conclusion follows. The idea is that a person is caught between (Gr. *dialambanesthai*) two difficulties, the Latin equivalent *complexio* (grasping) bearing the same meaning. See Logic.

**Diligence**. Stage coach once much used on the Continent, and in America; also in England from the middle of the 18th century, until superseded by steam trains. The large diligence was drawn by from four to seven horses, and weighed, with its freight, five tons. It had three compartments, the *coupé* in front for three passengers, the middle coach for six, and the *rotonde* behind for another six. In addition to these, behind the bench on which the conductor sat, which itself was behind the driver's seat, was a space in which the luggage was packed. The small diligence had only two compartments, the *coupé* and the middle or in-

Diligence. A form of stage coach

*terieur*. The word diligence appears at one time to have had the meaning of dispatch, haste. See Coach.

**Dilke, CHARLES WENTWORTH** (1789-1864). British critic and journalist. Born Dec. 8, 1789, he entered the Navy Pay Office, but his main interest was in literature, although he remained in the civil service until 1836. He acquired the Athenaeum in 1830, edited it until 1846, and was manager of the Daily News, 1846-49. He edited Old English Plays, 1814-16; and wrote on Pope, Junius, and Wilkes. He died at Alice Holt, Hants, Aug. 10, 1864. His collected articles were published in 1875, as Papers of a Critic, edited by his grandson, Sir Charles W. Dilke. His son Charles Wentworth Dilke (1810-69) was made a baronet in 1862.

**Dilke, SIR CHARLES WENTWORTH** (1843-1911). British politician. The son of Sir Charles Wentworth Dilke (1810-1869) and the grandson of Charles Wentworth Dilke, he was born in London, Sept. 4, 1843. Educated at Trinity Hall, Cambridge, he showed himself a bril-

liant scholar and also something of an athlete, and on leaving the university was called to the bar. In 1869 he succeeded his father as 2nd

Sir Charles Dilke, British politician  
London Stereoscopic Co

baronet and chief proprietor of the Athenaeum and Notes and Queries. In 1868 he entered parliament as M.P. for Chelsea. Closely associated with Chamberlain, the two entered Gladstone's ministry in 1880, Dilke becoming under secretary for foreign affairs. In 1882 he entered the Cabinet as president of the Local Government Board, and the highest honours of political life seemed to be within his reach.

In 1885 Dilke's official career was ended by his appearance as co-respondent in a divorce case. In 1892 he was M.P. for the Forest of Dean, Chelsea having rejected him in 1886. Chelsea elected him once more in 1905, but he had no further influence, and died Jan. 26, 1911. His wide knowledge of foreign and colonial affairs was set out in The Present Position of European Politics, 1887; Problems of Greater Britain, 1890; The British Empire, 1899. A Life of Dilke by S. Gwynn and G. M. Tuckwell (2 vols.) appeared in 1917.

**Dilke, EMILIA FRANCIS, LADY** (1840-1904). British art critic. A daughter of Major Henry Strong, of the Indian army, in 1861 she married Mark Pattison. After his death she married, in 1885, Sir Charles Dilke. In addition to acting as art critic to the Academy, she gave considerable support to the formation of women's trade unions. Her last work, The Book of the Spiritual Life, 1905, contained a memoir by Sir C. W. Dilke.

**Dill** (*Anethum graveolens*). An annual herb, one of the family Umbelliferae. It is a native of S. Europe and Asia, with leaves much divided into very slender lobes. The minute yellow flowers are disposed in umbels. The small flat-tish fruits are the dill "seed" of commerce, used for distilling oil of dill and for making the carminative dill-water.

Dill, an annual herb

**Dill**, SIR JOHN GREER (1881-1944). British soldier. Born at Lurgan, co. Armagh, Dec. 25, 1881, he was educated at Cheltenham College and the Royal Military College, and served on the Western Front throughout the First Great War. Director of military operations and intelligence in 1933, he was appointed G.O.C.-in-C., Aldershot, in 1937, and knighted that year. At the outbreak of the Second Great War he went to France as commander of the 1st corps; on May 26, 1940, he succeeded Lord Ironside as chief of the imperial general staff, retiring Dec. 25, 1941. Dill was promoted field-marshal and it was announced that he had been named governor-designate of Bombay, but he was given special employment in Washington. Sir John accompanied Winston Churchill on his visit to President Roosevelt and remained at Washington as head of the British joint staff mission. He died there on Nov. 4, 1944, and was buried in the Arlington National Cemetery.

Sir John Dill,  
British soldier

**Dillenius**, JOHANN JACOB (1687-1747). German botanist. Born at Darmstadt, of German parents, he was educated at Giessen in Upper Hesse. Dr. W. Sherard, consul at Smyrna (Izmir), induced Dillenius to come to England. He published *Hortus Elthamensis*, 1732, and *Historia Muscorum*, 1741. Sherard left £3,000 to found a chair of botany at Oxford, to be held in the first instance by Dillenius, who retained the position from 1734 until his death, April 2, 1747.

**Dillinger**, JOHN (1902-1934). U.S. criminal. Son of an Arizona farmer, he killed 14 people during a long career of robbery and murder, becoming described officially in the U.S. as Public Enemy No. 1. Betrayed by a former mistress, he was shot dead by Federal agents on July 22, 1934, while resisting arrest after leaving a cinema in Chicago.

**Dillon**, ÉMILE JOSEPH (1855-1933). Irish scholar and journalist. Brother of John Dillon, he was born in Ireland, and educated at the Collège de France, Paris, and at several European universities. He became an authority on Oriental literature, and was Russian correspondent to the Daily Tele-

graph, 1887-1914. One of the best known journalists of the day, he reported the Armenian atrocities, 1895; the Boxer rising, 1900; the Portuguese revolution, 1910; and the peace conference, 1919. His many books included *Maxim Gorky*, 1902; *The Future of Mexico*, 1921; *Leaves from Life*, 1932. He died June 9, 1933. *Consult Life*, H. Baerlein, 1947.

**Dillon**, JAMES MATHEW (b. 1902). Irish politician. Born in Dublin, he was son of John Dillon (v.i.). Educated at Mt. S. Benedict, co. Wexford, and the national university of Ireland, he was called to the Irish Bar, and elected to Dáil Eireann as Independent deputy for co. Donegal in 1931. He founded, with Frank MacDermott, the National Centre party, by which he was returned for Donegal in 1933. When this party, the League of Youth, and the Cumann nan Gaedheal combined to form the Fine Gael party, he was chosen vice-president. After O'Duffy's resignation, 1938, Dillon became deputy leader of the opposition, but resigned 1942 in protest against the party's neutrality policy. Elected 1942 and 1948 as Independent for co. Monaghan, to which constituency he had transferred in 1937, he became minister for agriculture in Costello's coalition, 1948.

**Dillon**, JOHN (1851-1927). Irish politician. A son of John Dillon, M.P., a leader of the Young Ireland party, he was educated at the university of Dublin, and became a doctor of medicine. In 1880 he entered the house of commons as M.P. for Tipperary, and was imprisoned as an ardent Nationalist. During 1883-85 he was on a ranch in Colorado but in 1885 was returned for East Mayo, which he represented for over 30 years.

Dillon was one of the most active spirits of his party. He took part in the movement called the plan of campaign, was more than once in prison, and was suspended in the house of commons for violent language. He succeeded Justin McCarthy as chairman of the Irish parliamentary party in 1896, resigning in 1900 so as to bring about reunion with the Parnellite minority group. John Redmond, who had a moderating influence upon Dillon, constantly

consulted him, and in March, 1918, on Redmond's death, he was chosen leader of the Nationalists, but the triumph of Sinn Féin left him almost without a following. He died Aug. 4, 1927.

**Dilly**. Capital and chief seaport of Timor, Portuguese E. Indies. It is on the N. coast of the island. In the Second Great War the Japanese, landing near on Feb. 20, 1942, secured the aerodrome, and occupied Portuguese, as well as Dutch, Timor. Pop. 3,500.

**Dilolo**. Marshy lake of Angola. It lies at an alt. of 4,695 ft., near the S. border of the Belgian Congo, and is one of the feeders of the Zambezi. Livingstone discovered it, Feb. 20, 1854.

**Dilution** (Lat. *dilutum*, p.p. of *diluere*, to wash away). Term normally used to indicate the addition of a diluent to a strong liquid to make it weaker. Applied to labour, it means the weakening of the professional status and earning capacity of the specialised worker by allowing semi-specialised or non-specialised workers to perform the same duties. As occupations and professions emerge and become more capable of clear definition, members combine and with varying success form with legal recognition "closed shops."

In Great Britain, doctors, barristers, and clergymen have secured legal definition of their status, and dilution is illegal. Accountants have attempted to do the same. Teachers are unable to form a profession because the state periodically lowers qualifications and standards of entry if there is a shortage of recruits. Among industrial workers there is much more difficulty because skills are difficult to define on paper, and machines are constantly replacing manual skill. In some professions, e.g. journalism, sport, music, nursing, the entrance of amateurs or semi-professionals creates a formidable problem. Extensive dilution weakens craft unions, but in the newer industrial unions, e.g. in the civil service, definition of grade duties, with or without graduated examinations, makes it possible to define status.

**Diluvium** (Lat., deluge). Coarse detrital matter deposited by powerful water-action such as sudden and violent floods. The word, used by Dean Buckland in 1823, in his *Reliquiae Diluvianae*: Organic Remains attesting action of a Deluge, embodied the belief then current that the boulder-clay of the glacial drift proved the Noachian deluge to have been universal.

John Dillon,  
Irish politician  
Haines

The diluvial period is now usually denoted by Lyell's word Pleistocene. See Alluvium.

**Dimazon.** A coal tar product sometimes used, in the form of a 2 p.c. ointment made with soft paraffin, for the treatment of burns, wounds, and skin diseases.

**Dime.** Silver coin of the U.S.A. It is a ten-cent piece, the tenth part of a dollar, and is about the size of a British sixpence.

**Dimension** (Lat. *dimensio*, a measuring off). In geometry or mensuration, a magnitude measured in a given direction. A point has no dimensions. A line has length only, and is therefore of one dimension. A surface has length and breadth—two dimensions. A solid has length, breadth, and thickness—three dimensions. When algebraic expressions were used to represent geometrical figures the idea was extended to them, so that an equation such as  $ax + by = c$  became an equation of one dimension, a quadratic equation  $ax^2 + by^2 = c$  an equation of two dimensions, and an equation in which any variable is of the  $n$ th power, an equation of  $n$  dimensions. See Fourth Dimension; Geometry.

**Dimethylaniline** ( $C_6H_5N(CH_3)_2$ ). Important compound of the group known as alkylanilines. Actually it is aniline in which both hydrogen atoms of the amino group have been replaced by methyl groups. In commercial practice it is prepared by heating aniline with methyl alcohol and hydrochloric acid at  $200^\circ$  to  $250^\circ$  C. until reaction is complete. It is a colourless, strongly basic oil, boiling at  $192^\circ$  C. and having a specific gravity of 0.9567 at  $23^\circ$  C. It is extensively used as an intermediate in the dyeing industry and is the raw material for the manufacture of tetranitromethylaniline (*q.v.*).

**Dimetian.** Name applied by the geologist H. Hicks, F.R.S. (1837–99), to the lowest of three series of pre-Cambrian age which he claimed to have localised in the ancient volcanic rocks of St. David's, Pembrokeshire. Sir A. Geikie (*q.v.*) regarded the Dimetian granite as having been intruded into the surrounding tuffs in Cambrian, or even later times. Later workers consider both to represent a huge pre-Cambrian volcano.

**Dimidiation** (late Lat. *dimidiatio*, halving). In heraldry, dimidating is a method of marshalling two or more coats of arms on one shield. Instead of duplicating the two entire coats and arranging them quarterly, or impaling them by placing them side by side, only

half of each coat is impaled. This gave rise to such curious compounds as the lion-boat, the fore part of a lion passant whose hind part is an ancient galley, or an eagle-bear. As a dimidiation might be "per pale" (perpendicularly), "per fess" (horizontally), "per bend dexter" (by a diagonal line from right to left), or "per bend sinister" (by a diagonal line from left to right), such extraordinary confusion arose that the method was generally abandoned before the 16th century. See Heraldry.

**Diminished.** In music, an interval which is one semitone less than a minor or a perfect interval. See Diminution; Interval.

**Diminishing Returns.** LAW OF. Generalisation in the enunciation of classical economic theory by Turgot, Adam Smith, Malthus, and Ricardo. It did much to earn for economics the opprobrious term "dismal science." Applied at first to agriculture at a difficult period, it asserted that, after a certain stage of cultivation, an increase in the amounts of labour and capital applied to land will yield a diminishing proportionate return of produce. This is true only when the application is at a given time, to a definite area of land, by the same type and quality of labour and capital, and when the produce is real produce. The law has no significance whatever when applied to money values.

Many writers have applied it to the world as a whole, and used it as an argument against planning an increase in the standard of living of the poorer classes. They assert that this cannot be done, for there is a natural limit in the production of necessities. Raise the standard of living of the masses, they say, and up will go the birth rate, population will outstrip the means of subsistence, and the last state will be worse than the first.

History, through progress in science and technology, supplies an answer to this assumption. For a decade before the First Great War, in a world where profit was very widely regarded as more important than increase of produce, and where restriction of output was a recognized and widespread practice, the rate of increase in the primary products needed by man was more than twenty times that of the increase in population.

The law of diminishing returns is of value when studying the relative efficiency of different types of organization under given conditions. It may be restated thus:

an increase in one factor of production, applied with a group of other factors, will, up to a certain stage, increase the total, the marginal, and the average product, but after that stage, there will be a more than proportionate decrease.

**Diminution.** In music (1) the presentation of a musical theme in notes of smaller value, thus: Bach Fugue in E.

Diminution of the same:

(See Augmentation.) (2) The decreasing of a minor or perfect interval by a semitone, through raising its lower or flattening its upper note: e.g. minor seventh.

Diminished sevenths of this minor seventh:

See Interval.

**Dimissory Letters.** Eccles. documents sent by a bishop to take effect outside his diocese. Their common use is for the ordination of candidates by another bishop. N., for example, is to be ordained to a title in Lincoln diocese. But no ordination taking place at that time at Lincoln, N. receives dimissorial letters from the bishop of Lincoln enabling him to be ordained elsewhere.

**Dimitrov, GEORGI** (1882–1949). Bulgarian politician. Born June 18, 1882, at Radoniev, 25 m. S. of Sofia, one of a large family, he became a composer. In 1900 he was made sec. of the Bulgarian printers' union, in 1904 sec. of the trade union federation of Bulgaria; and in 1909 was put on the central committee of the Communist party. Elected to parliament in 1903, he was imprisoned 1917–18 for anti-war activities, and deprived of his seat. He then went to Moscow, and in 1919 became a member of the executive committee of the Comintern. Returning secretly to Bulgaria in 1923, he took part in an abortive plot against the govt., and went once more into exile. Charged with complicity in the Reichstag Fire (*q.v.*), 1933, he ably pleaded his own cause, and was acquitted. In Moscow again, he became a Russian citizen, and was chosen gen. sec. of the Comintern. In 1945 he renounced his Russian citizenship and returned to Bulgaria, becoming prime minister from 1946 until his death, July 2, 1949, during a visit to Moscow.

Dinan, Brittany. View of the town and of the R. Rance, with the impressive Lanvallay viaduct in the foreground

**Dimity** (Gr. *dimitos*, of double thread). Stout cotton cloth with raised patterns, used for bed furniture and hangings. The figures or stripes are raised on one side and depressed on the other, the two surfaces thus showing reversed patterns. The name is also applied to a fine cotton dress fabric, sometimes with a reversible pattern. In 1641 dimity is mentioned as being manufactured of wool in England.

**Dimorphism** (Gr. *di*, double; *morphê*, form). Term applied to the phenomenon of a living organism assuming two different forms. In certain arthropods male and female are so different in form as to appear to belong to different genera (sexual dimorphism). Some butterflies differ in appearance at different seasons, and some of the individual hydroids in a zoological colony look like entirely different animals.

In chemistry, when a chemical compound may crystallise in two distinct forms it is said to be dimorphous; in three, trimorphous; in general, polymorphous. This property is explained by the fact that atoms constituting dimorphic minerals may be arranged in two different crystalline structures, without affecting the chemical composition as a whole.

Examples include calcium carbonate, which crystallises as calcite (rhombohedral, specific gravity 2.7) and aragonite (orthorhombic, specific gravity 2.9); iron tantalite ( $\text{FeTa}_2\text{O}_6$ ) as tantalite and tapiolite; trimorphous titanium oxide ( $\text{TiO}_2$ ) as rutile octahedrite and brookite.

**Dinagat.** One of the Philippine Islands. Lying to the N. of Mindanao, it belongs to the province of Surigao and is about 309 sq. m. in extent. It has a hilly backbone culminating in a peak over 3,000 ft. in height. Rice and other cereals

are cultivated, and fishing is carried on. Dinagat, the chief town, stands on the S.W. coast.

**Dinajpur.** Dist. and town of the former Bengal prov., India. The area of the district is 3,953 sq. m. In 1947 it was split in the partition of the prov. between E. Bengal (Pakistan) and W. Bengal (India). Dinajpur is noted for its archaeological remains, some dating from the 9th cent., while to others tradition gives a much greater antiquity. There are also some 18th cent. temples. The district is unhealthy, with deserted sites overgrown by jungle. A great rice-growing district, it produces rape, mustard, jute, and sugar-cane. Dinajpur town, on the E. bank of the Purnabhaha river, near its confluence with the Dhapa, is in E. Bengal, Pakistan. It is served by rly. Pop. dist., 1,926,833, almost equally Mahomedans and Hindus; town, 19,200, many of them Hindus.

**Dinan.** A town of Brittany, France, in the dept. of Côtes-du-

Nord. It stands on the Rance, 15 m. S. of St. Malo. Mainly on the left bank, it has on the right a suburb, Lanvallay; the river is navigable, and small steamers go to and from St. Malo. Dinan is remarkably picturesque, with town walls partly intact with three gateways; a castle now used as a prison; the cathedral of S. Sauveur, partly Gothic and partly Romanesque (damaged in the Second Great War), and the church of S. Malo; and interesting ruins in the neighbourhood. It has a river harbour. The viaduct over the Rance is notable. The Tour de l'Horloge dates from the 15th century. The town has some small manufactures and a trade in country produce. Barge-building is carried on. In the Middle Ages it was a famous Breton stronghold, and was associated with the exploits of Du Guesclin, whose heart is buried in S. Sauveur. Pop. 12,737.

**Dinant.** Town of Belgium, in the prov. of Namur. It stands on the right bank of the Meuse with the suburb of St. Medard on the left, 17 m. by rly. S. of Namur. The town's interest lies in its church of Notre Dame, a fine piece of Gothic architecture, and its citadel on a towering cliff above. Normally it is a tourist centre, being visited by those who wish to explore the Ardennes or go boating on the Meuse. The name is said to be a corruption of Diana, and a grotto where that goddess was worshipped is still shown.

Dinant had in the 15th century a pop. est. at 60,000; today it has some 7,000. Destruction of its walls and castle by Charles the Bold of Burgundy in 1466 was the beginning of its decay. It belonged then and afterwards to the bishop-

Dinant. Air view of this picturesquely situated Belgian town, showing the Gothic church of Notre Dame and the citadel on the cliff behind

ric of Liège and became Belgian on the foundation of that kingdom in 1830. In 1566 Philip the Good, duke of Burgundy, besieged and captured it, and, taking 800 of the inhabitants, tied them in couples back to back and threw them into the Meuse. On Aug. 15, 1914, in the First Great War, German advance guards captured the citadel and crossed to the left bank of the Meuse, but shortly afterwards had to recross the river when the French counter-attacked. On Aug. 23, Hausen's 3rd German army attacked the French on the W. bank, and falling upon Dinant killed 600 inhabitants and plundered and burnt the town, 1,263 houses being destroyed out of a total of 1,375. This was recorded as one of the worst German atrocities of the war. What was left of Dinant remained in German occupation until the Allied advance through Belgium in 1918.

**Dinapur** OR **DANAPUR**. Town of India. It is in the Patna district W. of that city, in the prov. of Bihar. Its Sepoy garrison started the Mutiny in 1857 for the Patna district. Pop. 31,025, two-thirds Hindus.

**Dinar**. Currency unit of Yugoslavia. The official 1946 exchange rate was 201.5 to the £1. Zinc coins of 5, 2, 1, and  $\frac{1}{2}$  dinar are in circulation, also notes up to 1,000 dinars. The unit is divided into 100 paras.

**Dinarchus** OR **DEINARCHOS** (c. 361–290 B.C.). Last of the so-called "ten" Attic orators. Born at Corinth, he came to Athens at an early age and wrote speeches for others to deliver. Belonging to the pro-Macedonian party, he was an opponent of Demosthenes, whose style he imitated, but with so little success that he was called the "barley Demosthenes." After the death of his protector Antipater he was put to death by order of Polyperchon. Three of his speeches connected with the affair of Harpalus (*q.v.*) are extant.

**Dinard**. Town and watering-place of Brittany, France, in the dept. of Ille-et-Vilaine. It stands on a headland at the mouth of the river Rance, St. Malo being on the other side of the river. Its prosperity depends mainly upon its numerous visitors, many of whom are, in normal times, English or

Dinard. Municipal casino at this favourite holiday resort on the north coast of Brittany

Parisians, and for them there are hotels, casinos, etc. Near is the popular village of S. Enogat. The Germans occupied Dinard during their advance into Brittany on June 19, 1940. U.S. troops were fighting in the town on Aug. 6, 1944, but it was not cleared of Germans until Aug. 15.

**Dinaric Alps** (anc. *Alpes Dinaricae*). Name given to that range of mountains linking the true Alps with the mountains of the Balkan Peninsula. The range, entirely in Yugoslavia, trends S.E. from the Julian Alps, dividing Croatia from Dalmatia, and extends into Bosnia and Herzegovina, forming the watershed between the rivers flowing to the Adriatic and the basin of the Save. Mostly calcareous, with karst characteristics, the mts. attain an alt. of some 6,000 ft., the chief peaks being Mts. Dinara and Orjen. *See Alps.*

**Dinas Rock**. Natural siliceous stone found in the vale of Neath Glam. It contains normally 98 p.c. of silica. Silica being one of the most refractory of natural substances, resisting the highest temperatures occurring in ordinary metallurgical processes, Dinas rock is largely used in making bricks for lining metallurgical furnaces. The rock is ground to a rather coarse sand, mixed with a little clay or lime, and pressed into bricks. While valuable for use in the simpler classes of metallurgical operations, Dinas bricks do not resist the action of metallic oxides, and must always be used with care, as they expand considerably under high temperatures.

**Dindigul** OR **DINDU-KAL** (The Rock of Dindu). Municipality of Madras province, India, in the Madura dist., 880 ft. above sea level. It is commanded by a

wedge-shaped rock, 350 ft. higher, on which stands a fort, 30 m. N.W. of Madura. Dindigul is a position of considerable natural strength, and in the past has been the scene of much fighting. To-day it is a trading centre and rly. junction, noted for tobacco, hides, coffee, and cardamoms. Cheroot making and the manufacture of silk thread are industries. Pop. 49,000, three-quarters Hindus.

**Dindings**. Strip of territory on the S.W. coast of the Malay Peninsula. It is 22 m. long and is included in Perak state. It yields coconuts, coffee, and pepper. The small island of Pangkor (Dinding) is part of the territory.

**Dingelstedt**, **FRANZ**, **BARON VON** (1814–81). German poet. He was born at Halsdorf, Hesse, June 30, 1814, and educated at Marburg. After having taught at Cassel and Fulda, in 1843 he was appointed librarian to the king of Württemberg. He acted as dramatist or director at the court theatres of Stuttgart, Munich, and Weimar, and from 1872 of the Vienna imperial theatre. He died May 15, 1881. He won popularity with his collection of political poems, *Songs of a Cosmopolitan Stargazer*, 1840. Later, with flippant cynicism, Dingelstedt renounced the liberal opinions and feelings by which he had won recognition. He also edited and translated many of Shakespeare's plays.

**Dinghy**. Bengali name for a small rowing boat. These boats are carried mostly by yachts and small vessels, as they are handy and can be dropped or picked up with ease. Collapsible rubber dinghies were carried by military aircraft in the Second Great War. They

Dinghy. Smallest ship's boat, used also for purposes of pleasure

accommodated from two to eight men, and could be inflated in a few seconds. They were equipped with emergency rations and medical supplies and the larger were fitted with a mast and sail. Some types were automatically inflated when they struck the water. *See Boat.*

**Dingle**. District in the city of Liverpool, England. It has a station on the Liverpool overhead rly. At Dingle Point on the Mersey there is a red group-flashing light. *See Liverpool.*

**Dingle**. Seaport, parish, and market town of co. Kerry, Eire. On Dingle Harbour, a N. arm of

1. Iguanodon of Kent and Belgium, 33 ft. long. 2. American triceratops, 25 ft. 3. Stegosaurus of England and America, 30 ft. 4. Brontosaurus, 60 ft. 5. Diplodocus, 84 ft. 6. Megalosaurus of Europe and India, a carnivorous dinosaur, 25 ft.

**DINOSAUR: RECONSTRUCTIONS OF MONSTER PREHISTORIC REPTILES, MADE FROM SURVIVING REMAINS: See page 2718**  
*Specially drawn by J. F. Campbell from material in the Natural History Museum, South Kensington*

Dingle Bay, 30 m. by rly. S.W. of Tralee, it is a centre of the fisheries, engages in mackerel curing, and exports butter. Linen manufacture was an important industry. Market day, Sat. Pop. 1,884.

**Dingle, HERBERT** (b. 1890). British physicist. Born Aug. 2, 1890, he was educated at Plymouth technical school and the Imperial College of Science. He was a member of British government eclipses expeditions, 1927 and 1932; vice-president of the Royal Astronomical Society, 1938-39 and 1942-44; and from 1946 prof. of the history and philosophy of science, University College, London. His publications include *Relativity for All*, 1922; *Through Science to Philosophy*, 1937; and *Sub-Atomic Physics*, 1942.

**Dingle Bay.** Inlet of the coast of co. Kerry, Eire. It penetrates 24 m. inland and is 18 m. wide at its entrance, where are Dunmore Head on the N. and Bray Head on the S. The bay harbours are Ventry, Dingle, and Valentia; with Castlemaine, separated from the bay proper by a peninsula called Inch, at the head.

**Dingo** (*Canis dingo*). Wild dog of Australia. It varies in colour from greyish red to black, and is a little smaller than the common wolf, the head being blunter and more dog-like. The tail is usually bushy, the limbs fairly long. It is common in the wooded districts of Australia, is nocturnal and shy, and is rarely found in packs. It makes its home mainly in hollow trees, in which its young, about six or seven in a litter, are born.

The dingo is a great pest to sheep and poultry, and a reward is given by the government for killing it. It is often domesticated by the natives, and freely interbreeds with European dogs. It was no

doubt introduced by man at some remote period, but was an inhabitant of Australia in the Pleistocene period.

**Dingwall.** Royal and police burgh and co. town of Ross and Cromarty, Scotland. It is at the head of Cromarty Firth, 18½ m. by railway N.W. of Inverness. There is some shipping, also an important weekly corn market

Dingwall, Scotland. View of the town from the west, looking towards Cromarty Firth

(Wed.). Of Norse origin, created a royal burgh in 1226, Dingwall has remains of the castle of the earls of Ross, an obelisk commemorating the first earl of Cromarty (d. 1714), a stone circle, and other antiquities. Pop. 2,554.

**Dinitrobenzene** ( $C_6H_4(NO_2)_2$ ). Chemical in long yellowish-white needles. It is prepared by running a mixture of nitric acid and sulphuric acid into nitrobenzene (*q.v.*), contained in a nitrator, the temperature being allowed to rise slowly to 100° C. The dinitrobenzene is purified by washing with water and crystallising from alcohol. The commercial product is a mixture of the three isomeric dinitrobenzenes which can be separated by fractional crystallisation. Dinitrobenzenes are used as intermediate products for organic synthesis.

**Dinitrochlorhydrin.** Viscous liquid with highly explosive properties. Its chemical formula is  $CH_2(ONO_2)-CH(ONO_2)-CH_2Cl$ . It is made by nitrating chlorhydrin with the same mixed acid as is used in preparing nitroglycerine.

Dinitrochlorhydrin has recently found use as an addition to nitroglycerine, since the freezing point of such a mixture is much lower than that of pure nitroglycerine—an important point in the manufacture of industrial explosives. Dinitrochlorhydrin is practically insoluble in acids and water and is not hygroscopic.

**Dinitroglycerine** (Glyceryl dinitrate). Explosive oil used to a certain extent in the explosives

industry, chiefly to render nitroglycerine explosives less liable to freeze. It is rather difficult to manufacture, and is always accompanied by the trinitrate or mononitrate or both. In normal practice the glycerine is allowed to run slowly into 3½ times its weight of nitric acid, the mixture being stirred with compressed air. After 10 hours the dinitroglycerine is separated and washed. Dinitroglycerine is less dangerous to manufacture than nitroglycerine (glyceryl trinitrate), and even if decomposition commences it does not explode. It is a colourless or pale yellow oil, having a density of 1.47 which freezes at about -50° C. One part is soluble in 20 of cold water or 5 of dilute acid, hence the necessity of care in washing. It has a toxic action similar to that of nitroglycerine, whilst it is less sensitive to heat and shock than the latter and possesses about 80 p.c. of its power. It gelatinises nitrocellulose better than does nitroglycerine, with which it is miscible in all proportions.

**Dinitroglycol.** Explosive oil of the formula  $CH_2(ONO_2)-CH_2(ONO_2)$ . Dinitroglycol is a colourless liquid, slightly more viscous than water, having a density of 1.48. It has a rather sweet, disagreeable taste and produces violent headaches. It is slightly soluble in water; very soluble in ether or alcohol.

In explosive properties it is similar to nitroglycerine, but is somewhat more powerful, and has the advantage of not freezing until cooled to about -22° C. It is more easily gelatinised than nitroglycerine by collodion cotton. Its low freezing properties are important, since the addition of 20 p.c. of nitroglycol to nitroglycerine ensures that the explosives in which it is incorporated shall remain unfrozen during winter in Great Britain. By 1932 all nitroglycerine explosives for use in Great Britain were of the low freezing type, and authorisation for use is now limited to this type. In making the non-freeze nitro-product, glycerine is mixed with about 25 p.c. of glycol and the mixture nitrated.

**Dinitrophenol.** An explosive compound prepared from phenol. Its chemical formula is  $C_6H_3(OH)(NO_2)_2$ . It crystallises as pale yellow, right-angled tablets (melting point 114° C.) which are odourless but poisonous. Dinitrophenol is a high explosive of

Dingo, the wild dog of Australia  
Gambier Bolton, F.Z.S.

similar properties to trinitrophenol, but is neither so sensitive nor so powerful. It has not found much use alone, but has been employed as an admixture to trinitrophenol for shell filling. It forms sensitive salts with metals; shells to be loaded with this explosive are first varnished on the inside.

**Dinitrotoluene.** Explosive compound prepared by partially nitrating toluene. It is an important high explosive, and one of the essential intermediate materials of the dyeing industry. It has the chemical composition  $C_7H_6(NO_2)_2$ , and six different isomerides have been prepared, but only three of these occur during direct nitration, under which conditions the meta compound forms the bulk of the product, and this isomeride is the only one of commercial importance. The crude product is a yellow crystalline mass with a melting point of  $66^\circ\text{--}68^\circ\text{C}$ . It is used in many commercial blasting explosives and smokeless powders and is frequently utilised as the starting material for the manufacture of trinitrotoluene. It is not a very satisfactory explosive alone, requiring to be mixed with an oxidiser, when it yields satisfactory products.

**Dinka.** Nilotic negro people, situate mostly in Equatorial and Upper Nile provinces, Sudan. The most powerful tribes breed milch kine; their poorer congeners in the Sudd marches (Moin Tain) live by fishing and hippo hunting. They worship a rain god (Dengdit), and the rainmakers (bain) possess great social power. Ancestral spirits (jok) are propitiated by animal sacrifices. Each tribe has its headman, but there is no national cohesion. See Shilluk.

**Dinmont, DANDIE.** The honest-hearted sheep farmer in Scott's novel, *Guy Mannerling*, who befriends Harry Bertram. His prototype was James Davidson, a Teviotdale farmer, who reared a variety of terriers known as Dandie Dinmont (*q.v.*).

**Dinosaur** or **DEINOSAUR** (Gr. *deinos*, terrible; *sauros*, lizard). Group of extinct land reptiles living in the Mesozoic era. Mostly of gigantic size with tiny brains, they dominated the world of their time by their bulk. Their skeletal remains are found in every continent, occasionally with impressions of the tuberculated skin, while in the Connecticut valley in N. America they have left a hundred varieties of their footprints.

The dinosauria form four sub-groups: (1) Beast-footed were carnivorous, with sabre-like teeth and hollow bones, mostly walking on the hind limbs. Typical are *Megalosaurus* and *Ceratosauros*, which were surpassed in size by *Tyrannosaurus*, 39 ft. long, whereas the Bavarian *Compsognathus* was no larger than a rabbit. (2) Lizard-footed were herbivorous, with solid bones, small heads, long necks and tails, usually walking on all fours. In N. America they attained the largest dimensions of any known quadruped, *Atlantosaurus* being nearly 100 ft., *Diplodocus* 84 ft. *Brontosaurus* and the English *Cetiosaurus* 60 ft. long. (3) Armoured were herbivorous and walked on all fours. The type genus is *Stegosaurus* of England and America, in which was developed along the back two rows of bony spines 3 ft. across. The Isle of Wight *Polacanthus* had

Dinka. Tribesman from the White Nile with elephant-hide shield

a spiny carapace over the hips. The American three-horned *Triceratops* had a head 6 ft. long, with an enormous bony frill. (4) Bird-footed, also herbivorous, walked on the hind limbs. Typical are *Iguanodon* of Maidstone and Brussels, 33 ft. long, and the allied *Claosaurus* of America. See *illus. p. 2716*.

**Dinothierium** or **DEINOTHERIUM** (Gr. *deinos*, terrible; *thērion*, wild beast). Genus of extinct proboscidean mammals, forming a sub-family of the elephants. *Dinothieria* apparently originated in early Miocene N. Africa, crossed into Europe, where their fossil skulls are sometimes  $4\frac{1}{2}$  ft. long, and survived into Pliocene times in S. Asia and Greece. They were divergent from mastodons and

elephants in having no upper tusks; the fronts on their lower jaws bore two tusk-like incisors which curved downwards and outwards.

**Dinwiddie, ROBERT** (c. 1693–1770). British colonial governor. Born near Glasgow, he became surveyor-general in the customs service, and in 1751 went to Virginia as lieutenant-governor. He recommended the annexation of the Ohio Valley and the erection of forts on the frontier. In 1753 he sent George Washington to the French forts on the Ohio to demand the withdrawal of French forces from English territory. He was recalled in 1758 after hastening the outbreak of the war against the French and Indians.

**Diocesan Court.** One of the spiritual courts of the Church of England. It is convened for the trial of ecclesiastical causes within a diocese, and presided over by the commissary or chancellor of the bishop. See Ecclesiastical Law.

**Diocese** (Gr. *dioklēsia*, administration). Territorial area over which a bishop exercises jurisdiction and pastoral care. In early times the practice appears to have been to appoint a bishop for each town with the rural area around it. There were 42 bishops in the Roman province of proconsular Asia, an area about the size of Lincolnshire, and 470 in the province of N. Africa. The primitive diocese was thus about the size of a modern rural deanery.

The term diocese is derived from the civil organization of the Roman Empire. Constantine increased Diocletian's subdivision of the empire to over twelve dioceses. Each was further divided into provinces. The Church was reorganized at the same time to follow roughly these imperial boundaries. Over the diocese was a patriarch or exarch who supervised the metropolitans or archbishops of the provinces into which the dioceses were cut up. These last had their seats in the chief towns of the provinces. In turn the archbishops supervised the bishops of all the urban and rural areas.

In the ecclesiastical organization of the Empire the terms diocese and province became in time transferred, with the result that an archbishop administered a province, and a bishop a diocese.

In Western Europe, save S. Italy, dioceses were larger than in Asia Minor or N. Africa, because the towns were fewer, as in the rural areas of the East. They decreased in size and proportion

to the larger number of towns in any given area; they were more numerous in Roman Gaul than in Spain, and in later centuries in Normandy than in Germany or Scandinavia.

In England the development of diocesan organization took a different course. The English dioceses in Saxon times were roughly continuous with the old Saxon kingdoms, and although their number had increased to about a dozen at the time of the Norman Conquest, their area remained large down to the 19th century. After 1066 one new English diocese was created (Carlisle) and four others (Ely, Lincoln, Norwich, and Salisbury) were reconstituted out of older Saxon sees, and were given new cathedral centres. No other new dioceses were created until the Reformation, when Henry VIII set up those of Bristol, Chester, Gloucester, Oxford, Peterborough.

Until the 19th century the number of English dioceses (including four Welsh) was 27, of which 22 were in the province of Canterbury, and five in that of York. In Victoria's reign eight new dioceses were created, and in the 20th century a further twelve; but the four Welsh sees, increased to six, became a new province under the archbishop of Wales. There are now 29 dioceses in Canterbury and 14 in York.

The modern English diocese follows roughly the county area, save around great cities like London, Manchester, and Liverpool, and wherever the population is dense, as in Lancashire and Yorkshire. The diocese has two to four archdeacons. The archdeaconry is subdivided into rural deaneries, which consist of about 10-25 parishes.

A diocesan conference is held annually, sometimes twice a year, to sanction and discuss finance and the spiritual and moral welfare of the diocese. It elects or nominates committees responsible for the administration of the several branches of diocesan activity. Members of the conference are elected by the clergy and laity of the rural deaneries.

The Episcopal Church in Scotland has also a diocesan organization (seven sees). The R.C. Church in England has been administered in modern times by diocesan bishops since 1850 (since the 17th century it had been under the jurisdiction of Vicars Apostolic, bishops without full diocesan powers who ruled over districts).

England and Wales now have 18 sees, four of which are archiepiscopal. Scotland has had its dioceses since 1878, and now has six sees, two of which are archiepiscopal.

**DIOCLETIAN** OR **GAIVS AURELIUS VALERIUS DIOCLETIANUS** (A.D. 245-313). Roman Emperor, 284-305.

Diocletian.  
Roman emperor  
Capitol Museum, Rome

Born in Dioclea in Dalmatia of humble parentage, he entered the army, where he had a distinguished career. On the death of Numerianus, he was proclaimed emperor by his soldiers. Owing to the continued pressure of barbarians on the frontiers of the empire, Diocletian thought it wise to appoint Maximian as a colleague, assigning to him the W. portion of the empire (286). This arrangement was followed by a further division in 292, when Constantius Chlorus and Galerius were appointed Caesars. Diocletian's capital was Nicomedia in Bithynia.

The period of his reign was marked by many successes. Britain was regained for the empire in 296, disturbances in Egypt were quelled with great severity, while the Persians and other barbarians were kept well outside its frontiers. The latter years of the reign of Diocletian were marked by a cruel persecution of the Christians. He abdicated on May 1, 305, and retired to his villa at Salona (Split) in Dalmatia, where he died.

Under Diocletian the empire became in form what virtually it had long been in fact—an absolute monarchy. An Eastern system of etiquette and ceremonial was introduced at the court, and the emperor had to be addressed as *dominus* or lord. Diocletian was an able administrator. His system of decentralisation did much to postpone the disruption of the decaying empire. The motive for his policy of multiplying the administrative divisions of the empire, which he carried out to a very minute degree,

was to reduce to a minimum the power of the holders of offices. To this end also he divorced the military from the civil command. For the adequate defence of the empire he created a powerful force which could be sent at a moment's notice to a threatened quarter. He was less successful in his policy of currency reform, while his attempt to fix maximum prices for commodities in his edict *De Pretiis Rerum Venalium* (On the Prices of Things for Sale) was an absolute failure. Consult *The Persecution of Diocletian*, A. J. Mason, 1876.

**Diode.** An electron tube or valve with two electrodes. The simplest form of valve, it was the original thermionic device produced by Fleming in 1904 after observations on the behaviour of carbon-filament lamps. The arrangement of its parts is shown symbolically, also a typical design, in the figure; while the curves indicate the current passing between its electrodes for varying voltages at four different filament heats expressed in watts. The cathode may be indirectly heated, consisting then of a thin rod wound with an insulated heater coil.

The diode valve is essentially a rectifier and the direct equivalent of the mechanical non-return valve with adjustable lift. Its action is based upon the emission of electrons from the hot cathode at a rate depending on the temperature. When a voltage is applied between the electrodes in the right direction to give cathode and anode their correct polarities (— and + respectively), the electrons are impelled towards the "plate" and constitute an electric current; there is no flow at all

Diode. Characteristics of diode valve with tungsten filament at various filament wattages. Inset: 1, arrangement, and 2, design of valve

when the opposite polarity is applied. The curves show that the supply of electrons is limited, the current reaching a maximum for each rate of heating, i.e. the valve becomes "saturated." Advantage is taken of this effect by using a saturated diode as a constant-current device. It is chiefly used to rectify the A.C. mains voltage for power-supply units of radio sets, etc.

**Diogenes** (Gr., sprung from Zeus). Common personal name in ancient Greece. *Pron.* Die-oi-neez.

**Diogenes OF APOLLONIA** (5th century B.C.). Greek philosopher. A native of Apollonia in Crete, he was the author of a work *On Nature*, in which, like Anaximenes (*q.v.*), he maintained that air was the universal primitive matter. All things are simply alterations of air, the result of condensation and rarefaction. According to Diogenes, air was a living, creative, and thinking substance.

**Diogenes OF BABYLON** (2nd century B.C.). Stoic philosopher. A native of Seleucia, near the Tigris, he succeeded Zeno as head of the school. He is noteworthy as one of the three philosophers sent by the Athenians to Rome, 156 B.C., to apologise for their treatment of Oropus (*q.v.*).

**Diogenes, CALLED THE CYNIC** (c. 412-323 B.C.). Born at Sinôpe on the Euxine, he accompanied his father to Athens and became a pupil of Antisthenes (*q.v.*). He carried the teaching of his master to extremes, went about slovenly and untidy, half-dressed and half-starved, and lived in a tub, or more probably a tiny mud-hut jokingly called a tub by the Athenians. During a voyage to Aegina he was captured by pirates and taken to Crete, where he was bought as a slave by a rich Corinthian. The rest of his life was spent partly in Athens and partly in Corinth, where he died. At Corinth he met Alexander the Great, who, being requested by Diogenes to get out of the way of the sunshine, made the well-known remark, "If I were not Alexander, I would be Diogenes." Nicknamed *Socrates gone mad* by Plato, Diogenes, who took no interest in political or social questions, left no writings, but is the subject of numerous anecdotes and the reputed author of numerous sarcastic and witty sayings.

**Diogenes Laërtius** (3rd century A.D.). Greek writer. Born at Laertê in Cilicia, he settled in Athens, where he wrote an account of *The Lives, Opinions, and Sayings of Famous Philosophers* in 10 books. Although inaccurate and uncritical, it is in many respects

Diogenes. From the painting by J. Jordaens, a 17th century Dutch artist, depicting Diogenes the Cynic, lantern in hand, passing through the market place seeking among the crowd for an honest man

an important contribution to the history of ancient philosophy, and is especially valuable for the fragments of authors, whose main work is lost, preserved in it.

**Diognetus, EPISTLE TO.** Christian writing in Greek first printed in 1592 by the 2nd Henri Estienne and ascribed by him to Justin Martyr. Later William Cureton discovered and published with Eng. trans. in his *Spicilegium Syriacum* (1855) a Syriac writing from a MS. of the 6th or 7th century which proved to be almost identical with the Greek. [This is ascribed to "Ambrose a chief man of Greece, who became a Christian, and all his fellow-senators raised a clamour against him, and he fled from them and wrote and showed them all their folly," and it has been suggested that this was perhaps the Ambrose who is represented by a Syriac tradition as the third primate of Edessa and the East.]

**Diomede.** Group of islands in Bering Strait, midway between Alaska and Siberia. They consist of Krusenstern, Ratmanov, and Fairway Rock, and are inhabited by some four-score Eskimos. Between them runs the border line separating Asia from America.

Diomedes, from a bust by Polycleitos  
*Louvre Museum*

**Diomedes** or **DIOMEDE.** In Greek mythology, king of Argos, one of the most conspicuous Greek heroes in the Trojan war. During the war he was under the special pro-

tection of the goddess Athena, with whose aid he inflicted wounds even on the deities Ares and Aphroditê. Along with Odysseus, Diomedes entered Troy in disguise, and carried off the sacred *palladium*, robbed of which the city was doomed to be taken. He is said to have died at Daunia in Apulia.

Another Diomedes, the reputed son of Arês, was king of the Bistones in Thrace, who possessed a herd of horses which fed on human flesh. He was killed by Hercules, and thrown to his own horses to be devoured. *Pron.* Di-on-ee-deez.

**Dion OF SYRACUSE** (c. 408-353 B.C.). Relative of Dionysius the elder and Platonic philosopher. At the beginning of the reign of Dionysius the younger, Dion, assisted by Plato, endeavoured to convert the tyrant to more enlightened ideas, but Dionysius soon tired of philosophy, and Dion was banished in 366. He returned, however, in 357, succeeded in driving out Dionysius, and made himself master of Syracuse. His own rule, however, failed to realize the hopes of the Syracusans. His severity made him unpopular, and he was assassinated.

**Dion Cassius OR CASSIUS DIO(N) COCCELIANUS** (c. A.D. 150-235). Greek historian. Born at Nicaea in Bithynia, of senatorial family, he held several offices under Commodus and later emperors, being twice consul. On his retirement from public life in 229 he returned to his native place, where he died. He was engaged for 22 years in writing his *Roman History* in 80 books from prehistoric times to the reign of Alexander Severus. Dion Cassius displays little appreciation of political history or democratic sympathies, but

is chiefly interested in military matters and court histories. His superstitious nature is obvious throughout the work. His chief models are Polybius, Thucydides, and in his somewhat tedious speeches the classical orators.

**Dion Chrysostom** (d. A.D. 117). Greek rhetorician, a native of Prusa in Bithynia. He spent much of his life at Rome, where he was held in high esteem by the emperors Nerva and Trajan. Eighty of his speeches and essays on miscellaneous political and moral subjects and pretended letters from distinguished personalities are extant. His eloquence gained him the epithet of Chrysostomus 'golden-mouthed'.

**Dione.** In Greek mythology, wife of Zeus and mother of Aphrodite. She was variously called the daughter of Oceanus and Tethys, or Uranus and Ge. At Dodona she took the place of Hera as the wife of Zeus, but when the oracle there became superseded by others Dione sank into insignificance.

**Dionne.** Name of five sisters, world-famous quintuplets (q.v.).

**Dionysia.** In ancient Greece, festivals held in honour of Dionysus or Bacchus (q.v.). The chief festivals were those held in Attica, the Greater Dionysia held at the beginning of spring, and the Lesser in December. The main feature of the former was a procession bearing the image of the god from Lenaeum to the Acropolis and back again. The festival symbolised the reappearance or coming to life of nature in the spring after its disappearance or death during the winter months. The dithyrambs sung in connexion with the festival originally had as their theme the adventures of the god Dionysus in his progress through the world, and were the germ of the drama. See Drama.

**Dionysius THE ELDER** (430-367 B.C.). Tyrant of Syracuse. At first a clerk, he afterwards joined the army, and so distinguished himself in the war against Carthage that in 405 he was made commander-in-chief of the Syracusan forces. Having surrounded himself with a bodyguard of 1,000 mercenaries and fortified the island of Ortygia for himself, he made himself absolute ruler of Syracuse, and before long had extended his rule to other cities of Sicily.

In 397 Dionysius reopened hostilities with the Carthaginians, which lasted until 392, afterwards forcing cities of Magna Graecia in S. Italy to acknowledge his authority. In his later years he was a prey to suspicion, and stories are told of his precautions to defeat possible attempts on his life. He would

never be shaved by a barber—using red-hot walnut shells for the purpose; he had everyone searched who came to see him, and flung harmless citizens into prison. The Syracusans were also ground down by excessive taxation. Though oppressive and cruel, Dionysius was a notable patron of art and literature; he beautified Syracuse with many fine buildings, and the philosopher Plato was for a time resident at his court. Dionysius was himself a poet, and one of his tragedies obtained first prize in the competition at Athens which was held 367 B.C.

**Dionysius THE YOUNGER.** Tyrant of Syracuse, 367-343 B.C. The first ten years of his reign were chiefly taken up with a struggle for mastery with Dion (q.v.), and in 356 he retired to Locri. In 346 he returned to Syracuse, which during his absence had been the prey of various military adventurers, and was able to re-establish himself as tyrant. The second tenure of Dionysius at Syracuse lasted only three years, when he was driven out by Timoleon, who had been sent from the mother-city of Corinth in response to an appeal from the democratic party among the Syracusans. Dionysius retired to Corinth (343) as a private citizen, being reduced to keeping a school and giving lectures in singing as a means of livelihood.

**Dionysius THE AREOPAGITE.** A convert of S. Paul when he preached at Athens (Acts xvii, 34). He is said to have become the first bishop of Athens, and to have been martyred there under Diocletian. Other legends confuse him with S. Denis, patron saint of France, and say that he suffered at Montmartre. The philosophical writings which bear his name are probably a 5th century production.

**Dionysius OF HALICARNASSUS** (d. c. 8 B.C.). Greek rhetorician and historian. He came to Rome about 30 B.C. and lived there until his death, teaching rhetoric and perfecting himself in the Latin language. His chief work was *Roman Antiquities*, in 20 books, a history of the Italian peoples from mythical times to the beginning of the Punic wars (264 B.C.). Of these 11 books are extant, going down to the period of the decemvirs (441 B.C.). The object of the work is to flatter both the Romans and Greeks, the former as the conquerors of the Greeks, the latter as the ancestors of their conquerors. In spite of inaccuracies it is an important authority on the history of early Roman institutions. Dionysius also wrote several rhetorical and literary treatises, among

them an *Art of Rhetoric*, and criticisms of ancient poets, historians, and orators (Homer, Thucydides, Demosthenes, Dinarchus), which exhibit far higher critical faculties than his history.

Other Greek literary figures named Dionysius are: D. Periēgētēs (guide), of uncertain nationality, who perhaps lived during the reign of Hadrian. He wrote in Greek a description of the world as known in his time. It was much used by later writers, and was translated into Latin by Priscian the grammarian, D. Thrax or the Thracian (c. 120 B.C.). A pupil of Aristarchus (q.v.), he taught in the island of Rhodes and was the author of the first Greek grammar. Written for the use of schools, it is still extant in an interpolated form. It treats of the eight parts of speech and inflexions, but not of syntax.

Dionysus. Bust of the Greek god in the National Museum, Naples

**Dionysus.** In Greek mythology, alternative name for Bacchus, the god of wine. See Bacchus.

**Diophantus** (4th century A.D.). Greek mathematician of Alexandria. He is considered the inventor of syncopated algebra, and he wrote an essay on polygonal numbers; but his chief work is his *Arithmetica*, in 13 books, of which six are extant, an algebraical treatise which had much influence on the Arabian school, and indirectly upon the development of European mathematics.

**Diopside** (Gr. *diopsis*, a view through). Rock-forming mineral; a member of the monoclinic pyroxene group, composed of metasilicate of calcium and magnesium, with small amounts of iron replacing some magnesium. It commonly occurs as white to greenish prismatic crystals or granules in igneous rocks and metamorphic rocks such as altered impure limestones.

**Dioptase.** A comparatively rare copper mineral found associated with copper ores in a few localities, e.g. Kirghiz Steppes, Congo, S.W. Africa, Chile. Composed of orthosilicate of copper ( $H_2CuSiO_4$ ), it is commonly found in emerald green six-sided prismatic crystals. Fine stones are sometimes used as gems.

**Diopter.** Form of theodolite, now obsolete, for measuring angles. The term is, however, most often used alternatively with dioptric as a unit for expressing the refractive powers of lenses.

**Dioptrics.** Science of refracted light, though the term is little used now. A dioptric is more often used to signify a unit of refractive power in terms of focal length. The numerical measure of the power of a lens expressed in dioptrics (or diopters) is the ratio of one metre to the focal length in metres of the lens. See Optics.

**Diorite.** Family of crystalline-granular rocks of igneous origin. Composed of plagioclase and iron-magnesia minerals—usually hornblende, which causes their prevailing dark-green colour—and of coarse or medium texture, they differ from granite in having no mica and little or no quartz. Axes of diorite are found in the Swiss lake-dwellings and elsewhere in neolithic Europe. It was quarried in early Egypt for vases and statues, the most famous being those of Khafra, found near his Gizeh pyramid. Imported diorite was used in early Mesopotamia for the Sumerian statues of Gudea of Lagash, and for the Babylonian Hammurabi Code.

**Dioscoreaceae.** Family of twining shrubs and herbs, chiefly natives of the tropics, belonging to the yam family. Most of the species produce tubers, known as yams, many of them useful as food when cooked, owing to the large quantity of starch they contain. The flowers are bell- or funnel-shaped, small, and inconspicuous. Black bryony (*Tamus communis*) is the best known British member. The name is taken from the Greek physician and botanist Dioscorides. See Elephant's-foot; Yam.

**Dioscorides, PEDACIUS, OR PEDANIUS.** Greek physician. A native of Cilicia in Asia Minor, he lived during the reign of Nero, 1st century. He was the author of a *Materia Medica*, in five books, which was long regarded as a standard pharmacopoeia. Other works on antidotes and drugs attributed to him are probably by a Dioscorides of Alexandria of later date.

**Dioscuri** (Gr. *Dios kouroi*, sons of Zeus). In Gr. mythology, name given to the heroes Castor and Pollux. See Castor and Pollux.

**Dip.** Inclination of the earth's magnetic field from the horizontal. The magnetic needle is never exactly horizontal except at the Equator. At the north or south magnetic poles it points vertically downwards, the north-pointing end of the needle dipping vertically downwards at the magnetic north. The extent of the dip from the horizontal is roughly dependent on latitude. But at any place it undergoes variation from year to year, the dip increasing over a period of years to a maximum and then falling again. See Needle; Poles.

**Dip.** Term used in navigation to signify the correction to be made in the measurements of angular altitude of celestial objects in order to allow for the height of the observer above the earth's surface. The observer measures the angle of elevation above the visible horizon; this measurement exceeds the true altitude by the dip, or angular depression of the line to the sea horizon below the horizontal plane of the observer.

For the observer at O, O H is horizontal, O S is the line to the horizon, O K the line to the object. Angle K O S is measured, angle H O S is the dip, angle K O H is the correct angular altitude of K.

Dip. Diagram showing in exaggerated form effect of dip. See text

If O X, the height of the observer, is  $h$  feet, then it may be calculated that the dip,  $d$ , measured in minutes of arc, is equal to  $1.06 \sqrt{h}$ , i.e., if  $h$  is 25 feet the dip is  $0^\circ 5.3'$ , or  $5' 18''$ ; if  $h$  is 100 ft. the dip is  $10' 36''$ . For approximate purposes the dip in minutes of arc may be taken as the square root of the height of the observer expressed in feet. The dip in minutes of arc is roughly equal to the distance of the horizon from the observer in sea or geographical miles, so that from the top of a cliff 256 ft. high the sea horizon is nearly 17 m. away.

**Dip.** In geology, the angle of inclination of a stratum or bed

with the horizontal. It is normal to the strike, which is the direction of a horizontal line drawn on the plane of the bed. Dip used in the same sense is also applied to the inclination of other geological features, e.g. dykes, faults.

Dip-slope is the hill-slope which is controlled by the inclination of the beds. It is usually the more gentle slope of an escarpment of which the scarp slope is the line of outcrop of the edges of the inclined beds.

**Dip-circle.** Instrument used for measuring magnetic dip. A thin magnet pivoted at the centre rotates about a horizontal axis. The inclination of the magnet to the horizontal is read on a graduated vertical scale.

**Diphenyl.** In organic chemistry, an aromatic hydrocarbon consisting of two phenyl groups united ( $C_6H_5C_6H_5$ ). Berthelot's method of preparing diphenyl is to pass the vapour of benzene through a red-hot tube. Diphenyl is a white solid insoluble in water. By heating it with chromic anhydride and acetic acid, benzoic acid is obtained as the oxidation product.

**Diphenylamine.** Basic amino derivative of formula  $(C_6H_5)_2NH$  discovered by A. W. Hoffmann in 1864. It is made by heating aniline with aniline-hydrochloride in an autoclave at  $210^\circ$  to  $240^\circ$  C., after which the product is first treated with hydrochloric acid and then with an excess of water, whereby the first formed diphenylamine hydrochloride is decomposed and the free base floats as a thick oil. After washing and separation it is rectified by fractional distillation. Diphenylamine forms colourless crystals which melt at  $54^\circ$  and boil at  $302^\circ$  C. Insoluble in water, but soluble in alcohol, it is used in the dyeing industry, as a stabiliser for smokeless powders, and is the basis of the high explosive hexanitrodiphenylamine (q.v.).

**Diphtheria** (Gr. *diphthera*, leather). Acute disease, characterised by the formation of a fibrinous exudate or membrane, most often in the throat, larynx, or nose. The membrane can also occur on the surface of a wound. The micro-organism is the Klebs-Loeffler bacillus named after its two discoverers.

Diphtheria may occur in infants, but is most frequent between the ages of 2 and 6 years, few cases occurring after adolescence. It is highly contagious, and infection is by direct or indirect contact. It is seldom airborne, even over a short

distance. The organisms reside in the secretion of the nose and throat, and are conveyed by kissing or sneezing, or on drinking glasses or handkerchiefs. The germ may live in the throats of the healthy, who act as carriers. All catarrhal conditions of the throat predispose to attack. A swab should be taken, and a culture grown therefrom, whenever a sore throat shows a suspicious exudate; should diphtheria be present, the Klebs-Loeffler bacillus can then be seen under the microscope.

The period of incubation is 2-7 days, the early signs being those of fever with headache and pain in the back and limbs. The throat becomes red and sore, and in a day or two there is a greyish-white membrane at the back of the throat or tonsils or in the nose. The glands in the neck swell.

The disease may present itself in malignant form with severe prostration and gangrene of the tissues of the nose and throat, a form often fatal. In membranous croup or laryngeal diphtheria, the membrane is developed within the larynx or wind-pipe, resulting in difficult breathing. Intubation is the immediate life-saving treatment.

Paralysis of the muscles of swallowing and of other muscles is a recognized complication, as is circulatory failure. These are toxic manifestations due to absorption of the virulent poison manufactured by the bacilli at the site of the membrane and carried off by the neighbouring lymphatics. These complications are insidious and treacherous; therefore all sufferers from diphtheria must have prolonged rest in bed. The essential treatment is early administration of antitoxin, which has much reduced the death rate. Antitoxin should not be used as a prophylactic for contacts, but given immediately the condition is diagnosed.

The Schick test shows whether an individual is susceptible to diphtheria. If a local inflammatory reaction follows the injection of a minute quantity of diphtheria toxin into the skin, susceptibility is indicated and immunising doses can be given. The widespread use of this procedure has greatly reduced deaths among children from this disease.

Hilary Ledgerwood, M.B.

**Diphthong** (Gr. *diphthoggos*, with double sound). Combination of two unlike vowel-sounds, coalescing into one syllable (house, oil). As a rule more stress is laid

upon the first vowel. The two frequently melt into one sound (pain, height). These two kinds of diphthongs are distinguished as proper and improper.

**Diplodocus** (Gr. *diploos*, double; *dokos*, bar). Genus of extinct gigantic N. American land reptiles. They were herbivorous, lizard-footed dinosaurs, living in Colorado and Wyoming in Jurassic times. They were unarmoured, long-necked, long-tailed, and walked on all fours. Their diminutive heads had the nostrils on the top, showing that they spent much time under water, browsing on aquatic weeds. The chevrons protecting the blood-vessels beneath the tailbones were formed of two separate bars slung in the middle, whence the generic name. See *Dinosaur*, illus. p. 2716.

**Diploid**. Term used in cytology to express the condition in a nucleus where the chromosomes are present in duplicate. The condition arises in sexual reproduction with the fusion of pairs of gametes (sex cells), each of whose monoploid nuclei contributes to the diploid nucleus of the first cell of the new organism one of each pair of its chromosomes. Such pairs of chromosomes are often recognizable during the

nuclear divisions occurring while the organism is growing by their similarity in size and shape, and are said to be homologous because it is believed that they perform similar rôles in its life. Particular pairs of chromosomes transmit contrasting, allelomorphic pairs of characters. Each chromosome contains a determinant (*q.v.*) for each of a number of characters; its fellow may contain the same kind of determinant for any particular character, or one for the contrasting character. The diploid condition persists until meiosis (*q.v.*) occurs.

**Diploma** (Gr. *diploos*, double). Term used for a certificate or other mark of efficiency, akin to a degree. Diplomas are given by institutions not of university rank, and also by universities in subjects in which they are not entitled to give degrees. The word means double, and originated in the fact that in Roman times earlier documents conferring certain privileges were written on two tablets of wax, which were then folded or doubled. The word was used in the Middle Ages for various official documents making grants of land, etc., and many collections of these have been made. See *Degree*.

## DIPLOMACY AND DIPLOMATISTS

Sir Charles Petrie, Bt., author of *Diplomatic History 1713-1933*

*An account of the growth and practice of diplomacy provides a useful general background to the many articles in this Encyclopedia on the great treaties of history and the biographies of notable ambassadors, foreign ministers, and other diplomatists. See also International Law*

Diplomacy is defined in the Oxford English Dictionary as "the management of international relations by negotiation." The word is derived from the Greek *diploma* which, among its meanings, has that of a letter of privilege. Diplomacy has existed in some form since the earliest days of civilization. During the past 150 years diplomacy has tended to become a profession, for which special training is necessary, though it is still common for diplomatic missions to be entrusted to politicians and others who are not diplomatists by career.

In medieval times diplomatists were often ecclesiastics because they were by far the best educated people; the Papacy itself early established an efficient diplomatic service. Nevertheless, the resident ambassador or minister was unknown until a much later date, and the diplomatist of the Middle Ages was usually an envoy sent by one monarch to another to discuss

some specific point such as a peace treaty, a frontier dispute, or a matrimonial alliance.

One of the first lay states to establish a permanent diplomatic service was Venice; she was represented by a resident ambassador in most of the leading capitals of Europe after 1500. It is in no way surprising that she should have taken the lead in this respect, for Venice was above everything a commercial power, and as such required early and accurate information about the intentions of other states. The reports of her envoys throw much light upon the 16th and 17th cents.

With the establishment of strong national monarchies in England, France, and Spain in the 16th century, the resident envoy became the rule, though he was still far from being a professional diplomatist. Usually he was a great noble who could afford to pay for the privilege, for his official remuneration was infinitesimal

and often he received nothing at all. With the growing intercommunication between states more was required of him; the negotiation of such general settlements as the treaty of Westphalia (1648) and the treaty of Utrecht (1713) called for qualifications of no mean order.

During this period first Spanish, and then French, diplomacy was pre-eminent, and the dominant position of Louis XIV in Europe was in no small measure due to his intimate acquaintance with what was taking place in foreign countries. As a rule, he did not employ members of the high aristocracy on diplomatic missions, but preferred men of the middle class such as he used in the administration of France herself.

The treaty of Vienna (1815), like that of Versailles (1919), was negotiated by a conference attended in person by the leading statesmen of Europe; but the 19th century as a whole witnessed the triumph of the professional diplomatist, and was, indeed, his heyday. Nevertheless, diplomacy underwent a great change during this period owing to improvements in means of communication and to the growth of democratic systems of government.

#### Functions of Diplomacy

The business of a diplomatist is not to initiate policy, but rather to negotiate along lines laid down for him by his government. Before the coming of the telegraph it was often necessary to leave him considerable latitude owing to the slowness of communication. Lord Stratford de Redcliffe, British ambassador in Constantinople, precipitated the Crimean War (1854) largely on his own initiative. The telegraph, and still more the telephone, drastically curtailed the freedom of action of the diplomatist, while the aeroplane has enabled the politician to become highly mobile, and so has further limited the function of the professional diplomatist.

The advent of democratic forms of government meant that ambassadors became the representatives of nations rather than of monarchs, which increased their responsibility. The public opinion of the country to which they are accredited has always to be taken carefully into account; and it is easier to make a mistake in dealing with millions of people than with a few individuals. There is now far more publicity for diplomatic activities, and since the First Great War there has been

an unparalleled interest in international affairs. Economic and financial problems, too, became of ever-increasing importance, and the development of wireless has not been without influence. All these changes have necessarily imposed fresh burdens upon the shoulders of the diplomatist.

Partly in consequence of this there has been a tendency, at any rate on the part of the British government, to revert from time to time to the earlier practice of appointing non-professional men to some of the big diplomatic posts: notable examples were the sending of Lord Derby to Paris, Lord Halifax to Washington, and Sir Samuel Hoare (Lord Templewood) to Madrid.

#### Ambassadors and Ministers

Of late the distinction between an ambassador and a minister has almost ceased to exist. Originally only the Great Powers were represented by an ambassador, and he had the right to demand an audience of the monarch to whom he was accredited, whereas a minister had to deal with the appropriate member of the government concerned. Even relatively insignificant powers now have ambassadors, and between them and ministers is a distinction without a difference.

In 1945 reforms were introduced into the British diplomatic service, which has since been known as the British foreign service. Previously the consular and diplomatic services were distinct; the former dealt with commercial matters, and the rule was once a consul (*q.v.*) always a consul. Now the services have been amalgamated, and all diplomatists will spend some of their time as consuls. This system had previously been adopted by other countries.

In a British embassy of the first rank there are, in addition to the ambassador, (1) the councillor, who acts as *chargé d'affaires* when the ambassador is away or the post is vacant, and at other times is second in command of the embassy; (2) the first secretary, chief assistant of the councillor; (3) the second, third, etc., secretaries (of whom there may be four or five); (4) the honorary attachés; (5) specialists in such matters as trade unions and agriculture.

It is usual for an entrant into the foreign service to spend a year or two at the foreign office learning the work before he is posted to a British embassy or legation abroad, and at different stages of his career he will be recalled to the foreign office for a spell.

From the beginning diplomatists have been accorded the immunities which earlier attached to heralds. In no circumstances can a diplomatic envoy be tried or punished for a criminal offence by the state to which he is accredited; generally speaking, he cannot be sued for debt or summoned as a witness.

His official correspondence, both postal and telegraphic, is privileged against censorship or any kind of interference, while his official residence is exempt from visit and search by the police.

On the other hand he is expected to conform voluntarily to local rules and regulations; he must not identify himself with any political party, and he must not overstep the rather uncertain boundary line which separates the duty of collecting information from the offence of espionage; or, perhaps, it would be more correct to say that he must not allow himself to be found out. If he misconducts himself his government will be asked to recall him, while in extreme cases he may even be put under arrest and expelled.

In totalitarian states, or when ideological differences, whether religious or political, are strong, difficulties are likely to arise. During the wars of religion in the 16th century the ordinary resident ambassador was often little better than a chartered spy, and many diplomatists were active conspirators. In modern times the totalitarian countries have frequently abused diplomatic privilege in the same way. But the diplomatist can do much to remove that uncertainty and suspicion which more than anything else leads to international friction.

**Bibliography.** Grotius on the Rights of War and Peace, abridged Eng. trans., W. Whewell, 1853; International Law, L. Oppenheim, 2nd ed. 1912, etc.; History of Diplomacy in the International Development of Europe, D. J. Hill, 1905, etc.; Guide to Diplomatic Practice, E. M. Satow, 1917; Diplomacy and the Study of International Relations, D. P. Heatley, 1919; The Practice of Diplomacy, Eng. trans. from F. de Callières, introd. A. F. Whyte, 1919; The Diplomatist, Jules Cambon, 1931; Diplomatic History, 1713-1933, Sir C. Petrie, 1946.

**Diplomacy.** Drama adapted by B. C. Stephenson and Clement Scott from Victorien Sardou's *Dora*. It was produced by the Bancrofts, Jan. 12, 1878, at the Prince of Wales's Theatre, London, where it ran for 329 performances. Notable revivals included those

by the Bancrofts at the Haymarket, 1884; John Hare at the Garrick, 1893; Gerald du Maurier at Wyndham's, 1913 (a freely modernised version); Gladys Cooper at the Adelphi, 1924. A burlesque, *Dora and Diplunacy*, by F. C. Burnand, was produced at the Strand Theatre, 1878.

**Diploma Gallery.** Home of the examples of work which artists, on becoming R.A., are required to present to the Academy within six months of their election. The rule governing the custom was passed in 1770; but as the Academy had been founded two years earlier, the first 36 members were exempt from the operation of the law. Most of them have since been represented by pictures, etc., purchased by the council or otherwise acquired. The exhibits now number about 300, and the collection is housed in the Diploma Gallery (which also contains works of foreign masters) at the Royal Academy, Burlington House, London.

**Diplomatic** (Gr. *diploma*, folded paper.). Word used for the critical study of documents, especially historical, to be carefully distinguished from diplomacy. The critical examination of the actual historical documents, charters, treaties, etc., was first called diplomatic (*res diplomatica*) in France in the 17th century, doubtless because some of the documents were known as diplomas. The study was taken up at various seats of learning as history became more scientific. Diplomatic is concerned solely with the genuineness or otherwise of the documents, and arose at a time when forgeries of ancient charters, etc., were plentiful and undetected. It has nothing to do with the truth or otherwise of the facts contained in them, nor does it seek to decipher them, that being the province of palaeography. There is a lecturer in diplomatic at Oxford. *See* History; Manuscripts; Palaeography.

**Diplomatic Corps.** Term applied to the general body of ambassadors and diplomatic agents accredited to a government. They enjoy special privileges, e.g. freedom from arrest, and when these are attacked they act in concert. Ministers rank according to seniority. The diplomatic corps accredited to the court of St. James's is under the supervision of a marshal, assisted by a vice-marshal and an assistant marshal. *See* Diplomacy.

**Diplomatic Service.** This body was amalgamated with others in

1943 to form the new foreign service of the British government. *See* Foreign Service, British.

**Dipnoi** (Gr., double breathing). Term applied to the lung fishes, which have developed the power of breathing air with a simple lung as well as extracting air from the water by gills. There are three existing genera: the Australian *Ceratodus*, the African *Protopterus*, and the S. American *Lepidosiren*.

**Dipper** (*Cinclus*). Name sometimes applied to the water ouzel. The bird is common in England, where it is often seen about the streams, feeding on aquatic insects. It is brown in colour, with white underparts, and can walk under water by gripping the stones

Dipper or water ouzel

with its feet. At any greater depth than that just sufficient to cover its head the bird uses its wings in the effort to keep below water. Its nest is made of grass, skilfully concealed by a covering of moss.

**Dipsacaceae.** Family of perennial or biennial herbs. Belonging to the teasel family, they have opposite leaves, and small, funnel-shaped flowers gathered into a hemispheric or cylindric head. Well-known examples are the teasel (*Dipsacus sylvestris*) and the scabious (*Scabiosa*).

**Dip-Sector.** Sector between the true and the real horizon at sea. At sea the altitudes of celestial objects are measured from the visible sea horizon. This is below the true horizon by an amount depending on the elevation of the observer's eye above the surface of the sea. *See* Dip; Navigation.

**Dipsomania.** Paroxysmal drinking to excess of alcohol; really a form of manic depressive psychosis. It manifests itself in attacks of great alcoholic excess with no intake of alcohol between the attacks. It is not induced by any previous taking of alcohol. Treatment lies in the province of psychology, but rest and skilful nursing are necessary. Apomorphine has been found helpful.

**Diptera** (Gk. *dis*, two; *pteron*, a wing). Order of insects comprising the two-winged or true flies. Only fore-wings are present, the hind-wings being modified into a pair of minute knobbed organs, or *halteres*, of sensory function. Over 85,000 species are known, more than 5,000 in Britain. *See* Fly.

**Dipterocarpaceae** (Gr. *dipteros*, double-winged; *karpos*, fruit). Family of large trees yielding resinous balsamic juice. They are natives of the tropics of the Old World. They have alternate leaves, and often fragrant flowers disposed in flat-topped clusters. The fruits are leathery with winged appendages, and containing a single seed. The juices of the trunk are used as pitch, varnish, and medicine. One species (*Dryobalanops*) furnishes Borneo camphor. *Vateria indica* yields the pinaceous dammar, used for varnish.

**Diptych** (Gr. *diptychos*, folded in two). Hinged, two-leaved tablet of wood, metal, or ivory. Folded together like a book, with its inner surfaces coated with wax, it was used by the Greeks and Romans for writing on with a *stilus*, a small iron rod, pointed at one end and blunt at the other (for smoothing the wax when correction was necessary), that did duty as a pen. Later, the diptych was adopted by artists, the tablets

Diptych in ivory, showing The Virgin and Child and Christ blessing. Early 14th century; 8½ inches high  
Victoria and Albert Museum

being replaced by panels on which were painted pictures mostly of a religious character. *See* Triptych.

**Dir.** Territory of the North-West Frontier Prov., Pakistan. The nawab of Dir is the overlord of the territory. Wherever possible cultivation is carried on, and the soil yields rich crops. The region is mountainous, and is drained by the Panjkora and its tributaries. Timber is exported down the rivers. Area about 3,000 sq. m. Pop. approx. 119,000.

**Dirac**, PAUL ADRIEN MAURICE (b. 1902). British physicist. Born Aug. 8, 1902, he was educated at Bristol university and St. John's College, Cambridge. In 1932

he became Lucasian professor at Cambridge, and the following year was awarded the Nobel prize for physics. In 1939 he received the Royal Society's medal for development of new quantum mechanics. His *Principles of Quantum Mechanics* revolutionised the approach to the subject. *See* Quantum Theory.

**Dirae.** In classical mythology, one of the names under which the Eumenides (*q.v.*) were known to the Romans.

**Dircē** (Gr. *Dirkē*). In Greek mythology, wife of Lycus, king of Thebes. For her cruel persecution of Lycus's former wife, Antiope, the children of the latter, Amphion (*q.v.*) and Zethus, when they reached manhood, besieged Thebes, killed Lycus, and tied Dircē to a bull. *Pron.* Dir-see.

**Direct Action.** Term used by the French syndicalists to imply that the industrial strike is preferable to the slower constitutional method of obtaining change through political action at the polls and in parliament. Direct action was favoured by a section of the British trade unions in 1918, but in 1920 an overwhelming majority of the Trades Union Congress (*q.v.*) rejected it in favour of constitutional methods. Later that year, however, a council of action was set up to employ direct action to influence the British government's policy towards Bolshevik Russia. In May, 1926, the T.U.C. called a general strike in an effort to compel the government to intervene in favour of the miners. This was unsuccessful, and direct action of this type was made illegal by the Trade Disputes and Trade Unions Act, 1927, repealed 1946. *See* Trade Disputes Acts.

**Direction Finding.** Application of radio communication to the determination of the position of a ship or aircraft relative to one or more known points. Various systems are all based upon two fundamental principles: (1) radio waves travel through space with the same velocity as light waves; (2) maximum signal voltage is generated in a vertical loop or frame aerial when the plane of the aerial is parallel to the direction of travel of the radio waves, and zero voltage is generated when the plane of the aerial is at right angles to the path of the radio waves. In its simplest form a direction finder consists of a receiving set connected to a frame aerial capable of rotation about a vertical axis. Transmitting stations, or radio

beacons, send out a given signal at regular intervals on a specific wavelength.

Rotation of the frame aerial of the receiving set to a position of either maximum or minimum signal strength gives the direction of the transmitters. The rate of change of signal strength with rotation being much greater at the minimum position than at the maximum, the setting for minimum signal strength is invariably used in practical D.F. navigation. When the position of minimum intensity is found, the plane of the aerial is in line with the direction of the transmitting station. By linking the frame aerial with a scale marked off in degrees, to read zero when the plane of the aerial is at right angles to the geographical meridian, the minimum position provides a direct indication of the bearings of the transmitting station. When the bearings of two or more transmitting stations have been plotted on a chart, the position of the direction finder can be established relative to the known positions of the transmitting stations. The latest types of D.F. installation provide bearing determinations to an accuracy of less than one degree.

Direction finding apparatus may be fitted with the cathode ray oscillograph to give direct and visual readings on a fluorescent screen when atmospheric electricity renders sound signals inaudible. *See also* Radar.

**Directoire Style.** Simplified form of decoration which preceded the empire style in France. It marked a reaction in taste from the 18th century modes. The name was used when France was under the Directory (*q.v.*).

**Director** (Lat. *dirigere*, to direct). One who holds a governing administrative position. In English company law the word has a special meaning. A director is appointed under the articles of association to manage the affairs of a company. The directors must act as a body, and the decision of the majority is final. Their powers to act for the company are set out under its articles. Usually, although it is not legally necessary, they must have a certain financial qualification, and are liable for gross negligence in the discharge of their duties and for breach of trust.

**Directorium** or **ORDO.** Latin name for a calendar issued annually by the bishops of the R. C. Church to their clergy. Printed in Latin, it contains the

necessary information for the daily services of the Mass and the Breviary. In the early Middle Ages few rubrics were written down, and instructions for the order of service were in the main oral. By the 11th century a written ordinal of Sarum (Salisbury) came into use in England, and from the ordinal came the directorium or pye (*pica sarum*), as it was called in England before the Reformation. As the breviary then consisted of four separate books, some guide as to its use was necessary. The general directorium for the Church of England is contained in the various tables and instructions at the beginning of the Book of Common Prayer. *See* Calendar.

**Director of Public Prosecutions.** British official, appointed by the home secretary. It is his duty, under the attorney-general, to institute criminal proceedings and assist the police in conducting them. The great majority of public prosecutions are begun by the police, but the director must prosecute where the offence is punishable by death, or where he is ordered to do so by the attorney-general or home secretary.

**Directory, THE** (Fr. *Le Directoire*). Committee of five who governed France from 1795 to 1799. In 1795 it was resolved to frame a new constitution, and this provided for a legislative assembly of two houses, and for the actual work of government by five directors. They were chosen by the council of ancients, the upper house of the assembly, from a list of 50 persons elected by the 500 members of the lower house. One was to retire each year. The National Convention was dissolved and the five chosen. The first five were Rewbell, Barras, La Revellière-Lépeaux, Carnot, and Letourneur. They divided the various departments between them, their headquarters being in the Luxembourg. The establishment of the Directory aroused opposition, which was crushed by Bonaparte. The new government created a slight feeling of security, while its credit was enhanced by military successes, due in part to Carnot's organizing genius. But differences soon appeared among the directors, and on Sept. 4, 1797, Rewbell and two acting with him managed, by a *coup d'état*, to get rid of Carnot and Barthélemy, his sole supporter among the five, who had taken the place of the retiring Letourneur. The legislative assembly did as the three directors wished, and a new reign of terror began. Mean-

while, the financial position grew worse, and in 1799 France met with reverses in the field. The Directory was clearly dying, and Sieyès, one of the five, was planning to overthrow the constitution of 1795. Under these conditions Bonaparte arrived in France, and by the *coup d'état* of 18 Brumaire (Nov. 9, 1799) put an end to the Directory. See French Revolution.

**Directory.** Guide to the inhabitants of a town or district, giving addresses and occupations; list of members of trades or professions; or telegraphic or cable addresses. The first London Directory was printed for Sam Lee and sold at his shop in Lombard Street, near Pope's-head Alley, and Dan Major at the Flying Horse in Fleet Street, 1677. "A Collection of the Names of the Merchants living in and about the city of London . . . carefully collected for the benefit of all dealers which shall have occasion with any of them." The Post Office London Directory, so called since 1819, grew out of The New Annual Directory, 1800.

**Directrix.** In conic sections, a fixed line used in the definition of the ellipse, parabola, and hyperbola. These conic sections may be defined as the locus of a point whose distances from a fixed point and a fixed line are in constant ratio. The fixed line is the directrix, the fixed point a focus. See Conic Sections; Focus.

**Dire Dawa.** Town of Abyssinia. It is 25 m. N.W. of Harrar, and is connected by rly. with the port of Jibuti in French Somaliland on the Red Sea. In the Second Great War it was captured from the Italians by a S. African force on March 29, 1941. Pop. 30,000.

**Dirge.** Song, chant, or piece of music expressive of mourning. The word is a contraction of the Lat. *dirige*, first word in the Roman Catholic Office for the Dead, from the Vulgate version of Psalm 5, 8. From this it has come to mean such expressions of grief for the dead as the coronach of the Scottish Highlands or the keening of an Irish wake.

**Dirigible.** Term applied to any aerial vessel capable of being steered. It was originally employed to distinguish from the ordinary balloon the lighter-than-air vessel which on being fitted with motive power of its own acquired dirigibility. See Aeronautics; Airship.

**Dirk** (17th. cent. dork; perhaps from Du. *dolk*). A form of short

Dirk. Highlander's dirk and sheath

dagger or poniard worn by Scottish Highlanders. Its triangular blade is sharply pointed, and its length varies from 12 to 20 ins. It is also the side-arm of a midshipman in the British navy. See Dagger.

**Dirk Hartog.** Island off W. coast of Australia, the most westerly point. Its length is 40 m. and its breadth 10 m. Near it to the N. are the islands Doré and Bernier, the former a sheep station, the latter an isolation hospital for aborigines.

**Dirt Track Racing.** Name by which speedway racing was first known. See Speedway Racing.

**Dis.** In Greek mythology, alternative name for Hades or Pluto, the ruling deity of the underworld.

**Disability.** The state of being unable to perform an action. There are physical disabilities, e.g. the inability to see or hear; and legal disabilities, i.e. disabilities imposed on certain classes of persons by law and custom. Minors, for instance, are prevented by law from entering into contracts except for necessities; women in some countries still, as in the past in the U.K., are not allowed to vote or to serve on public bodies; and lunatics are not permitted to manage their own business affairs.

**Disabled Person.** Man or woman incapacitated in small or great degree by physical disability. The Disabled Persons (Employment) Act, 1944, gave to all such persons the right to government assistance in training to overcome their disability, where this is serious, and in finding employment. It set up a register of such persons, registration not, however, being compulsory; and it compelled employers of 20 or more employees to include a quota (which varies from time to time and is fixed by the minister of Labour) of registered disabled persons among them.

**Disarmament Conference.** International conference convened at Geneva on Feb. 2, 1932, with a view to reducing world armaments. The preamble to part V of the treaty of Versailles had envisaged general disarmament, and Act 8 of the League Covenant declared that the maintenance of peace required the reduction of national armaments to the lowest point consistent with national safety. In 1930 a League commission put forward a draft convention, which however, ignored such essential points as the number of trained

reserves permissible to any nation, and the application of science and industry to the production of war materials.

An obstacle to general agreement was that the draft convention provided for Germany remaining at the level of disarmament imposed on her at Versailles. When the conference met, under the presidency of Arthur Henderson (Great Britain), it took an unharmonious course. France was solely concerned with her own security; Germany harped on the question of equality; Russia advocated measures far too radical for general acceptance. The conference adjourned for three months; when it resumed in Dec., Germany's demand for equality was recognized, and a draft convention was presented by Ramsay MacDonald providing for substantial disarmament over eight years. This plan was unanimously adopted on June 8, 1933, but in Oct. Germany withdrew from the conference and the League of Nations, and the conference adjourned indefinitely.

**Disbar.** In England, the process of unmaking a barrister. A barrister can only be disbarred by the benchers of the Inn of Court to which he belongs. See Barrister.

**Discharge.** Cancellation of the contract of enlistment (*q.v.*). A certificate is sent to the soldier on which is shown the cause of discharge. A soldier who leaves the colours and takes up civil employment is not necessarily discharged—he may have been transferred to the army reserve following the termination of the colour service for which he was contracted. A soldier who has served 12 years is time-expired and entitled to a free discharge, provided that he has not re-engaged to complete 21 years; except that during a state of emergency such service may be prolonged by an Act of parliament, or when serving overseas under peace-time conditions he may be held for a year.

In peace-time a regular soldier may purchase his discharge after a specified time, or take it with pension after 18 years' service. Soldiers no longer fit for service are discharged and if their disability is accepted as attributable to, or aggravated by, their military service, they are eligible for a disability award. Men discharged on account of physical disability due to military service during the First and Second Great Wars were eligible for a silver badge. See Badge illust.

**Discharge.** In English law, the final step in the release of a bankrupt from his liabilities. After the conclusion of his public examination a bankrupt may apply for his discharge to the judge, who may grant it at once; grant it after a certain period or subject to certain conditions, *e.g.* the payment of a certain dividend; or refuse it. The judge must take into account the report of the official receiver on the case. The court cannot grant an unconditional discharge where the bankrupt has committed an offence in which certain facts are proved—*e.g.* assets are under 10s. in the £ of his liabilities. *See* Bankruptcy.

**Discharge.** For this term in electricity, *see* Electric Discharge.

**Discharge Tube.** Vessel containing a rarefied gas through which an electric discharge (*q.v.*) is caused to pass. Its object is often to give light, as in neon or fluorescent lamps, or to generate cathode rays or electrons or X-rays. The chief forms of discharge tubes are illustrated in the article on Electronics.

1. *Elementary Discharge Tube.* When the initial researches into the conduction of electricity through rarefied gases were being carried out, a plain glass tube about 1 to 3 ft. long was used, with a side connexion for attaching the exhaust pump, and disk-ended electrodes fused through the ends. Small ornamental tubes are also made, permanently evacuated and containing various residual gases, for scientific display purposes; they are known as Geissler tubes.

2. *Crookes Tube.* Permanently evacuated form of (1), resembling an electric filament lamp in shape, for demonstrating the properties of cathode rays.

3. *X-Ray Tube.* By causing the cathode ray beam to strike a metallic target, X-rays are generated at the point of impact.

4. *Cathode Ray Tube.* The original Crookes tube generated cathode rays, and present-day cathode ray oscillographs are a specialised form. Large metal oscillographs and electron microscopes have a discharge tube at the upper end for creating the beam.

5. *Valve.* Thermionic valves and photo-electric cells are also specialised forms of discharge tubes, but are usually classed as electron tubes.

6. *Neon Lamps.* Small discharge tubes containing two closely spaced electrodes and a residual filling of neon are used on D.C. and A.C. supply systems at

200 volts or over. They give a weak orange red light and are chiefly used for signalling.

7. *Long Discharge Lamp.* The mercury arc lamp is a high power discharge tube now used mostly for photography. The Moore tube, which reached a length of 180 ft., was used as a lamp about 1908.

8. *Fluorescent Lamp.* The plain discharge lamp was improved by the utilisation of the ultra-violet rays in the discharge, which add to the illumination by causing special powders coating the inside of the tube to fluoresce in various colours. This development was then carried on to the production of the fluorescent lamp, which gives a near approximation to daylight. *See* Electronics.

**Disciple** (Lat. *discere*, to learn). One who professes to be learning or to have learned something from another and maintains what he has learned on the authority of his teacher. In this sense the word is applied to the immediate followers of Jesus Christ. After the Ascension it was used of all who professed belief in Christ's teaching. The word occurs once in the O.T. (Isaiah 8), and is of frequent occurrence in the N.T., in which it is applied to Moses (John 9); followers of John the Baptist (Matt. 9); and followers of the Pharisees (Matt. 22). *See* Apostle; Jesus Christ.

**Disciplina Arcani** (Lat., discipline of the secret). Term applied to the practice in the early Church of reserving to the baptized and to communicants instruction and participation in the more solemn rites of the Christian religion. This secrecy concerned the sacraments, the doctrine of the Trinity, the Creed, the Lord's Prayer, and ordination. It was maintained in intercourse with unbelievers.

Based, it is thought, on Matt. 7, v. 6; 1 Cor. 3, vv. 1-2; Heb. 5, vv. 12-14, and influenced by fear of profanation and persecution, by the desire to secure fitness of candidates for the church membership by gradual initiation, and by the example of the pagan Mysteries, it was observed between the 2nd and 6th centuries. To it is

partly attributable pagan hostility and the symbolical and enigmatic language of early Christian writers. *Consult* The Ariens of the Fourth Century, J. H. Newman, 1833.

**Discipline** (Lat. *disciplina*, instruction, training). Implicit obedience to certain rules of conduct which is exacted from soldiers, pupils, and others. Soldiers are trained by a process of drill to obey orders without thought of consequences. Thus they can be relied upon to carry out unpleasant or dangerous duties without hesitation, and to live in strict accordance with regulations for the general good. Neglect of regulations is a breach of discipline, and is punished under disciplinary codes such as the Army Act and the King's Regulations. Wilful infractions of these codes are regarded as insubordinate behaviour, although among civilians they might amount to no more than the exercise of personal liberty. The opposite is true of disciplinary developments in schools, where the tendency towards freedom and self-discipline has become general.

**Disclaimer.** In English law, a renunciation or denial. A person nominated in a will as executor may disclaim before probate. A trustee in bankruptcy may disclaim an onerous property—*e.g.* a lease—on paying compensation. During the Second Great War a tenant of land which suffered war damage could end his tenancy by giving a notice of disclaimer.

**Disco** or **Disko.** Island off the W. coast of Greenland, N. of Davis Strait and separated from the mainland by Waigat Strait. It has an elevation of 2,500-3,000 ft., and

possesses stone-quarries, lignite coal mines, iron, and valuable fisheries. The harbour and town of Godhavn lies on the S. coast. Area, 3,200 sq. m.

**Discobolus** (Gr. *diskos*, quoit; *bolos*, thrower). Name of the famous bronze statue by Myron (*q.v.*), representing an athlete in the act of "throwing a discus." The British Museum (Towneley Marbles) has a copy of the original, and there is another in the Vatican.

Discobolus. Vatican copy of the bronze statue by Myron

**Discomycetes** (Gr. *diskos*, disk; *mykēlēs*, fungi). Fungi of the family Ascomycetes. The spore-bearing organ is typically a disk, mostly with upturned edges, more or less fleshy, and usually brightly coloured. The cells (asci) containing the microscopic spores are immersed in the substance of the disk, and open on its upper surface. In *Helvella* and *Morchella* (Morels) the disk form is departed from, the spore-bearing tissue being spread over a stalked conical or rounded head.

**Discord.** In music, a combination of two or more notes which requires a following combination, called its *resolution*, to satisfy the ear; e.g.

See Concord; Harmony; Interval.

**Discount** (Lat. *dis*, off, away; Fr. *compter*, to count). Financial term, strictly meaning an allowance made when a bill or debt of any kind is paid before it is really due. It is chiefly used in connexion with bills of exchange, the discount on which is calculated according to the state of the money market. For instance, a banker might give £95 for a bill of exchange for £100, due twelve months from date. This is rather more than 5 p.c.: if he charged discount only at the rate of 5 p.c. he would pay £95 4s. 9½d. for the bill, a year's interest on which is £4 15s. 2½d.

In a looser sense discount means the amount allowed off the prices that buyers pay for goods. In the wholesale trades most manufacturers and merchants sell subject to discounts of varying rates. One advantage of this method is that it enables retail prices to be fixed with ease. For instance, a manufacturer advertises an article at a certain price which is the price of sale everywhere. The retailer obtains his profit because he buys subject to a considerable discount, usually something like 33½ p.c. The word is also used for the amount by which any investment or security is less than its face value. For instance, if Consols are at £90 they are at a discount of 10, and if £100 of stock is offered to the public for less than £100 it is said to be offered at a discount. In this sense discount is the opposite to premium. See Bill of Exchange; Compound Interest.

**Discovery.** English legal term. In a legal action a party is entitled, subject to certain restrictions, before trial, to make the other party state in writing and on oath what documents relating to the matters

in question he has or has had available or in his possession. He may also, by leave of the court, put written questions to the other party, to be answered in writing and on oath, called interrogatories, to compel him to discover facts material to the points at issue.

**Discovery.** British ship. There have been several ships of that name used for Polar exploration. The first, commanded by William Baffin, made six voyages to Arctic regions between 1602-16. The second voyaged to Hudson's Bay in 1719. The third took part in Capt. Cook's third voyage; in the fourth Vancouver found the land named after him. The fifth was commanded by Capt. H. F. Stephenson during the Franklin Relief Expedition of 1875.

The sixth carried Capt. R. F. Scott's expedition to the Antarctic, 1901-04. She afterwards traded between West India Dock, London, and James Bay, Canada. She was requisitioned by the Admiralty in 1914, and in 1916 went to the aid of the stranded members of the Shackleton Antarctic expedition. In 1923 the *Discovery* was commissioned for a three-year oceanographical and meteorological expedition, and later made surveys of Kerguelen Island. In 1931 she was laid up at East India Dock, London, where she remained until presented in 1938 to the Boy Scouts Association for the use of sea scouts and moored in the Thames off the Victoria Embankment. Constructed of oak and teak, the *Discovery* was launched at Dundee in 1900; she displaces 485 tons on a length of 172 ft. and a beam of 33 ft.

**Discretion.** Term used in English law. A court has sometimes a discretion as to whether it will make an order, e.g. for an injunction, or for costs. In the divorce court a petitioner who has been guilty of adultery must ask for the discretion of the court to be exercised in his or her favour. If full disclosure is made the court usually grants a decree.

**Discursive** (Lat. *discurrere*, to run backwards and forwards). Epithet applied to reasoning which, in order to reach conclusions from

premises, passes from one term to another, comparing them in succession one by one. Discursive knowledge is obtainable by a process of thought, whereas intuitive knowledge is based upon certain fundamental and unquestionable *a priori* principles. The term discursive is also applied to desultory reasoning or conversation which does not keep strictly to the subject in question. See Intuition.

**Discus** (Gr. *diskos*). Round or oval piece of stone or metal.

Inthrowing the discus, which was one of the contests of the Greek Pentathlon (q.v.) and is still a favourite pastime in Greece, the competitor who threw farthest was the victor. The sport was revived at the Olympic Games in 1896. The regulation modern discus consists of a circular piece of wood not more

Eastwood

than 8½ ins. in diameter surrounded by a rim of iron, plates of brass being inserted in the centre to bring the weight up to not less than 4½ lb. The world's record throw of 186 ft. 10½ ins. was made by F. E. Gordian (U.S.A.) in 1949.

**Disease.** Ill health due to a recognizable cause. A localised disease is one which is limited to a definite part of the body, for example, lupus. A constitutional disease is one which affects the whole body, such as scarlet fever. Some diseases, e.g. syphilis, are localised in the early stages and become constitutional later.

An infectious or a contagious disease is due to the action of a micro-organism in the body, or part of the body. An epidemic disease attacks a large number of persons more or less simultaneously. An endemic disease tends to recur in a particular locality. A congenital disease is present at birth and is sometimes, though erroneously, spoken of as inherited. It is due to an infection of the child before birth. It seems probable that a tendency to develop a disease, e.g. diabetes, may be inherited.

**NOTIFICATION OF DISEASES.** When an inmate of any building is suffering from a notifiable disease the local medical officer of health must be notified. This duty falls first on the head of the family,

next on the nearest relatives present, next on anyone in charge of the patient, and finally on the occupier of the building. The doctor attending the patient is also required to notify.

The following are notifiable diseases: smallpox, cholera, diphtheria, membranous croup, erysipelas, scarlet fever, typhus, typhoid, enteric or relapsing fever, plague, cerebro-spinal fever, acute poliomyelitis, acute encephalitis lethargica, acute polioencephalitis, ophthalmia neonatorum, puerperal pyrexia, malaria, dysentery, acute primary and acute influenza pneumonia, and tuberculosis. Local authorities may make any other disease notifiable in their area.

**Diseases of Animals Acts.** British Acts of Parliament, passed 1894 to 1937, provide for the prevention, notification, and treatment of certain diseases of animals. The minister of Agriculture and Fisheries makes orders relating to specific diseases: cattle plague (rinderpest), pleuro-pneumonia of cattle, foot and mouth disease, swine fever, sheep-pox, sheep-scab, and, for certain purposes, glanders, rabies, anthrax, parasitic mange in horses, tuberculosis, epizootic abortion and lymphangitis, and a large number of fowl diseases.

The animals to which the provisions apply are cattle, sheep, goats, swine, and, for some purposes, dogs, cats, horses, poultry, and hens. The minister may extend the provisions to any four-footed animal, any birds, and any disease. The owner of an animal with any of these diseases must inform the proper authority. Infected animals must be isolated, and the movement of animals and holding of markets in any area may be forbidden. The minister may order the slaughter of an infected animal, and of animals that have been exposed to infection; the owner being entitled to compensation.

**Disendowment.** Alienation of church property by the state. In England the claim of the established church is that the word established only implied state recognition of pre-existing rights, and it contends that church property is only national property in the sense in which all property within the state is national property. The liberationist view is that, the church being no longer coextensive with the nation, tithes and lands derived from pre-Reformation endowments should be diverted to strictly national

purposes. By Acts of 1869 (operative 1871) and 1914 (operative 1920) the Irish and Welsh Churches were disendowed as well as disestablished, the clergy in each being given a life interest in their benefices. See Church of England; Disestablishment.

**Disentis or Dissentis** (anc. *Desertinum*). Village and health resort of Switzerland, in the canton of Grisons. It stands near the confluence of the Vorder with the Mittel Rhine, at an alt. of 3,764 ft., 34 m. W.S.W. of Coire. Its Benedictine abbey, said to have been founded in 614, is the oldest in Switzerland, and was rebuilt after its partial destruction by the French in 1799. Beautiful views of the Rhine valley are gained.

**Disestablishment.** Term used for the separation of church and state. Such separation took effect in France, Dec. 11, 1906. The Irish Church was disestablished and disendowed Jan. 1, 1871, the Act having been passed in 1869. After attempts in 1886, 1892, 1894, 1909, and 1912 to disendow and disestablish the English Church in Wales, an Act was passed in 1914 and came into effect in 1920.

The movement for the disestablishment of the English Church started about 1831. The Society for the Liberation of Religion from State Patronage and Control, known as the Liberation Society (*q.v.*), was founded in 1844, and the Church Defence Institution in 1860. In 1896 the latter became the Church Committee for Church Defence and Church Instruction. Bills to disestablish and disendow the English Church were rejected in 1871 by 374 votes to 89; in 1872 by 295 to 61. Leading members of the English Church have expressed themselves as willing to agree to disestablishment, but regard disendowment as confiscation. They point out that the Free Churches themselves are bound by the doctrinal provisions of their trust deeds. The liberationist argument is that disestablishment must be accompanied by disendowment of all the ancient endowments, which include those of the cathedrals.

**Disease** (Fr. woman speaker). Term now applied to an actress who specialises in monologue as distinct from parts in plays. Yvette Guilbert was the most celebrated of the class. The Americans, Ruth Draper and Cornelia Otis Skinner, are others who have achieved success.

**Disfranchisement.** Depriving persons of the franchise or right to

vote, and also of the right to be separately represented. A parliamentary constituency is said to be disfranchised when it loses the right to send separately a member or members to the house of commons. Under the Reform Act of 1832 no fewer than 56 boroughs were disfranchised, a number of others suffered the same fate under the Act of 1867, and further groups under later Acts of redistribution. The individual voters, however, are not disfranchised, for, given the necessary qualifications, they become voters in the county or other new constituency in which the former constituency is merged. Following corruption at the time of an election, a constituency may be disfranchised for a term of years, and during that period is not represented in the house of commons. Thus, Macclesfield was disfranchised after the general election of 1880, and Northampton was virtually disfranchised after 1880, when Bradlaugh would not take the oath, and the house refused to let him sit unless he did.

The second kind of disfranchisement is taking away the right to vote from individuals. Thus, in 1782, the parliamentary vote was taken away from all those employed in the excise, customs, and post office, and was not restored until 1867. In 1918 those who had been conscientious objectors during the First Great War were deprived of the franchise for a limited period. See Franchise.

**Disinfection or Sterilisation.** Term applied to the various processes of destroying those unicellular forms of life known as bacteria, but usually extended to cover the killing of certain protozoa. The term is applied equally to pathogens and non-pathogens. Disinfection is performed either by chemical agents called disinfectants or by physical agents such as light or heat. A disinfectant kills micro-organisms, whereas an antiseptic inhibits their growth and multiplication without necessarily killing them. To be effective, a disinfectant must dissolve in or be miscible with water, for adsorption of toxic substances on to or diffusion of such substances through the external membranes of the bacterial cell occurs only in an aqueous environment.

The correct amount of heat always kills bacteria readily, and on the whole moist heat is more effective than dry. Those bacteria which form spores are much more difficult to kill by any method of disinfection than those which do

not. Most of the human pathogens do not form spores.

Objects which can be made really hot in a flame can readily be freed from living bacteria. Laboratory glass-ware, which when new is often heavily infected with *bacillus subtilis* spores from straw packing, can be sterilised by dry heat in an oven—preferably electric—at a temperature of about 165° C. for an hour. Glass-ware can also be sterilised by steam under pressure in the autoclave; this method is also used for surgical dressings and instruments. Non-absorbent cotton-wool plugs should be used to prevent damping. A pressure of 1 atmosphere corresponding to 120° C., when the autoclave is properly manipulated, will ensure sterility after 10 to 30 minutes.

“Live” steam at 100° C. is not a reliable agent for disinfection as it fails to kill spores in any reasonable time. Immersion in boiling water is safe only if carried out by persons with knowledge and experience of the difficulty and danger involved. Certain media containing heat-coagulable proteins cannot be submitted to a temperature of even 100° C. without damage. They are sterilised by a process known as inspissation: discontinuous heating at 60° C. for an hour on several successive days, followed by slow heating up to 75° C. to coagulate the medium. Goods of rubber should be sterilised in the autoclave. Some liquids can be filtered free from bacteria by means of special filters of porcelain, sintered glass, or collodion. Chemical disinfection is not generally a reliable substitute for disinfection by heat, but often objects are too large or too fragile for heat treatment.

Disinfection of the skin is a difficult problem. Absolute alcohol is not so effective as 75 p.c. alcohol in water, as the former tends to coagulate matter on the bacterial envelope and prevents real penetration and toxic action. Alcohol, in any event, has no residual effect. Swabbing the skin with ether probably has only a local analgesic and cleansing effect. Painting with tincture of iodine is effective and has a residual effect, although it is somewhat destructive to the skin. The method of skin sterilisation consists in working into the skin a dilution of proprietary preparations of para-chlor-meta-xylenol, chlor-chresols, and benzyl cresols. As these substances are relatively non-toxic, non-irritant, and non-volatile solids or viscous liquids,

they possess a marked residual action. Methods of attacking bacteria deep in the body, where they cannot be reached by chemical disinfectants, depend on the use of agents such as sulphanilamide or penicillin, which seem to encourage the anti-bacterial action of the blood although the exact nature of their mechanism is not precisely known.

The efficiency of disinfection is a function of (a) dilution of the disinfectant; (b) the time of disinfection; (c) the temperature of the disinfection. The method of evaluation now almost universally used in the U.K. is the Rideal-Walker test (B.S.I. specification 541/1943). A rough guide is to use a dilution of some 10 to 20 times the stated R.W. coefficient, but for special purposes the directions of reputable manufacturers should be followed. Black and white disinfectants and the lysols are preparations of the higher homologues of phenol of coal tar origin. Hypochlorite preparations are widely sold. For aerial disinfection moist formaldehyde vapour is still used; hypochlorites were used in air raid shelters during the Second Great War in the form of fine mists; aerosols containing hexyl-resorcinols, lactic acid, etc., are also applied.

A. SCIVER, B.Sc., F.R.I.C., F.I.S.E.

**Disintegration.** In nuclear physics, decomposition of a radio-active element, resulting in the formation of a different element. This process may take place naturally or be produced artificially, the result either way being a stable end-product which is non-radio-active. Disintegration thus involves transmutation of one element into another, and several unstable intermediate elements may be formed before the new element of lower atomic mass is obtained.

The process is simple in that as the nuclei of the atoms are left in an excited condition they emit their surplus energy in the form of alpha-, beta- or gamma-particles. When disintegration is produced artificially, as by bombarding an atom with alpha-particles, the emission produced is of positrons, whereas in the natural disintegration of radio-active materials the emission is that of electrons. By natural disintegration radium is converted into lead of much lower atomic weight. Thus the dreams of the medieval alchemists of transmutation of one element into another have been realized by modern science. *See* Atom.

**Disjunction.** In cytology, separation of the members of the pairs of homologous chromosomes into different nuclei. Disjunction occurs during meiosis. In this process two nuclear divisions result in the division of tetrads of chromatids twice longitudinally so that the four nuclei which are formed each contain one of the chromatids but never both members of each homologous pair. They have disjoined. They may do so at either of the nuclear divisions, and it is not necessary for all pairs in one nucleus to disjoin simultaneously. During synapsis, which precedes disjunction, chromatids may be twisted across one another, forming chiasmata. When disjunction occurs, chromatids may break at a chiasma; the two parts so formed may become attached to corresponding parts of another chromatid which has broken simultaneously. Thus chromatids exchange corresponding lengths and new combination of determinants (*q.v.*) arises. Disjunction is thus the cytological process which “deals out” nuclear substance and with it heritable qualities in fresh combinations.

**Disjunctive** (Lat. *disjungere*, to disunite). In logic, a disjunctive judgement is a proposition in which the truth of one of two or more statements is asserted, in which the subject or predicate contains disjunctive ideas: A is either B or C; either A or B is C. In a disjunctive syllogism the major premise is disjunctive: A is either B or C; A is B; therefore, A is not C; A is either B or C; A is not B; therefore A is C. It is also a grammatical term. *See* Conjunction.

**Disk** or **Disc.** Word meaning a flat plate. It is used in astronomy for the seemingly flat figure of a body in the heavens; in botany for the surface of an organ as opposed to the margin, and in several other senses—with certain flowers, e.g. daisies, for the central portion of the head.

**Dislocation** (late Lat. *dislocare*, to put out of place). Displacement of the head of a bone from its socket in a joint. This is sometimes congenital, i.e. present at birth, when the condition is due to some fault in development. The hip is the joint most frequently affected. More often dislocation is due to violence, such as a fall, particularly if a strong muscular effort is made at the moment of injury. When the skin is broken and communication is made with

the external air, the condition is spoken of as compound dislocation, and when associated with fracture of a bone the term fracture-dislocation is employed. The signs of dislocation of a joint are pain, bruising, and swelling, deformity of the limb, and impairment of movement. Cartilages attached to the bones may be torn and muscles injured. Treatment consists in restoring the bone to its normal position by manipulation, with the patient probably under an anaesthetic, followed by a course of massage to remove inflammation, etc. See Massage; Surgery.

**Dismal Swamp.** Morass in the U.S.A. Mainly in Virginia and partly in N. Carolina, it lies well above the surrounding country, and covers an area of about 750 sq. m., to which it has been reduced by drainage. The centre is occupied by Lake Drummond, and most of the remainder is covered with cypress, cedar, other trees, and grass. The swamp formed part of Washington's Virginia estate, and he supervised the first attempt at reclamation. The Dismal Swamp Canal, 22 m. from Albemarle Sound to Chesapeake Bay, is a link in the system of inland waterways from New York to Florida; it enables shipping to avoid Cape Hatteras. Constructed in 1828, the canal was reopened in 1899. The Washington highway also traverses the swamp.

Walt Disney. Part of the vast Disney studios at Hollywood: left, the inking and painting building; right, the animation building

**Disney, WALTER ELIAS** (b. 1901). American film cartoonist. Born at Chicago, Dec. 5, 1901, his father an Irish-Canadian, his mother of German origin, he went to school in Kansas City and attended the Chicago academy of fine arts. Trained as a commercial artist, he went to Hollywood in 1923. In a garage, his first studio, he drew animal cartoons, but after the creation of Mickey Mouse in 1928 the garage became a vast film factory to keep pace with the demand for Disney productions. Soon Disney was employing numerous draughtsmen and controlling his own art studios.

Mickey Mouse, once perhaps the most popular character of the screen, was surpassed by his friends—Donald Duck, the eternal lowbrow, Pluto, the pathetic bloodhound, and Goofy, an in-

Walt Disney. American film cartoonist

determinate creature. In 1932 Disney turned to short films in colour, featuring all these and a host of other characters from nature in his musical Silly Symphonies, of which Three Little Pigs was the most famous. Even these did not supply full scope for his brilliant, witty, and often beautiful technique, and in 1938 appeared his first full-length musical cartoon film, Snow White and the Seven Dwarfs. Ostensibly for children, this was an extension of all that had gone into his earlier work; it was followed by the moral fantasy Pinocchio. In 1942 came Dumbo (the baby elephant) and Bambi (the baby deer); but after America's entry into the Second Great War Disney concentrated mainly on propaganda films and instructional cartoons on entirely new lines for training in the U.S. forces. His most ambitious work was Fantasia (1941), in which he set patterns and stories to eight pieces of classical music played by a symphony orchestra. In Song of the South, 1947, he combined cartoons with living characters. The Reluctant Dragon (1941) showed scenes in the Disney studios and revealed something of his highly organized methods of production.

**Disorderly House.** Habitation which becomes a public nuisance. The keeper of one is liable to imprisonment and fine. Under an English statute passed in 1751 and extant, two ratepayers can compel the local authority to take action by indictment. The measure applies to gaming-houses, places of ill-fame, and other houses where crimes or disturbances of the peace are probable. The machinery for prosecution under this Act is clumsy and costly. Where the dis-

orderly house is a brothel, Criminal Law Amendment Acts of 1885 and later are invoked. These provide summary penalties, increasing in severity after a previous conviction, for keeping or managing such a house or permitting it to be used for the purpose.

**Dispatch** OR **DESPATCH**. Term originally applied to any message conveyed by special messenger to ensure speedy delivery, but now used of official documents generally. It is also specially applied to communications on military and naval matters, in particular to the accounts of actual fighting operations transmitted to his government by the officer commanding the fighting forces. Current accounts of operations are limited to a condensed *résumé* of their general trend in order to baffle the enemy, the detailed accounts usually termed dispatches not being as a rule published until some considerable time after the events to which they refer. Dispatches, in contradistinction to the daily *communiqués*, deal fully with the tactical as well as the strategic features of the operations, and mention by name the units engaged and the salient features of the duties undertaken by them. Officers and other ranks whose conduct has deserved special mention are also named in dispatches.

**Dispatch Rider**. Orderly employed with troops on active service who is specially detailed for the conveyance of orders and messages between headquarters and units, or between one unit and another. In all wars this duty has called for men of exceptional courage, resource, and integrity. Speed being essential, mounted men were usually employed, but towards the end of the 19th century cyclist orderlies were also instituted. At the outbreak of the First Great War numbers of motor cyclists were enrolled as dispatch riders and proved invaluable in maintaining communication between units when the field telephone system broke down. During the Second Great War dispatch riders were essential to the movement of armour and mechanised transport, as they kept the front and rear of columns in touch.

**Dispensary for Sick Animals, PEOPLE'S**. Organization founded in 1917 to promote the alleviation of suffering among animals by treatment. It maintains hospitals and dispensaries in London, the provinces, and in France, Rumania, Tangier, Egypt, Palestine, South Africa, and the Netherlands E. Indies. While an animal is being

treated, its owner is advised as to its care, prosecutions for cruelty being thus reduced in number. Its head office is at 14 Clifford Street, London, W.1. See *Cruelty to Animals*.

**Dispensation** (Lat. *dispensare*, to weigh out, distribute). Term denoting (1) a general scheme or arrangement under which certain definite laws and regulations are appointed to men, as, for example, the Jewish dispensation, the Christian dispensation; (2) a relaxation or suspension of a law granted by competent authority in a particular case, while yet the law remains binding on the general community.

In the Roman Catholic Church the power of dispensation rests on the theory that he who makes the law has the power to suspend it, and that this power is exercised personally or by delegation. Thus, while the Divine law may never be abrogated, the pope claims as teacher to define its limits, and as vicar of Christ to grant dispensations from certain impediments in matrimonial cases, from vows and from orders. By delegation the power of dispensation is vested in certain specially appointed tribunals and congregations, and is further exercised by bishops, vicars-general, and parish priests. The Council of Trent enacted that the payment of money *ipso facto* rendered a dispensation null and void, but in practice certain fees, nominally to cover the expense of the grant of a dispensation, and alms to be devoted to pious purposes, may be imposed.

**Dispensing** (Lat. *dispensare*, to weigh out). The compounding of drugs. In early days the process was crude, minerals and animal substances being generally dispensed by reducing them to fine powder. With vegetable drugs, even in remote times, the dispensing was more elaborate; the herbs were soaked in water with or without the aid of heat and the solution used. For many years dispensing was chiefly confined to vegetable substances. Minerals fell into disuse until later, when the various salts were prepared and then these salts were dispensed. Advances in medicine and science have improved methods of administering medicaments, so that dispensing today demands a knowledge, not only of plant products, but of synthetic chemicals, vaccines, serums, vitamins, animal glands, and the new antibiotic substances, such as penicillin and streptomycin.

In the U.K. a dispenser is one qualified under the Pharmacy Acts to carry on the business of a chemist

and druggist, which includes the dispensing of physicians' prescriptions. The Society of Apothecaries grants a qualification to act as an assistant or dispenser to an apothecary. Public bodies generally require persons holding public appointments in institutions to possess a pharmaceutical qualification. No one may use in business any title, emblem, or description suggesting he has any qualification for selling, dispensing, or compounding drugs or poisons if he has not that qualification. The maximum penalty is a fine of £20 and a further £5 a day if he continues after caution.

The Apothecaries Act (1815) directed the Society of Apothecaries to institute an examination to test the fitness and qualification of those who worked to act as "assistants to apothecaries in compounding and dispensing medicines." The assistant's certificate entitles the holder to dispense medicines in a physician's surgery, public dispensary, or hospital, or in a pharmacy; under the National Health Insurance Act, holders of the certificate can dispense medicines for insured persons under the supervision of a registered pharmacist. But an assistant may not keep a chemist's shop. To do this it is necessary to pass the Chemist and Druggist qualifying examination of the Pharmaceutical Society and to be registered as a chemist and druggist, i.e. a pharmacist. It is also necessary to register the premises at which the business is carried on. Pharmaceutical chemist is a term restricted to those who have passed the higher examination conducted by the Pharmaceutical Society.

#### Weights and Measures

Doctors' prescriptions are usually dispensed by apothecaries' weight, and written in signs, for scruple, drachm, and ounce. On the Continent the metric system of weights and measures is used; and since in 1899 the British Pharmacopoeia—the official volume describing drugs used in medicine—appeared with both metric and apothecaries' weights against each preparation, that publication has also used the metric system in all its descriptions.

To become an assistant in dispensing of the Society of Apothecaries it is necessary to present a certificate in general education (matriculation, including pass in English and arithmetic) or school certificate (with pass in both English language and arithmetic). Candidates must be 18 before they

can enter for the examination and must present evidence of instruction in chemistry and practical pharmacy. The examination is both theoretical (oral) and practical (dispensing).

Many women pass the assistants' examination, while others enter the pharmaceutical profession. Women have opened chemists' shops of their own; others find employment in hospitals, institutions, and pharmacies.

To become a pharmacist, the first step is to pass a recognized examination in general education. The student must then register as an "apprentice or student," and be given one year's full-time instruction at a recognized institution. The intermediate examination is then taken, followed by a further year's full-time study. Before the Chemist and Druggist qualifying examination (the minor) is passed, the student must undergo a practical course of study (apprenticeship) in a shop or approved hospital dispensary or manufacturing pharmaceutical laboratory of at least 4,000 hours. For the Pharmaceutical Chemist diploma (the major) longer full-time instruction is required. Possession of a university degree in pharmacy does not entitle the holder to practise or to registration as a pharmacist.

**Dispensing Power.** In English history, the power claimed by certain kings of allowing an individual to break the law without penalty. It must be distinguished from the suspending power, the suspension of the operation of a general law.

As an outcome of their admitted right of pardoning offenders, the Tudor and Stuart kings before James II often exercised this privilege, and in 1663 Charles II tried, but in vain, to secure the formal consent of parliament to it. Under James II the matter became critical. In 1686, in the case of Sir Edward Hales, the king obtained from a packed bench of judges a decision declaring the dispensing power legal, and proceeded to use it in favour of Roman Catholics, giving them offices from which they were excluded by law. These proceedings aroused great anger and contributed to that discontent among his subjects which led them to drive James from the throne. The declaration in the Bill of Rights that "the pretended power of suspending or dispensing with the law, as assumed of late, is illegal," ended the practice. See Rights, Bill of; Sovereignty.

**Dispersal.** The term used in botany for the scattering of seed. Seed plants normally grow fixed in the soil, from which they draw supplies of water and salts, spreading their leaves in the air to catch the light. Each plant requires for healthy existence a certain minimum living space; it is thus advantageous to a new generation if the seeds from which they are to develop are distributed far from the parent. Colonisation of a fresh habitat results from the dispersal of seeds to a fresh and suitable locality.

Some plants accomplish dispersal by "explosive mechanisms." As a gorse pod dries, contraction occurs in opposed directions in its two sides and a tension is set up which ultimately causes the two to fly apart with such violence that the seeds are slung away. Similar mechanisms are found in the fruits of the crane's bill, where strips of the bill curl up suddenly; and in the pansy, whose shiny seeds are pinched out from between the sides of the valves of the pod just as wet orange pips may be projected by pressure between finger and thumb. In the squirting cucumber, explosions caused by the sudden relief of sap pressures set up within juicy fruits may shoot the seeds out.

Most plants, however, depend on external agencies for impelling their seed. Poppy capsules sway in the wind until sufficient momentum has been imparted to the loose seeds within for them to be slung out of the pores at the top. Very small seeds, such as are formed by some orchids, blow about as if they were dust. Hairs grow out from the seed coats of willow herb or cotton, or from the pericarps of single seeded fruits, e.g. dandelion, thistle, upon which wind pressure may bear to drive the seeds. A similar effect arises from the outgrowth of the testa, e.g. pine, or the pericarp, e.g. sycamore, to form wings which, delaying the fall of the structure, give it a chance to be caught up by the wind and floated through the air.

Water movement serves many plants which grow in or near it and form buoyant seeds or fruits.

Animal movement helps in two ways. Seeds or structures containing them may have hooks which catch in the fur or feathers of passing animals, the seeds being later brushed off; and fleshy parts may be used as food while the seeds are not consumed. Common examples of the former method are found in cleavers, geum, agrimony, and burdock; and of the latter in the apple, rose, blackberry, and strawberry. Even when the seed is swallowed by an animal, it often passes through the alimentary tract unharmed. The seed envelopes often protect the embryo inside from damage, though they themselves may undergo softening which makes germination easier when the seeds are deposited with the animal's faeces around them to act as manure.

**Dispersion.** Name given to a phenomenon in optics. If a narrow pencil of rays of white light, such as sunlight, is allowed to pass obliquely from one medium into another, as from air into

Dispersion. Diagram illustrating the dispersion of light through a prism. For explanation see text

water, glass, or crystal, it is found that in the second medium the light is spread out into various colours, violet being more deviated than red. This is called dispersion. If a beam of parallel rays of white light is allowed to enter a dark room at X through a narrow slit, it will fall virtually unaltered on a screen at  $X_1$ . When a prism is introduced the pencil of light will be bent towards the base of the prism; but the patch on the screen will no longer be the same size as before; it will be spread out as  $Y Y_1$ , and it will be drawn out into a rainbow band. The white light has been dispersed, and the colours have been spread out because the amount of bending effected by the prism is different for light of different colours. (See Colour col. plate; Refraction.)

Some minerals, when viewed under convergent polarised light,

show characteristic types and degrees of dispersion—an important diagnostic feature in determinative mineralogy.

**Displaced Person.** Any person who, as a result of action by the fascist or Nazi regime, of a regime allied in the Second Great War to one of these, of the Quisling or similar regimes, or of the Falangist regime in Spain, had been deported from or been obliged to leave his land of nationality or former habitual residence. The term came into use as the Allies entered Germany in 1945 and began to overrun camps, underground workshops, and other places where such people were found; it was precisely defined at the first meeting held in London, April 8–June 1, 1946, of the United Nations' Special Committee on Refugees and Displaced Persons. Most displaced persons were nationals from the conquered countries compelled to work for the Germans in Germany. At the end of the war in Europe, Allied military authorities found themselves responsible for care of some 7,500,000 such people, mainly Russians, Poles, French, Dutch, Belgian, and Norwegians. Camps, whose administration was passed by the military to the United Nations Relief and Rehabilitation Administration (*q.v.*), were set up throughout Germany for their reception and they were fed, clothed, and housed until it was possible to send them back to their countries of origin. When U.N.R.R.A. came to an end in 1947, some 800,000 persons remained. Many, particularly Poles and Balts, feared to return to their country of origin. All were passed to the care of a new U.N. body, the international refugee organization. Israel, est. 1948, absorbed most of the Jews. The U.K., Canada, Australia, Belgium, Venezuela, Chile, Brazil were among other countries that gave asylum to selected refugees. But disbandment of I.R.O. in 1950 would, it was expected, leave some thousands without resources.

**Displacement.** Nautical term indicating the weight of water displaced by a ship or any other floating body and consequently the weight of the body itself. Since 35 cu. ft. of water weighs one ton, the displacement tonnage of a vessel is found by dividing by 35 the number of cu. ft. of water displaced when the ship is immersed to its load line.

**Displayed.** In heraldry, a bird fronting the spectator, with outstretched wings and legs, is said to

Displayed, in heraldry

abased" or "abaissée."

**Disposition** (Lat. *dis*, apart; *ponere*, to place). Word with two or more meanings. In psychology, it means a relatively permanent tendency to act in any certain way either because the organism inherited the tendency or because it learnt it from experience. It may mean simply the predominating bent, or constitutional habit, of one's mind.

Legally, disposition refers to the disposal of property, especially at death. In Scotland it has a special meaning, that of a deed by which property, generally landed property, is transferred. Disposition and settlement refers to a deed by which a man, in lieu of making a will, arranges for the disposal of his property on his death.

**Disputation.** Literally, a verbal contest. The word was used at the universities in the Middle Ages and later for a formal argument, in which a certain proposition was upheld by one and attacked by another. For long it was the custom for those desiring to obtain a degree to prepare and read a Latin thesis, and then, in a disputation, to defend his opinions against certain persons chosen to oppose him. Many of the subjects were theological, such as the familiar Can an archdeacon be saved? or How many angels can stand on the point of a needle? About the time of the Reformation the word was applied to more serious verbal encounters between theologians, e.g. the one at Leipzig in 1519 on papal supremacy. See Degree; Scholasticism.

**D'Israeli, ISAAC** (1766–1848). British author, father of the earl of Beaconsfield (*q.v.*). Descended from a family of Jews, belonging to the Spanish Sephardim, he was born in London, May 11, 1766, and is famous as the compiler of four entertaining literary miscellanies, *Curiosities of Literature*, 6 vols., 1791–1834; *Calami-*

be displayed. As a rule the ends of the wings point upwards, but if the pinions point downwards the bird is described as "displayed

ties of Authors, 1812–13; *Quarrels of Authors*, 3 vols., 1814; and *Amenities of Literature*, a projected history of English literature of which 3 vols. appeared, 1841. He was made D.C.L. of Oxford for his *Commentaries on the Life of Charles I.*, 1828–30. He died at Bradenham House, Bucks, Jan. 19, 1848.

**Disruption.** Name given to the secession on May 18, 1843, of 420 ministers of the Church of Scotland on the question of the patronage of livings. The seceding ministers, who numbered nearly half the church ministers, were followed by their congregations. Under the leadership of Dr. Thomas Chalmers, they formed the Free Church of Scotland. See Chalmers; Free Church; Presbyterianism.

**Diss.** Urban dist. and market town of Norfolk, England. It stands on the Waveney, 19 m. S.W. of Norwich, on the railway. Formerly noted for "Suffolk hempen cloth," it now manufactures brushes and mats, and is an agricultural centre. There are weekly sales of livestock. Market day, Fri. Pop. est. 4,000.

**Dissecting.** Cutting apart the organs or tissues of a plant or animal in order to display the coarser structural features. Medical students are required to make a complete dissection of the body as part of their course for a medical qualification. See Anatomy.

**Disseisin.** Word of French origin, the opposite of seisin (*q.v.*). It meant in feudal times the act of dispossessing a man of something, especially of land. It was generally an illegal proceeding. See Feudalism.

**Disseminated Sclerosis.** Organic nervous disease common in the U.K. and Europe. The cause is still wholly unknown. It may well be infective in origin but behaves like no known infective disease. The family and personal history of the victim afford no clue to tracking the cause; and the disease attacks equally both sexes, usually between the ages of 16 and 30.

Patches of sclerosis, variable in size, establish themselves throughout the substance of the brain and spinal cord. The main signs are nystagmus (involuntary oscillatory movement of the eyeballs), intention tremor (uncertainty of action manifest only on voluntary movement), and scanning speech (mode of speech in which each syllable is pronounced over-distinctly); while the emotional and intellectual life is altered and

Isaac D'Israeli,  
British author  
From an engraving

unbalanced. The course of the disease is unpredictable, though febrile diseases and pregnancy influence it adversely. No remedy is of real avail, though certain cases respond favourably to the removal of streptococcal or other toxins. Other nerve tracts may be conditioned to carry on the work of those destroyed.

**Dissenter** (Lat. *dissentire*, to disagree). One who dissents from the doctrine or discipline of the established Church of England. The term came into use soon after the Revolution of 1688, and appears still to be the legal term. The name Nonconformist can be applied with historical accuracy only to those ministers and congregations who left the Church of England after the Act of Uniformity, 1662. See Nonconformity.

**Dissenting Deputies.** Association of laymen, representing the Presbyterian, Congregationalist, and Baptist denominations. It was formed in 1732, and has the privilege of approaching the sovereign and offering an address.

**Dissertation** (Lat. *disserrere*, to discuss). Discourse or treatise of a formal kind. The word is specially applied to the essays or theses required by some universities from candidates for degrees of a kind not awarded after the usual examinations. Such are the degrees of doctor of literature (D.Litt.) at London, and of Ph.D. at many German universities. See Degree; University.

**Dissimulation** (Lat. *dissimilis*, unlike). In philology, a change whereby one of two similar sounds is made unlike the other. It is the opposite of assimilation (*q.v.*), but occurs far less frequently. Thus, in Latin *meridies* (mid-day) is for *medidies*; Latin *peregrinus* appears in Italian as *pellegrino*.

**Dissociation.** Term used in chemistry for the splitting of a molecule into simpler parts; it is used in two different ways: (1) to denote the breaking up of a molecule by the action of heat, (2) to explain electrolytic conduction, especially of aqueous solutions, by the breaking up of molecules into ions. Instances of the first use are the splitting of ammonium chloride by heat into ammonia gas and hydrochloric acid gas; also the splitting of phosphorus pentachloride into phosphorus trichloride and chlorine.

The second use of the term began about 1887, when it was brought in to explain the conductivity of aqueous solutions and electrolysis in general; a solution

of common salt was considered to be a mixture of solutions of sodium ions and of chlorine ions. Recent investigations have shown that crystals of common salt are not mere aggregations of molecules of NaCl, but of symmetrically arranged atoms (or ions) of sodium and chlorine. Consequently the dissolving of crystals of common salt in water

is effected by allowing water, not necessarily in the form of molecules, to intervene between the atoms or ions of sodium and chlorine.

**Dissociation.** In psychology, the separation of an idea or a desire from the control of the individual, making it coconscious, or the splitting of the personality into disunited parts. Alternating double or dual personality is a condition of mental dissociation in which the same individual shows an alternation of two different characters (*e.g.* Stevenson's Dr. Jekyll and Mr. Hyde). In multiple personality there are three or more such states.

**Dissolution** (Lat. *dissolvere*, to break up). Term used for the termination of an organized society. It is specially applied to a parliament dissolved either by the sovereign, acting on the advice of his ministers, or by the efflux of time, normally in the U.K. five years. Unlike many foreign assemblies, the British parliament, as a sovereign body, can prolong its own existence, thus postponing a dissolution. A dissolution differs from a prorogation, which marks the end of a session and does not necessitate a general election. (See Parliament.) The word is also used for the termination of a partnership. This may be dissolved either by the lapse of time or after due notice given, the change being announced in The London Gazette in order to safeguard the rights of creditors. See Partnership.

**Dissonance** (Lat. *dissonare*, to disagree in sound). Term in music (1) sometimes used synonymously with discord; (2) to denote a combination of two sounds whose vibration numbers are not in simple ratio (*i.e.* not both occurring in the first six notes of the same

Distaff. Peasant girl of Normandy with spinning wheel and distaff

harmonic series). Such pairs of dissonant sounds produce "beats" or waves instead of coalescing in a steady combined tone. See Beat; Discord; Resonance.

**Distaff** (A.S. *distæf* = *dise*, bunch of flax; *stæf*, staff). Short cleft stick on which was wound wool, carded cotton, or flax to be spun. It was held under the left arm, and the threads drawn from it were

twisted by the forefinger and thumb of the right hand. The spun thread was wound on a bobbin suspended from the thread and rotated so as to prevent the spun thread from untwisting. It is also used for the staff or rock of a hand-spinning wheel, upon which flax for spinning is suspended.

The word also symbolises feminine attributes, as in distaff rights, the distaff side of the family.

**Distemper** (Lat. *dis*, out of proportion; *temperare*, to mix). Paint in which the medium consists essentially of an aqueous solution of glue. The solid ingredients usually contain a high proportion of lime so that in time the film becomes fairly resistant to water from the formation of insoluble calcium carbonate by combination with the carbon dioxide of the air. In washable distempers casein replaces the glue. Casein is insoluble in water but soluble in limewater. When the paint dries, the lime is slowly precipitated as carbonate and the liberated casein is left insoluble. The whole film thus becomes water-resistant. A further modification is to emulsify such a medium with a drying oil, *e.g.* linseed. Paints of this type are sometimes called "oil bound water paints." See Paint; Tempera.

**Distemper.** An influenza-like condition from which many animals suffer. The term is most often used to describe the condition in the dog. The disease is caused by a virus; it is not so much the fundamental illness which does serious damage as the secondary invading germs, which can attack the respiratory system causing pneumonia and allied complications, the digestive tract causing severe diarrhoea and exhaustion,

or the nervous system causing hysteria and fits.

The death rate among dogs and the whole picture of treatment has been altered by the use of active immunisation. Very young puppies are unsuitable subjects; they can be passively protected by the inoculation of serum. The dog must be in sound health and under professional care during the whole treatment for protection. The method of choice is to give a vaccine first, to be followed some 14 days later by an injection of virus. Another method is to give the virus first, followed within 24 hours by an injection of serum. Serum has little value in late cases with secondary infections, but in the early stage of the disease it may prevent an attack from becoming severe.

**Distich** (Gr. *distichos*, in two rows). Classical term for a couplet containing the complete expression of a single idea. Strictly, the distich consists of a hexameter and a pentameter line; it is the form of many of the epigrams in Greek anthologies. *Pron.* distik.

**Distillation** (Lat. *destillare*, to drop down). Physical process by which a liquid is partially or wholly vaporised and the vapour then recondensed to the liquid state. Modern distillation apparatus consists of three parts: a still in which the liquid is heated, a condenser in which the vapours are cooled, and a receiver in which the liquefied vapours are collected. When the process of distillation is to separate two or more liquids of different boiling points (fractional distillation) an additional device, the fractionating column (*q.v.*), may be interposed between still and condenser. For small scale work in the laboratory the apparatus is usually made of glass, whereas in industrial equipment metal is commonly used. The cooling medium in the condenser is generally air or water, but for very volatile substances the greater cold necessary may be supplied by ice, ice-salt mixtures, solid carbon dioxide, liquid air, or other liquefied gases. In most small-scale work distillation is an intermittent process, the operation being carried to completion on one batch before the next is introduced into the still. In many large-scale operations, however, there is a continuous feed of raw material into the still and a continuous withdrawal of residue and vapour.

Some liquids decompose at temperatures below their normal boiling point; distillation of them

is effected in a partial vacuum. A liquid boils when its vapour pressure equals the external pressure; reduction of pressure in the still is therefore equivalent to a reduction in vapour pressure of the liquid, which can thus boil and distil at a lower temperature than normal. Consideration of Dalton's law of partial pressures shows that the introduction of steam into the still (steam distillation) has a similar effect.

In the chemical laboratory this important process is used for separating the solvent from solutions and for recovering pure liquids from mixtures of liquids. Fractional distillation is also used as a method of analysis, *e.g.* the analysis of hydrocarbon gas mixtures by preliminary liquefaction and subsequent fractional distillation of the liquid.

Distillation is much employed industrially, the typical example being the production of ethyl alcohol as both beverage and solvent. Others are the production of pure water (distilled water); preparation of potable water from sea water; separation of methyl alcohol (wood spirit) from the products of the destructive distillation of wood; fractionation of tars and crude petroleum; production of essential oils; recovery of ammonia from the crude ammonia liquor of the coal tar industry; and metallurgical processes such as the purification and recovery of mercury.

Normal distillation involves only physical change. When processes associated with chemical as well as physical change are referred to as distillation, the prefix "destructive" or "dry" is used. The best example is the destructive distillation of coal by heating in retorts to produce coal gas, coal tar, ammonia, and coke. Other substances treated in a similar manner are wood, for the production of wood tar (Stockholm tar), wood spirit, acetone, turpentine, and charcoal; and oil shale, for the production of shale oil, ammonia, and paraffin wax. See Alcohol; Petroleum; Refinery.

**DISTILLATION PLANTS.** During the Second Great War, compression distillation plants were developed to provide a constant supply of fresh water from seawater, the apparatus being used extensively to prolong the radius of action of submarines and other craft where lack of space prevented the fitting of large fresh-water tanks.

Compression distillation depends upon mechanically compressing

the steam and leaving the evaporation compartment of the still to raise its temperature a few degrees. At the higher pressure, the steam condenses above the boiling point of the evaporating raw water, so that the heat can flow from the condensing steam to the raw water and boil it. The average unit had a distillation capacity of 250 gallons of fresh water per hour.

Chief advantages of the compression distillation unit are: it is entirely self-contained; requires no cooling medium; is stable in operation; needs a minimum of attention, and can be adjusted to yield directly from seawater sterile distilled water of the highest chemical purity suitable for batteries. Stills operating on a similar principle, but with a lower distillation capacity, form part of the equipment of lifeboats and aircraft dinghies. They work on paraffin or solid fuel and produce fresh water from the sea in a few moments. These stills saved hundreds of lives of shipwrecked men during the U-boat campaign of the Second Great War.

**Distillers' Company.** London city livery company. It received its first charter in 1638, and rules

Distillers' Company arms

and by-laws were drawn up in 1639 by Sir Theodore de Mayerne, physician to Charles I, and Dr. Thomas Cademan. A second charter, granted 1687, was confirmed in 1690. The order of the common council, 1774, that all distillers within civic jurisdiction should be members of the company has long been obsolete. The offices are at 49, Leadenhall St., E.C.3. See City Companies.

**Distilling.** The term used to denote process by which certain alcoholic beverages are obtained by distillation (*q.v.*). According to ancient writers, distilling was a Chinese art long before it was practised by the Arabs in the 7th century. The Arabs distilled essence of turpentine from pitch; they also distilled rosewater and other perfumes, assisting condensation by applying wet cloths to the heads of their crude stills.

Alcohol was unknown to the Arabs as late as the 12th century. Arrack distilled from toddy, the fermented sap of various palm trees, is said to have been known in India since 800 B.C., and in Ceylon

Distilling. 1. Fermenting vats, where yeast is added before the liquor is distilled. 2. Wash and spirit still. 3. Spirit safe, where the distillation is first run off from the still and tested. 4. Horizontal refrigerator for cooling the spirit

from time immemorial. Brandy (eau de vie) is distilled from weak wines. Cognac, the brandy of Charente, is distilled in ancient alembics from locally grown grapes.

Whisky is distilled from a fermented solution of malted barley, or malted barley mixed with other cereal grain. Malted barley only is usual for Scotch pot-still spirits. A small proportion of oats is generally added to the mash for Irish whisky. What is known as grain whisky, both in Ireland and Scotland, is obtained by using a large proportion of unmalted grain (maize or Indian corn) in the brew. Malting develops the enzyme diastase, which in suitable solution has the power of converting starch into fermentable sugars. Malt is crushed, and unmalted grain ground for brewing. The hot saccharine liquor run from the mash tun is known as wort. After cooling it is "pitched" with yeast and fermented to produce alcohol. When fermentation begins wort becomes wash.

Rum is distilled from a fermented wash, the wort for which is prepared by dissolving sugarcane syrups in hot water and fermenting with the "skimmings" from collections of wort in active fermentation. Molasses spirit for industrial uses is prepared in Great Britain by dissolving mo-

lasses in water and fermenting with specially prepared molasses wort in active fermentation.

With the exception of Hollands, gin is not distilled directly from wash. The finest London gins are made by distilling good quality grain spirit in which juniper berries and other flavouring ingredients have been macerated for 24 hours or so. Another method, favoured in France, is to conduct the spirit vapour in specially made stills through a small container filled with juniper and flavouring spices. Considerable quantities of gin are compounded by mixing gin essence with grain spirit.

Types of stills vary from the simple pot-still, which is an alembic or pot covered by a head with an escape pipe for vapour, to complicated column stills fed continuously with fermented wash and discharging highly rectified spirit for days without intermission. In spirit distilling, normally the object is to separate the alcohol from a fermented wash or wine and to collect a liquid of higher alcoholic strength. This is possible because of the difference between the boiling points of water (100° C.) and alcohol (78.35° C.). As the wash is heated in the still, whether by fire or steam, the vapour driven off contains in its early stages a higher proportion of alcohol than of

water. As the alcohol vaporises, the liquid becomes less alcoholic, and its boiling temperature rises. By reason of this, and because of the affinity of alcohol for water, a sharp or clean separation is not possible, and the vapour is always to some extent charged with some proportion of water. Water fractions are reduced by condensers in series furnished with reflux pipes, but in pot-still distilling it is usual for the vapour to be condensed by passing through a "worm" which is water-cooled outside. As there are invariably other liquid matters in fermented wash or wine, the water and spirit vapours are contaminated with impurities. These combine in what is known as fusel oil, or higher alcohols. Traces of so-called impurities give brandy, whisky, or rum its characteristic flavour.

Patent or column stills for continuous distilling have developed from a single column still designed by a French distiller, Cellier-Blumenthal (1808), for distilling wine, washes brewed from grain, and potatoes. The inner fittings of his column included lenticular plates in the lower section and a few bubbling plates in the upper section. Improvements, including St. Marc's fire-heated column and Stein's, were soon made and introduced in the U.K. The only patent still of old time that survives is

Coffey's apparatus (*see* Alcohol illus.), the usual equipment of grain spirit distilleries, which is built in two columns: (a) the analyser, and (b) the rectifier. Each consists of super-imposed frames separated by copper diaphragm sheets. With the exception of the spirit sheet and the upper sheets of the rectifier, all diaphragms are perforated. Each column is enclosed top and bottom with binding sheets. Drop tubes communicate downwards from frame to frame.

The analyser vaporises fermented wash and the rectifier condenses spirit vapour. Condensation of the spirit vapour is expedited by running the wash pipe through nearly every diaphragm in the rectifier, the wash growing hotter as the pipe descends the column until it has almost reached boiling point by the time it is discharged into the upper chambers of the analyser. Wash is exhausted of its spirit vapour long before it reaches the bottom of the analysing column, but several frames are provided as safety measures. The heavier oily alcohols condense in the lower frames of the rectifying column while lighter spirit vapour is purified as it is forced upwards by pressure of vapour from the analyser through layers of condensates on each diaphragm sheet until a sufficient degree of purity is obtained (say 65 to 67 or even 68 overproof). This is expected in the top frames of the rectifier, which are water-cooled to condense the strong spirit vapour for discharge from the spirit sheet. The hot spirit is run through a refrigerator and observation safe to the spirit receiver. Exhausted wash is discharged from the analyser. Impure spirits are discharged from the rectifier to one or more vessels designed for trapping fusel oil, while the tailings from distilling, when the still is being worked off, are run from the spirit sheet through a branch pipe to feints receivers.

The continuous distilling system used on the continent of Europe, such as the French Barbet and the German Ilge, work on similar principles, but their fittings and diaphragm arrangements are different.

**Distinguished Conduct Medal.** British military decoration. Instituted in 1862, it is conferred upon

Distinguished Conduct Medal

non-commissioned officers and men for "individual acts of distinguished conduct in the field." Familiarly known as the D.C.M., it is (as from Aug. 1, 1918) awarded for "services in action" only. The obverse of the medal bears the effigy of the reigning king; reverse, inscription, "For Distinguished Conduct in the Field." The ribbon is three stripes equal width, outside red, centre blue. In the First Great War the number of D.C.M.s awarded was 24,391 for services in the field. During the Second Great War 1,531 D.C.M.s and 7 bars were awarded.

**Distinguished Flying Cross.**

British decoration awarded for gallantry in face of the enemy to officers and warrant officers of the Royal Air Force. It was instituted in 1918, and the ribbon is purple and white, striped diagonally. Originally the ribbon had horizontal bands, but this was altered in 1919. Since April, 1941, the D.F.C. may be awarded to officers and warrant officers of Allied air forces serving with the R.A.F., to the personnel of any air force raised within the British Empire, and to officers and warrant officers of the army and Royal Navy flying on duty with the R.A.F. During the Second Great War, 18,971 Distinguished Flying Crosses were awarded.

Distinguished Flying Cross

**Distinguished Flying Medal.**

British decoration instituted in 1918 for award to non-commissioned air crew personnel of the Royal Air Force for acts of gallantry when flying against the enemy. Since 1941 the D.F.M. may be awarded to personnel of any air force raised within the British Empire, and during the Second Great War it was awarded to personnel of Allied air forces serving with the R.A.F., and to non-commissioned personnel of the army and Royal Navy flying on duty with the R.A.F. During

the Second Great War 6,380 Distinguished Flying Medals were awarded. The ribbon resembles that of the D.F.C., but has narrower stripes.

**Distinguished Service Cross.**

Silver cross established in Britain in 1901 as the Conspicuous Service

Distinguished Service Cross

Cross, its award being confined to warrant officers and subordinate officers of the navy whose services have been noted by special mention in dispatches. In Oct., 1914,

the present title was substituted and the scope of the award extended to include commissioned officers of the rank of lieutenant and below. The ribbon is three stripes equal width, outside blue, centre white. The number of Distinguished Service Crosses awarded in the Second Great War was 4,460.

**Distinguished Service Medal.**

British medal instituted in Oct., 1914. Its award is confined to chief petty officers and lower ratings in the navy, and to non-commissioned officers and men in the marines, and it is granted to those "who set an example of bravery and resource under fire, but without performing acts of such pre-eminent bravery as would render them eligible for the Conspicuous Gallantry Medal." During the Second Great War 6,693 Distinguished Service Medals were awarded. The ribbon is three stripes equal width, outside blue, centre white with a thin blue stripe.

Distinguished Service Medal

**Distinguished Service Medal**

(INDIA). Award instituted by Edward VII, June 25, 1907. It is open to the rank and file of the Indian army, and during the First Great War was also opened to other troops acting under orders from the government of India. The medal bears the sovereign's profile, the reverse having a laurel wreath inscribed "For Distinguished Service." The ribbon is deep violet with borders of blue.

**Distinguished Service Order.**

British naval, military, and air force order given to officers. It was

Distinguished Service Order badge

instituted by Queen Victoria, Nov. 9, 1886. It ranked next to the Order of the Indian Empire until 1902, when King Edward caused it to rank after

the Royal Victorian Order. Recipients are called companions, the reigning monarch being the sovereign of the order. British officers only are eligible for the companionship, but foreign officers who have been associated with the British forces may become honorary members. Officers can be nominated only after their names have appeared in dispatches for "meritorious or distinguished service in the field or before the enemy."

The badge of the order is a gold Maltese cross, enamelled white, edged gold, having on one side the imperial crown in gold and on the reverse the imperial and royal cipher; it is suspended from the left breast by a red ribbon, edged blue. Appointments are by royal warrant. In the First Great War 8,862 were awarded for services in the field, 695 first bars, 70 second, and 6 third; also 21 D.S.O.s for services in connexion with the war. Since 1917 officers of the Merchant Navy have been eligible for the award. During the Second Great War, 3,691 D.S.O.s were awarded, of which the Royal Navy gained 685, the Army 1,928, the Royal Air Force 1,078, and the Merchant Navy 14.

**Distortion.** In metallurgy, an alteration from the usual or ideal shape, resulting from unequal cooling of a casting or by the quenching of a mass of unequal section. Distortion changes the physical and mechanical properties of a metal, there being usually a tendency for the metal or alloy to harden. Generally tensile strength is raised and ductility is reduced, the hardness increasing also; but certain lead alloys actually soften when distorted in a suitable manner. These changes in properties result from modifications in the crystal structure of the metal, which reveals under the microscope a change in orientation of its grain structure. In severe distortion brittleness may result and annealing be necessary to restore ductility. Distortion practised deliberately will produce desired shapes; e.g. drop-forging is performed hot, and wire-drawing is a cold-working process.

**Distraint** or **DISTRESS** (Lat. *distingere*, to pull asunder). In English law, the right to seize goods, without process of law, as security for a debt. The most usual case is that of a landlord seizing a tenant's goods for rent. Distress must now be levied by the landlord himself or a bailiff certified by the local county court, and only between sunrise and sunset. No forcible entry can be made. Wearing apparel, beds, and bedding up to the value of £5 must be left on the premises; and if the goods of a lodger, sub-tenant, or other person than the tenant (except his wife) are seized, they can be claimed by the owner under certain conditions. Tools and implements of trade that do not exceed £5 in value may not be taken; the excess over £5 may be taken only if there is no other sufficient distress. An action lies for irregular or wrongful distress. By legislation introduced during the Second Great War a landlord could not exercise his right of distress without the leave of the court. See Rent Restriction.

**Distributary.** One of the many channels of a delta. The waters of a tributary or affluent flow into the main river, those of a distributary flow from the main stream. The distributaries of the Mississippi delta are known as passes.

**Distribution.** Term used in economics and commerce with various meanings. The distribution of wealth or of goods among various classes of the community may refer to a statistical comparison of standards of living. Distribution is also the means by which goods are conveyed to purchasers; this aspect is considered under Retail Distribution.

In printing, type which has been set and afterwards broken up is said to be distributed or "dissed."

At bridge, distribution is (1) the pattern in which the 13 cards in a player's hand are divided among the four suits; (2) the pattern in which the cards of any one suit are divided among the four hands.

**Distribution of Animals.** Land-locked animals have evolved during a period of important changes in the configuration of the land masses of the earth's surface. The study of animal distribution shows the history of some of these changes most strikingly. The restriction of some forms to the Australian region and the absence of placental mammals there show that Australia was isolated too early to allow the invasion of ordinary mammals. On the other

hand, the finding of river-dwelling fish obviously closely related on the W. coast of Africa and the E. coast of South America is strong evidence that these lands were once contiguous. This study will always be associated with the name of Alfred Wallace, though the simplicity of his original ideas has not been upheld by increasing observation.

**Distributor.** Device for sending an electric current through a number of different paths in turn. It consists of a rotating arm which forms part of the common circuit and touches a number of brass contacts as it revolves, each contact being a terminal of one of the alternative paths. Distributors supply high tension current to the sparking plugs of multi-cylinder motor car engines from a magneto or induction coil; or feed a number of coils (each serving a separate cylinder) with low tension current from a common source.

Distributor is the name for low tension street cable for supplying light, heat, or power to the community.

The distributor is also an important feature of multiplex telegraphy, enabling as many as eight messages—four in each direction—to be sent simultaneously over a single wire. A distributor is required at each station; and the two arms are kept in step by a phonic wheel under control of a tuning fork. Assuming four messages to be sent in one direction: the first transmitting and its corresponding receiving instrument will be connected up with contacts 1, 5, 9, 13; the second with 2, 6, 10, 14; and so on. If the contacts are 200 in number, and the arm revolves three times per sec., every instrument is in circuit with the line

$$\text{wire } \frac{200 \times 3}{4} = 150 \text{ times per sec. ;}$$

and a signal, though actually sent out as a series of impulses, has the effect of a single impulse, owing to the inertia of the moving part of the receiver. See Circuit, Electric.

**Distributor.** Agricultural implement for evenly distributing artificial manure in quantities that can be definitely regulated. A distributor consists essentially of a rectangular box mounted on wheels, with a slit below from which the manure falls. This is stirred up and prevented from getting lumpy by various devices, and in one type centrifugal force is brought into play by the action of revolving horizontal disks. Some machines distribute artificial manure and seeds simultaneously.

**District Attorney.** Public prosecutor in the U.S.A. (1) Federal district attorneys are appointed by the president for each federal judicial district as deputies of the attorney-general. (2) State district attorneys (sometimes called county attorneys or circuit attorneys) are usually elected by popular vote. Members of the former class commonly figure less prominently in the public eye than those of the latter, since most crimes, especially those of a sensational character, are offences against state laws rather than federal laws. A state district attorney often needs to be not only a skilled lawyer but a man of no little moral and physical courage, as he may have to deal with racketeers and gangsters who possess wealth and influence and are prepared to go to any length in self-defence. An official who can land them in prison may become a national figure; e.g. W. T. Jerome, who cleared up the gambling resorts of New York City; J. W. Folk, whose fight against municipal corruption in St. Louis led to his becoming governor of Missouri; C. S. Whitman, elected governor of New York after his successful prosecution of a murderer; and Thomas Dewey (*q.v.*).

**District Council.** In the United Kingdom, a body elected to carry on local government. There are two types of district council, the urban and the rural, both established in England and Wales by the Local Government Act of 1894, later governed by the Act of 1933. Every urban district has a council. Its members are chosen by the electorate in April, and serve for three years; sometimes one-third of them retire each year, sometimes all retire at once. Women are eligible. Meetings are held at least four times a year. Councils elect their own chairmen, who are, by virtue of their office, magistrates for the county. They are the sanitary authority and the highway authority for roads which are not under the ministry of Transport or county council. They are also the authority for carrying out provisions of the Town and Country Planning Acts.

Every rural district, which may be either a single parish or a group of parishes, has a council. Provisions as to its members, officers, and meetings are the same as those relating to urban district councils. The minister of Health may confer some of the functions of an urban upon a rural district council, or apply to rural districts any Act referring to an urban district.

In Scotland district councils were established by the Local Government (Scotland) Act, 1929, under schemes prepared by each county council. The provisions of the Local Government (Scotland) Act, 1894, as to parish councils were applied to district councils, which took over some functions of the abolished parish councils.

**District Line.** Part of the London underground rly. system. With an E. terminus at Upminster, it comes on to the Metropolitan inner circle at Tower Hill, leaves it at Gloucester Road, and divides into four W. branches to Richmond, Wimbledon, Hounslow West, and Ealing Broadway, with a connexion to Uxbridge. The section from Westminster to Kensington was opened in 1863, and in 1871 the line began at Mansion House. It was built on the "cut-and-cover" system; the cuttings being roofed over and sometimes built upon. Beyond the central area the line is no longer underground, but often elevated. The West Bournemouth crosses over it in a steel conduit at Sloane Square stn. Motive power was originally steam, but early in the 20th century the line was electrified. *See* London Transport.

**District Nurse.** One who provides skilled nursing and midwifery for persons of all classes in their own homes, the necessitous being nursed free. She may undertake general nursing only or combine this with midwifery. The Queen's Institute of District Nursing was founded in 1889, and is the central body to which practically all the county and district nursing associations of the U.K. are affiliated. Over 8,000 district nurses cover 98 p.c. of the U.K.

**District of Columbia.** Territory of the U.S.A. Enclosed on three sides by Maryland, and bordered by the Potomac on the S.W., it covers 69 sq. m. and is continuous with the federal capital Washington. The surface is hilly or undulating, with fertile valleys watered by the Potomac and its E. branch, the Anacostia, which forms the E. boundary of the district.

Originally the area was 100 sq. m., granted by Maryland and Virginia, but in 1846 the portion ceded by Virginia was restored to that state. It held the city of Washington and Georgetown until 1895, when the latter was incorporated as part of the capital; it is now a residential suburb. The district was made the seat of government by Act of Congress July 16, 1790, and in 1800 the U.S.A. assumed

authority over it. The continental congress had already assembled ten times in eight different places.

Washington himself laid out the site, having sold his lands in the neighbourhood, and engaged the French architect Pierre L'Enfant to design the city. In 1871 the district was designated a territory, with a governor and legislature and delegates to congress. Now the latter has exclusive jurisdiction over it; administration is by three commissioners, two of them residents appointed by the U.S. president for three years, and the other a member of the army corps of engineers. The district is the seat of George Washington and Georgetown universities, the latter a Jesuit institution, of the Catholic university of America, Trinity College (for women), Howard university (for negroes), the American university (Methodist), etc. Industries produce almost wholly for government and local consumption. Pop. 663,091. *See* Washington.

**District Registry.** Office in the charge of a registrar, where the wills of persons dying in that district can be proved and kept for inspection. An Act of 1857 established district registries in many of the chief towns in England and Wales. The principal registry is at Somerset House, London.

**Distringas.** Term used in English law. At first it was a writ to compel a person to do something by distraining on his property, and in this sense it is obsolete. But there is a legal process often called *distringas* whereby a person who claims to be interested in stock in any company can put a restraint upon its transfer so that it cannot be got rid of until his claim is satisfied. *See* Distrain.

**Ditchling Beacon.** Hill of Sussex, England, one of the highest points of the South Downs. Rising near Hassocks, about 7 m. N. of Brighton, it is 813 ft. high, and on its summit are remains of a British camp.

**Dithion** or **SODIUM DITHIOSALICYLATE.** Remedy for rheumatism. The dithiosalicylic acid is made by heating salicylic acid with sulphur chloride, and from this the sodium salt is obtained. Dithion is derived from Greek *di*, double, two, and *theon*, sulphur.

**Dithmarschen.** District of N. Germany, in Holstein. Forming part of the long belt of dune country which borders the North Sea, the area is bounded by the Elbe and the Eider, and lies on the W. side of the isthmus of Jutland.

**Dithyramb** OR DITHYRAMBUS. Irregular ode couched in enthusiastically lyrical language. Originally a choric dance and song in honour of Dionysus, the term dithyrambic is now applied to lyric poetry characterised by vehement passion. See Poetry; Verse.

**Dittmar**, KURT (b. 1890). German soldier and propagandist. He was born at Magdeburg, son of a historian. A captain after the First Great War in the new Reichswehr, he became a colonel in 1936, and commanded the army engineers on the outbreak of war in 1939. He led a division on the Lapland front in 1941. From May, 1942, Dittmar broadcast commentaries on the army; his comparatively objective reports being often at variance with those spread by Goebbels.

**Diu**. Island off the N.W. coast of India, belonging to the Portuguese. It is situated at the S. extremity of the peninsula of Kathiawar, 170 m. N.W. of Bombay. Area, 20 sq. m. It is the seat of a governor, who is subordinate to the governor-general of Goa. Salt is worked. The town of Diu was at one time a great trade centre, where the Portuguese withstood a famous siege in 1545, and its buildings bear evidence of former prosperity. The silting up of its harbour is the principal cause of its decline. Pop. 14,000.

**Diuretics** (Gr. *dia*, through; *ouron*, urine). Drugs employed to increase the quantity of urine excreted by the kidneys. Their administration results in a diluted urine when it tends to precipitate solid matter as in certain forms of Bright's disease and heart disease; and in dropsical conditions, most often associated with heart or kidney failure, helps to diminish the amount of fluid in the body. Digitalis, caffeine, juniper, and potassium citrate have a diuretic action.

**Divali**. Hindu feast of lamps, celebrated on certain dark autumnal nights in honour of various divinities, notably Lakshmi (*q.v.*). Lamps are carried in the streets, there are displays of fireworks, and from the floating or sinking of little rafts decked with lamps favourable or unfavourable omens are drawn. During the festival tradesmen open their account books for the new year, and gamble to test their luck. In Bengal, divali is known as Kali pujah, festival of Kali (*q.v.*).

**Divan** OR DIWAN. Persian word of many meanings: a bundle of written sheets, a collection of

poems by a single author, an account book, register, office, custom house (Fr. *douane*), council, council chamber, reception room, cushioned seat or couch. In the 18th and 19th centuries European rooms fitted with seats and cushions in the Turkish style, smoking lounges, and tobacconists' shops were called divans. In Anglo-Indian usage the word was used of the prime minister of a native state, of the principal native officer of a mint or other government institution, and, in Bengal, of the native steward of a European household.

**Dive**. Term in aeronautics to describe the nose-first descent of an aircraft followed at its finish by a flattening out to level flight. When a dive is made with the engine running it is known as a power dive and tends to "over-rev" the engine, because the increased pressure on the face of the airscrew blades, due to the rapid downward velocity of the aircraft, accelerates their normal revolutions. Power diving is the basis of the technique of aerial attack called dive bombing.

**Dive Bombing**. Method of low level precision bombing. It was developed by the German Condor Legion in the Spanish Civil War and later used with devastating effect in the invasion of Poland in 1939 and of France and the Netherlands in 1940. Dive bombers formed an essential component of the Panzer division, for which they acted as close support artillery. They rendered ineffective the defending artillery and armour, and then transferred their activities to points deeper within the enemy lines.

In a dive bombing attack the aircraft is inclined towards its target at an angle of 40°-60°, its downward velocity being checked by dive brakes (*q.v.*). The correct moment for release of the bomb is immediately after the aircraft flattens out; if the bomb were dropped whilst the aircraft were actually diving on the target it would fall short. No sight is used, the pilot relying on judgement.

The effectiveness of the dive bomber decreased when it encountered strong opposition. When

150 German dive bombers attacked the aircraft carrier *Illustrious* in Valletta harbour in 1942, 90 were shot down by ship and shore A.A. batteries. The principal defect of dive bombing was that the aircraft, being pointed directly at the target, was also directed at the guns defending it. Moreover the aircraft, slower than a fighter, could not easily escape when engaged. The German Junkers 87 did achieve success early in the Second Great War. The nearest British approaches to the dive bomber were the Hurricane "tank-buster," first used in the Western Desert, the Typhoon, used in the invasion of W. Europe, and the Fairey Barracuda, used by the Royal Navy.

**Dive Brake**. Adjustable flap fitted to the trailing edge of an aeroplane wing to retard velocity when diving. The flaps are controlled by the pilot, and when down lie approximately at right angles to the surface of the wing. The brake thus offers opposition to the upward flow of air and slows down the aircraft's rate of descent.

**Diver** (*Colymbidae*). Name given to a family of birds. There are four British species, all found in Scotland, and more rarely in England. They have feet set far back, which gives them an upright attitude when standing and an awkward gait when walking; but in the water they somewhat resemble geese with long sharp beaks. They feed entirely on fish, and spend the winter at sea, visiting the inland waters in the nesting season. They rarely fly except in the migrating season. They can remain under water more than five minutes.

The Great Northern diver (*Colymbus immer*), the largest of the group, is found in W. Europe, Iceland, and Canada. It is over 30 ins. long, and has black plumage thickly spotted with white on the upper parts, with white below. The white-billed Northern diver (*C. adamsonii*) is very rare. The black-throated diver (*C. arcticus*), found in the Hebrides, Scandinavia, N. Asia, and America, is somewhat smaller, and has a grey head and purplish black throat. The red-throated diver breeds locally in Donegal.

Diver. Great Northern diver, largest of the group

**Diver**, KATHERINE HELEN MAUD (d. 1945). British novelist, known as Maud Diver. Born in India, she passed most of her early life there or in Ceylon, but settled in England after 1890. By name Marshall, she married Lt.-Col. Diver in 1896. Her first novel, *Captain Desmond*, V.C., 1907, published when she was 40, established her as a popular writer on British India, especially the N.W. frontier. From a series of similar novels she turned to history with *Kabul to Kandahar*, and *Inc Royal India*, 1942. She died Oct. 14, 1945.

**Diver's Paralysis.** Disease which occurs in divers and those working in caissons under increased pressure, owing to excessive absorption of nitrogen by the blood. See *Caisson Disease*.

**Diverticulitis.** Inflammation of a sacculated portion of the colon. The wall of the lower gut gives before pressure, forming pockets, in which the food mass lodges. This mass, unable to clear itself, gives rise to irritation, and then to localised inflammation, causing discomfort and pain. X-ray examination facilitates recognition of the condition. It is found equally in men and women after the age of 40, especially when there is a history of constipation. It is associated often with irritability of the bladder. Reflex indigestion is often found as in appendicitis. Treatment consists in a low-residue diet, free from pips and skins of fruit and salads. Some paraffin preparation should be given with every meal so that no hard mass may form in the intestine, and drugs of the belladonna family are useful in preventing painful spasm.

**Dives** (Lat., rich). The rich man in Jesus' parable of the Rich Man and Lazarus (Luke 16, vv. 19-31) is often designated by the Latin equivalent *Dives*. His lot in this world and the next is contrasted with that of Lazarus, a beggar; whereas Lazarus is comforted, *Dives* suffers anguish.

**Dives-sur-Mer.** Port and watering-place of Normandy France. In the department of Calvados, 15 m. N.E. of Caen, it stands at the mouth of the little river Dives. It has an old church and 16th cent. wooden market buildings. It was long a Norman port, and from here William the Conqueror is supposed to have sailed to England in 1066. It shares a station with Cabourg, a more modern place with a casino. A metal working industry is carried on near by.

**Divide.** Word used in America and Australia for a mountain range that divides two valleys. An example is the Great Divide in Wyoming, or the Great Dividing Range (*q.v.*) in Australia.

**Dividend** (Lat. *dividendum*, something to be divided). Usually the money distributed from profits to the shareholders in joint stock companies. Dividends are often of two kinds, those on preference or preferred shares which are at a fixed rate, and those on the ordinary shares which vary with the profits. Dividends on preference shares are either cumulative or non-cumulative. If the former, dividends which are not paid owing to lack of profits remain a charge on the company's future profits, and must be paid before the ordinary shareholders receive anything; if the latter, no liability is carried forward. The latter class, like the ordinary shares, stand or fall by the results of a single year.

Most companies pay two dividends a year: one an interim dividend and the other a final one, paid after the year's accounts are made up. The directors, having before them the audited accounts, decide upon the amount and recommend its payment to the shareholders, who as a rule simply pass it. Directors are liable to the company if they knowingly pay dividends out of capital. Income-tax is usually deducted before the dividend is paid. Dividends are sent by means of dividend warrants, which are stamped to serve as cheques. Dividend is also used for the money paid to the creditors of a bankrupt in settlement of claims; and to winners of football pools. See *Company Law*.

**Divi-divi** (*Caesalpinia coriaria*). Small tree, member of the family Leguminosae. It is a native of S. America. The leaves are divided into four to seven pairs of leaflets, the latter again into 16 to 24 slender segments. The white flowers are in branched sprays, and are succeeded by S-shaped flattened pods which, owing to the tannin they contain, are exported for tanning purposes, and known to commerce as *divi-divi*, *libi-divi*, or *libi-dibi*.

**Divina Commedia.** Dante's great poetic trilogy, *The Divine Comedy*, probably completed in 1321; earliest extant editions, printed 1472. The title *Commedia* was used because the story has a happy ending; the adjective *Divina* has been added by posterity. The Soul of Man, represented in the poet, passes from the worldly life

into sin, and, with the shade of Virgil as a guide, to a vision of his misery in Hell. By repentance and penance the marks of the seven deadly sins are effaced in Purgatory; towards the close of which the shade of Virgil leaves him, and Beatrice, Heavenly Love, becomes his guide through Paradise. See *Dante*; Italy; Literature.

**Bibliography.** The standard English translation is that of H. F. Cary, 1814, and there is an admirable one by Longfellow, 1867; consult also W. W. Vernon's *Readings on the Inferno*, 2nd ed. 1906; *Purgatorio*, 3rd ed. 1907; *Paradiso*, 2nd ed. 1909.

**Divination** (Lat. *divinare*, to see like a god). Quest or discovery of the unknown by non-rational processes. The knowledge thus sought or obtained may be the identity of wrongdoers; the right choice of persons, places, things, or acts; the whereabouts of persons or of desired things; the fate of persons in health or sickness; the divine will; or future events.

Divination by omen may be deemed to have sprung from the disposition to regard two consecutive events as standing in the relation of cause and effect. Arising in that early atmosphere of thought which is called magico-religious, it is associated with the principle of sympathetic magic. When the conception supervened of divine beings capable of being propitiated, the magician, the master of the supernatural, passed into the diviner, their servant. Divination thereupon came to imply, consciously or unconsciously, an appeal for guidance, and in some communities was formally recognized.

At the dawn of recorded history divination controlled the public and private life of W. Asia. Early Sumerian practices, taken over and developed by Semitic Babylonia, became a complex system which afterwards affected the religious usages of ancient Greece and Rome. These practices drifted to early China, where oracle-bones from Homan are datable before 1200 B.C., as well as to Vedic India, and close parallels are recorded in ancient Mexico and Peru. Babylonian methods—three occur together in Ezek. 21—profoundly influenced Jewish usage.

In the stricter sense divination is subjective or intuitive. It is a mode of "seeing like a god." It makes use of (1) dreams; (2) autohypnotism; (3) subconscious impression; (4) necromancy. Its highest manifestation is the oracle. Dreams are either involuntary or purposely sought by crystal-gazing

and the like. Autohypnotism includes trance and frenzy; the subconscious includes the phenomena of clairvoyance, divining rods, and planchette.

In a wider sense it embraces various objective processes involving empirical deductions from observed facts. These facts are regarded as omens, whose interpretation may be undertaken by the lay observer, explained by published books, or dependent upon the services of professional diviners, such as the school of augurs in ancient Rome and Mexico. They are sometimes conceived as supernatural signs or portents, sometimes as events shown by experience to be habitually followed by others. These objective processes include the observation of (1) living things, as in augury and palmistry; (2) dead things, as in haruspicy, the inspection of entrails, and scapulomancy, that of shoulder-blades; (3) physical objects, as in astrology, geomancy, and the behaviour of sand, fire, or water; (4) magical mechanisms, as suspended rings, keys, or sieves; (5) the consultation of books at random—Virgil, the Bible; (6) the casting of lots.

Almost all these methods survive in primitive culture or in popular superstition. The flight and song of birds are noted in Borneo, the movements of lizards and insects in Torres Straits. Fowls are slaughtered by the Nagas and Kavirondo; livers are inspected in Borneo; chicken-bones in Burma. The Barotse use knuckle-bones, the Borneo Kayans bears'-teeth dice, the Polynesians coconut teetotums. *See Magic; Prophecy; Soothsayer.*

**Divine Right.** Political theory that all authority has a divine sanction, and that the sovereign power does not exist merely by the will of the people or the consent of the government. The doctrine that a monarch exercises his power by inherited right and not in virtue of any contract, actual or implied, with his people, grew up under the Tudors in the 16th century, and the tact of Elizabeth enabled it to pass without serious challenge.

It was, however, during the reigns of James I and Charles I that it was most in evidence. Both the kings and the ecclesiastics welcomed it, and arguments in its support were taken from the Bible. The clash between it and the ideas held by the parliamentarians was the fundamental cause of the Civil War. The establishment of William and Mary upon the throne in 1688

*Courtesy of Siebe, Gorman & Co., Ltd.*

was a rude shock to the theory of divine right, while the accession of the Hanoverian dynasty in 1714, with a title based on a definite parliamentary act of settlement, rendered it untenable by supporters of George I. The chief exponent of divine right in England was Robert Filmer, while it was preached in France by Bossuet. *See Sovereignty; consult also Theory of the Divine Right of Kings, J. N. Figgis, 1896.*

**Diving.** Descent under the sea, during which the diver is submerged for a prolonged period and for which artificial aids are neces-

sary. Salvage work, harbour and dock construction and maintenance, and all work of an underwater character are dependent on the modern "dress" diver. The diving-dress used universally today is the "closed" dress, so called because the diver is totally enclosed, except for his hands, in a water-tight dress and helmet supplied with air from the surface by pump or air-compressor and air-line. The first "closed" dress was introduced in 1837 by Augustus Siebe (1788-1872) and on it the present-day dress is based. This comprises: (1) The dress proper, made of sheet indiarubber, interposed between and affixed to two layers

of stout tanned twill. The only openings are at the wrists, which are provided with cuffs of vulcanised rubber compressed by stout external rubber rings, and at the top. (2) The corselet, of tinned copper, between the lower edge of which and an external metal strap the neck of the dress is clipped by nuts and bolts. There are two hooks, back and front, from which leaden weights are suspended. The corselet has a circular neck with interrupted screw threads out on the outside to engage with similar threads on the inside of (3) the helmet, of stout beaten copper,

provided with a removable circular glass window in front, and a fixed window in each side, and in some types a top window, a non-return air inlet valve at the back, and an air escape valve at the right side. If telephonic communication is used, a receiver is fitted in the crown, a transmitter to the right of the front of the glass, and a switch, pressed by the diver's chin, beneath the glass. (4) The leaden breast and back weights, 40 lb. each. (5) Boots, weighted with lead or brass, scaling 30 lb. or more. (6) A lifeline, used for raising and lowering the diver, and for signalling. (7) A length of flexible wire-lined rubber tubing with metal couplings. (8) A hand-driven air-pump or an oil engine or electrically-driven air-compressor which forces air from above through the tube and inlet valve into the helmet.

When dressed to descend the diver carries some 170-200 lb. He regulates the air escape valve so that the air-pressure inside the dress is slightly above that of the water outside, and air escapes freely in a continuous stream, while keeping the dress sufficiently inflated to displace almost the weight of diver and equipment.

For special purposes, self-contained apparatus rendering the diver independent of surface air supply can be used. This mostly embodies the self-regenerative breathing circuit by which compressed air and oxygen are supplied to the diver from cylinders carried on his dress, and his exhaled breath is purified of carbon dioxide by passing it through a suitable absorbent. He thus breathes the same air several times over. This system was designed in 1878 by H. A. Fleuss in association with Siebe, Gorman & Co., Ltd., and improved later by Fleuss in collaboration with R. H. Davis. Many types of self-contained dresses were used during the Second Great War, by crews of midget submarines, "human" torpedoes, etc. For short periods of immersion such as in the escape from sunken submarines the Davis submarine escape apparatus is used by the Royal Navy. (See Submarine.)

To increase the depth to which divers can with safety descend is a problem to which much experiment is devoted, and experiments have been made with aluminium suits which allow descent to greater depths. The limiting factor is the danger to the diver of compressed air illness, caused by the formation of nitrogen bubbles in the system,

Diving Bell. The ordinary, or Smeaton, diving bell  
*Siebe, Gorman & Co., Ltd.*

should he change from the high pressure of deep water to lower pressure too quickly. Adherence to decompression tables, by which the diver is brought to the surface in specially calculated stages at each of which he waits for specific periods, enables him to return to normal pressure slowly. The safe limit of depth has been taken over 300 ft.; with mixtures of oxygen with hydrogen, helium, or nitrogen for supplying the diver, greater depths have been attained. If he has been under water 12 minutes at 200 ft., where the pressure is 89 lb. per sq. in., he will require 32 minutes for his ascent. To reduce the discomfort to the diver in cold water, the Davis submersible decompression chamber was introduced; this is lowered to a certain depth at which the diver enters the chamber, removes his heavy gear, and decompresses in comparative comfort. *Consult Deep Diving and Submarine Operations, Sir Robert Davis, 1936.*

**Diving.** Act of plunging into the water. One of the most useful methods, especially for racing purposes and for diving into shallow water, is the straight forward plunge, in which the body is hurled head foremost from a position almost level with the water, at a very little depth beneath the surface for a distance of some 30 ft.

The plain header, a straight dive, head first from some height, with the legs in the air and carrying the diver down a considerable distance before the hands are turned upwards to enable the body to rise to the surface, should be attempted only in a depth of at least 10 ft. of water, in which there are no weeds. Jumping into the water in an upright position, legs first, is a favourite way with many swimmers, and is easily acquired, but is not strictly diving. Though appearing easy and graceful when executed by a thoroughly compe-

tent exponent, these feats, especially that of throwing a backward somersault into the water, are exceedingly dangerous for the novice. The swallow dive, a jump from a height of 40 ft. to 50 ft., with the arms outstretched at right angles to the body, is a graceful variety. *See Swimming.*

**Diving Bell.** A steel open-bottomed chamber used for underwater work in dock and harbour construction, the building of piers and jetties, etc. The "bell," usually of rectangular shape, is very heavy, so that it sinks down through the water. Water is excluded by air forced in under pressure. Around the sides of the bell, within, are seats for the workmen who descend in it. Lifting tackle is attached to the roof, by which blocks of stone, etc., can be hoisted and lowered on to the bed prepared for them on the foundations of the structure being erected. The bell is lowered, hoisted, and moved along by means of a crane on a barge, or on the staging or jetty. A telephone provides communication.

John Smeaton employed a diving bell for the Ramsgate harbour works in 1784. His bell was a rectangular wooden one, strengthened with iron, and accommodated two workmen. Nine-teen years later John Rennie, in charge of repair work at Ramsgate, designed a cast iron diving bell about 6 ft.  $\times$  4½ ft.  $\times$  6 ft. high, having a number of heavy bull's-eye windows in the top. The weight was about five tons, ten times that of Smeaton's primitive appliance. *See Caisson; Diving.*

**Divining Rod.** Twig used in "dowsing" or searching for subterranean springs of water or veins of ore. The dowser holds a forked twig in his hands, which on approaching the hidden water or metal twists and sometimes breaks. The practice has been in use from early times for locating a wide variety of substances. In the majority of tested cases the results have proved entirely negative, but a few dowsers are too often successful for the phenomena to be ascribed to chance or coincidence. The twisting is said to be due to the effect of the neighbourhood of water or metal on certain sensitive constitutions. Dr. J. W. Gregory, F.R.S., considers that the survival of dowsing in the search for water is because shallow supplies of water are scattered abundantly but irregularly, and water diviners are quick to detect faint surface indications.

**Divinity.** Word meaning the essence of God, applied by theologians in various senses. It is commonly used as a synonym for theology, in the sense of the science of divine things, including the nature and attributes of God, the principles of His government, and the relations of man with God, and his consequent duty to Him. It is also used of the Divine Being and of the minor deities of polytheistic systems. See God; Theism.

**Divisibility.** In mathematics,

In both houses of parliament the act of voting is known as a division. At such times, announced by the ringing of a bell, strangers withdraw and the doors are closed. The members then divide, *i.e.* pass into one or other of the two division lobbies—ayes to the right, noes to the left—where their names are taken by two members known as tellers. The number that has passed through each lobby is then counted and the result announced.

**Division.** In the military

sense, a division is the unit of troops between an army corps and a brigade. Its strength varies from 12,000 to 20,000 men, dependent upon whether it is an armoured or infantry division. A division is the normal command of a major-general and has three brigades, with its own artillery, engineers, and supply services. Normally it is the largest unit in which British troops are organized; but in warfare the usual practice is to form three divisions into an army corps. During the Second Great War it was usual to calculate the strengths of the various combatants in divisions. In the Royal Navy, the term division is applied to a group of four or more warships. The Royal Marines have divisions based on Portsmouth, Plymouth, and Chatham.

**Divisions.** Musical term used in the 17th and 18th centuries to denote what are now called variations (*q.v.*). It referred especially to those of a quick nature, in which the notes of the original theme were divided into a larger number of shorter notes. Divisions on a ground meant a series of such variations built up over a recurring bass theme or phrase; they were a favourite diversion of performers on the viols (*q.v.*) and were sometimes extemporised. The long runs of semi-quavers in such songs as *Let the Bright Seraphim* and *Rejoice Greatly* by Handel may be called divisions.

the property by which a larger number contains a smaller an integral number of times.

In physics the term divisibility arose from the semi-metaphysical conception of the atom, an atom of matter being theoretically a particle so small that it was not susceptible of further division. But with the development of the theory of electrons it became no longer even theoretically sound to speak of an atom of matter as indivisible.

**Division.** Word used in several senses. In a political sense it is used in the United Kingdom and other parts of the British Empire for an electoral area that sends a member to the house of commons.

## DIVORCE: LAW AND PROCEDURE

*An explanation, contributed by a legal expert, of the terms and working of the Matrimonial Causes Act of 1937, in England and Wales, is followed by a survey of divorce laws in other parts of the world, including the U.S.A.*

Power was first given to the courts in England and Wales to pronounce a divorce—i.e. dissolve or put an end to an existing marriage—by the Matrimonial Causes Act, 1857, which set up the modern divorce court. Jurisdiction in matrimonial matters had previously been vested in the ecclesiastical courts, but these courts could not dissolve a marriage although they could grant decrees of nullity—i.e. declare there never had been a marriage—and also grant decrees which had the effect of a judicial separation. Before 1857 a divorce could be obtained only by a private Act of parliament. From 1857 to 1923 a husband could divorce his wife for adultery, but a wife could not divorce her husband unless she could prove in addition to adultery some offence such as cruelty or desertion. The law of divorce was revised by the Matrimonial Causes Act, 1937, under which a divorce can be obtained by either a husband or a wife on proof of (a) adultery; (b) desertion for at least three years; (c) cruelty; (d) the fact that the person against whom the proceedings are taken is incurably of unsound mind and has been continuously under care and treatment for at least five years immediately before the presentation of the petition. The act of 1937 did, however, introduce one important new limitation: no petition can be presented in the first three years of marriage unless in the opinion of the court exceptional hardship is involved for the petitioner or exceptional depravity on the part of the respondent. In divorce and other matrimonial cases, the proceedings never go by default. Thus, the petitioner must prove the facts necessary to entitle him (or her) to a decree even though the other party does not defend the proceedings.

**ADULTERY.** Where the ground of the petition is adultery the confession of the party accused may be accepted by the court as sufficient, but as a general rule the court wants corroboration.

**DESERTION.** No comprehensive definition of desertion has ever been laid down. The mere fact that husband and wife live separately is not sufficient, since

they may have to do so because of the husband's work. On the other hand, in exceptional cases there has been held to be desertion even where husband and wife have continued to live in the same house if it could be shown that one or other has deliberately severed the common home. Again, as a general rule a wife is bound to live with her husband if he offers her a suitable home at the place of his choice, and if she refuses to accept such a home she deserts him. There is no desertion if the party alleged to be deserting had in fact a good ground for leaving the other (for instance, where a husband leaves a wife who has confessed to adultery), but the ground must be "grave and weighty." Drunkenness, for example, is not normally considered sufficient.

As desertion must be against the will of the deserted party it follows that if husband and wife have agreed to separate and live apart neither can afterwards complain of that original separation as being desertion (although in certain exceptional circumstances where a husband and wife have separated by agreement either may nevertheless later desert the other, as where both have repudiated the agreement). Similarly, when a wife has obtained in a magistrate's court a separation order against her husband which contains a clause that they shall not live together, such an order ends any desertion there may have been, since a wife cannot complain that her husband is deserting her when she has applied for and obtained from the court an order prohibiting him from living with her.

**CRUELTY.** When the petition gives cruelty as a ground for divorce the law requires that there should be some real or apprehended injury or danger to bodily or mental health. There is a popular impression that mental cruelty is not sufficient, but the true test is not whether the cruelty is physical or mental but whether it causes, or may reasonably be expected to cause, injury to health. Persistent nagging may be enough, and an act which would not of itself be sufficient may become sufficient if repeated many times or if followed by other acts.

**INSANITY.** When insanity is the ground, it must be proved that the insanity is incurable and that the respondent has for at least five years immediately before the petition been a patient in a mental hospital.

Where the ground of the petition is adultery, no divorce can be obtained if there has been connivance, condonation, or collusion; nor, where the ground of the petition is cruelty, if the cruelty has been condoned. In certain other cases, the court has a discretion to grant or dismiss a case: for instance, if the petitioner has been guilty of adultery, unreasonable delay in presenting the petition, or cruelty, whatever the ground of the petition; if the petitioner has been guilty of desertion, wilful separation, or cruelty, where the ground of the petition is adultery or cruelty; or if the petitioner has been guilty of such wilful neglect or misconduct as to conduce to adultery, unsoundness of mind, or desertion, where the petition is on these grounds.

At one time the court would rarely grant a divorce where the petitioner had been guilty of adultery, but today the court does so more often, taking into account matters such as the interests of society, which, on the one hand, require that the marriage tie should be respected, but, on the other hand, make it undesirable to refuse to terminate a marriage that has completely broken down. The court also considers how any children of the marriage will be affected and whether there is any prospect of marriage between the petitioner and the person with whom he or she admits adultery. If, however, the petitioner has to ask the court to exercise its discretion in his or her favour on the ground of adultery, it is absolutely essential that full disclosure of the facts should be made at an early stage in the proceedings. The facts are set out in writing in what is called a "discretion statement" and this is kept in a sealed envelope until required.

**NULLITY.** Whereas a decree of divorce assumes that the husband and wife were validly married and puts an end to the marriage as from the date of the decree, a decree of nullity is a declaration that two persons who may have considered themselves husband and wife were never in fact validly married at all. Before 1937 marriages could be annulled only if the persons were

within the Prohibited Degrees (*q.v.*) of relationship; or if one of them had not at the time of the marriage reached the age at which marriage is legally possible (16 since 1929); or if one of them was already married to someone else; or if there was no proper consent to the marriage as, for example, because one of the parties was of unsound mind; or where the marriage was celebrated without some necessary formality—*e.g.* the banns were not properly published—or where one of the parties was incapable of consummating the marriage. The Matrimonial Causes Act, 1937, however, added several new grounds of the greatest importance, and now, while these earlier grounds still remain, a marriage may in addition be annulled (*a*) where it has not been consummated because of the wilful refusal of the respondent; (*b*) if either party was at the time of the marriage of unsound mind or a mental defective or subject to recurrent fits of insanity or epilepsy; (*c*) where the respondent at the time of the marriage was suffering from venereal disease; or (*d*) was at that time pregnant by some person other than the petitioner. In cases (*b*), (*c*), and (*d*) the petitioner must have been ignorant of the facts at the time of the marriage, the proceedings must have been started within a year of the marriage, and there must have been no marital intercourse since the facts were discovered.

**JUDICIAL SEPARATION.** A judicial separation does not end the marriage. It merely puts an end to the obligation of the husband and wife to live together. Thus the parties are not free to marry again. Further, the wife remains a wife and on her husband's death becomes his widow if she survives him and is entitled, if he has not made proper provision for her in his will, to apply to the court for reasonable maintenance out of his estate under the Inheritance (Family Provisions) Act, 1938. A decree of divorce or nullity destroys this right. A judicial separation can be obtained on any ground on which a divorce can now be obtained or where a decree for the restitution of conjugal rights has not been obeyed. Where a decree of judicial separation has been obtained or a separation order made in the magistrate's court on grounds on which a divorce might have been obtained, a petition for divorce may later be presented and the court

may treat the decree of judicial separation or the magistrate's order as sufficient proof of the adultery, desertion, or other ground on which it was granted, and grant a divorce accordingly.

**RESTITUTION OF CONJUGAL RIGHTS.** When without proper cause a wife leaves her husband, or a husband leaves his wife, the party aggrieved may take proceedings for restitution of conjugal rights. When a decree is made, the party obtaining it cannot by force compel the other to obey it, and such proceedings are today rarely taken and of little importance. Until 1923 they were valuable in that a wife could obtain a divorce if she could prove that her husband had committed adultery and had in addition failed to obey a decree of restitution. Since 1923, however, it has been unnecessary for her to prove anything more than adultery.

**ALIMONY AND MAINTENANCE.** Alimony is the provision which the court orders the husband to make for his wife when there is a marriage subsisting. Maintenance is the provision a man is ordered to make for his ex-wife after a marriage has been ended by divorce obtained by the wife, or has been annulled. While any matrimonial proceedings by a wife are pending, whether for divorce, nullity, or judicial separation, a husband may be ordered to pay alimony *pendente lite*. After judicial separation he may be ordered to pay permanent alimony. Alimony *pendente lite* is usually such sum as will bring the wife's income up to one fifth of the joint income of husband and wife, and permanent alimony is usually such sum as will bring the wife's income up to a third (sometimes a half) of the joint income. The amount of maintenance may also be a third of the joint income, but in none of these cases is there a fixed rule. A husband may be ordered to pay permanent alimony after a decree of judicial separation, even though he was the petitioner and obtained the decree, but apart from some exceptional cases, as where a husband obtains a divorce on the ground of his wife's insanity, a husband cannot be ordered to pay maintenance to a wife when it is he who has obtained the divorce. Where a wife divorces her husband on the ground of his insanity she may be ordered to pay him maintenance, and where a man obtains a nullity decree he may be ordered to maintain his "wife."

**DAMAGES.** A husband may in proceedings for divorce or for judicial separation on the ground of adultery claim damages against the man who has committed adultery with his wife—that is, the co-respondent. The wife, however, has no similar claim against a woman who has committed adultery with her husband. The amount of the damages cannot of course be calculated in accordance with any exact rule. They are designed to compensate a husband for the loss of his wife and for the injury to his feelings.

**DECREES.** Under the Act of 1857, divorces were absolute when pronounced. An Act of 1860 made a change in the proceedings for divorce and nullity by which a decree nisi is first made. This does not end the marriage, which continues until the decree absolute. A decree absolute is not made automatically, but must be applied for by the petitioner at any time after six weeks from the decree nisi. (The period of waiting was six months up to August, 1946.) If the petitioner does not apply within three months of first being entitled to do so, the respondent may apply. It is only on the decree being made absolute that the marriage comes to an end.

**KING'S PROCTOR.** The King's Proctor may intervene in divorce or nullity proceedings to oppose the making of a decree, at any time before the decree absolute, and his most usual ground for doing so is that the proceedings have been collusive. A private person may likewise intervene.

**JURISDICTION.** All matrimonial causes may be heard either in the Probate Divorce and Admiralty Division of the High Court in London or at Assizes. Apart from certain exceptional cases, no divorce can be obtained in England unless the husband and wife are domiciled in England at the time of the proceedings. Domicile may differ from residence, and in general a person is domiciled either in the country in which he was born or, if he has left that country, then in the country in which his permanent home is situated. A wife takes the domicile of her husband, so that if a woman domiciled in England marries a man domiciled elsewhere, or if a man who at the time of his marriage was a domiciled Englishman changes his domicile, the wife cannot obtain a divorce in England. This caused hardship in cases where a man deserted his wife and went abroad permanently, so changing his domicile, and in

1937 it was made possible in such cases, and also where the husband was deported from the United Kingdom, for a wife to obtain a divorce in this country. Still greater difficulties arose during the Second Great War when British women married members of the Allied forces stationed in this country, or other foreigners domiciled abroad, and it was specially provided by the Matrimonial Causes (War Marriages) Act, 1944, that as a temporary measure a decree of divorce or nullity in respect of such marriages might be obtained in England (or Scotland) if the marriage took place on or after September, 1939, the husband being at that time domiciled outside the United Kingdom and the wife being at that time domiciled in England (or Scotland). If, however, husband and wife had since the marriage lived together in the country in which the husband was domiciled, the right to bring proceedings in England or Scotland was lost. It should be noted that the provision that no divorce petition could be presented within three years of the marriage did not apply to marriages which come within this Act.

**CHILDREN.** The court may make provision for the custody, maintenance, and education of the children of the marriage where there are proceedings for divorce, nullity, or judicial separation. As a general rule, the custody of the children will not be given to the guilty party in the proceedings; but the first and paramount consideration is the welfare of the children. The party deprived of the custody may, however, be given access to the children. When a child reaches the years of discretion, that is, usually, 16, the court will take into account the wishes of the child.

**PRESUMPTION OF DEATH.** Under the Matrimonial Causes Act, 1937, the court may presume the death of either husband or wife and dissolve the marriage. The fact that the party whose death it is desired to presume has been absent from the petitioner for seven years, and the petitioner has no reason to believe the other party has been alive within that time, is evidence of death until the contrary is proved; but even before that time death may be presumed if there are facts making it likely that death has taken place. If, after a decree has been made absolute, it is found that the person thought to be dead was in fact alive, the dissolution of the marriage nevertheless holds good.

**SCOTS LAW.** Before the Divorce (Scotland) Act, 1938, divorce could be obtained in Scotland for adultery or desertion for four years, but since that Act the grounds are substantially the same as in England. The restriction in English law, that no divorce proceedings can be taken until three years after marriage, does not apply in Scotland. The new grounds for nullity, introduced in England in 1937, likewise do not apply in Scotland. The provisions enabling the death of a husband or wife to be presumed and the marriage dissolved apply in Scotland also. Subject to the Matrimonial Causes (War Marriages) Act, 1944, proceedings for divorce can be taken in Scotland only if the parties are domiciled Scots. In Scotland there are not two decrees, one nisi and the other absolute, as in England, but one decree only. Upon divorce, except on the ground of insanity, the guilty party loses all rights to succeed to property of the other party, and the innocent party can claim these rights just as though the guilty party were dead.

**IRELAND** (both Eire and N. Ireland) has no absolute divorce, but the courts may grant a divorce *a mensa et thoro* (i.e. a separation); and a petitioner may secure a dissolution by act of parliament.

**DOMINIONS.** In Canada, exclusive authority to legislate on divorce was conferred on the dominion parliament by the British North America Act of 1867. As the dominion parliament has passed no act, there is no complete divorce in Alberta, Manitoba, Ontario, Quebec, or Saskatchewan, except by act of the dominion parliament. British Columbia, New Brunswick, Nova Scotia, and Prince Edward Island retain the divorce laws they had before federation. There is no divorce in Newfoundland.

Grounds for divorce vary in the states of Australia, but on the whole are wider than in Britain. New Zealand admits adultery; wilful desertion for five years; habitual drunkenness for four years, plus cruelty or desertion by the husband, neglect of household duties by the wife; seven years' penal servitude; incurable lunacy for at least 10 years. South Africa follows Roman Dutch law, allowing divorce for adultery, unnatural offences, malicious desertion, and lifelong imprisonment.

**EUROPEAN CONTINENT.** Italy, Spain, and Portugal, being Roman Catholic countries, do not allow

absolute divorce, but only divorce *a mensa et thoro*. Roman Catholics in these countries, as elsewhere, can in certain circumstances secure a papal dispensation of nullity of marriage (see Dispensation). Italy does not recognize foreign divorces of Italian subjects. Belgium allows divorce by mutual consent, on account of the adultery of the wife, adultery by the husband only if he has brought a concubine into the marital home, cruelty, conviction for infamous offences; an interval of three months must elapse before remarriage. In the Netherlands, divorce is allowed for adultery, wilful desertion for five years, unnatural offences, life imprisonment, absence for 10 years; the court sits in private, and makes efforts to dissuade husband and wife from seeking divorce. In Sweden, divorce is granted after the expiry of a year from the date of a judicial separation on the grounds of aversion, for aultery, six years' absence without news, conduct endangering life, imprisonment for life. In France, a law of Sept. 20, 1792, virtually terminated the obligations of marriage. Divorce was made easy under the code Napoléon, abolished on the restoration of the monarchy in 1816, and reintroduced in 1834. The grounds are adultery, violence or cruelty, serious moral and social offences of one partner against the other, condemnation to an infamous penalty of either spouse, mutual determination to separate persisted in for three years and established to the satisfaction of the court; publication of divorce proceedings in the press is forbidden.

In Russia, marriage and divorce were treated very laxly for a time after the revolution of 1917, but regularity was soon reintroduced, mutual consent and an appearance before the official who registered the marriage being at first sufficient to secure divorce. Subsequently the spouse asking for divorce had to establish a true case before a court, and by a law of June 27, 1936, the tax on divorce was augmented to 50 roubles for the first, 150 for the second, 300 for the third and subsequent decrees.

Under Muslim law, a wife can never divorce her husband, though she can take steps to secure the dissolution of her marriage; the husband can repudiate his wife at will. In Palestine, divorce matters are governed by the religion to which the parties belong, and any divorce granted must be secured

through and registered by the appropriate religious authority.

**UNITED STATES OF AMERICA.** When the United States, on achieving her independence, incorporated in her legal system the common law of the mother country, she made an exception in the case of divorce, for she established no ecclesiastical courts, such as were alone competent at that time to deal with this question in England. The granting of divorce has therefore been from the first within the jurisdiction of secular courts only. Divorce, like marriage, is regulated under the constitution by state, not federal, laws, with consequent great diversity of practice. South Carolina granted divorces only from 1949. Everywhere the primary cause is adultery, which in New York is the sole cause allowed. Among other causes recognized in different states are pregnancy of wife by other than husband at time of marriage (the husband being then unaware of the fact), impotence if unknown at time of marriage, desertion for a period varying from one year to five years, insanity, cruelty ranging from "contumelious words accompanied by a contemptuous demeanour" to physical violence endangering life, neglect to provide for a wife, and incompatibility of temperament. In the Philippines adultery is the only cause for divorce; in Hawaii six months' desertion is sufficient.

Jurisdiction is based on the domicile of the parties. The usual period of residence within a state required by its law is one year, but in Idaho and Nevada it is as little as six weeks, and in Massachusetts as much as five years. In 1945 the supreme court ruled that each state has the right to decide whether the six weeks' residence under which Nevada grants divorces constitutes a legal domicile, and consequently upheld the refusal of a N. Carolina court to recognize a Reno divorce.

Bills have been introduced into congress proposing a constitutional amendment that would empower that body to enact a national divorce law. They have made little headway, mainly because any uniform law would be too lax to satisfy public opinion in some states and too strict in others.

**Dix, JOHN ADAMS** (1798-1879). American diplomatist, statesman, and soldier. Born at Boscawen, New Hampshire, July 24, 1798, he served in the army and then practised as a lawyer. He became a member of the senate, 1845-49,

and secretary of the treasury, 1861. He rendered good service in the Civil War, and helped to suppress the riots in New York, July 13-16, 1863, against conscription.

Minister to France, 1866-69, and governor of New York, 1873-74, he died April 21, 1879. *Consult* Memoirs, ed. by his son Morgan, 1883.

**Dixcove.** Small port of the Gold Coast, W. Africa. It is in the W. province, 10 m. N.E. of Cape Three Points. There is an old fort, situated on high ground overlooking the harbour, commenced by the English in 1691.

**Dixie.** Popular name for the southern states of the U.S.A. Its origin is doubtful. Some consider it a corruption of Dixon, the joint surveyor of the Mason and Dixon line. Others derive it from a currency note issued by a Louisiana bank. This was for \$10, and contained a large "Dix" in the centre of its reverse side. Hence Louisiana, and later the whole south, became known as the Land of Dixies. The name gained vogue through an inspiring song, "Away Down South in Dixie," composed in 1859 by D. D. Emmett, a member of a troupe of coloured minstrels; this served during the Civil War as a Confederate national anthem.

**Dixie, LADY FLORENCE CAROLINE** (1857-1905). British traveller and writer. Born in London, May 24, 1857, the youngest daughter of the 7th marquess of Queensberry, in 1875 she married Sir Alexander Beaumont Dixie. Her travels in Patagonia, 1878-79, were the subject of an interesting volume, *Across Patagonia*, 1880. In the Boer War of 1880-81 she was war correspondent for *The Morning Post*, and in 1882 published her experiences, *In the Land of Misfortune*. The same year appeared *A Defence of Zululand and its King*. She died Nov. 7, 1905.

**Dixmude.** Town of Belgium, in the prov. of W. Flanders. It is on the river Yser, 12 m. N. of Ypres, 42 m. W. of Ghent. The chief buildings are the church of S. Nicholas, with some valuable works of art, and the town hall. Early in the First Great War there was much fighting around Dixmude, the Germans entering it on Nov. 10, 1914. The town was again prominent in the second battle of

John Adams Dix, American statesman

Ypres, 1915, and was captured by the Belgians, Sept. 29, 1918. *See* Ypres, Battles of; Yser, Battle of the.

**Dixon, WILLIAM HEFORTH** (1821-79). British traveller and historical writer. Born in Manchester, June 30, 1821, he was editor of *The Athenaeum*, 1853-69. He travelled widely in Europe, the East, and the U.S.A., and contributed to the foundation of the Palestine Exploration Fund. *New America* (1867) was his most successful travel book; and *Her Majesty's Tower*, 1869-71, and *The History of Two Queens* (Catherine of Aragon and Anne Boleyn), 1873-74, his chief historical works. He died Dec. 27, 1879.

**Dixon Entrance.** Strait separating Prince of Wales Island, Alaska, from Queen Charlotte Island, British Columbia. In length 100 m., with a maximum breadth of 70 m., it is noted for its scenery. It was discovered c. 1785 by G. Dixon, an English navigator.

**Dizful.** Town of Persia, in the prov. of Khuzistan. It stands on the Diz river, 32 m. N.W. of Shuster, and is noted for its mosques and bridge of 22 arches. There is trade in indigo, and the town is the chief mart of the prov. Pop. 15,000.

**Djakarta.** Alternative form of Jakarta, name given in 1949 to Batavia. *See* Batavia.

**Djakova.** Alternative spelling of the Yugoslav town Jakova (*q.v.*).

**Djemal Pasha, AHMED** (1861-1922). Turkish politician and soldier. Born at Istanbul, of obscure origin, May 1, 1861, he became minister of marine in 1914, and in 1915-17 led Turkish forces in Sinai and Palestine. His cruelties in Syria led to the shereef of Mecca assuming the title of king of the Hejaz in 1917. On the collapse of Turkey in Oct., 1918, Djemal Pasha fled. Accused of misappropriation of state funds and of crimes against international law, he was condemned to death in his absence in July, 1919. Turkish peace delegate at Paris in 1920, he was assassinated at Tbilisi, on July 22, 1922.

**Djezzar, AHMED** (1735-1804). Pasha of Acre. Born in Bosnia, he was sold as a slave to Ali Bey, who employed him as an assassin, hence his surname of Djezzar, the butcher. He escaped from Egypt in 1773, and became governor of Beirut, and afterwards pasha and vizier of Syria. In 1791 he was deprived of office, but was restored, and when Bonaparte invaded Syria, rejected the conqueror's overtures, and in cooperation with

Sir Sidney Smith defended Acre in 1799. Three years later he made peace and received Napoleon's envoy.

**Djibouti** OR **DJIBBAH**. Alternative spellings for the seaport and capital of French Somaliland, also spelled Jibuti (*q.v.*).

**Djubbah**, **DJIBBAH**, OR **JUBBAH**. Long, simple cloak-like garment worn by the Arabs.

**Dmitrov**. Town of R.S.F.S.R., in the region of Moscow. It stands on an affluent of the Volga, 45 m. N. of Moscow, and trades in grain and vegetables. There are leather, cloth, and soap factories, and tanneries. At the standing market much business is done in Russian leather, sail-cloth, linen, and wax, and woollen, silk, and cotton stuffs.

**Dniester**. River of Russia, mainly in White Russia S.S.R. and Ukraine S.S.R. It rises in the Valdai plateau in the Western region of R.S.F.S.R., and is navigable almost from its source, although below Dnepropetrovsk navigation is much impeded by the famous *porogi* (rapids). It passes Smolensk, Rogachev, Kiev, Dnepropetrovsk, and Kherson, a little below which it falls into the Black Sea by a large estuary. Its chief tributaries are the Beresina, Pripet, and Desna. These rivers are obstructed by ice in the winter and suffer from drought in the summer, but are mostly navigable in the spring. The Dniester is of great importance for the conveyance of corn to Odessa. Its ancient names were Borysthenes and Danapris. Its length is 1,340 m.

In July-Aug., 1941, a great battle between the Russians and Germans raged in the Dniester bend for the possession of industrial Ukraine. The Russians withdrew E. of the river on Aug. 16, and the Germans captured Dnepropetrovsk on Aug. 27. The great Dniester dam was put out of action next day by the retreating Russians. On Sept. 14, 1941, the Russians evacuated Kremenchug, and the Germans crossed the lower Dniester.

The Russian summer offensive of 1943 swept the Germans back to the river, which the Russians began crossing on Sept. 25. On Oct. 17 they launched an offensive S.E. of Kremenchug. They retook Dnepropetrovsk on Oct. 25. Fighting within the river bend continued, until on Dec. 26 the Russians opened an offensive that drove the Germans back, and on Dec. 29 another attack began within the bend of the river, compelling

the Germans to evacuate eastern Ukraine.

**Dniester Dam**. A hydro-electric structure completed in 1932 under the Russian first five year plan to impound the waters of the Dniester and provide electric power for the tractor plants, steel mills, and aluminium factories established on the river. Ultimately the whole of the highly industrialised region of Krivoi Rog in the bend of the Dniester became dependent upon the dam for its power, which was also carried by transmission cables through a wide area of Ukraine S.S.R.

Built of reinforced concrete, the dam is  $\frac{1}{2}$  m. long and 200 ft. high. It impounds 291,800,000 gallons of water, and the seven turbines in the power station develop 900,000 h.p. to generate 540,000 kilowatts. The dam and power station form one of the largest electrical generating units in the world. To accommodate the personnel, a new town called Zaporozhe was built. The cost of the whole project totalled £25,000,000.

During the German advance into Ukraine the retreating Russians, in accordance with their "scorched earth" policy, breached this dam on Aug. 28, 1941. The Germans were able to repair the damage and made partial use of the power station until 1943, when they did further damage as they withdrew before the Russian offensive. Early in 1944 the Soviet government began reconstruction, and in March, 1947, the first of three 1,000-ton generators installed by a U.S. firm was put into action.

**Dneprodzerzhinsk**. Industrial town of Russia, in Ukraine S.S.R. It stands on the right bank of the Dniester, 20 m. W.N.W. of Dnepropetrovsk. Its fate in the Second Great War was practically the same as that of the bigger city, described below; it was occupied by the Germans on Aug. 27, 1941, and recaptured by troops belonging to the 3rd Ukrainian army on Oct. 25, 1943. Pop. 147,829.

**Dnepropetrovsk**. City of Ukraine S.S.R.; the capital of a province, and the eleventh city by pop. in the U.S.S.R. The pre-Revolutionary name was Ekaterinoslav (Catherine's glory). It stands on the Dniester near the beginning of the rapids, 250 m. N.E. of Odessa, with which it is the chief emporium for trading. It has rly. connexion with Kharkov and Kherson. General engineering and vast power stations provide the main employment. The town dates from 1786, when Potemkin built for the empress Catherine II a summer residence on the site of an old Polish fortress. Under the Soviet regime its pop. was more than doubled, reaching (1939) 500,662.

In April 1918 the town fell to the Germans. They captured it again in the Second Great War on Aug. 27, 1941. Dnepropetrovsk was liberated by troops of the 3rd Ukrainian army, who made the crossing of the river under cover of fog, Oct. 25, 1943.

**Dniester**. River of Ukraine S.S.R. and Moldavia A.S.S.R. Rising in the Galician Carpathians, it falls into the Black Sea, between

Dniester Dam. View taken during the reconstruction of the great dam in the Ukraine, first breached by the Russians in their scorched earth policy and later by the retreating Germans; it is half a mile long and 200 ft. high

the mouths of the Danube and the Dnieper. Much of its course of 750 m. forms the N.E. boundary of Bessarabia, which after the Second Great War was incorporated into the U.S.S.R. The Dniester is an important waterway for the conveyance of grain. Navigation is impeded, as on the Dnieper, by rocks, sandbanks, winter ice, summer drought, and rapids. Its valley is carved sometimes 500 ft. into the plateau, so that the towns lie along the valley edge. Its ancient names were Tyras and Danastris.

During the First Great War a battle was fought on the Dniester in June, 1915, between Austro-German and Russian armies. On June 1 the Russians were behind the line of the Dniester with bridgeheads on the further bank. The Austro-Germans forced a crossing on June 6, but were driven back on the 9th, and a second attack was also repulsed.

There was violent fighting along the line of the lower Dniester during the German thrust to Odessa in July, 1941, in the Second Great War. On July 19 German-Rumanian forces crossed the river at several points. Ten days later Rumanian troops reached the mouth, occupying Akerman. In March, 1944, the Russians opened offensives in Ukraine to clear that region and invade Bessarabia. The river was crossed on a 30-mile front by the 2nd Ukrainian army on March 19. Meanwhile the 3rd Ukrainian army had been driving the Germans from the Black Sea coast, retaking Odessa on April 10. There was then a lull on this front, but Akerman was liberated Aug. 23, the Dniester then being free throughout its course.

**Doab.** Name given in India to the land between two confluent rivers, but more particularly to the territory between the Ganges and Jumna, in the United Provinces. In this are situated Allahabad, Cawnpore, Etawah, Hathras, Meerut, Saharanpur. The Doab is irrigated by the Upper Ganges, Lower Ganges, and Eastern Jumna canals, and is the greatest wheat-producing area in the United Provinces. It is a stoneless alluvial plain.

**Dobbie, SIR JAMES JOHNSTON** (1852-1924). Scottish chemist. Born at Glasgow, Aug. 4, 1852, he was educated at its high school and at the universities of Glasgow, Edinburgh, and Leipzig. During 1884-1903 he was professor of chemistry in the university of North

Wales, then appointed director of the Royal Scottish Museum, Edinburgh. In 1909 he succeeded Thorpe as principal of the government laboratories, London, and in 1915 was knighted. He died June 19, 1924. Dobbie's original work was chiefly concerned with the constitution of the alkaloids and the relation between the chemical constitution and the absorption spectra of organic compounds.

**Dobbie, SIR WILLIAM GEORGE SHEEDEN** (b. 1879). British soldier. He was born in Madras and educated at Charterhouse and the R.M.A., Woolwich. After serving in the South African and First Great wars, he was inspector of the Royal Engineers and commandant of the school of military engineering, 1933-1935. Dobbie was appointed G.O.C. Malaya in 1935, and as lieutenant-governor and c.-in-c. of Malta, 1940-1942, retiring owing to ill-health. He was created K.C.B. in 1941. G.C.M.G. in 1942.

**Dobbin, MAJOR.** Character in Thackeray's *Vanity Fair*. Although a self-effacing, faithful friend, his sterling merit is overshadowed by his ungainliness and simplicity.

**Dobell, BERTRAM** (1841-1914). British bibliophile. Not until he was nearly fifty was he able to devote much time to literary pursuits, but he built up a bookselling business in Charing Cross Road, London, and a reputation as a bookman. He discovered and identified the works of Thomas Traherne, which he edited, 1903; edited the works of James Thomson (*Bysshe Vanolis*), 1895; wrote and published *Sidelights* on Charles Lamb, 1903; and edited the works of William Strode, 1907. He brought to light a MS. copy of Sidney's *Arcadia* (*q.v.*).

Sir James Dobbie,  
Scottish chemist  
*Elliott & Fry*

Sir William Dobbie,  
British soldier

Bertram Dobell,  
British bookman

In 1906 he issued a notable catalogue of privately printed books, and he was author of *A Century of Sonnets*, 1910. He died Dec. 14, 1914.

**Dobell, SYDNEY THOMPSON** (1824-74). British poet. Born at Cranbrook, Kent, April 5, 1824, he was the son of a wine merchant and was educated privately. His life, spent mainly in Cheltenham as a wine merchant, was varied by numerous visits to the Continent in search of health. His chief works are *The Roman*, 1850; *Balder*, 1854; and *England in Time of War*, 1856, which enjoyed great popularity. He died Aug. 22, 1874.

Sydney Dobell,  
British poet

**Döbeln.** Town of Saxony, Germany. It stands on an island in the Mulde, 35 m. S.E. of Leipzig. It is a rly. junction, and has a number of manufactures, chiefly of various kinds of iron goods. Of its public buildings the church of S. Nicolas, a 15th century building, and the town hall may be mentioned. Pop. 22,560.

**Doberan.** Town and watering-place of Mecklenburg, Germany. It stands near the coast of the Baltic, 10 m. W. of Rostock, in the state of Mecklenburg-Schwerin. Its attractive surroundings and radioactive springs made it a popular resort. The chief building is a Gothic church dating from the 14th century and restored in the 19th century. There are a palace, owned by the former grand dukes of Mecklenburg, and the ruins of an abbey. About 4 m. away is Helligendamm, known for its bathing. Pop. 5,236.

**Dobritch, BAZARDJIK, OR BAZARJIK.** Town of Bulgaria, in Dobruja. It is situated on a small tributary of the Danube, about 28 m. N. of Varna, with which it is connected by rly. It is in that S. part of the Dobruja ceded to Rumania by Bulgaria after the second Balkan War of 1913 and restored in 1940. During the First Great War it was captured by the Bulgarians in Sept., 1916. Pop. 29,938.

**Dobruja, DOBRUDJA, OR DOBRUSCHA.** District of the Balkans, now divided between Rumania and Bulgaria. Called Dobrogea by the Rumanians and Dobritch by the Bulgarians, it is almost quadrangular in shape, and with an area of 8,969 sq. m. It is bounded W. and

N. by the Danube, E. by the Black Sea, and S. by Shumen co. of Bulgaria. A considerable part of it consists of lagoon, marsh, and sandy plains, but in the fertile tracts agriculture is the chief occupation. From Cernavoda to Constanta it is traversed by a rly., from which near Megidia (Mejidie) a branch line runs S. to Dobritch (Bazardjik) and into Bulgaria. The only important town is Constanta; other towns are Tulcea, Babadag, Silistria, Megidia, and Dobritch.

In 1878 Southern Dobruja (2,956 sq. m.) was awarded to Bulgaria after the Russo-Turkish war of 1877-78, but after the second Balkan war in 1913 Bulgaria was compelled to cede it to Rumania. During the First Great War it was invaded and conquered by Mackensen in 1916. It was given to Bulgaria by the treaty of Bukarest, 1918, but at the final peace treaty was restored to Rumania. In 1940, after negotiations between Rumania and Bulgaria, the former ceded S. Dobruja to the latter. The new frontier followed that of 1912, running from just N. of Silistria on the Danube, to S. of Mangalia on the Black Sea. Pop. about 700,000. The inhabitants of the Dobruja are an extraordinary mixture of races and religions.

**Dobson, FRANK** (b. 1887). British sculptor. Born in London, Nov. 18, 1887, he worked in the studio

Frank Dobson, British sculptor, at work in his studio

of Sir William Reynolds and later settled in Cornwall. Influenced by the Post-Impressionist exhibition of 1909, he built up a European reputation as one of the leading English sculptors. His bronze figure of Truth aroused much controversy when it was exhibited at the Leicester Galleries, London, 1930, but was bought for the nation and is now in the Tate Gallery. Dobson, who in 1923 became president of the London Group (*q.v.*) for four years, developed his work

along abstract lines, characterised by massive strength. He held one-man exhibitions at Bristol in 1940 and London in 1944, being made A.R.A. in 1942. See Art illus. p. 665.

**Dobson, HENRY AUSTIN** (1840-1921). British poet and essayist. He was born at Plymouth, Jan. 18,

Austin Dobson  
Russell

1840, and educated in England and in Strasbourg. From 1856 to 1901, when he retired, he served on the Board of Trade, becoming a principal clerk in 1884. In 1873 Austin Dobson published his first book of verse, *Vignettes in Rhyme*, followed by *Proverbs in Porcelain*, 1877; *Old World Idylls*, 1883; and *At the Sign of the Lyre*, 1885. In prose he wrote *Eighteenth Century Vignettes*, 1892-96; *Sidewalk Studies*, 1902; *A Bookman's Budget*, 1917. His fame rests more on *Lives of Fielding*, 1883; *Steele*, 1886; *Goldsmith*, 1888; *Horace Walpole*, 1890; *Hogarth*, 1891; *Richardson*, 1902; and *Fanny Burney*, 1903. He edited the *Diaries of Madame D'Arblay* and *Evelyn*. Echoing every quaint form of verse to be found in the old poets, ballade, rondeau, triolet, he was also closely familiar with 18th century literature. He died Sept. 2, 1921.

**Dobson, WILLIAM** (1610-46). English painter. Born in London, he passed his early years in obscurity. He was then discovered by Van Dyck, whose pupil-assistant he became. On the latter's death in 1641, Dobson succeeded him as serjeant painter to the king, but after the Civil War became so poor that he died in a debtors' prison. His portraits of King Charles, Fairfax, and Sir Harry Vane may be cited.

**Doce** (Port. *Rio Doce*, sweet river). River of S.E. Brazil. It rises in the Serra do Espinhaço, Minas Geraes, flows N.E., curves S.E., and, traversing Espirito Santo, enters the Atlantic at Barra do Rio Doce; length, about 430 m. Its cataracts impede navigation.

**Docetism** (Gr. *dokein*, to seem). Early heresy which taught that the body of Christ was not real or material, but only an appearance. Like all forms of Gnosticism, it was based on the doctrine of the essential evil of matter. The body with which the Son of God clothed Himself could not therefore be one of

matter, and hence was not real but apparent. Some of the Docetae held that Christ's body was a mere phantasm, and others that it was substantial but not of material substance. The origin of this heresy is ascribed by some early writers to Simon Magus, but by others to Julius Cassianus, a disciple of Valentinus. As a necessary corollary, the Docetae denied the reality of the birth and crucifixion of Christ, while some rejected the union of His divine nature and human body in one personality.

**Dock** (*Rumex*). Genus of biennial and perennial herbs of the

Dock. Leaves and flowers of great water dock

family Polygonaceae. Natives of all temperate countries, they have stout tapering rootstocks, alternate leaves, and greenish flowers without petals arranged in whorled clusters. The leathery red or brown fruits are three-sided. Some of the species are notorious pests of agriculture; others, owing to their acidity, are esteemed as

salads and potherbs, especially the smaller species known as sorrels.

**Dock.** Artificial construction enclosing, or partly enclosing, a calm water area in which ships can lie afloat against quays for the purpose of loading or discharging goods or passengers.

Where the rise and fall of the tide is small, as in the Mediterranean, or moderate, as at Southampton, the docks may be open to the tide. In such docks the water depth at the lowest state of the tide must be more than the draught of the largest vessels that use them. Sometimes a tidal basin of this kind is provided between a tidal sea or river and a closed dock.

Where the tidal range is considerable, docks are generally separated from tidal waters by an entrance provided with one pair of gates or by a lock. By this means the water level in the dock can be maintained near high tide level. The effect is that ships can be accommodated in closed docks of much less overall depth than would

be needed in open or tidal docks in the same locality, so lessening the cost of construction. A further benefit is that the ship is kept at a nearly constant level relative to the quay, which facilitates loading and discharging.

Where only one pair of gates is provided, these are opened only for two or three hours about high tide, to avoid reducing the depth of water in the dock to too low a level.

If ships are to enter or leave the dock at any state of the tide, a lock (*q.v.*) with two pairs of gates, and of a sufficient size to accommodate the largest vessel using the dock, must be provided to raise or lower vessels between dock water level and tidal water level. A few docks are impounded or kept at a water level higher than high tide level, by pumping water from the sea or river into the dock.

The sides of the dock may consist of concrete or masonry walls with vertical faces to the water, against which ships can berth. Another type of quay is a thin wall of steel or concrete sheet piles driven into the dock bottom and anchored back at the top by tie rods. The wall supports the ground behind in the same way as a masonry wall. Alternatively the quays may be of open construction carried on cylinders or piles and made of timber, steel, or reinforced concrete. Other types of berthage are provided for specific purposes.

Entrance gates, like lock gates, were formerly made of wood, but current types are hollow boxes of steel plates with internal steel framing. Internal subdivisions are provided, with arrangements for water ballasting so that the gates when in use are only slightly too heavy to float. They can thus be opened and closed with little effort compared with the older solid gates which had to be supported by rollers running on the floor. Each leaf of a pair of gates is larger than half the width of the entrance, so that when closed the leaves meet at

Dock. Air view of Southampton Docks, showing several great liners at their berths. This is an example of the open dock system

an obtuse angle pointed towards the dock. The vertical meeting faces are of timber, generally greenheart, as are the heel posts at the pivot edge of each gate, and the clapping sill along the lower edge. When closed, the timber clapping sill of each gate bears against the vertical face of a granite sill formed in the bottom of the entrance.

The construction of the gates, sill, and walls is such that the difference in water level between the dock and the outside water forces all the meeting faces tightly together and so keeps them watertight. In some gates sluices are

provided in the gate structure for passing water out of the dock to reduce its level when required; but a newer practice is to pass the water through sluice controlled culverts in the dock walls.

The older types of gates are opened and closed by chains hauled by winches, manually or mechanically operated. Newer types are generally operated by hydraulic rams, though electric gate machines also exist. When open the gates fit into recesses in the entrance walls so as to leave unobstructed the full width between the walls.

Alternative methods of closing dock entrances are rolling or sliding

Dock. Part of London's great enclosed dock system, which is situated on both sides of the Thames. In the centre are seen the West India docks, in the Isle of Dogs

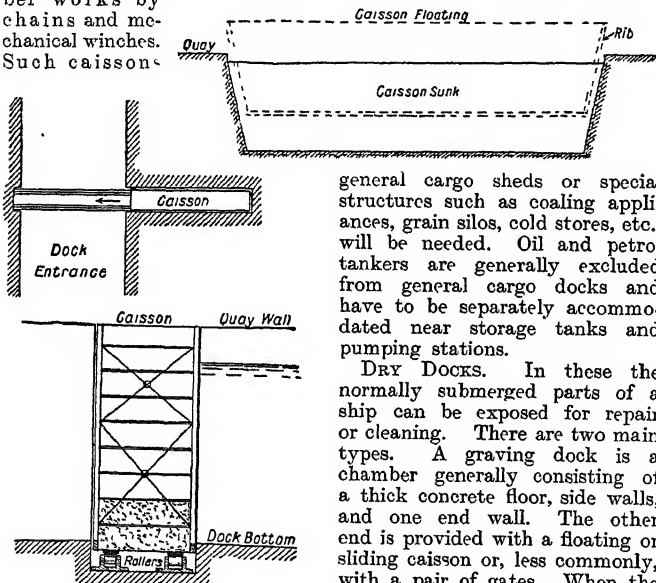

Dock. Left, sectional diagram of quay wall. Right, plan of dock gates; when open, they fit into recesses in the quay walls

caissons which may be likened to sliding doors. When open they rest in chambers built into the walls; when closed they bear against meeting faces prepared in the walls and floor of the entrance. Haulage in and out of the chamber works by chains and mechanical winches. Such caisson-

For efficient operation, docks must be provided with roads and railways along the quays, cranes of types suitable for handling cargo, capstans and bollards for manoeuvring and mooring ships. According to the trade dealt with,

Dock. Rolling caisson for dock entrance, in plan (above) and in section (below). Top right, floating caisson in section

have the advantage over gates of providing support for a straight roadway of useful width across the entrance, but, slower to operate, are less suitable for busy entrances.

Another closing device is the floating caisson, but this is very slow in operation and its use is limited to the entrances to dry docks. It is a steel vessel of adjustable draught so shaped that it can be sunk to fit into grooves made in the walls and bottom of the entrance, or floated to clear the grooves and be towed away. Watertightness is provided by timbers on the caisson bearing on prepared masonry faces.

general cargo sheds or special structures such as coaling appliances, grain silos, cold stores, etc., will be needed. Oil and petrol tankers are generally excluded from general cargo docks and have to be separately accommodated near storage tanks and pumping stations.

**Dry Docks.** In these the normally submerged parts of a ship can be exposed for repair or cleaning. There are two main types. A graving dock is a chamber generally consisting of a thick concrete floor, side walls, and one end wall. The other end is provided with a floating or sliding caisson or, less commonly, with a pair of gates. When the entrance is open the dock is full of water, permitting a ship to be floated in. The entrance is then closed and the dock emptied by pumping. Where the graving dock is entered from tidal water, it may be partly emptied by the fall of the tide. As the water level falls the vessel settles on to previously arranged keel blocks and bilge blocks and may be supported by struts between the sides of the dock and the sides of the vessel. When the vessel is ready to leave the dock, water is

readmitted, the entrance opened, and the vessel floated out. Graving docks are generally operated as part of a ship-repairing organization and are provided with large cranes for lifting heavy parts.

A floating dock is itself a vessel designed to lift a ship until it is completely out of the water. The floating dock consists of a floor and two side walls, all constructed as hollow steel boxes subdivided into chambers which can be flooded or emptied to vary the depth of flotation of the dock. Pumping machinery and compressed air plant are installed in the walls for this purpose. To dock a vessel, the floating dock is submerged sufficiently for the vessel to be floated in over the dock floor. The dock is then raised, by pumping out water, until the vessel rests on the prepared keel and bilge blocks on the floor of the dock. Pumping continues until the ship and the dock floor are raised clear of the water. Struts may also be used to support the sides of the vessel. The vessel is refloated by refilling the dock with water. An interesting feature in most floating docks is the "self-docking" principle, by which the dock is divisible into sections each of which can itself be raised out of the water for inspection and repair. Most floating docks are of steel, but they have also been built of timber and reinforced concrete.

Floating docks can be towed from place to place and are therefore of great value for naval purposes. They have a shorter life than graving docks and are more costly to maintain. It is also essential that they should have both deep water and secure anchorage. They are normally provided with cranes running on the walls, and are frequently

Dock. Graving dock at Southampton, with a vessel on keel blocks ready for repair

connected to land by fixed structures, but ship repairing operations are naturally more difficult than in graving docks surrounded by solid land.

A variant of the floating dock is the depositing dock, consisting of one wall and a floor of separate pontoons upon which the vessel is lifted. The dock is then moved so that its pontoons alternate with sections of a fixed staging upon which the vessel is deposited by submerging the dock, which can then be removed for use with another staging. This system is suitable for small vessels only and is not greatly used.

Small vessels are generally repaired on slipways. These are inclined railways on which wheeled cradles can be run down below water and under the vessel, which is then hauled up to the above-water portion of the slipway. Consult Dock Engineering, B. Cunningham, 1922; Docks, Wharves, and Piers, F. M. G. Du Plat-Taylor, 1928.

M. Nachsen, M Inst.C.E.,  
M.I Struct.E.

**Dock.** Place in a court of law in which prisoners stand during trial. It is usually an enclosure surrounded with rails, and facing the judge. The word appears to be derived from the room in the Old Bailey which, it is said, was called bail-dock by the criminals. See Court; Criminology.

**Dock Brief.** A prisoner on trial at assizes or quarter sessions for an indictable offence or appealing to the court of criminal appeal is entitled to instruct any barrister in court to appear for him for a fee of 23s. 6d., or in some courts a guinea.

**Docker.** Workman employed in handling cargoes in ships and warehouses or on quays. Dock labourers in the U.K. are officially styled port transport workers and numbered about 110,000 in 1946. For long this type of labour was poorly paid, the working hours being irregular and uncertain; and many unnecessary hardships were inflicted on the workers, a state of affairs first brought to public attention in 1889 when, under the leadership of Ben Tillet, Tom Mann, and John Burns, the London dockers went on strike for a wage of sixpence an hour ("the docker's tanner") and a minimum engage-

Dock. Floating dock at Southampton, with the liner Majestic undergoing an overhaul

ment of four hours. The public subscribed £48,736 to a strike pay fund, towards which also over £30,000 was remitted by telegraph from Australia. Thanks to this practical sympathy, the dockers won their demands. But conditions remained bad, owing to the casual nature of the work. In 1920 a committee inquired exhaustively into wages, hours, etc., and recommended a substantial advance of wages, together with a system of registration and maintenance grants to counteract the evils of casual labour; but little came of these proposals.

In 1940 the British government made registration schemes at the ports compulsory; the following year the ministry of War Transport became responsible for the employment of dock labour in the ports of the Mersey and Clyde, workers receiving for the first time a guaranteed weekly payment of £4 2s. 6d. In June, 1941, the National Dock Labour Corporation Ltd. was established to operate the Dock Labour Essential Work Order at all principal ports, except those of the Mersey and Clyde. It accepted responsibility for payment of a guaranteed sum of 6s. for each half-day on which a man was unemployed. In 1946 the Dock Workers (Regulation of Employment) Act did away with casual employment in the docks. See Casual Labour.

**Dockers' Battalion.** British corps raised by Lord Derby in 1915 for unloading military supplies at Liverpool. Men ineligible for combat duties on account of age or physical disability were enlisted into the army, provided with uniform, and were subject to military discipline. The Liverpool battalion was attached to the King's Liverpool Regiment, and Lord Derby, with temporary rank

of colonel, was appointed O.C. A similar organization, the Transport Workers' Battalion, was soon raised for duty at the London docks and attached to the York and Lancashire Regiment. These battalions were distinct from the Labour Corps (*q.v.*), which also supplied companies of dock labourers.

During the Second Great War, loading and unloading of ships at military ports and bases were carried out by dockers' companies of the Royal Engineers and Pioneer Corps (*q.v.*). Units of these two corps served in all theatres of operations, earning distinction in N. Africa and Italy, where they frequently worked under shell fire and aerial bombardment. Unlike the military dockers of the First Great War, they were trained and equipped to take their place as combat troops if necessary.

**Dock Warrant.** Document given to the owner of goods lying warehoused in a dock, stating to whom they belong. If the goods change hands the document should be endorsed and given to the new owner. These warrants can usually be placed as security with bankers and must bear a stamp.

**Dockyard.** Government naval establishment comprising engineering works, slipways, stores, etc., where ships of war are constructed or repaired, supplied with material and personnel, and made ready for sea. Normally, however, dockyards are mainly used for overhauling and refitting, the bulk of new construction being given to private shipbuilders on the Clyde, Tyne, or elsewhere. They are administered by a director of dockyards, assisted by the director of stores and director of naval construction, and a special department at the Admiralty; but the additional civil lord, who is controller of the navy, is charged with their general management, and all business matters relating to them.

The first dockyard in British naval history was built at Woolwich (*q.v.*) in the reign of Henry VIII. Others were then built at Portsmouth, Deptford, Chatham, and Sheerness, and under William III, at Plymouth. In 1814 a yard was built at Pembroke to replace one at Milford Haven. The chief dockyards of the British Empire are at Chatham, Devonport and Keyham, Harwich, Haulbowline, Invergordon, Pembroke, Portsmouth, Rosyth, Sheerness, Gibraltar, Malta, Ascension, Bermuda, Simonstown, Sydney.

During the Second Great War the royal dockyards at home and

overseas had to maintain a world-wide docking and repair organization for all the requirements of British and Allied naval vessels. Work had to be done with the greatest expedition, particularly on destroyers and escort vessels engaged in the battle of the Atlantic, generally in complete secrecy and frequently in the face of intense air raids. Some 97,000 refits were completed in the royal dockyards between 1939 and 1945. Amongst the new warships built were one aircraft carrier, four cruisers, four sloops, and 22 submarines. Six floating docks and a large proportion of the landing craft used for combined army and naval amphibious operations were built. The dockyards further performed innumerable tasks in the operation and maintenance of naval air stations, training establishments, barracks, and fleet bases.

Leading dockyards of other countries include: Boston, Brooklyn, Key West, Norfolk, Va., Portsmouth, N.H., and Pensacola in U.S.A.; Brest, Cherbourg, Lorient, Rochefort, and Toulon in France; Naples, Spezia, and Venice in Italy; Kronstadt, Sevastopol, and Leningrad in Russia. At the end of the Second Great War, the Kiel and Wilhelmshaven dockyards in Germany and those at Kure and Nagasaki in Japan were destroyed.

**Doctor** (Lat., teacher). Name applied in the Middle Ages to a teacher of logic and theology, but now generally denoting a medical practitioner. For specially eminent teachers the word was coupled with a descriptive adjective, and used as a title, e.g. William of Occam was the invincible doctor, Bonaventura the seraphic doctor. The title Doctors of the Church was given to certain early fathers distinguished by their authoritative teaching and sanctity. The university degree of doctor was first conferred, in law or divinity, at Bologna about 1130, in Paris towards the end of the 12th century, and in England in the 13th century, and that in medicine in the 14th century. Doctors' degrees in music, philosophy, science, literature, and other faculties followed. Honorary doctors' degrees are conferred, those granted by the archbishop of Canterbury being known as Lambeth degrees. (See Degree.)

The name doctor is also applied to various mechanical appliances, especially contrivances for remedying defects, e.g. in textile printing and paper-making the "doctors"

are metal blades which remove colour, threads, and other superfluous matter from the rollers. The name is also given to the lancet-fish (*Acanthurus*), and to an artificial fly used by anglers. From the practice of doctoring or darkening light-coloured wines, brown sherry is sometimes called "doctor."

**Doctors' Commons**, or "The College of doctors of law exercent in the ecclesiastical and admiralty courts." Society or college of English lawyers of considerable antiquity. It obtained a charter in 1768 and had its headquarters near S. Paul's cathedral, London. Its members, who were called fellows, had the sole right of appearing in ecclesiastical (including divorce), probate, and admiralty courts, while proctors, who did the work of solicitors, were attached to it. The members had to be doctors of law of either Oxford or Cambridge, and from them the judges of the archbishops' courts were always chosen. Under the Probate Act of 1857 this college was dissolved.

**Doctrinaire** (late Lat. *doctrinarius*). A term commonly applied to the politician, economist, scientist, or artist who maintains that a definite end can be attained only by following certain principles, and thereby makes the means of greater importance than the end. The word, used in France after the restoration of the Bourbons in 1815, as a journalistic nickname for the philosophic statesman Royer-Collard, came to be applied to the political group of constitutional royalists led by him and supported by Guizot, Camille Jordan, and others. In 1830 the Doctrinaires were merged in the Orleanist party.

**Doctrine** (Lat. *doctrina*, instruction). Word used generally for the instructions given or principles taught by a particular person to his followers, and for the declared tenets of a society of persons. Thus Christian doctrine is both the teaching of Christ set out in the N.T. and the body of belief contained in the catechisms and other official documents of the Christian churches. Every sect of Christians has also its particular and distinctive doctrine expressed in its own formularies. Philosophy, politics, economics, science, and art all have their doctrines, i.e. precepts expounded by certain persons and schools of thought.

**Document** (Lat. *docere*, to teach). Term used for printed or written matter of an important kind. In law it means anything

that can be used in evidence, and in the plural is frequent in the vocabulary of lawyers. It is also used for papers of interest and value to the historian. See Evidence; Film; Manuscripts.

**Dodabetta**. Mt. of Madras, India, in the Ootacamund subdivision of the Nilgiri district. It is 8,760 ft. above sea level, the highest point in the Nilgiri Mts., and is the second highest point S. of the Himalayas. Cinchona and ipecacuanha are cultivated on the slopes. Ootacamund, the hot weather seat of the Madras gov. lies N.

**Dodd, FRANCIS** (1874-1949). British artist. Born at Holyhead, Nov. 29, 1874, he studied at the Glasgow art school and in France and Italy. Elected a member of the New English art club in 1904, he was one of the official war artists during the First Great War, and executed a valuable series of portraits of British admirals and generals on active service, published in 1917, and other works, remarkable for detail. Trustee of the Tate Gallery, 1929-35, A.R.A., 1927, and R.A., 1935, he took his own life, March 7, 1949.

Francis Dodd,  
British artist

**Dodd, WILLIAM** (1729-77). An English preacher, forger, and man of letters. Son of the vicar of

William Dodd,  
English preacher  
From an engraving

Bourne, Lincs, he was born May 29, 1729, and educated at Clare College, Cambridge. He was ordained in 1751, and became a curate at West Ham. Popular as a preacher at the Magdalen Institution, in 1763 he was made chaplain to the king. Falling into debt, he forged Lord Chesterfield's name to a bond for £4,200. Arrested, he returned £3,000, promised £500 more, and offered security for the remainder. He was, however, at the instance of the lord mayor, committed for trial, sentenced May 26, and, despite the efforts of Dr. Johnson and others on his behalf, hanged on June 27, 1777. His works include *Beauties of Shakespeare*, 1752; *Commentary on the Bible*, 1765-70; and *Thoughts in Prison*, 1777. Consult *A Famous Forgery*, P. Fitzgerald, 1865.

**Dodd, William Edward** (1869-1940). American historian and diplomat. Educated at Virginia polytechnic institute, he was professor of history at Randolph-Macon College, 1900-08, and later at Chicago university. U.S. ambassador to Germany from 1933, he resigned in 1937 on account of his strong democratic principles and dislike of Nazism. Editor of *The Riverside History of the U.S.A.*, 1915, his publications included *Woodrow Wilson and his Work*, 1920; *Ambassador Dodd's Diary*, 1941. Dodd died Feb. 9, 1940.

**Dodder** (*Cuscuta*). Genus of annual, herbaceous, leafless parasites of the family Convolvulaceae. They are natives of temperate and tropical countries. The seeds germinate in the ground, but the seedlings attach themselves by suckers to young plants such as clover, vetch, thyme, furze, or flax. The growth of the host plant lifts the dodder from the ground, its roots perish, and it becomes entirely parasitical. Its red, yellow, or white thread-like stem twines in a tangle round its

Dodder. The herbaceous parasite on the smaller furze

host, and at intervals gives off clusters or spikes of minute, pitcher-shaped flowers.

**Doddridge, Philip** (1702-51). English divine. Born in London, June 26, 1702, he was educated at

*From an engraving*

where he was minister in 1722. Seven years later he was pastor at Northampton, where he founded a seminary for training Nonconformist ministers. He was a keen advocate of the use of shorthand. He did much to promote foreign missions and the

education of the poor, and was the author of some famous hymns (collected after his death), and of the popular *Rise and Progress of Religion in the Soul*, 1745. He died at Lisbon, Oct. 26, 1751.

**Dodecahedron** (Gr. *dōdeka*, twelve; *hedra*, seat, surface). Twelve-faced solid, each of the

Dodecahedron, a twelve-faced solid

faces of which is a regular pentagon or five-sided figure. When all the thirty edges are the same length the solid is regular.

**Dodecanese** (mod. Gr. *dōdeka*, twelve; *nēsia*, islands). Name given to twelve islands of the Aegean: Nisyros, Cos, Casos, Patmos, Charki, Leros, Tilos, Symi, Astropalia, Lipso, Carpathos, and Kalimno. They lie S. of the islands of Nikaria and Samos, and N. of the E. extremity of Crete, in the Aegean, off the S.W. coast of Asia Minor. Pop. 58,962, nearly all Greeks of pure Ionic stock. The islands were occupied by Italy in April, 1912, in the course of her war with Turkey over Tripoli, and retained by her in spite of the protests of the inhabitants. In 1920 Italy transferred the islands to Greece, but in 1922 repudiated the cession.

Apart from their wealth in fruit and domestic animals, Rhodes and the Dodecanese islands are of great strategic value for any military operations in S.E. Europe. After the entry of Italy into the Second Great War in June, 1940, her bases and aerodromes on the islands were frequently bombed by Allied aircraft, while British warships carried out periodic bombardments.

After the surrender of Italy in Sept., 1943, small Allied forces were landed on Cos, Leros, and Samos. Cos (*q.v.*) was finally taken by the Germans on Oct. 11; Leros was heavily raided at the end of the month. German troops landed from the sea on that island on Nov. 12, and by parachute in the central section. Lack of reinforcements and air protection led to the

overwhelming of the garrison on Nov. 16. The British troops on Samos were reinforced by Greek soldiers of the Sacred Brigade, dropped by parachute. The island was occupied by the Germans on Nov. 21 after all British and Greeks, some Italian troops, and the majority of the inhabitants, had been evacuated in ships of the Royal Navy.

On May 9, 1945, Allied troops landed on the occupied islands to receive the surrender of the German garrisons. Under the peace treaty between the Allies and Italy signed in Paris, Feb. 10, 1947, Italy again ceded the islands to Greece, who took over their administration on March 31.

**Döderlein, Ludwig** (1791-1863). German classical scholar. Born at Jena, he became professor of philology at Erlangen in 1819, which post he held till his death. He was the author of a valuable work on Latin Synonyms and Etymologies, of a handbook on Synonyms (Eng. trans.), and of a *Homeric Glossary*.

**Dodge, Henry Percival** (1870-1936). American diplomat. He was born at Boston, Jan. 18, 1870, and educated at Harvard. Admitted to the bar in 1895, he was attached to the U.S. embassy in Berlin, 1899-1906, and transferred to Tokyo, 1906-07. Later he was successively American minister to Honduras, Salvador, Morocco, and Panama. In 1914, on the outbreak of the First Great War, he was appointed special agent for the repatriation of Americans in Europe. He died Oct. 16, 1936.

**Dodge, Mary Mapes** (1838-1905). American author. She was born in New York, a daughter of

a professor of chemistry, and married at an early age William Dodge, a lawyer. On her husband's death she was left with two young sons

Mary Mapes Dodge, American author

and turned to writing stories and verses for youthful readers. On the starting of *St. Nicholas*, 1873, she was appointed editor, and for many years maintained it in the front rank of magazines for the young. Her many volumes of fiction included *Irvington Stories*, 1864; *Hans Brinker*, or the *Silver Skates*, 1865, her most popular tale, which was awarded a prize by the French

Academy; Donald and Dorothy, 1883; and The Land of Pluck, 1894; while among her verses were Rhymes and Jingles, 1874; Along the Way, 1879; and Poems and Verses, 1904.

**Dodgson, CHARLES LUTWIDGE.** English writer and mathematician, better known as Lewis Carroll (*q.v.*), the pseudonym under which he wrote Alice's Adventures in Wonderland, etc.

**Dodman, THE.** Headland of Cornwall, England. It is on the S. coast at the E. end of Veyan Bay, 8 m. S. of St. Austell. It stands about 400 ft. high, and affords magnificent views. In 1918 it passed from the earl of Mount Edgcumbe to the National Trust. The Dodman is Dead Man's Rock of Quiller-Couch's novel.

**Dodo** (Port. *doudo*, stupid). A large extinct bird (*Didus ineptus*), formerly inhabiting Mauritius. It was related to the pigeons, and was rather larger than a swan. The plumage was grey, the tail feathers short and curly. The head bore a massive beak, the legs were exceptionally stout, and the wings rudimentary. It became extinct towards the close of the 17th century.

**Dodona.** Oracle of Zeus near Mt. Tomoros or Tmaros in Epirus, ancient Greece. The responses of the god were supposed to be declared

by the rustling of the wind in the oak or beech trees. According to one story, a black pigeon from Egyptian Thebes is said to have perched on an oak at Dodona and commanded an oracle to be founded there. The responses were originally interpreted by priests called Selli, afterwards by old women called Peleides (pigeons). The oracle of Dodona was often consulted in preference to the more famous oracle at Delphi, which was supposed to favour the Dorians.

**Dods, MARCUS** (1834-1909). A British theologian. The son of a Presbyterian minister, he was born at Belford, Northumberland. Educated at Edinburgh academy and university, he became a minister, and from 1864 to 1889 was minister of Renfield Free Church, Glasgow. In 1878 he was charged with holding unorthodox views, the matter coming before the general assembly. However, theology became more liberal, and in 1889 Dods was made professor at New College, Edinburgh. In 1907 he was

chosen principal of the college. He died April 26, 1909. He wrote The Bible: its Origin and Nature, 1905, and other works giving the results of the higher criticism.

**Dods, MEG.** In Scott's novel, St. Ronan's Well, hostess of the Cleikum or Mowbray Arms Inn, in the Old Town of St. Ronan's. For favoured visitors she could make her inn "the neatest and most comfortable old-fashioned house in Scotland"; but usually she "ruled with a high hand, not only her men-servants, but over the stranger within her gates." Her pet phrase was "What for no?" She described her bark as worse than her bite, but her tongue, "when in full career, is vouched to have been heard from the kirk to the Castle of St. Ronan's." Her ire was specially directed against a rival and "fashionable" establishment, the Fox Hotel.

**Dodsley, ROBERT** (1703-64). English publisher. Born at Mansfield, Notts, Feb. 13, 1703, son of a schoolmaster, he was first a stocking weaver, then a footman. With the profits of A Muse in Livery (1732), and a dramatic satire, The Toy-Shop (1735), written while still a footman, and with the help of Pope and others, he opened a bookshop, The Tully's Head, Pall Mall. He issued A Select Collection of Old Plays, 12 vols., 1744; with Burke founded The Annual Register, 1758; and published for Pope, Gray, Goldsmith, Sterne, Young, Akenside, and Johnson, to whom he suggested a plan for an English dictionary. He died at Durham, Sept. 23, 1764.

**Doe, JOHN, AND ROE, RICHARD.** Imaginary names used in English legal procedure for purpose of convenience. For instance, if Thomas Jones wished to claim freehold land in the possession of John Smith, he could best do it in an action of ejectment. But an action of ejectment could be brought only by a leaseholder, and not a freeholder. So Jones created a fictitious lease to John Doe, and then brought an action, "John Doe on the demise of Thomas Jones v. John Smith." John Doe by his claim then said that he was a tenant of Jones, and Smith had ejected him "with force and arms, battle-axes, spears, bows," and other weapons. Richard Roe was a similar creation. At one time he was made defen-

dant. He was supposed to be the real defendant's (Smith's) tenant; and Smith used to come in and vouch for him. This legal fiction was abolished by the Common Law Procedure Act of 1852.

**Doenitz, KARL** (b. 1891). German sailor. Born at Grunau, near Berlin, he joined the German imperial navy in 1910 and, on the outbreak of the First Great War, was transferred to the naval air arm. A U-boat commander, 1916-18, he was captured by the British and interned in Great Britain, but later released as the result of feigning madness. In 1929 he became commander of the cruiser Emden. He studied U-boat warfare in all its aspects, joined the Nazi party, and organized the secret construction of U-boats. On the outbreak of the Second Great War he was in command of a U-boat flotilla. Promoted admiral in 1942, he became grand admiral and c.-in-c. of the German navy the following year, and was responsible for the U-boats' "pack" method of attack. During the final German breakdown in May, 1945, announcing his appointment as Hitler's successor, Doenitz negotiated the surrender of the German armed forces. He was arrested at Flensburg on May 23. He was named among the major war criminals, appeared before the international tribunal at Nuremberg, was found guilty of crimes against peace and of crimes committed in warfare, and was sentenced to 10 years' imprisonment on Oct. 1, 1946.

**Doesburg.** Town of Holland, in the prov. of Gelderland. It stands at the junction of Old and New Yssel, 6 m. S.E. of Dieren. It has a 15th cent. church.

**Dog.** In zoology, name applied to a family (*Canidae*) of flesh-eating mammals. They are placed between cats and hyaenas on the one hand, and weasels and bears on the other. This family includes all wild and domesticated dogs, as well as the wolf, fox, and jackal.

Dogs are digitigrade, *i.e.* they walk on their toes, and have blunt claws that cannot be retracted like those of the cats. They have four toes on the hind feet, and, except the Cape hunting dog, five on the fore feet. All have long muzzles and a large number of teeth, usually 42. Although a fox and a bulldog, or a

DOG: TYPES FAMILIAR IN FARM FIELD. AND HOME

wolf and a Maltese terrier, differ greatly in appearance, in all important anatomical features they are so nearly identical as to justify their inclusion in the same family.

All dogs in the wild state are of dull and inconspicuous coloration, except the Cape hunting dog, which is black and yellow, and in general appearance resembles a hyaena. Most of them assemble in packs for hunting, which they do mainly by scent, and the common cry of all is a howl rather than a bark. They live in burrows, caves and clefts in rocks, and most of them are nocturnal in their habits. They are found in nearly all parts of the world, Madagascar and Ceylon being the only notable exceptions. Of the various wild species, the dingo of Australia, probably introduced by man at a remote epoch, is the best known. It works havoc among the flocks, and is one of the greatest pests of the country. The Asiatic wild dogs are represented by the pariah dogs of India and the dholes, which are somewhat like jackals in appearance. Both the African wild dogs, the Cape hunting dog and the long-eared Cape dog, present so many features of difference from the true dogs that they have been formed into separate genera. While the former resembles a hyaena, the latter is strikingly like a fox. In S. America there are the crab-eating dog and the bushdog.

#### Dogs and Wolves

Of the numerous breeds of domestic dog the Kennel Club recognizes only 82, but naturalists have distinguished as many as 185 varieties. There is little doubt that the domestic dog has descended from the wolf, with a possible admixture of the jackal. Dogs interbreed freely with wolves and their offspring is fertile, which is not usually the case with hybrids between different species. The less specialised breeds closely resemble the wolves of their native lands. The dogs of the Eskimos and the N. American Indians are nothing more than domesticated wolves, and it is the common practice to tie up the females in the forests that they may be served by the wild wolves, with a view to maintaining the stamina and hardness of the breed. The domestication of the wolf is by no means so difficult as is usually supposed, especially in the case of the American species. There is, however, one striking difference between the modern dog and his wild cousins. The pupil of the dog's eye is round, while that of the fox and jackal is vertical; and in the wolf it is placed obliquely.

The domesticated dog was known in the earliest historical times. In prehistoric days neolithic man appears to have had two species of dog associated with him, for their remains have been found in the Danish kitchen middens, the Swiss lake villages, and other centres of habitation. Whether these dogs ever roamed Europe in a wild state or were only domesticated wolves is a moot point. Within the historic period we find the dog venerated by the ancient Egyptians, which is possibly the reason why it was held in such abhorrence by the Hebrews as an unclean animal. The Assyrians and Babylonians used the dog in hunting, and it is remarkable that both Assyrian and Egyptian sculptures show several types of dog that can be recognized to-day. Strabo states that in early Britain bloodhounds were used in war, and in the Norman period we find mention of hunting dogs. More than a dozen breeds were maintained in the 15th century.

#### Classification of Dogs

Of all animals the dog is the most suitable and useful as a companion for man. It has been maintained that the dog is the most intelligent animal next to man, and although this is open to doubt, there is no question that its intelligence is of a very high order. The value of this is greatly augmented by the fidelity of the dog, which has often been known to sacrifice its life in defence of its master. The Romans classified dogs as hunting dogs, sheep dogs, and watch dogs, and the division still holds good. But it is more usual now to classify them as hounds, sheep dogs, terriers, spaniels, mastiffs, and lap dogs. They range in size from the Tibetan dog and the Great Dane down to the tiny Japanese lap dog, which is often valued at its weight in gold.

Dog breeding is now an important industry. Unfortunately, the tendency has too often been to breed for the purpose of intensifying eccentricities, as in the case of the modern bulldog, rather than to develop qualities of practical utility. Still, much has been done by careful selection to improve the hunting varieties, and by skilful crossing some useful new breeds have been evolved. An example of this is seen in the whippet, which is a cross between the English greyhound, the Italian greyhound, and a terrier. A remarkable example of what can be accomplished by scientific breeding is seen in the reappearance of the extinct Irish wolfhound. In the 'sixties, Captain Graham of Dursley, in Gloucestershire, by skilful

and repeated crossing of dogs known to be descended from the original breed, ultimately succeeded in reproducing all the points of the genuine wolfhound.

#### Dog Shows and Breeding

In 1776 the first dog club was founded by Lord Orford, but it was not until 1859 that the first dog show was held at Newcastle-on-Tyne. Since that date shows have become so popular that about 500 are held locally in Great Britain every year, and the number of dogs exhibited has grown from 60 to many thousands. The growth of the fancy has resulted in making dog breeding a lucrative business. The sum of £1,000 has been paid on several occasions for champion bulldogs and St. Bernards, while a fox-terrier has been known to change hands for £500. A collie has fetched £1,500. Mrs. J. B. Walz in South America refused £3,000 for a bulldog. The Kennel Club was founded in 1873 by S. E. Shirley, and now virtually controls the dog fancy of the world. All the recognized shows are held under its rules, and it has exercised great and beneficial influence in controlling the vagaries of breeders, and in suppressing many cruel and objectionable practices. There are also clubs in connexion with all the leading breeds, both in the United Kingdom and abroad. Sectional shows are regularly held, stud books are carefully kept, and the fancy, as it is called, is thoroughly organized.

**DOGS AND THE LAW.** The owner of a dog that bites anyone may be liable in damages if he knew the dog was liable to attack human beings. The owner is also liable for all injury done by a dog to horses, mules, sheep, goats, pigs, or poultry, even though he did not know the dog to have a propensity for such acts.

Among works of reference on dogs may be mentioned *The Dog Owner's Manual* J. Z. Zine, 1937; *The Kennel Encyclopedia*, ed. F. T. Barton, 1946.

**Dog.** In mechanics, a catch of various kinds. A dog-shore is a prop of timber used to support a vessel until the moment of launching, which is accomplished by knocking the dog-shores away. A timber-dog is a bar of metal with ends turned at right angles to the middle part and sharpened to hold large balks together. A dog-clutch is a sliding clutch with jaws which interlock when one part is moved endways. Dog-spikes with flattened heads are used to secure flat-bottomed rails to their sleepers.

**Dogberry.** Chief comic character in Shakespeare's *Much Ado About Nothing*. A city constable, his self-satisfaction and abuse of language and logic provide relief to the serious interest of the play.

**Dogcart.** High two-wheeled open, one-horsed vehicle with two transverse seats placed back to back, for four passengers. The rear seat folds up, and the back foot board can be fixed up to enclose the body of the cart. Dogcarts are sometimes used when driving tandem. See Coach.

**Dog Cockle.** In conchology, the popular name of a bivalve found round the British coast. It is the *Pectunculus glycymeris* of the family Arcadae, and has almost circular shells, yellowish-white in colour with irregular dark-red markings. Large specimens measure as much as 2½ ins. across. It is sometimes known as the combshell, from the many teeth on the inner edge of the shell. See Bivalves illus.

**Dog Days.** Period about the time of the heliacal rising of the Dog Star, i.e. the time when it first emerges from the sun's rays and becomes visible before sunrise. The ancients attributed the heat and unhealthiness of the season and the highest rising of the Nile in Egypt to the influence of the Dog Star. The time of heliacal rising of the Dog Star depends on latitude, and occurs later each year owing to the precession of the equinoxes. The date of the first dog day ranges from July 3 to Aug. 15, and the duration of the period from 30 to 54 days. Now, the dog days are July 3-Aug. 11.

Dogcart. Single-horse dogcart with rubber-tired wheels  
W. A. Rouch

**Doge** (Lat. *dux*, a leader). Title of the heads of the republics of Venice and Genoa. Soon after 700 a doge appears in the history of Venice, which, with the adjacent cities, had hitherto been ruled by tribunes. The first doge was Paolo Lucio Anafesto. Soon the republic came into being as an independent state, and its ruler, the doge, enjoyed great power and prestige. There were attempts, especially in the 10th century, to make the office

Doge. Fishermen presenting the ring of S. Mark to the Dogs of Venice, as depicted in Bordonone's masterpiece  
*Accademia, Venice*

hereditary in certain powerful families, e.g. the Orseolo, but they were defeated, and at various times the laws governing the election were altered.

At one time the doge was chosen by a body of eleven persons nominated by the great council of 480; later, the electors numbered 40, and then, to avoid the possibility of a tie, one more was added.

They were chosen by four persons nominated by the great council.

After 1268 there was a more elaborate system of choosing the 41 electors, the object still being to check the power of certain families. Lots were cast several times until eventually 41 persons were selected who were the actual electors. Gradually the powers of the doge were definitely limited, but he remained a splendid figure ceremonially, having in Europe the

rank of a sovereign prince, and sailing on Ascension Day in great state to celebrate the union of Venice and the sea. The last doge was Lodovico Manin, who abdicated in 1797. Perhaps the best known were Andrea Dandolo, the conqueror of the Turks, and Marino Faliero, put to death for conspiracy, 1358. In Genoa the president was a doge from 1339 until the French conquest. At first he held office for life, but in 1528 the period was fixed at two years. See Venice: History.

**Dog Fish** (*Scyliorhinidae*). A group of fishes of the shark family, but mostly smaller in size. They have a cartilaginous skeleton, no

Dog Fish. Specimen of the *Mustelus canis*, an inhabitant of the North Atlantic

spines on the dorsal fin, and most of them have spotted skins. The mouth is on the under side of the head, and is provided with several rows of teeth. Distributed over the tropic and temperate seas, they feed on crustaceans and molluscs.

Several species, e.g. the greater (*Scyllorhinus stellaris*) and lesser spotted dog fish (*S. caniculus*), are common around the British coasts, and are detested by fishermen, as they interfere with the nets and steal the bait off the lines. The flesh, which is coarse and strongly flavoured, appears in the market under the name of rock salmon; the dried skin, known as shagreen, is used in wood polishing.

**Dog Gate.** Name given to a gate originally placed at the top of a flight of stairs to prevent the house dogs from invading the upper rooms. Victorian houses were frequently fitted with these gates on the nursery floor to stop children from going downstairs.

**Dogger.** Globular concretion occurring in oolitic and greensand rocks. At the base of the lower oolite in Yorkshire, doggers or cat-heads of sandy ironstone, worked for iron ore, give their name to the dogger series, which reappears in the middle brown Jura formation of N.W. Germany. In the Kellaway beds and greensand they are calcareous, in the coralline masses of fossil shells and corals.

**Dogger.** Dutch deep-sea fishing boat, about 80 tons. It is a large two-masted, ketch-like smack, used in the North Sea, particularly on the Dogger Bank. Its peculiarity consists in a well in the middle, in which the fish caught are kept alive until the boat reaches port.

**Dogger Bank.** Extensive sandbank in the North Sea, almost equidistant from England and Denmark, with a mean depth of from 60 ft. to 120 ft., a length of 150 m., and a breadth of 70 m. It is a noted fishing ground, especially for cod. On Oct. 21, 1904, during the Russo-Japanese War, a Russian Baltic fleet on its way to the Far East fired on some British fishing trawlers, sinking one and damaging others, and killing two and wounding several members of the crews. The tsar expressed regret at the accident, which was inquired into by an international commission, and compensation was duly made by the Russian government. Two battles have been fought here, one between the Dutch and English in 1781, and another in the First Great War.

**Dogger Bank, BATTLE OF THE.** Fought between the British and the Dutch, Aug. 5, 1781. France

and Spain were allied against Britain and had recognized the independence of the U.S.A.; Holland had joined the Armed Neutrality of 1780, and there was fighting in every part of the world. Admiral Sir Hyde Parker was in charge of the free movement of British trade in the North Sea. Early in Aug., 1781, he was returning from the Baltic with a large fleet of merchantmen. Zoutman, the Dutch admiral, also in charge of a merchant convoy, was northward bound, when on Aug. 5 he encountered Parker, southward bound, on the Dogger Bank. Parker sent his merchantmen home to England, while Zoutman kept his trading fleet at some distance to leeward.

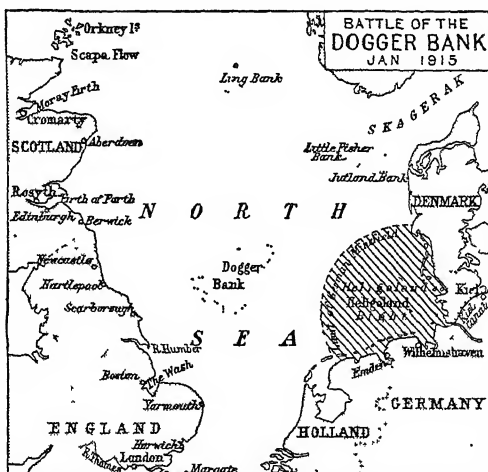

The opposing admirals both had scratch fleets, severally of seven ships, accompanied by frigates. Parker had only two of solid value, the *Fortunate*, his flagship, and the *Berwick*, both of 74 guns, while the best ships in the Dutch fleet

aded one another, each side being severely damaged, and then each withdrew to its own port without any conclusive results.

**Dogger Bank, BATTLE OF THE.** Naval engagement between the British and Germans, Jan. 24, 1915. On Jan. 23, 1915, the German battle cruisers Seydlitz, Moltke, and Derfflinger, the armoured cruiser Blücher, the light cruisers Graudenz, Stralsund, Kolberg, and Rostock, with 22 destroyers, left German waters to attack the British coast. That same day the whole of the British Grand Fleet left Rosyth and Scapa to carry out a sweep of the North Sea.

The Germans were sighted by British light cruisers, which had moved up from Harwich, about 160 m. W.N.W. of Heligoland, near the Dogger Bank, at 7.20 a.m. of Jan. 24. Their presence was signalled to Sir David Beatty, commanding the British battle-cruiser force, which consisted of *Lion* (flagship), *Princess Royal* and

*Tiger*, *New Zealand* and *Indomitable*, with eight light cruisers and about 26 destroyers. Beatty at once gave chase, gradually raising his speed to 28½ knots. At 8.52 he was within 20,000 yds. of the last German ship, the *Blücher*, and formed a line of bearing so that his guns could attack, and after testing shots, *Lion* at 9.9 made the first hit on the *Blücher*. A little later the Germans returned this fire, and the British began to make repeated hits. At 9.45, *Blücher* was

Dogger Bank. Map of the North Sea, showing position of the sandbank and extent of the German minefield

were the *De Ruyter* of 68, Zoutman's flagship, and the *Generaal Admiraal* of 74. The battle was fought on the established principles of the 18th century, which often led to inconclusive actions. The British fleet, which had the wind, was to bear down and each ship was to find its adversary. Parker laid his flagship alongside the *De Ruyter*. He had three ships ahead of him and three astern, while Zoutman in his line had four ahead and two astern. In this formal system of fighting, the leading Dutch ship was tackled by the *Berwick*, the second ship had no opponent, and all the other ships were engaged, except Parker's sternmost ship. For three and a half hours the fleets cannon-

dropping behind fast, much damaged, and the first and third German ships, probably Seydlitz and Derfflinger, were on fire.

At 10.48 *Blücher*, badly on fire, with a heavy list, dropped out of the line and turned N. She was abandoned by her sister-ships, as any other course would have meant their own immediate destruction. Beatty ordered *Indomitable*, which was dropping behind the other British ships, to attack her. *Blücher* was subjected to a heavy fire, but as she continued her resistance, the British light cruiser *Aurora* fired two torpedoes at her and sank her. Of her crew of 885, only 123 could be rescued, since a Zeppelin came up and

**Dogger Bank.** Sinking of the German armoured cruiser Blücher in the battle of the Dogger Bank, Jan. 24, 1915. Photograph taken from a British cruiser and purchased for £1,000 by The Daily Mail

attempted to bomb the light craft engaged in the work. The other British battle cruisers continued the pursuit, much hampered by a smoke-screen which the German destroyers put up.

Soon after 10 a.m. submarines were seen by the British and avoided; at 11.3 Lion was hit by two shells below the water-line, which put her feed-tank out of action and compelled her to leave the line. The rest of the fleet, under Rear-Adm. Moore, was ordered by Beatty to pursue and close on the enemy while he shifted his flag. It passed out of sight; when Beatty rejoined it in a destroyer at 12.20 p.m., it was returning, and he learnt that, though two of the German battle cruisers had shown signs of considerable damage, the battle had been broken off, about 90 m. from Heligoland, at a point "where dangers from German submarines and mines prevented further pursuit." This premature withdrawal caused surprise in the German fleet and led it to suppose that the British had suffered very severely.

Thus the battle ended in the escape of the three best German ships owing to the unfortunate injury to Beatty's flagship. The British casualties were 6 killed and 11 wounded in Tiger and 11 wounded in Lion, which latter ship was speedily repaired at Newcastle. In the German squadron Seydlitz lost 168 men killed by a single hit, which put two of her turrets out

of action and set her badly on fire. A second hit in her armoured belt astern caused a serious leak. Derflinger was reported to have lost 260 killed and wounded, but the Germans stated that she was but slightly damaged.

**Doggerel** or **DOGGREL**. Verse indifferent or mean in thought and faulty or worthless in construction. The term is also applied to burlesque verse, such as that of Butler's Hudibras. Doggerel was once used as a verb, implying frequent repetition of an argument.

**Doggett**, THOMAS (d. 1721). Irish actor. Born in Castle Street, Dublin, he first appeared in London at Bartholomew Fair. In 1691 he played Nincompoop in D'Urfey's *Love for Money* at Drury Lane, and, with Cibber, Wilks, and Swiney, managed The Haymarket during 1709-14, when, owing to a disagreement, Doggett separated from his partners, and acted intermittently at Drury Lane until his death. In Aug., 1715, he founded the race for the Doggett's Coat and Badge. Among Doggett's principal characters were: Fondlelove in *The Old Bachelor*, and Ben in *Love for Love*, both by Congreve, who greatly admired Doggett's acting; Tom Thimble in *The Rehearsal*; and the First Grave-digger in *Hamlet*. Doggett was the author of one comedy, *The Country Wake*, in which he himself took a part in 1696. He was well known for his social qualities in his day.

### Doggett's Coat and Badge.

Prize annually competed for by Thames watermen in a rowing race. It was founded Aug. 1, 1715, by Thomas Doggett, who bequeathed a sum of money for it,

now controlled by the Fishmongers' Company. The course is from London Bridge to Chelsea, and the list of winners has been preserved since 1791. No races took place in 1915-19 owing to the First Great War: the suspended races were decided in 1920. In 1939 the course was covered in 28 mins. 39 secs. No races were held in the years 1940-46.

Doggett's Coat and Badge, the prize rowed for by Thames watermen since 1715

Drawing by C. G. Harper

**Dog Licence.** Tax imposed on all dog owners, with few exceptions, such as farmers, shepherds, and blind persons. Introduced in 1796, and again imposed in 1808, the tax has long been a regular source of revenue to the country. It has varied in amount from time to time, being 12s per dog in 1866, 5s. at a later date, and then 7s. 6d.

The number of dog licences in the U.K. in the year before the Second Great War exceeded 3,000,000. Puppies under six months are exempt from the tax.

**Dogma** (Gr. *dokein*, to hold an opinion). Word used of a statement or opinion regarded as true. Originally applied to the tenets of certain philosophers and to public decrees, being used in the Greek of the N.T. in the latter sense (Luke 2 and Acts 16), the word became generally restricted to statements of belief held by the Christian Church to be of divine revelation. In modern usage dogma is briefly a statement of revealed truth defined by the Church. All the principal dogmas of Christianity, the Trinity, the divinity of Christ, and the articles of the Apostles' Creed, are held by those who regard them as true to be of divine revelation in their origin and to have been defined by divine guidance.

Revealed truth does not become a formal dogma until it has been defined authoritatively by the Church. While the R.C. Church declares its dogmas to be unchangeable for all time it recognizes that revealed truth does not require to be defined until challenged by criticism, misinterpreted by lack of understanding, or liable to be stated erroneously. Hence the history of Christian dogma is the history of controversy demanding settlement. The claim of the R.C. Church to be the sole authority for definitions of dogma is not accepted by Anglicans, Nonconformists, or by the Eastern churches. Hence the dogmas of the Council of Trent, and of papal infallibility defined by the Lateran Council, 1870, are rejected outside the communion of Rome, and only those dogmas are retained which date from the early general councils of the Church.

Roman Catholics, while required to believe all defined dogmas of their church, maintain that these dogmas are defined because they are existing truths and are not truths created by definition. Dogmas are not restricted to revealed religion. Science also has its dogmas, i.e. statements considered to be proven by observation and by experiment.

**Dogmatism.** The positive assertion of doctrines or opinions; in philosophy, a system which goes beyond the sphere of experience, without having first tested the capacity and limits of the intellect. The dogmatist has implicit faith in the efficiency of human reason,

and lays down certain general principles as the foundation of his system. He is opposed to the sceptics and to the critical philosophers: the former doubted the truth and value of human knowledge generally, while the latter tested the limits of reason.

**Dogra.** People of Rajput stock in Kashmir, Jammu, and adjacent valleys. Mostly Hindu round Jammu, and Muslim farther W., about one-seventh of the population speak a Punjab Dogri dialect. The Dogra Regiment, raised locally, had a good record in the Second Great War.

**Dog Rose** (*Rosa canina*). Shrub of the family Rosaceae. A native of Europe, Siberia, and N. Africa, it is common in hedgerows and thickets, which it climbs by the aid of flattened hooks. The leaves are broken up into 5-7 oval leaflets with toothed edges; the sweet scented pink or white flowers are about 2 ins. across, appearing in June. The fruit is the familiar crimson hip, of which a syrup rich in vitamin C is made.

**Dogs, ISLE OF.** District of London, on the Thames, opposite Greenwich. It was

originally a peninsula, its present character being due to the formation of the West India, East India, and Millwall docks, and the Limehouse and Blackwall basins. It constitutes a large portion of the borough of Poplar. The Island gardens, two and a half acres, were opened 1895. The footway tunnel to Greenwich starts from these gardens, while the entrance to the Blackwall Tunnel is near the East India Dock gates. Cubitts Town in the Isle of Dogs, having been almost wiped out by the air raids of 1940-41, became in 1945-46 the site of some 300 prefabricated houses, the first to be erected in London.

**Dog's-bane** (*Apocynum androsaemifolium*). Perennial herb of the family Apocynaceae, native of N. America. It has opposite, oval leaves and fragrant, nodding, bell-shaped flowers. These flowers, coloured pink, are well known for their five sensitive scales, which bend together when touched by an insect and detain it. The plant is acrid and poisonous.

**Dog's Mercury** (*Mercurialis perennis*). Perennial herb of the family Euphorbiaceae. A native of Europe, N. Asia, and N. Africa, it has a slender creeping rootstock and dark green oval or lance-shaped

leaves. The flowers are small, green, and inconspicuous, the males on separate plants from the females. Good King Henry (*Chenopodium bonus-henricus*) is cultivated as a pot-herb in some places under the name of mercury. See Chenopodiaceae.

**Dog Star** OR SIRIUS. Sirius (q.v.) in Canis Major and Procyon in Canis Minor were formerly called the dogs of Orion.

**Dog-tooth Ornament.** The name given to a small blunt-pointed ornament used in hollow mouldings. Early English architecture provides many examples, and some believe that it was brought from the East by the Crusaders. See Architecture; Moulding.

**Dog Watch.** Two-hour watches on board ship, that from 4 to 6 p.m. being called first dog, that from 6 to 8 p.m. second dog. The rest are four-hour watches.

**Dog Whelk.** Popular name of a common British mollusc, *Nassa reticulata*, which does great mischief to oyster and mussel beds. The name is incorrect, since the creature is not a whelk.

**Dogwood** (*Cornus sanguinea*). Shrub belonging to the family Cornaceae. A native of Europe and

of N.W. Asia, it has opposite, entire, oval leaves and clusters of small cream-white flowers, which are succeeded by small black berries. The latter are round, very bitter, and yield an oil

which has been used for lamps and soap-making. The hard, tough wood is serviceable for many purposes where size is not required, such as rounds of ladders; the twigs are made into skewers, and the tonic and astringent bark provides a substitute for cinchona. In N. America the name dogwood is given to about 20 species of *Cornus*, e.g., *C. florida*, a lovely flowering shrub.

Dog's Mercury, leaves and fruits

Dog Tooth ornament, an architectural decoration

Dogwood leaves and berries

**Doherty, HUGH LAWRENCE** (1876-1919). British lawn tennis player. A Londoner, born Oct. 8, 1876, he was a schoolboy champion and played lawn tennis for Cambridge against Oxford, 1896-98. He won most of the singles titles; at Wimbledon, 1902-06, and in Scotland, Ireland, the Riviera, and the U.S.A. With his brother Reginald (1872-1911), the Wimbledon champion of 1897-1900, he won the doubles there 1897-1905. The two were supreme in their day, being the first to perfect the art of the smash.

**Dohnányi, ERNST VON** (b. 1877). Hungarian composer. The son of a professor, he was born at

E. von Dohnányi,  
Hungarian composer

Pressburg (Bratislava) July 27, 1877, and received musical training from the cathedral organist and at the Royal Hungarian Academy of Music, Budapest. In 1897 he was awarded a prize for his symphony in F. He appeared as a pianist in England, 1898, and in the U.S.A., 1899. Influenced at first by Brahms, his earlier compositions were predominantly classical in form, though marked by great brilliance and originality, e.g. Variations on a Nursery Song. His later style tended towards national romanticism, as in the ballet *Pierrette's Veil*, and the opera *Tower of Voivod*, 1922. Director of the conservatoire of Budapest, Dohnányi was imprisoned after the Axis defeat in 1945 on account of his fascist sympathies.

**Doine.** Lake or loch of Scotland. It is in Perthshire, 4 m. W.S.W. of Balquhider, and is separated from Loch Voil by a short stream. Its waters are carried through that and other lakes to the Teith.

**Doiran.** Town and lake of Macedonia, on the boundary between Bulgaria and Greece. The town is situated on the S.W. of the lake, about 40 m. N. of Salonica. It frequently figured during the First Great War in the operations of the Salonica expedition, and finally was captured from the Bulgars on Sept. 18, 1918, by British and Greek troops. Pop. normally about 4,000. Following the German invasion of Greece and Yugoslavia in 1941, Doiran was seized by the invaders on April 7. Occupied later by Bul-

garian troops, Doiran was liberated by the surrender of Bulgaria in Sept., 1944.

Lake Doiran is a circular body of water, about 5 m. long N. to S., and somewhat less E. to W., 10 m. E. of the Vardar river. It has an area of 15 sq. m. and is 500 ft. above sea level.

**Doisy, EDWARD A.** (b. 1893). American biochemist. Born at Hume, Ill., Nov. 13, 1893, he was educated at the university of Illinois and became professor at the St. Louis university school of medicine in 1923. Director of S. Mary's hospital in 1924, as a research worker he specialised in "blood buffers," in the isolation of hormones, and of the pure crystalline vitamin K. Together with the Danish professor, Henrik Dam, he was awarded the Nobel prize for medicine in 1943, after having been honoured since 1940 by numerous honorary degrees, medals, and awards for his discoveries.

**Doit or Duit.** Dutch copper coin, one-eighth of a stiver = 1d., now obsolete. It was used, although illegal, in England in the 16th century, and was current in Scotland, where it was worth 1d. Scots. The word is used generally for any tiny coin or anything of little value.

**Dol.** Town of Brittany, France, in the dept. of Ille-et-Vilaine. It stands in a level and fertile tract, 13 m. by rly. S.E. of St. Malo. An agricultural centre, it is a market for produce of the surrounding district, and is famous for its market gardens, while tobacco is also grown. Tanning is another industry. An old town, Dol was a bishop's see about 600 to 1790, the bishop being the spiritual head of all Brittany. The cathedral, a fine Gothic building, dating from the 13th century, is dedicated to the English S. Samson.

**Dolabella, PUBLIUS CORNELIUS** (c. 70-43 B.C.). Roman general notorious for his profligacy and extravagance. When tribune he actually introduced a bill for the cancellation of debts, which was quashed by Caesar. During the Civil War he changed sides twice, supporting first Pompey and then Caesar. After the murder of the latter, he joined the republican party, but abandoned it on being made governor of Syria by Antony. His extortion and violence and the murder of Trebonius (*q.v.*) led to his being declared a public enemy. Besieged in Laodicea, he evaded the penalty of his crimes when

the city was taken by causing one of his own soldiers to put him to death. His wife was Tullia, daughter of Cicero.

**Doldrums.** Name given by sailors to the low-pressure belt of equatorial calms; here the N.E. and S.E. trade winds meet, and very heavy rainfall and thunderstorms are often experienced. Owing to the apparent migration of the sun, the position of the Doldrums changes, being farthest N. in the northern summer, and farthest S. in the southern summer, although even then it does not completely cross the equator. Its mean position is N. of the equator.

**Dole.** Charitable distribution of money or food in small quantities. In the Middle Ages doles were established in perpetuity by the interest accruing from bequests of land or money. Such doles are still in existence, notably one at Hereford. The term was also applied in an unofficial sense to the allowance paid to the unemployed in Great Britain after the First Great War. The unemployment insurance scheme which came into operation in 1912 introduced the payment of unemployment benefit in return for the payment of premiums, and thus had no suggestion of unearned charity. In 1919, however, so many returning service men were unable to obtain work that the government provided for an unemployment donation for ex-service workless. In 1920 a new Act placed all unemployed persons on the same level, yet the word dole continued to be applied commonly but incorrectly to unemployment pay. See Labour Exchange; Insurance, National; Unemployment.

**Dôle.** Town of France, in the dept. of Jura. It stands on the river Doubs and on the Rhine-Rhône canal, 29 m. S.E. of Dijon. An old town, its chief buildings include the church of Notre Dame, the hôtel de ville, and the hôtel Dieu. The town is a centre for agricultural products, including wine. In the Middle Ages Dôle was in Burgundy, and for about 250 years the capital of Franche Comté, having then both a parliament and a university. It passed about 1479 to the house of Austria, and was taken by the French in 1674. Pop. 18,250.

**Dolerite** (Gr. *doleros*, deceptive). Coarsely crystalline rock, intermediate in texture between gabbro and basalt. It is composed of plagioclase, augite, and other minerals. The name was in

the past limited to greenstone found in tertiary lavas, the more weathered forms being called diabase. The toughness and other properties of dolerite give it value in road building.

**Dolet, Étienne** (1509-46). French scholar and printer. Born at Orléans, he studied in Italy, and became proof-reader for a Lyons printer, Sebastian Gryphius, who in 1536-38 issued Dolet's *Commentariolum Linguae Latinae*. In 1538 Dolet opened a press of his own at Lyons, but his views provoked ecclesiastical persecution and his business success commercial rivalry. He was burnt as a heretic in Paris, Aug. 3, 1546. A bronze statue to his memory by Guilbert was erected in 1889.

Étienne Dolet. Guilbert's statue of the French printer-martyr, in the Place Maubert, Paris

**Dolgelley.** Market town, co. town, and urban district of Merionethshire, Wales. It stands under Cader Idris, and is served by rly., being 9 m. E. of Barmouth. For the sake of its scenery it is visited by tourists. There are a grammar school, a market hall, and an assize hall. A weekly paper in Welsh is published. The town has a little fellmongering and wool trade. Market days, Fri. and Sat. Pop. 2,740.

**Dolichocephalic** (Gr. *dolichos*, long; *kephalē*, head). Term usually used of human heads and skulls whose breadth is less than three-fourths of their length. The long, narrow-headed form is found among the Nordic and Mediterranean types of the Caucasian race (Swedes, Berbers), as well as Hamites and Semites. With these the narrowness pertains to the frontal region. It is occipital in most others, including Dravidians, Papuans, Polynesians, Australian aborigines, Eskimos, and a primitive South American type (*Botocudos*). It prevails also in Negro, Bantu, and Bushman-Africa. See Cephalic Index.

**Dolichos.** Group of edible pulses produced by different species of the family Leguminosae. They are natives of the tropical and temperate regions of Asia, Africa, and S. America. The principal of

these is *Dolichos lablab*, a native of India, a climbing herb with trefoil leaves and violet flowers, followed by flat rough pods containing a few seeds. When young they are eaten like kidney-beans, or the mature seeds are cooked like haricots.

**Dolin, Anton** (b. 1904). Professional name of Patrick Healey-Kay, British dancer. Born at Slinfold, Sussex, July 27, 1904, he studied dancing with Astafieva, Nijinska, Legat, and Cecchetti, and appeared on the stage at the Princes Theatre, London, in 1916 in a children's play. In 1923 he danced as Daphnis in Daphnis and Chloe with the Russian ballet at Monte Carlo. Having toured in Spain, France, and Germany, he returned to London in revue. He was associated with the Camargo Society and the Vic-Wells company, and in 1935-37 toured with Alicia Markova (*q.v.*)—a dancing partnership which continued intermittently for many years. In

1939 with the Russian ballet, he appeared in *Le Fils Prodigue*. Dolin's *Divertissement* was published in 1931, and his autobiography, which was entitled *Ballet Go-Round*, in 1938.

Anton Dolin, British dancer

**Dolina.** Italian name for the funnel-shaped cavities giving communication with the underground systems of drainage commonly found in limestone regions. The name is used in the Karst region N. and E. of the Adriatic Sea. In the British Isles similar cavities are called swallow holes and sinks. See Karst; Pot Holes.

**Doll.** Toy representing a human figure. As a plaything the doll is of remote antiquity and universal distribution, though apparently least

Doll. Ancient and modern examples of these toys. In the top row are an Egyptian doll (on left) and ancient Greek specimens in clay, terra-cotta, and rag. Those in the centre row are (left to right) English 18th century, and Dutch and English 19th century. Those in the bottom row are (left to right) Russian, British, and Japanese products of the 20th century

general in Asia. Dolls were common in Asia Minor; among the Arabs, in Egypt, where they are known to have existed in the 18th-17th century B.C., in Greece, and in Rome, where specimens have been found in the catacombs. They are common among all African tribes, Australian aborigines, Red Indians, and the Eskimos, and while in some instances a certain magical significance is attached to them, generally they supply a natural want in the development of the human imagination.

The doll exists for the mature man as well as for the child. Lubbock, in his *Origin of Civilisation*, comments on the savage's fondness for such toys as dolls and Noah's arks, and even in so highly developed a civilization as that of Peru under the Aztecs dolls are said to have been the constant playthings of Montezuma and his court. It is usual to explain the pleasure derived by girls from dolls as a gratification of the maternal instinct. So many boys, however, pass through a stage of doll-love that this theory is not entirely satisfactory; moreover, girls almost without exception prefer girl-dolls to boy-dolls, while their affection for baby brothers and sisters is equal. Boys usually prefer boy-dolls.

This points to the human desire for companionship as the explanation of the child's love for its doll, combined with its early identification of self with its belongings. The child regards the doll, not as its child, but as its other self, and manifests its own self love towards it in many illuminating ways. Imagination imparts the warmth of life and love to the inanimate toy, and upon it the child lavishes its whole confidence and trust, deriving from it in return a satisfaction of love never impaired by a failure of sympathy and understanding, of which even a mother must sometimes be guilty simply because she is grown up. In this perfect companionship, not a whit less real because it is an illusion, and perhaps also in the gratification of some decorative instinct by the fashioning and putting on of garments which the child itself admires, the explanation of the doll's fascination is more probably to be found than in the more generally accepted theory of the gratification of the maternal instinct.

Dolls are, and have been, made from all sorts of materials variously stuffed, e.g. rags, leather,

china, and pot, wax, wood, and unbreakable compositions. The limbs are often dexterously jointed to assume any position; and other approaches to realism have included the use of real hair and eyelashes, movable eyes, and contrivances to simulate breathing or even speech.

**Dollar.** Name of a silver coin once widely current in Europe, now the unit of the monetary systems of the U.S.A., Canada, Mexico, and several S. American states; in these last it is now represented by the peso with a value of from 1s. to 2s. 6d. It descends from the thaler (*q.v.*), a standard coin in the 16th century. As the piece of eight the Spaniards introduced it into America, whence it, or its equivalent, spread to India, the Straits Settlements, China, Zanzibar, and Abyssinia, where Maria Theresa dollars are still highly valued. In 1797, owing to the scarcity of English coins, the British government reissued Spanish dollars, with plate-marks or the letters G.R. in a shield.

Today the standard dollar is the American coin adopted by the U.S.A. in 1792, and the unit of currency until 1873, when a gold standard was adopted. The silver dollar weighs 4.125 grains, .900 fine. The U.S. gold dollar weighed 25.8 grains (or 1.6718 grammes), .900 fine. The currency of Canada, including Nova Scotia, New Brunswick, British Columbia, and Newfoundland, is based on the U.S. dollar and similarly divided into 100 cents. The dollars now in use in the U.S.A. are paper currency, called "greenbacks." See *Eagle*.

**Dollar Area.** Term loosely used for those countries whose currencies are closely linked with that of the U.S.A., e.g. Canada and the S. American republics. See *Sterling Area*.

**Dollar Princess, THE.** Comic opera adapted from the German of A. M. Willner and F. Grünbaum by Captain Basil Hood, composed by Leo Fall, and produced at Daly's Theatre, London, Sept. 25, 1909, where it had a run of 430 consecutive performances.

**Dollart, THE.** Arm of the sea, really a widening of the estuary of the Ems. It is 10 m. long and about 7 m. broad. The port of Emden lies a few miles from the E. shore. The Dutch asked for its cession to the Netherlands after the Second Great War, with the object of draining it except for a channel, to be kept navigable jointly by the Dutch and the Germans. See *Ems*.

**Dollfuss, ENGELBERT** (1892-1934). Austrian statesman. Of peasant stock, he was born at

E. Dollfuss,  
Austrian statesman

Texing, Lower Austria, Oct. 4, 1892, and was educated at Vienna university, where he studied law, and at Berlin. Having served with distinction in the First Great War, he entered politics and eventually led the Christian Social party—equal in numbers with the Socialist, but with considerably greater power. Minister of agriculture, 1930, after the collapse of the Credit-Anstalt and the disorganization of Austrian finances, he was appointed chancellor in May, 1932. He staved off collapse and set himself the task of attempting to restore prosperity. Nicknamed the "pocket chancellor," because he stood less than 5 ft., he was assiduous in attending economic conferences abroad, but in competition with Nazi activities embarked upon a campaign of repression against Socialism from which his reputation did not emerge unscathed. His main ally against the Nazis was the Heimwehr, a semi-fascist para-military organization led by Fey and Starhemberg; the price of its assistance was the crushing of the powerful Social Democrat party. This led to an attempt upon Dollfuss's life, Oct. 2, 1933, and culminated in the outbreak of Feb., 1934, in Vienna, Graz, and Linz. The Vienna revolt was suppressed only after severe bloodshed and several days of bitter fighting. Dollfuss, with the help of the Heimwehr, continued to resist Nazi encroachment, but was assassinated, July 25, 1934, by a Nazi band led by Otto Planetta during a frustrated "putsch" meant to bring Austria under Hitler's rule.

**Dolling, ROBERT WILLIAM RADCLYFFE** (1851-1902). A British clergyman and social worker. Born Feb. 10, 1851, at Magheralin, co. Down, he came into prominence as a social worker in Dublin. He was warden of the S. Martin's League of postmen, in London, 1879-82. After taking orders he had charge of S. Martin's Mission, Stepney, 1883-85. His chief work was carried out as vicar of S. Agatha's, Landport, 1885-96, in connexion with the Winchester College Mission. In ten years he raised £50,000 for this work,

before he resigned on the question of ritual. Father Dollinger's large-hearted evangelism endeared him to the poor. During 1898-1901 he was vicar of S. Saviour's, Poplar, where his chief work was on behalf of the children. His health broken by overwork, he died May 15, 1902, and was buried at Woking. A Dollinger Memorial Home for working girls of Landport and Poplar was opened at Worthing, 1903. *Consult* his *Ten Years in a Portsmouth Slum*, 1896.

**Döllinger, JOHANN JOSEPH** IGNAZ VON (1799-1890). German theologian. Born at Bamberg, Bavaria, Feb. 28, 1799, and educated at Würzburg, he became a Roman Catholic priest. In 1826 he was appointed to the chair of ecclesiastical history at Munich, where he vigorously attacked Protestantism. In 1861 he began to lecture against the temporal sovereignty of the pope; and when the Vatican council in 1870 proclaimed papal infallibility, Döllinger refused to accept the decree. For this he was deposed from the priesthood and excommunicated. He was sympathetic towards the Old Catholic movement, and presided over the conference of Bonn in 1874. In his closing years he laboured much to promote unity among the various churches. Of his historical and controversial books the most famous was *The Pope and the Council*, 1869, issued under the pseudonym of Janus. Döllinger died at Munich, Jan. 10, 1890. His *Life* was written by J. Friedrich, 1899-1901.

**Dollmann, FRIEDRICH** (1882-1944). German soldier. As an artillery expert he served with the "Big Bertha" battery during the First Great War. He held a succession of staff appointments and was promoted general of artillery in 1936. Dollmann commanded the German 7th army that broke through the Maginot Line in 1940, and after the fall of France organized the defences and long-range batteries on the Channel coast. He was killed on June 27, 1944, while commanding an army in Normandy.

John Dolland,  
English optician  
From a portrait in  
the Royal Observatory,  
Greenwich

**Dolland, JOHN** (1706-81). English optician. Born June 10, 1706, of Huguenot parents, in Spitalfields, London, he was brought up to his father's trade

of silk weaving, but studied many subjects, including Latin, Greek, optics, and astronomy. In 1752 he joined his eldest son Peter (1730-1820), who had set up as an optician, and began to apply his theoretical knowledge to practical work. His great achievement was the invention of the achromatic telescope, which gained him the Copley medal of the Royal Society in 1758. He died Nov. 30, 1761.

**Doll's House, A.** Prose drama by Henrik Ibsen, produced at Christiania (Oslo) in 1879. The English adaptation by William Archer was produced at the Novello Theatre, London, in 1889. The play led to considerable discussion on the problems of a married woman's life with which it deals, and to a wide recognition of its author's position as one of the chief dramatists of the age.

**Doll's House, QUEEN MARY'S.** A miniature house, perfect in every detail, at a scale of one in. to the foot, designed for Queen Mary in 1924 by Sir Edwin Lutyens, and furnished and decorated by leading commercial firms and notable artists. It was exhibited at the British Empire Exhibition at Wembley in 1924, and later was on view in many places in aid of charities in which Queen Mary was interested. It was then permanently installed at Windsor Castle. *See* *illus.* in next page.

**Dolman** (Turk, *dolaman*, long robe). Short jacket slung from the shoulders, with the sleeves hanging loose, worn formerly by the Hussars. The custom is said to have arisen from an incident of battle when a regiment had only time to put one arm into the sleeve of their coats. Women adopted a similar garment towards the end of the 19th century, and called it by the same name. *See* *Costume*.

**Dolmen.** Megalithic chamber comprising an unhewn capstone upon two or more uprights. In Great Britain, it is frequently called a cromlech, and incorrectly a Druid altar. Though originally covered with earth or stone, many became exposed in early recorded times. Infrequent in England (Lanyon Quoit, Cornwall; Chagford, Dartmoor), they are commoner in Wales (Arthur's Quoit, Swansea; Pentre Ifan, Pembroke; Plas Newydd, Anglesey) and rare in Scotland. In Ireland more than 800 are enumerated (Kernanstown, co. Carlow, with a 100-ton capstone; Legananny, co. Down).

Out of the simple dolmen developed the corridor-tomb or passage-grave, of which there are

examples in Kit's Coty House, Kent; Wayland Smith's cave, Berks; and King Orry's grave, Isle of Man. There are still 4,458 dolmenic tombs in France; many in Holland, Scandinavia, Portugal, Spain, and the whole Mediterranean basin. Many thousands remain in N. Africa, with outlying survivals on the upper Nile (Madi) and W. Africa (Gambia). Eastward they extend over Ammon and Moab to India, the Malay Archipelago, Korea, and Japan. The word dolmen, of Celtic origin, is explained as meaning either stone table (*dol*, *tol*, table; *men*, stone), or a stone with a hole (*doll*, *toll*) underneath. *See* *Cromlech*; *Stone Monuments*; also *Carnac illus.*

**Dolmetsch, EUGENE ARNOLD** (1858-1940). French musician and instrument maker. The son of a Swiss piano-forte maker, he was born at Le Mans, Feb. 24, 1858. He learnt wood working and piano-forte making in his father's workshop, and studied at the Brussels conservatoire under Vieuxtemps, and at the Royal College of Music in London. Music master at Dulwich College, his original methods of group instruction brought him into public notice. In 1889 he began researches into early keyboard music, collecting and restoring virginals, viols, clavichords, etc., and giving his first recital of pre-Corelli string music in 1891. After some years in the U.S.A., he returned to England in 1914, the year in which he published *The Interpretation of the Music of the 17th and 18th Centuries*. Moving to Haslemere, Surrey, with his family (all skilled performers), he started annual festivals there in 1925. In 1928 the Dolmetsch foundation was inaugurated for the training of scholars and craftsmen to meet the demand for Dolmetsch instruments. The founder, who was granted a civil list pension in 1937, died Feb. 28, 1940.

Arnold Dolmetsch,  
French musician

**Dolomite.** Mineral composed of calcium magnesium carbonate ( $\text{CaMg}(\text{CO}_3)_2$ ), but generally having part of the magnesium replaced by iron and manganese. The ration of calcium to magnesium is not strictly constant. Crystals are often rhombohedral with curved faces. The colour is generally white to reddish. Dolomite differs

Doll's House, made for Queen Mary in 1924, and kept at Windsor Castle. The pictures show the exterior and the exquisite miniature interior fittings and decoration, all to scale at one inch to the foot, in dining-room, library, and queen's wardrobe. See previous page

from calcite in that it does not effervesce readily in cold acid.

The massive form of dolomite is of much greater importance than the crystalline mineral. Massive dolomite and dolomitic limestones constitute extensive strata; the Dolomite Alps of the Tyrol cover

hundreds of sq. m., and Permian magnesian limestones are common in England. Some dolomites have been formed by direct deposition from sea water; many from the interaction of magnesium salts; others from various processes which have transformed original

rocks (generally limestones) into dolomite.

Dolomite is used extensively for refractory purposes in the basic processes of steel production. It may be used for extracting magnesium metal and making basic magnesium carbonate, and with asbestos for heat-insulating. A special kind with magnesia makes Vienna lime, a compound for buffing metals. Other applications are as a flux in metallurgical processes and a building stone. Most countries have supplies.

**Dolomites.** Division of the Alps, Italy, in Venezia and Venezia Tridentina. They extend N.E. from Trent to Monte Cristallo, and culminate in Mt. Marmolada, 10,979 ft. Of limestone formation, they are distinguished by their jagged peaks, steep precipices secluded valleys, and magnificent scenery. The mineral dolomite (*v.s.*) is named from them.

During the First Great War the Dolomites, with part of the Julian Alps, formed virtually a single front on the Italian sector. In the general advance of May, 1915, the Italians failed to reach their objective, the Pusterthal rly. On Nov. 7 they reached Col di Lana, but were obliged to abandon it sixteen days later. In Oct. the Italians had crossed the Austrian frontier at Pontebba but could not cut the Tarvis rly. line. In Sept., Monte Rombon was taken and the Austrians evacuated the Plezzo valley, but the Italians were never able to reach the Austrian rly.

**Dolores.** Town of Argentina, in the prov. of Buenos Aires. It is about 130 m. by rly. S.S.E. of the capital. In its public gardens there is a fine monument to Liberty, identical with that in the Plaza de Mayo in Buenos Aires. Founded 1818, the town has law courts and a national college. There is trade in fruit and grain. Pop. 25,000.

**Dolphin** (Gr. *delphis*; Lat. *delphinus*). Name applied generally to a group of the smaller cetaceans, including the porpoise, narwhal, white whale, and the killer; but more properly to the genus *Delphinus*. This genus includes those species which have distinctly developed beaks, formed by a prolongation of the skull, and armed with some 40 to 60 teeth. The head has a bulbous appearance, due to the presence of a mass of blubber in front of the forehead. The eye is fairly large and conspicuous, but the external ear is a mere pinhole. The skin is black on the back, striped with greyish yellow on the

flanks, and white beneath. In length the dolphin varies from 8 ft. to 10 ft. Like all cetaceans, it is not a fish but a mammal, and produces one at a birth.

The common dolphin (*Delphinus delphis*) abounds in the English Channel, and does damage to the herring and mackerel fisheries. It is always found in herds, and is in the habit of following ships. The white-beaked dolphin is a rather rare visitor to British shores. The bottle-nosed dolphin, also rare, has occasionally been found in the Thames and around the coast. The white-sided dolphin has been taken a few times off the Orkneys.

**Dolu.** Town of Central Africa, in Bornu, Cameroons. It is situated 100 m. S. of Lake Chad and 130 m. S.E. of Kuka. Pop. 35,000.

**Dom.** Tribal name of several menial peoples in India. They numbered perhaps a million, besides those classed as Dommara, Bansphor, Basor, and Mirasi. The Bihar and Orissa Magaiyas are vagrants, the central Indian Bansphors bamboo-workers, the Himalayan Doms scavengers, the Punjab Mirasis minstrels. Mostly of aboriginal descent, their animism is partly Hinduised.

**Dom.** Mt. of Switzerland, in the canton Valais. In the Lepontine Alps, it is the culminating point of the Mischabelhörner, between the valleys of Zermatt and Saas. Alt. 14,935 ft. The first to ascend it was the Rev. J. L. Davies in 1858.

**Domagk, GERHARD.** German pathologist. He discovered, and described in 1935, the drug prontosil, for use against streptococcal infections, puerperal fever, etc. Appointed professor of pathology and anatomy at Münster in 1937, he developed his discovery in parallel with French developments in the sulphanilamide field and with British ones producing M. & B. 693, in the Elberfeld Bayer laboratories of I.G. Farbenindustrie. Awarded the Nobel prize for medicine in 1939, he was prevented by Nazi legislation from accepting it.

**Dombaas.** Railway junction in Oppland co., S. Norway, where the Oslo-Trondhjem and Oslo-Aandsnes rlys. meet 90 m. S. of Trondhjem and 160 m. N. of Oslo. At the entrance to the Gudbrandsdal valley, it was the scene of fierce fighting in April, 1940, when 200 German troops landed by parachute and attempted to destroy the junction. Later Norwegian forces counter-attacked to regain the town and were joined by British troops. In face of strong enemy attacks the

Allies on May 1, 1940, evacuated the whole area. See Norway.

**Dombey and Son.** Charles Dickens's sixth novel. Originally issued in monthly parts (Oct., 1846–April, 1848), with illustrations by Phiz, the full title being *Dealings with the Firm of Dombey and Son, Wholesale, Retail, and for Exportation*, the story was intended to illustrate the evil consequences of pride as its predecessor, *Martin Chuzzlewit*, had illustrated those of selfishness. Mr. Dombey, the central character, is a prosperous city merchant, obsessed to the exclusion of other emotions by pride in his young son Paul as his potential successor as head of the firm. The story of the boy's early death and the dispelling of the father's dream is one of Dickens's most moving episodes, but the subsequent plot concerning Dombey's second marriage and eventual downfall is generally considered somewhat melodramatic. The neglected daughter Florence is an appealing character, but most readers return to the book for the rich humour of Captain Cuttle, Major Bagstock, Mr. Toots, Susan Nipper, Jack Bunsby, Dr. Blimber, and many other comic characters.

**Dombrowski, JAN HENRIK** (1755–1818). Polish soldier. Born in Aug., 1755, he served in the army of the elector of Saxony, and there won his reputation. In 1791 he returned to Poland, and was one of the leaders of the Poles in their resistance to the Russians and Prussians during the final partitions. He was next in Italy, where he led a corps of Poles in the interest of France. He held commands under Napoleon 1806–13, being in the invasion of Russia and at Leipzig. At the peace of 1815 he was given a high position in the army of Poland, then under Russian rule. Died June 26, 1818.

**Dome.** Term denoting the form presented by stratified rocks when folded by pressure so as to dip in all directions from a central point. Its antithesis is called a basin. A dome is therefore the shortest possible anticlinal, which normally comprises a ridge between two half-domes. The Westmorland lake district is an immense denuded dome. Analogous structures in igneous rocks are called volcanic domes. In crystallography the term denotes the gable-like termination of some forms of lateral prisms. See Rock.

**Dome** (Lat. *domus*, a house; cf. Ger. *Dom*, and Ital. *duomo*, a cathedral church). Name given to a spherical roof over a circular or polygonal building. The sphere,

like that of the cupola (*g.v.*), may be one of several varieties, but semicircular, semi-elliptical, and bell-shaped domes are the most common. The dome was a development of the arch principle of construction, and as such was largely employed by the Romans. One of the most famous domes in the world is that of the Pantheon at Rome, completed in the reign of the Emperor Hadrian (c. A.D. 123). It is built of solid concrete, is lighted by a small, circular opening or eye at its summit, and measures 142½ ft. in diameter. Roman domes were applied exclusively to circular buildings.

It remained for the Byzantine builders to place a circular dome upon a square or rectangular structure. This they accomplished by means of pendentives, or fan-shaped corbels, which were introduced at the angles of the square, so as to form a circular base for a round dome. The Byzantines also invented the "drum," or cylindrical dwarf tower, round which they grouped the windows that lighted the dome, and thus obviated the necessity of breaking the curve of the dome itself by openings. Most of the domed Christian churches of the Middle Ages are constructed on the Byzantine plan, with the great central dome crowning the middle portion of a Greek or Latin cross. The dome of the mosque of S. Sophia, Istanbul, measuring 107 ft. in diameter; the great dome of the Tomb of Theodoric, at Ravenna, which is hollowed out of a single block of stone; and that of the octagonal church of S. Vitale, at Ravenna, were all built in the 6th century.

Famous domes of the later Middle Ages are those of S. Mark's, Venice, and S. Sophia at Salonica, while the domes of S. Peter's, Rome, and of S. Paul's, London, the latter based upon the former, may be classed together as products of the late Renaissance. Wren's famous creation is only 100 ft. in diameter, as against 139 ft. of its exemplar. It is a first principle of domical construction that the dome should stand by itself, the materials keeping their place by their own gravity. In practice, however, it is frequently ribbed with iron or timber. Modern domes are often constructed iron, notable examples of such structures being the domes of the British Museum, and the Capitol at Washington. The dome of the Invalides in Paris (318 ft.) is built of timber and lead. See Architecture: Cathedral.

**Domenichino** (1581–1641). Italian painter, whose real name was Domenico Zampieri. He was born at Bologna on Oct. 21, 1581, and studied with Calvaert and the Carracci. Removing to Rome, he assisted Annibale Carracci in the decoration of the Farnese palace. His increasing reputation aroused such malignant hostility among his brother painters that he went back to Bologna, but at the summons of the pope he returned to Rome in 1621, when he painted the Martyrdom of S. Sebastian for S. Peter's. In 1630 he settled in Naples, where he executed the decoration with frescoes of the Cappella del Tesoro. Here the animosity of the local painters was so bitter that when Domenichino died suddenly at Naples, April 15, 1641, it was said that he had been poisoned.

Domenichino's reputation rests chiefly on his frescoes. His masterpiece in this medium is the series of paintings in the Chapel of S. Cecilia in S. Luigi de Francesi, Rome, representing scenes from the life of the saint. His greatest oil-painting is *The Last Communion of S. Jerome*. See *Cecilia* illus.

**Domesday Book.** Survey of the land of England, drawn up in 1086 by order of William the Conqueror. The information was obtained by sending officials into each county. From each village or manor came the priest and four villagers, and after interrogating them the officials noted down the facts. These were entered on rolls, and from these the book itself is compiled. From it the four northern counties are excluded, as are London, Winchester, and other towns, but for a different reason.

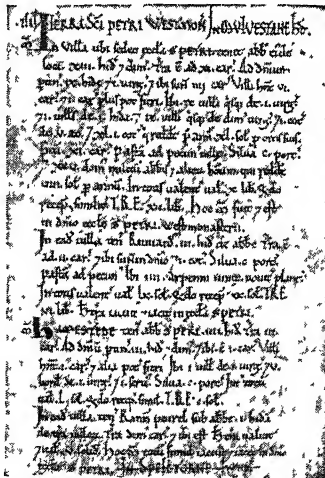

The book was intended by William to be a record of his rights, i.e. of the income to which he was entitled, and the information collected was all directed to this end. He wanted to know how much each place could and should pay, either by way of gold or land tax, or by way of rents and other dues. In each county the first entries are those of the king's own lands, then come those of the lands held by the religious houses, abbeyes, bishops, etc., then those of lay tenants-in-chief, and finally those of others. Most of the entries state what the land was worth in the time of King Edward (Edward the Confessor) in 1066, what it was worth when its present owner received it, and what it was worth when the book was compiled. In each was given the amount of arable land, the number of villeins, cottars, and other workers, the number of ploughlands and oxen, and particulars about churches, mills, fisheries, etc.

There is also a good deal of miscellaneous information, throwing light on various local customs.

The following is the entry in Domesday about Westminster, then a rural area:

In the villa, where is situated the church of S. Peter, the abbot of the same place holds 13½ hides. There is land for 11 plough teams. To the demesne belong nine hides and one virgate, and there are four plough teams. The villeins have six plough teams, and one more might be made. There are nine villeins with a virgate each, one villein with a hide, 9 villeins with a half virgate each, one cottar with five acres, and 41 cottars rendering a shilling each yearly for their gardens. There are 25 houses of the abbot's soldiers and of other men, who render is a year or £10 in all; when he received them the same; in the time of King Edward £12.

The book is of supreme value for the economic conditions and social history of the time, and much study has been spent on it. A number of theories have been based upon Domesday and many estimates made from it. In it the number of villeins enumerated is 108,000, of borderers 12,000, of cottars 23,000, and of free men 12,000. One calculation is that about 5,000,000 acres were then under the plough. The original book is in the Public Record Office, London. It was kept first at Winchester, being afterwards for a long time at Westminster. It was printed and published in 1783, and photographic facsimiles have appeared for each county.

Domesday Book Facsimile of entry, translated above, relating to Westminster

From the original in the Public Record Office

During the Second Great War, Domesday Book was stored for safety in the prison at Shepton Mallet Som. See *Danegeld*. Feudalism. Manor *consulti* also Domesday Book and Beyond F. W. Maitland, repr 1907

**Domestication.** Process of accustoming animals and plants to live and propagate under human control. It involves control of mating; provision of food; protection from adverse environment, climatic and animate; and training to specialised services. It has endowed mankind with constant food, clothing, means of transport, and companionship. It was practised before written history began but was apparently unknown to palaeolithic man.

**ANIMALS.** When breeding in captivity is lacking, as with the elephant, the human control is preferably called taming. The dog may have domesticated itself in early neolithic time under dingo or pariah dog conditions, as shown by Danish kitchen-middens; breeding for herding and hunting came later in central Asia and Egypt. The origin of domestic cattle, sheep, and goats is more obscure. Segregation for ritual purposes, with sacrificial milking, offers the likeliest explanation. The horse, a palaeolithic food-animal, may, like the ass, have been tamed on Eurasian grasslands for milking prior to its use for transport and riding, just as the camel was under desert nomadism. The pig may have reached neolithic lake-dwellings in Europe from Transcaspiian oases.

Under the early metal cultures control was extended to such useful animals as the cat, cheetah, silkworm, domestic fowl, and bee. The domestication in America, in late pre-Columbian times, of the llama, alpaca, turkey, and even the cochineal insect, is best explained as a secondary effect of the migration of ideas across the Pacific. The variability of species under domestication, exhaustively studied by C. Darwin, brought about unforeseen structural modifications which have culminated in the triumphs of modern systematic breeding. See *Animal*; *Evolution*.

**PLANTS.** The unforeseen germination of refuse seeds and rootlets round the primeval homestead may have suggested the first rudimentary tillage. Deliberate seed-sowing upon grave-mounds belongs to a later psychology. The domestication of edible grasses and pulses, bringing in its train the hoe, sickle, plough, wagon, irrigation, quern, bread, beer, and village life, was a neolithic invention, not yet definitely localised. Transcaspiian oases and Swiss lake-dwellings have yielded three varieties of barley, two of millet, and three of wheat; in W. Asia vine and olive were under early cultivation. Neolithic flax, the first woven fibre, preceded cotton cultivation in

Asia by several millennia. The invention of metallurgy, by facilitating timber-cutting, fostered the development of meadow, field, and orchard, and made the Mediterranean basin and the Nile and Euphrates valleys a home of ever-advancing agriculture. These ideas penetrated to Bantu Africa and S.E. Asia. Crossing the Pacific, they were the originating impulse of the ancient civilizations based upon settled tillage in America, whose staple pre-Columbian cereal was maize. *See Botany.*

**Bibliography.** Variation of Animals and Plants under Domestication, C. R. Darwin, 2nd ed. 1875; Origin of Cultivated Plants, A. L. L. P. de Candolle, 1884.

**Domestic Science.** Term of American origin commonly used for the study of domestic economy, *i.e.* the various processes which go to the good ordering of a home or other place of residence. There are schools and training colleges for students and intending teachers of domestic subjects in London and other centres of the U.K. Bristol university gives a degree course in domestic science (B.Sc.). Domestic science subjects (*e.g.* cookery, laundry, needlework) are in the curriculum of most girls' schools.

**Domestic Servant.** Paid male or female worker employed in household duties. Domestic service for both men and women is one of the oldest occupations. In the ancient societies of Egypt, Greece, and Rome, the paid domestic servant existed side by side with the household slave.

With the abolition of slavery in Europe, the number of domestic servants increased and, mostly drawn from peasantries accustomed to existing on small wages, were the lowest paid class of the community. In time the servant communities employed in the average households of the well-to-do developed social strata of their own, ranging from the butler, housekeeper, and cook, to the bootboys and kitchenmaids.

Following the industrial revolution and the rapid expansion of population, the number of women domestic workers in Britain greatly increased. There was a large surplus of women who, through lack of opportunity in industry, were ready to take domestic employment. Concurrently a new urban middle class built the large town houses which only cheap servant labour could run.

At the beginning of the 19th century, domestic service in Great Britain was numerically the most

important paid occupation for women, providing a living for more than half of the total of women gainfully employed. By 1880 there were in Great Britain 130 female domestic servants for every 1,000 of the population.

In the 20th century wider opportunities of livelihood presented themselves for women in industry and in all industrialised communities women became speedily more reluctant to enter domestic service. Between 1911 and 1921 the number of women in domestic service in the U.K., for instance, declined by 20 per cent. The Second Great War, with conscription and direction of women, further aggravated the position, but in Feb., 1946, the ministry of Labour announced the formation of an experimental national institute of houseworkers.

In English law domestic servants are entitled to a month's notice or a month's wages in lieu thereof. They must give the same notice or pay the same amount. The value of their board and lodging is not taken into account in England. They are insurable for industrial injuries and under the National Insurance Act. They are, like other servants, liable for negligence, though not for any little act of carelessness. A mistress has no right to search a servant's box without a magistrate's warrant, but a domestic servant can be summarily dismissed for disrespect, disobedience, or bad conduct, such as drunkenness or immorality. *Consult The English Abigail.* D. Stuart, 1946.

**Domett, ALFRED** (1811-87). British colonial statesman and poet. Born at Camberwell Grove, London, May 20, 1811, and educated at St. John's College, Cambridge, he was called to the bar at the Middle Temple, 1841. In 1842 he went to New Zealand and his absence moved his friend, Robert Browning, to the writing of the poem *Waring*. In N.Z. Domett entered public life, being secretary in 1851 and in 1862 prime minister. He returned to London in 1871. He published his first volume of verse in 1833, and the poem, *Venice*, in 1839, contributing meanwhile to *Blackwood's Magazine*. After his retirement he wrote further poems, *Ranolf* and *Amohia*, 1872; and *Flotsam* and *Jetsam*, 1877. In 1880 he was made C.M.G. He died Nov. 2, 1887.

**Domett, SIR WILLIAM** (1754-1828). British sailor. Entering the navy at the age of 15, he was promoted to lieutenant in 1777. He was present at the action off

Ushant (1778), Chesapeake (1781), St. Kitts (1782), and Dominica (1782), after which he returned with dispatches to

Sir William Domett, British sailor

England. He was at the relief of Gibraltar and the battle of Cape Spartel. In 1793 war broke out with France and Domett was, as he had been in 1783, flag-captain to Sir Alexander Hood in the Royal George, seeing action in the battles of June 1, 1794, and Lorient (1795). He helped to settle the mutiny at Spithead (1797). In 1801 he served in the Baltic, in 1804 was promoted rear-admiral, and in 1813 became commander-in-chief at Plymouth. Knighted in 1815, and made admiral in 1819, he died May 19, 1828.

**Domfront.** Town of France. It stands on the Varenne in the dept. of Orne, 43 m. N.W. of Alençon. Famous historically, it had in the Middle Ages a strong castle, built in the 11th century for the protection of Normandy. Some ruins of this remain. The town, which has an 11th century church, takes its name from S. Front, a hermit who settled here in the 6th century.

**Domicile** (Lat. *domus*, a house). Place of legal (usually also habitual) residence. Domicile is decided by international law. A man's first domicile is that of his origin, which depends on his father. When he attains majority he can make a domicile of choice, and is held to be domiciled where he resides, if he intends to remain there, making it his house.

On giving up a domicile of choice a man reverts to his domicile of origin until he has acquired another domicile of choice. A married woman's domicile is that of her husband. Usually only the court of the husband's domicile can grant a divorce. A woman ranking as a British subject whose husband goes abroad and deserts her can nevertheless obtain a divorce in Great Britain, and special provision was made in the Second Great War to enable British wives of foreigners to obtain divorces in Great Britain.

**Dominance.** In genetics, the development of one character in an individual whose genetic constitution also contains the latent capacity for producing a character of contrasting kind. Which of the two characters shall appear can be determined only by breeding

experiment. When a pure bred tall pea plant is crossed with a pure bred dwarf pea plant, the offspring are all tall plants. Dominance is here the development of the tall character, despite the fact that one of the parents was dwarf and should presumably pass that character on. That dwarfness is passed on and is merely latent in the offspring may be shown by fertilising the seeds of one of them with its own pollen. Some of the plants which grow up from those seeds will be dwarf, so the tall offspring must have transmitted the dwarf character of one parent although they resembled the other in being tall.

**Dominant** (Lat. *dominare*, to rule). In music, the fifth degree of the major or minor scale; e.g. in key C the dominant is G. The chord of the dominant seventh fixes the key; for example, in the B (♯) shows it is not key F,

while in the F (♯) shows it is not key G. Under normal conditions, it must be key C, which alone possesses B and F in its unaltered scales. It is also a central or dominating note in the older modes (q.v.).

**Dominic, SAINT** (1170-1221). Founder of the Dominican Order of Friars Preachers. His name was Dominic de Guzman, and he came of an old Castilian family, being born in 1170 at Calahorra, Spain. He was ordained about 1195, and became an Augustinian canon at Osma in Castile. He was charged by Pope Innocent III with a mission to the Albigenses in the S. of France in order to bring them back to Catholicism. In this work he displayed remarkable zeal, and proved himself an eloquent and fervent preacher.

In order to continue this work he founded in 1216 an order of preaching friars, who at first adopted the Augustinian rule and later received papal sanction as the

Order of Friars Preachers, since generally known as Dominicans (q.v.). Later S. Dominic was appointed Master of the Sacred Palace at Rome; this office has been ever since reserved for members of his order. He died at Bologna, Aug. 6, 1221, worn out by his con-

stant work and a life of the utmost ascetism, and was canonised 1234. His festival is kept on Aug. 4.

**Dominica.** British West Indian island and colony, in the Windward Islands, lying between Gua-

Dominica. Map of the British West Indian island discovered by Columbus in 1493

deloupe and Martinique, French Leeward Islands. In length 29 m. by 16 m. broad, with an area of 281 sq. m., the island, of volcanic origin, is very mountainous, rising in the Diablotin to 4,747 ft. There are many thermal springs, a celebrated boiling lake, sulphur deposits, and forests. The arable parts (about one-quarter) are fertile, producing limes, coconuts, oranges, bananas, spices, and cocoa.

The island's capital, Roseau (pop. 9,600) is the seat of an elective council. There is a native settlement with mixed negroes and 100 pure Caribs. The name commemorates the discovery by Columbus on Sunday (Lat. *dies Dominica*), Nov. 3, 1493. Pop. est. 54,505.

#### Dominical Letter.

Called Sunday Letter, and used in the construction of the calendar to mark the Sundays throughout the year. It must be one of the first seven letters of the alphabet.

Beginning with A for Jan. 1, the first 7 days of the year receive each the following letter up to G. If Jan. 1 falls on a Saturday the Sunday or Dominical letter for the year will be B. If Jan. 1 is a Monday, the Sunday letter will be G. See Calendar.

**Dominican Republic** or SANTO DOMINGO. Republic of the West Indies. It occupies two-thirds, the eastern part, of the island of Hispaniola, covers an area of 19,332 sq. m., and had a pop. in 1943 of 1,882,932. The final boundary settlement with Haiti was made in 1936. The capital is Ciudad Trujillo (114,308) on the S. coast. The leading commercial crops are sugar cane, cocoa, tobacco, maize, and molasses. Large forest areas yield cedar, mahogany, satinwood, and dye woods. Mineral resources have yet to be fully exploited, but gold, silver, platinum, copper, iron, rock salt, and petroleum occur. Railways run some 800 m., principally between Sanchez and Puerto Plata, the chief port; there are over 2,300 m. of motor roads.

The republic is governed under the constitution of 1942 by a president elected for 5 years and a two-chamber congress (senate, 19 members; chamber of deputies, 38 members), the executive being vested in the president, assisted by a cabinet of eight. The prevailing religion is Roman Catholic. Education is free and obligatory. A university was founded in 1538. The inhabitants are of mixed Spanish, African, and Indian races, but speak Spanish and are essentially Spanish in their mode of living, in contrast to their neighbours in Haiti. Racial problems induce many Haitians, in spite of severe penalties, to enter the Dominican republic, with consequent civil disturbances.

The negro republic of Haiti, set up in 1804, dominated the whole island until 1844, when the Dominican republic gained status as an independent country. While the U.S.A. was engaged in civil war, 1861-65, Spain resumed control over this lost colony. In 1916 the country was occupied by U.S. marines, who left in 1934. During the American occupation, order and security were established, new roads and rlys. were constructed, commercial production grew rapidly, population increased markedly. Early in the 20th century the U.S.A. undertook to collect the customs, giving 45 p.c. of the revenue to the government and retaining 55 p.c. for repayment of debts; the 45 p.c. thus brought into the local treasury was greater than the whole revenue of any preceding year.

The Dominican republic had the first stone-built church, San Nicolas, in all the Americas. The cathedral at Ciudad Trujillo contained originally in an ornate tomb

S. Dominic as portrayed by Fra Angelico in his picture of the Crucifixion in S. Mark's Church, Florence

the remains of Christopher Columbus. A shrine to the memory of the discoverer, to cost upwards of £1,000,000 contributed by all the American nations, is sited here. Ciudad Trujillo was largely destroyed by a hurricane, Sept. 3, 1930; and the island was damaged by a tidal wave, Aug. 5, 1946. *Consult* The Americans in Santo Domingo, M. M. Knight, 1928. *See* Haiti, map.

**Dominicans.** Common name for the religious order of friar preachers instituted at Toulouse in 1216 by S. Dominic. In accordance with the decree of the second Lateran council (1215), which forbade the institution of any new order in the Church, the founder adopted the existing rule of S. Augustine and thus obtained the formal sanction of Pope Honorius III and a bull confirming the foundation of the new order, Dec. 22, 1216.

The name of Black Friars was given to the Dominicans on account of the black cloak which they wear over a white tunic. S. Dominic was himself an Augustinian canon and his followers wore the habit of canons regular; subsequently they adopted a white tunic with hood and the scapular. The aim of the order was to teach truth, and *veritas* (truth) is its motto. The Dominican family is divided into three branches. The first is composed of men preachers, who shall deliver to others the fruits of study. The second consists of women, enclosed nuns, consecrated to a life of prayer and contemplation. The third branch—commonly called tertiary—was divided again into (1) those living in community, and (2) men and women living in the world who desire to adopt a rule of life and to share in the work of the order; S. Catherine of Siena (*q.v.*) is the most famous of them.

The organization is democratic in basis, each priory electing its superior, and the priories electing their provincial ruler. In 1217 S. Dominic began sending his followers abroad. Centres were established at Paris, Madrid, Rome, and Bologna. The first general chapter was held at Bologna in May, 1220. The preaching friars arrived in England in Aug., 1221, and settled in Holborn, London, and at the suppression of the monasteries there were 58 foundations in England.

Missionary zeal sent Dominicans beyond the confines of Europe. Through Armenia and Persia they pressed into Asia as far as India, where they made a centre at Goa, and arrived in China and Japan.

In the wake of Portuguese explorers they passed into Africa. This progress is typical of their activity in all domains; there seems no branch of human knowledge in which Dominicans have not left their mark. As well as S. Catherine of Siena, S. Thomas Aquinas, Fra Angelico, Fra Bartolommeo, Savonarola, Tauler, and Henry Suso were of the order.

In the popular mind the Dominicans are always associated with the Inquisition. On this tribunal members of the new orders, and particularly Dominicans, were generally chosen to sit. In all cases of heresy tried at Rome the presiding official must be a Dominican, while the master general and another member are ex-officio consultors.

In spite of this connexion it is noticeable that in the Middle Ages the order appears on more than one occasion as stepping forward to stand between those holding unpopular views and opinions, the Jews for example, and popular clamour, and the records of the order show its members as a whole distinguished for a singular clarity and breadth of view. The revival in France, associated with the name of Lacordaire, resulted in the re-erection in 1850 of the French province. *See* Black Friars; *consult* The Dominican Order and Convocations, E. Barker, 1913.

**Dominion** (Lat. *dominus*, a lord). Word meaning lordship or authority. It was the name given to the federation of the Canadian provinces carried out in 1867. The phrase "Great Britain and the Dominions" was used at the Imperial Conference of 1926—a secretaryship of state for Dominion Affairs had indeed been set up the previous year—and the position of self-governing dominions was laid down in the statute of Westminster, 1931. This referred to Canada, Australia, New Zealand, South Africa, the Irish Free State, and Newfoundland. The constitution of Newfoundland was suspended in 1933, and in 1949 it became a province of Canada. The Irish Free State in 1937, assuming the Irish name for the country, declared Eire to be a sovereign and independent state, though it remained associated with the British Commonwealth for certain purposes until 1949. Meanwhile, India (1947–50), Pakistan and Ceylon became the first dominions not originally colonised from Europe. *See* Westminster, Statute of.

**Dominion Day.** Public holiday in Canada on July 1 to celebrate the anniversary of the foundation

of the dominion, 1867. Dominion Day is kept in New Zealand on Sept. 26 as a public holiday to commemorate the country's elevation to dominion status in 1907.

**Dominions.** Former name of a British govt. dept. It was created by the Conservative government in July, 1925, when the Dominions office was set up to take over the Colonial office business relating to the self-governing dominions, also to the colony of Southern Rhodesia and various South African territories. The National government of 1931 and later administrations appointed separate ministers for the dominion and colonial offices. In 1948 the secretaryship of state and the office were both changed in name from Dominions to Commonwealth Relations.

**Dominions Royal Commission.** A body appointed in 1912 under the chairmanship of Lord D'Abernon to report upon the resources and development of the self-governing dominions of the British Empire. Six members represented the U.K. and one member each sat for Canada, Australia, New Zealand, South Africa, and Newfoundland. It held its first sitting in London, and 160 others in the capitals of every state or province of the dominions. The final report of the Commission was published in 1917.

**Dominis, MARCO ANTONIO DE** (1566–1624). An Italian theologian and scientist. A native of Dalmatia, and educated at Loretto and Padua, he was at first associated with the Jesuits, and for a time lectured on physics and mathematics. He became bishop of Segni and archbishop of Spalatro. In 1616 he joined the Anglican Church, and was appointed dean of Windsor by James I. Six years later he went to Rome and sought reconciliation with his former church; but he was imprisoned by the Inquisition, and died a few months later.

**Domino.** Mask, half-mask, or a cloak, worn by masqueraders as a disguise. The term is applied also to the wearer of the garment. A domino was also an ecclesiastical hooded cloak, black on one side, whence the name of the game of dominoes is supposed to have been derived. *See* Acting.

**Dominoes.** Game invented in Italy in the 18th century. It is played with 28 oblong pieces, termed cards or stones, marked with indented black spots, on an ivory face divided into two compartments, and having black backs generally made from ebony. The

pieces are numbered 6-6 (double-six), 6-5, 6-4, down to 6-0; the same with the 5, 4, 3, 2, and 1 respectively; and 0-0 (double-blank).

In the French or Draw Game the dominoes are shuffled face downwards on the table, and the right to play first is determined by each player drawing a piece, the drawer

Dominoes. Complete set or "pack" of dominoes; the lowest is known as the double-blank, the highest as the double-six

of the highest number having the lead, or, as it is called, the "down." The pieces are then re-shuffled and each player takes seven, the rest forming the stock which remains on the table unfaced. The leader plays a domino (it is invariably best to lead the highest), and the other follows by matching the number at one end of the card played, from his own hand or by drawing from the stock. This continues with each player alternately until the

dominoes, both in hand and in the stock, are exhausted; the one who is first out calling "Domino," and winning the game by the number of pips contained on the pieces (or cards) still in possession of his adversary. If it is impossible for either player to exhaust his pieces, the one left with the smaller number of pips wins.

Other varieties of domino games are the block game, domino-whist, domino-loo, threes and fives, Sevastopol, bingo, the passing game, and the matador game.

**Domitian** (A.D. 51-96). Roman emperor. His full name was Titus Flavius Domitianus Augustus. He was born Oct. 24, 51, the younger son of Vespasian, and succeeded his brother Titus in 81. Tacitus's gloomy picture of the reign of Domitian was probably biased. Modern research indicates that he took a genuine interest in provincial government, and that misrule in the provinces was practically unknown in his reign. Latterly, however, he appears to have become suspicious and tyrannical, and informers flourished. Among those persecuted by him were the Christians. A punitive expedition against the Chatti, a series of campaigns in Britain under Agricola, and a war with the Dacians which ended in a humiliating peace, were the military features of his reign. The declining influence of the senate was still further impaired under Domitian, and the emperor assumed a pomp and circumstance more characteristic of despotism than anything seen at the courts of his predecessors. He met his death at the hands of a freedman named Stephanus, instigated by the emperor's own wife Domitia, Sept. 18, 96.

**Dom Juan**; or, *LE FESTIN DE PIERRE* (Don Juan: or, the Feast of the Statue). Five-act comedy by Molière. Adapted from Spanish-Italian originals, the scene is laid in Sicily. Dom Juan's valet, Sganarelle, serves as the author's mouthpiece, and the part was acted by Molière himself. The comedy was first produced at the Palais-Royal, Paris, Feb. 15, 1665, but not printed until 1682.

**Domodossola**. Old frontier town of Italy, in the prov. of Novara. It is 19 m. by rly. N.W. of Pallanza on Lake Maggiore. It commands fine views of the Pennine Alps, especially of Monte Rosa, and is a convenient centre for tourists to the Alps. A monument here marks the spot where the airman Chavez met his death after making the first flight across the

Alps, Sept., 1910. Domodossola was the headquarters of an Italian resistance movement against Fascists and Nazis in the summer of 1944. Pop. 6,000.

**Domra**. Russian musical instrument similar to the balalaika (*q.v.*), but of oval shape.

**Domrémy-la-Pucelle**. Village of France, in the dept. of Vosges. It stands on the Meuse, 6 m. N.W. of Neufchâteau, and contains the house where Joan of Arc (*q.v.*) was born in 1411, and which became state property in 1818. Opposite the house is a monument with a bust of the heroic saint. On a hill in the neighbourhood, where she is supposed to have heard the voices which inspired her, a magnificent church has been built.

**Don** (Lat. *dominus*, lord). Title prefixed to the Christian name in Spain, formerly confined to men of rank, but now used like "Mr." The feminine is *doña*. In the United Kingdom fellows or tutors of a college in a university are called dons. In the form "dom" the title was prefixed in Portugal and Brazil to the Christian name by royal princes and, with royal authority, by private persons.

**Don**. River of the West Riding of Yorkshire, England. It rises in the Pennines near the Cheshire border and flows S.E. through Sheffield, thence N.E. past Rotherham and Doncaster to the Ouse, which it enters at Goole. It is linked up by canals with the Trent and the Calder. Its length is 70 m.

**Don**. River of Aberdeenshire, Scotland. It rises near the Banffshire boundary and flows for 78 m. in an E. direction to the North Sea, which it enters a little to the N. of Old Aberdeen. Its valley contains the richest alluvial farm land in the county, and has great granite quarries. The lower river drives paper and woollen mills.

**Don**. River in S. Russia. Rising from Lake Ivan in the region of Moscow, S. of Tula, it flows S.E. and S.W. through the regions of Voronezh and Stalingrad and the Azov-Black Sea area into the sea of Azov. The vineyards and wines of its neighbourhood are celebrated, and it provides excellent fishing. It is navigable, except in the winter, for half of its 1,160 m., and is one of the chief waterways for transporting cattle and grain from the interior. It is connected with the Volga by the Kalach-Stalingrad rly., and has numerous tributaries. It is the ancient Tanais.

In their campaign in Russia during the Second Great War,

German forces reached the Don at the end of Nov., 1941. After capturing Rostov, the invaders were driven out in a few days by Gen. Remizov's army. In 1942 there was fierce fighting at Voronezh in early July, and by July 10 German forces were firmly established on the E. bank. There was savage fighting in the Don bend as the Russians retired E. On July 24 the Germans crossed the river at Tsymlyanskaya, and Rostov was evacuated three days later.

Having relieved Stalingrad, Russian forces crossed the Don at three places between Kalach and Tsymlyanskaya on Dec. 5. Two armies crossed the frozen reaches of the middle Don, liberating hundreds of villages and routing the Italian expeditionary force. With the recapture of Voronezh in Jan., 1943, the E. bank of the Don was cleared of German forces, except in the Rostov area until that city was retaken on Feb. 14.

**Don, KAYE ERNEST** (b. 1891). A British racing motorist. Born April 10, 1891, he began to race cars in 1920, won the Ulster T.T. race in 1928, and made lap records at Brooklands, exceeding 136 m.p.h. in 1930. Taking up motor boat racing in 1931, in Miss England II he attained 103½ m.p.h. on the Parana river and 110 m.p.h. on Lake Garda. He failed, however, at Detroit in 1931 and 1932 to recover the British international trophy for this sport from the U.S.A.

Kaye Don, British racing motorist

**Donaghadee.** Watering-place of co. Down, N. Ireland. It stands on the North Channel, 22½ m. E. of Belfast by the Belfast and County Down rly. It has telegraphic and telephonic communication with Portpatrick, Scotland, from which it is distant 21½ m. Pop. 3,358.

**Donald, SIR ROBERT** (1861-1933). British journalist. Born in Banffshire, he gained journalistic experience in Edinburgh, Northampton, Paris, and New York. He founded the Municipal Year Book in 1893 and was editor of the Daily Chronicle, 1892-1918. In 1906 he took charge also of Lloyd's News, becoming managing director of United Newspapers, Ltd., in 1911. In the First Great War he was a director at the

ministry of Information. He was made G.B.E., 1924, and died Feb. 17, 1933.

**Donald Duck.** Character in cartoon films by Walt Disney. Appearing first in the black-and-white Orphans' Benefit, 1934, he was drawn in coloured films with The Band Concert, 1935, and in his unending predicaments became one of the outstanding creations of the cinema. See Disney, Walt.

**Donaldson, JAMES** (1751-1830). Scottish newspaper proprietor and philanthropist. Expanding the prosperous printing business in Edinburgh left him by his father, Donaldson left £240,000 to found a home for 300 poor children.

**Donarite** (Ger. *Donner*, thunder). German blasting explosive. The composition varies according to its place of manufacture, but its main feature is its high content of nitroglycerol, 22-33 p.c., with a small amount of nitroglycerine, both gelatinised with 1 p.c. nitrococton. It also contains 50-70 p.c. ammonium nitrate and sodium nitrate, one p.c. wood meal, and up to 12 p.c. di- and trinitrotoluol. Its manufacture involves the following operations: (a) preparation of the gelatine from the nitroglycerol and collodion cotton with the addition of D.N.T.; (b) preparation of the solid mixed components; (c) kneading the above to form a loose mass, which is then made into cartridges.

**Donat, (FREDE- RICK) ROBERT** (b. 1905). A British actor. Born in Manchester, March 18, 1905, he studied for the stage with James Bernard, making his first professional appearance in Julius Caesar at Birmingham, 1921. A member of Sir Frank Benson's company, 1924-28, he acted with the Liverpool repertory company, at the Cambridge festival theatre, and scored an outstanding success in London in *Precious Bane*, 1933. He played then in *A Sleeping Clergyman* and *Mary Read*. He joined the Old Vic company in 1939, and in 1943 took over management of the Westminster Theatre, where he played in *The Cure for Love*, 1945. Donat

entered films in 1932, and was starred in *The Count of Monte Cristo*; *The Thirty-Nine Steps*; *The Ghost Goes West*; *Goodbye Mr. Chips*; *The Young Mr. Pitt*; *The Winslow Boy*. See Actor illus.

**Donatello**, in full Donato di Niccolò di Betto Bardi (1386-1466). Italian sculptor. Born at Florence, he appears to have left for Rome about 1401, possibly in the company of Brunelleschi, and to have returned again to Florence in 1406. Two years later he received the commission for the famous statue of S. George, in Or S. Michele (now in the Bargello), Florence, completed in 1415; he also executed a S. Peter and a S. Mark. He went to Padua in 1444, and there produced the noted equestrian statue of Gattamelata—the first horse to be cast in bronze.

Other important works were wrought at Ferrara, Venice, and Modena, and in 1457 the master returned to Florence, where he died Dec. 13, 1466. His bronze David, in the Bargello, and the beautiful Judith, in the Loggia dei Lanzi, proclaim him as the greatest sculptor of single figures since classical days. Consult Lives, H. Rea, 1900; 10th earl of Crawford, 1903.

**Donati, GIOVANNI BATTISTA** (1826-73). Italian astronomer. Born at Pisa, Dec. 16, 1826, he was admitted in 1852 as a student at the Florence observatory, and became director in 1864. He discovered six comets, that observed June 2, 1858, being named after him. He was one of the first to apply the spectro-scope to astronomical research. He died Sept. 20, 1873.

**Donatio mortis causâ.** Legal term meaning a gift of personal property in prospect of death, and to take effect on the donor's death. The gift must be completed by

Donatello, Italian sculptor From an old print

Donatello. His statue of S. George in the Bargello, Florence

delivery—mere words will not do. Thus "You can have my watch after my death" is not a valid gift unless the watch is actually handed to the donee. Such a gift is revoked if the donor recovers from his then illness, and the property reverts to him—e.g. the watch must be handed back. If the person making the gift dies and the property left by him is not sufficient to pay his debts, the gift may be taken for that purpose, as it is similar to a legacy. Estate and legacy duties are payable on gifts.

**Donation of Constantine** (*Donatio Constantini*). Forged document by which Constantine the Great conferred on Pope Sylvester and his successors imperial rights in, together with possession of, the city of Rome "and all provinces, places, and towns of Italy and the Western regions."

Under the title *Constitutum domini Constantini imperatoris* the document, which is addressed by the emperor to the pope, consists of two parts. In the first Constantine gives the history of his conversion to the Christian faith. In the second he enumerates the details of his grant to the pontiff in Rome, which he abandons for the new capital he has established for himself in the East. The authorship, date, and purpose of the forgery still await elucidation. One view is that its purpose was to further the territorial aspirations of the papacy, traces its origin to Rome, and dates it in the 8th century. The other, contending that its object was rather to justify the transfer of the imperial dignity (*imperium*) to the Franks, finds its origin in the Frankish empire, and dates it at the time of the coronation of Charlemagne (800), or in the following century. It was first clearly referred to by Pope Leo IX in 1054. It was shown to be a forgery in the 15th century. See Constantine.

**Donatists.** Followers of Donatus the Great, a sect formed by members of the N. African Church about the beginning of the 4th century. It seems to have originated gradually from the objection raised to the reconciliation of those Christians who had fallen away in times of persecution. But the immediate cause of the Donatist disruption was the consecration of a rival bishop of Carthage by Bishop Donatus about A.D. 311.

The ultimate result was the division of the African Church into two great parties, the Catholic and the Donatist. The latter consecrated opposition bishops, and in

some cases at least rebaptized orthodox clergy and laity who joined them. The Donatists claimed to be orthodox on all points and to be in complete doctrinal agreement with the Catholics, but to possess alone an uncorrupted priesthood. See Christianity.

**Donauwörth.** Town of Bavaria, Germany. It stands just where the Wörnitz joins the Danube, i.e. on the left bank, and is 25 m. N. of Augsburg. Among its churches are the Gothic parish church of the 15th century, and the one formerly belonging to the monastery of the Holy Cross. The abbey buildings are now used for a school, library, and other purposes. There are a Gothic town hall and the Tanzhaus. There is trade along the river, and manufactures of beer, etc. Donauwörth developed from a group of houses around the castle of Mangoldstein, and for three centuries after 1307 was a free city. The ruler of Bavaria entered it in 1607 in order to punish the inhabitants for interfering with a religious procession, and it remained, except for a few years, part of Bavaria. Marlborough's victory of the Schellenberg was gained here July 2 (N.S.), 1704. Pop. 5,000.

**Donbas.** Contracted name for the industrial region of Ukraine S.S.R. described as Donetz Basin.

**Don Benito.** Town of Spain, in the prov. of Badajoz. It stands on the left bank of the Guadiana, 27 m. by rly. E. of Merida. In a district rich in grain and fruit, it trades in oil, wheat, and wine, and manufactures soap, jute, brandy, flour, cloth, and linen. It dates from the 15th century, when it was founded by refugees from Don Llorente, which was subject to inundation. Pop. 21,059.

**Doncaster.** Co. and parl. bor. and mkt. town of the W. Riding of Yorkshire, England. It stands on

the Don, 156 m. N. of London and is served by two main line rlys. The chief church is S. George's, a cruciform structure with a lofty central tower; it was rebuilt after designs of Sir G. Scott in the 19th century. There are other churches, an old grammar school, mansion house, guildhall, and corn exchange. A charter was granted by Richard I in 1194.

Doncaster is an important rly. centre, with traffic from extensive coal mines in the neighbourhood. Here are the large railway workshops, while the industries are the making of agricultural machinery, electric goods, brass, wire rope, wallpaper, and artificial silk. The Don is navigable, and there is water communication with Sheffield, Goole, and Hull. Doncaster is governed by a mayor and council and has a service of buses and trolley-buses. The town returns one member to parliament. Doncaster is also famous for its race meetings, the St. Leger being run on a Wed. in Sept. on Town Moor. There are cattle and retail markets on Tues. and Sat. Pop. est. 71,030.

**Donegal.** Maritime county of Eire, part of Ulster. It has about 165 m. of rugged and deeply indented coast-line on the Atlantic ocean. Donegal Bay in the S., and Loughs Swilly and Foyle in the N., are the largest inlets, and the Foyle is the longest stream; Lough Derg, the only lake of any size is studded with many small islands. Aran, Tory, and several smaller islands lie around the coast. The surface is mountainous (Erigal, 2,466 ft.) and frequently boggy. Stock-rearing and fishing occupy the majority of the people.

Donegal tweed is woven in many places and linen manufactured at Raphoe. Eight deputies are returned to the Dáil. Lifford (county town), Letterkenny, Ballyshannon, Donegal, and Bundoran are the chief towns. Land area, 1,865 sq. m. Pop 136,035.

**Donegal.** Market town and seaport of co. Donegal, Eire. On Donegal Bay, at the mouth of the Eask,

Doncaster, Yorks. The south side of the parish church of S. George, built by Sir Gilbert Scott in 1858

46 m. S.W. of Londonderry by rly., it trades in agricultural produce. The Annals of the Four Masters (1636) were compiled in its Franciscan monastery, remains of which and a castle of the O'Donnells still exist. Near by is a chalybeate well. Market day, Sat. Pop. 9,674.

**Donegal Bay.** Large inlet of the Atlantic off the N.W. Irish coast. It penetrates inland some 35 m. between the counties of Donegal on the N. and E. and Sligo and Leitrim on the S. It is 30 m. across at its entrance between Malin More or Teelin Head and Lenadood Point. Several bold promontories project into the bay, the chief of which are Drumanoo

another Arthur. Arthur, the 3rd earl, was created a British peer as Baron Fisherwick in 1790 and given the Irish titles of earl of Belfast and marquess of Donegall in 1791. Edward, the 4th marquess, was dean of Raphoe for over 40 years. Edward Hamilton (b. 1903) succeeded his father as 6th marquess in 1904. Educated at Eton and Christ Church, Oxford, he became a journalist, contributed regularly as a columnist to *The Sunday Dispatch*, and was war correspondent to *The Star*.

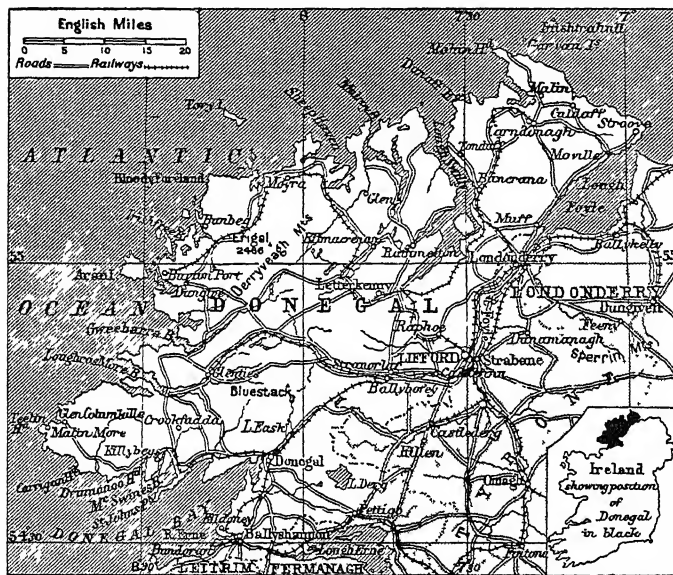

**Donetz.** River of Ukraine S.S.R. and the Azov-Black Sea area of R.S.F.S.R. The chief tributary of the Don, it rises near Kharkov and, flowing S. and S.E.,

from the Donetz field with iron ore from the mines of Krivoi Rog made possible the development of a large ferrous metallurgical industry in Ukraine. Bauxite and manganese also occur.

In the Second Great War the Germans were advancing in Oct., 1941, into the Donetz basin, and Kharkov and Stalino had fallen. Marshal Timoshenko assumed command of the southern half of the Russian front and checked the thrusts. The Germans pressed on towards Rostov, which they took, but in the last days of Nov. a counter-attack threw them back nearly to Stalino. In July, 1942, the invaders launched a double offensive, the S. arm in the Donetz area taking Voroshilovgrad on July 19 and cutting the Moscow-Rostov rly. After bitter fighting in the Don bend the Germans established two bridgeheads on the S. bank of the lower Don.

In Dec. 1942 and Jan. 1943 Russian offensives on the Middle Don drove the German armies back to the Donetz. By the beginning of Feb., 1943, the Soviet armies were endangering the German hold on the Donetz basin. By March 9 the Russians had been forced back yet again to the N.E. bank of the Donetz, evacuating Kharkov March 15; but German attempts to cross the upper river were repelled. On Aug. 23 Kharkov was recaptured and a new Soviet offensive began in the Donetz basin. On Sept. 4 Soviet forces crossed the northern Donetz at several points; Stalino was liberated on the 8th; and the expulsion of German forces from the basin was completed.

**Don Giovanni.** Tragi-comic opera in two acts by Mozart with libretto by Da Ponte. An operatic masterpiece, this comedy of manners which conflicts with human issues represents Mozart at his most dramatic, *e.g.* the music of the statue, the arias of Donna Anna and Donna Elvira, the final quartet. The overture—one of the most elaborate composed by Mozart—was written the night before the first performance at Prague, Oct. 29, 1787. In the 19th century in England the flamboyant, essentially Italian character of the text was misunderstood. The opera was first given in England by amateurs at Hayward's Floorcloth Manufactory; an English version was produced at Covent Garden, May 30, 1817. Revivals at Glyndebourne in the 1930s, in the original Italian were noteworthy as was the Sadler's Wells version (E. J. Dent's translation).

Donegal, Eire. Map of the extreme north-western county of Ireland. Its mountains and bays provide some of the most picturesque scenery in Ulster

Head, St. John's Point, Kildoney Point, and Roskeeragh Point. It receives the waters of the rivers Erne, Eask, and smaller streams, and the towns of Donegal, Killybegs, Bundoran, and Kildoney stand on its shores. Anchorage is not considered safe, but refuge may be sought in the small inlets that open off the bay.

**Donegall, MARQUESS OF.** Irish title borne by the family of Chichester since 1791. In 1612 Sir Arthur Chichester, lord deputy of Ireland, was made a baron, and in 1625, the year after his death, his brother, Sir Edward, was made a baron and a viscount. In 1647, the family having acquired large estates in Ireland, his son Arthur was made earl of Donegall, and was succeeded in 1674 by his nephew,

falls into the Don near Shakhti. It is 675 m. long. It gives its name to a prov. of Ukraine.

**Donetz Basin or DONBAS.** Industrial region of Ukraine S.S.R. It covers some 10,000 sq. m. and includes Stalino and Rostov. In 1930 the Russian government decided to construct 14 new towns in this district, among them Gorkovka, with a view to making it the greatest coal-producing area in Europe. Huge power stations, agricultural machinery factories, and engineering works were erected at a cost of nearly 650 million roubles. The Donetz basin contains about 60 p.c. of the bituminous and anthracite coal reserves of the Soviet Union, and had an annual pre-war output exceeding 80 million tons. Combining coal

**Dongola.** Name of two towns on the Nile in the Northern province of the Anglo-Egyptian Sudan. New Dongola is situated on the left bank, above the third cataract, and 750 m. S. of Cairo. During the operations against the Mahdi in 1884-85 it formed the British base, but when the British forces were withdrawn the town fell into the hands of the Mahdi. It is now a flourishing town with fine buildings and a thriving trade.

Old Dongola, on the right bank of the Nile, 75 m. S.S.E. of New Dongola, was the capital of the kingdom of Dongola, but was destroyed by the Mamelukes in 1820, and is now uninhabited.

**Donington Hall.** County mansion in Leicestershire. It is near the village of Castle Donington, so named because there was once a castle here of which ruins remain beside the Trent, 9 m. N.E. of Ashby-de-la-Zouch. The hall, which stands in a fine park, was built in 1795, and was long the property of the earls of Huntingdon. When the 10th earl died in 1789 the hall passed to his sister Elizabeth, mother of the first marquess of Hastings. When Henry, the 4th marquess, died in 1868, it passed to his sister, the countess of Loudoun, and then to her son, the earl. During the First Great War the hall was used as a place of internment for German officers; it attracted much attention owing to visits paid to it by English persons of high station, and to the luxurious style of living permitted. In the Second Great War the neighbouring race track was taken over by the War office as a motor transport depot. *See* Castle Donington; Prisoner of War.

**Dönitz, KARL.** The name of this German Nazi leader is spelt Doenitz in this work.

**Donizetti, GAETANO** (1797-1848). Italian composer. Born at Bergamo, Nov. 29, 1797, the son of a

weaver, he became a soldier after he had studied music at Naples and Bologna. He was a teacher in Naples, lived after 1837 in Paris, and for a few years

Gaetano Donizetti, Italian composer

was master of the imperial chapel at Vienna. Composing over sixty operas, he exhibited a great natural gift for melody. The most popular are *Lucrezia Borgia* (1833), *Lucia di Lammermoor* (1835), *La Fille du*

Régiment (1840), and *Linda di Chamounix* (1842), and two early ones, *Zoraide di Granata* (1822), and *Anna Bolena* (1830). The earliest won for him a public triumph in Rome and exemption from military service. Donizetti also wrote masses, string quartets, and songs. He died April 8, 1848.

**Donjon** (late Lat. *domnio*, a dungeon). Principal tower of a castle, which served as the living place of the owner and his family, and as a refuge for the garrison in case of siege. *See* Castle; Keep.

**Don Juan.** Central figure of a long popular Spanish story, traditionally said to have had a basis of fact. Don Juan, according to the legend, in the 14th century killed a nobleman with whose daughter he had eloped. He was finally trapped by some friars in their monastery and murdered. The story has been utilised in drama many times, notably by Tirso de Molina (Gabriel Tellez), c. 1630, who was apparently the first to give Don Juan the surname Tenorio; Molière, 1665; and Zorrilla y Moral, 1844. It was satirised by Bernard Shaw in *Man and Superman*, 1905. In opera Don Juan has been treated by Mozart (Don Giovanni, *q.v.*, 1787) and other composers.

**Don Juan.** Serio-comic epic poem by Byron (*q.v.*). His name is all that the hero has in common with the famous figure of Spanish romance. Upon his amatory adventures and wanderings over a great part of Europe his creator lavished wit, humour, satire, and pathos, as well as his unique descriptive power and very mundane philosophy of life. Written in the Spenserian stanza, the sixteen cantos were published anonymously in six instalments, 1819-24.

**Donkey.** Alternative name for the domestic ass. *See* Ass.

**Donkey Engine.** Auxiliary stationary engine used for pumping, generating electricity, operating winches, or other work aboard ship not connected with actual propulsion. *See* Engine.

**Don-nai** or **DONHAI.** River of Cochin-China, S.E. Asia. It rises in the highlands of Annam, at an alt. of 5,000 ft., and follows a generally S.W. course, effecting a junction with the Sebong and other streams to form a delta discharging into the China Sea. Two arms of the delta are navigable. The town of Saigon stands on its banks. Length, 250 m.

**Donnay, CHARLES MAURICE** (1859-1945). French dramatist. A Parisian, he began his career as playwright with *Phryné*, 1891,

following this the next year with *Lysistrata*, an adaptation from Aristophanes. His other plays include *Le Retour de Jérusalem*, 1903; *La Patronne*, 1908; *Le Ménage de Molière*, 1912; *Les Éclaireuses*, 1913; *La Chasse à L'Homme*, 1917. A commander of the legion of honour, and a member of the French academy since 1907, he died April 1, 1945.

**Donne, JOHN** (1573-1631). An English poet, courtier, and divine. Born in London, of Roman Catholic

John Donne, English poet  
Contemporary portrait

parentage, he was educated at Oxford and Cambridge. He entered Lincoln's Inn in 1592, joined the Anglican communion, accompanied Essex to Cadiz in 1596, and to the Azores in 1597. He travelled in Italy, Spain, Germany, and the Low Countries, and became private secretary to the lord keeper Egerton, whose niece he married clandestinely in 1601. In 1615 Donne was ordained and became in succession curate at Paddington, royal chaplain, vicar of Keyston, Hunts, rector of Sevenoaks, reader in divinity at Lincoln's Inn, dean of St. Paul's, 1621, and vicar of St. Dunstan-in-the-West. He died March 31, 1631, and was buried in St. Paul's cathedral.

As a poet Donne still suffers from his alleged occasional crudities; while his metaphysical arguments and conceits are obscure to many readers. But the originality, force, and passion of some of his lyrics, the glowing and sensuous records of what were evidently personal experiences, the sceptical and subtle thought, place him among the foremost love poets. The *Eccstasy* and *The Sun Rising* show Donne perhaps at his best. The brilliant, bitter *Satires*, 1593-97, are among the earliest English rhymed couplets. After about 1608 he turned to spiritual poems and intellectual exercises in theological verse; the superb sonnet, *Death, be not proud*, and *A Hymn to God the Father*, may be mentioned from this period.

The last of the great Elizabethan preachers, Donne in his sermons was lucid and attentive to patristic precedent. His theology was liberal and reasoned. His prose works include the *Pseudo-Martyr*, 1610, a reply to Bellarmine's defence of the Popish recusants; and a posthumously

published apology for conditional suicide, *Biathanatos*, 1648. With few exceptions his verses circulated only in MSS. during his lifetime; his sermons he carefully prepared for the press. *Pron.* Dun.

**Bibliography.** Izaak Walton's *Lives*, ed. H. A. Dobson, 1898; *Life and Letters*, E. Gosse, 1899; J. D., a *Study in Discord*, H. I. A. Fausset, 1924; *Poems*, ed. H. J. C. Grierson, 1931; *Study of Prose Works*, E. M. Simpson, 1924; *Sermons: selected passages* ed. L. P. Smith, 1920; *Critical Works*, ed. E. N. Hooker, 2 vols., 1943.

**Donnelly, IGNATIUS** (1831-1901). American author and politician. Born at Philadelphia, he was called to the bar and removed in 1857 to Minnesota, where he took a prominent part in politics. During 1863-69 he sat in Congress as a Republican. He is principally remembered for his book, *The Great Cryptogram*, 1887, wherein he sought to prove that Bacon was the author of Shakespeare's plays. He also wrote *Atlantis*, 1882, to show that there once existed in the Atlantic, opposite the Straits of Gibraltar, an island which was the Atlantis of the ancients. Donnelly died Jan. 1, 1901. See *Bacon-Shakespeare Controversy*; *Cryptography*.

**Donnybrook.** Southern suburb of the city of Dublin, Eire, formerly a country village. In 1204 King John granted a licence for an annual fair to be held here, and this became, especially in the 18th and 19th centuries, the most disorderly of all Irish fairs. It was abolished in 1855.

**Dono, PAOLO DR.** Alternative name for the Florentine painter described as Uccello, Paolo (*q.v.*).

**Donoghue, STEPHEN** (1884-1945). British jockey. Born at Warrington, Oct. 15, 1884, Steve

Donoghue was apprenticed to the trainer John Porter at Kingsclere, later proceeding to Ireland. His career in England dated from 1910, his first big success being the winning of the

Steve Donoghue,  
British jockey  
Bassano

Cambridgeshire that year. From 1911 Donoghue was the most popular British jockey. In 1920 he rode 143 winners, and for years headed the list of successful jockeys. His chief title to fame was his score of six Derby winners—in substitute races in 1915 (Pommern) and 1917 (Gay Cru-

sader), and four at Epsom: Humorist 1921, Captain Cuttle 1922, Papyrus 1923, Manna 1925. He was the first rider to achieve three successive Derby wins. Donoghue won the Oaks in his last season, 1937. He died March 23, 1945. His son Pat Donoghue also became a jockey.

**Don Quixote.** Spanish novel by Miguel de Cervantes (*q.v.*). The first part was published in 1605, the second in 1615, having been

preceded by a spurious second part by Avellaneda a year earlier. The story was designed as "from beginning to end an attack upon the books of chivalry."

Romances of chivalry had attained an extraordinary vogue, despite clerical fulminations and legal interdict. Cervantes' wonderful story of Don Quixote, the knight whose head was turned by the reading of romances of chivalry, and of his squire Sancho Panza, "did instantly what sermons and legislation had failed to do"

(Fitzmaurice-Kelly). The story, said to contain 669 characters, is one of the world's greatest works of fiction.

**Bibliography.** Text, ed. D. Clemencin, 6 vols., 1833-39; ed. J. Fitzmaurice-Kelly and J. Ormsby, 2 vols., 1898-99; ed. D. Clemente Cortejon, J. Givanel Mas, and J. Suñé Benajes, 1905, etc.; ed. F. Rodriguez Marin, 6 vols., 1916-17. Facsimile reproduction of the original editions (Part 1, 1605; Part 2, 1615), printed for the Hispanic Society of America, 1909; Shelton's first Eng. trans. (Part 1, 1612; Part 2, 1620), repr. in Tudor Translations, with introd. by J. Fitzmaurice-Kelly, 4 vols., 1896; Eng. trans. J. Ormsby, 1885.

**Doocars.** Submontane tract in the extreme N. of India. It is in Jalpaiguri district, Rajshahi division, Bengal, near the frontiers with Nepal, Sikkim, and Bhutan. The area is about 3,500 sq. m., largely under tea where cultivation is possible, though there are also

paddy fields and jute and tobacco crops. The land at the foot of the Himalayas is mostly jungle forest, inhabited by wild beasts and receiving heavy monsoon rains. Pop. about 136,000.

**Doodle.** Colloquial term, of U.S. origin, for a scribbled drawing or decoration of the kind made by many people as a sub-conscious aid to concentration, *e.g.* on telephone pad or agenda paper. The U.S. term to doodle originally

Don Quixote and Sancho Panza alight at an inn which the knight imagines to be a castle, mistaking a country girl for a beautiful lady of high degree

From a painting by E. Gamba in S. Kensington Museum

meant to trifle, but the more special significance was popularised on both sides of the Atlantic by an incident in Frank Capra's film *Mr. Deeds Goes to Town*, 1936.

**Doodlebug.** Popular name in the U.S.A. for the ant-lion (*q.v.*). As such the word is familiar to readers of Mark Twain's *Adventures of Tom Sawyer*. In the summer of 1944 it took on a new significance, being used first by U.S. troops in England, then by English people, as a popular name for the German V1 weapon, the Flying Bomb (*q.v.*). The sound of the missile as it travelled through the air had some resemblance to that of a buzzing insect.

**Dooley, MR.** Irish-American character invented by the humorist Finley Peter Dunne (*q.v.*).

**Doolittle, JAMES** (b. 1896). U.S. army air force officer. Born Dec. 14, 1896, at Alameda, Calif., he served as a flying instructor

1. Example of old English doorway, Whitstable, Kent.  
 2. Norman door, of the little church of Patricksbourne, near Canterbury, Kent.  
 3. Angle door, decorated Tudor style, Bradfield House, Devon.  
 4. Carved drawing-room door, Red Lodge, Bristol, c. 1590.  
 5. Library doorway, Thorpe Hall, near Peterborough.  
 6. Portal of S. Macdon, Sarmental, Burgos Cathedral, 16th century.  
 7. Porta del Paradiso, Baptistery, Florence, c. 1450.  
 8. Door of chapel, Chateau d'Amboise, late 15th century.  
 9. Entrance door of Oratory, House of Pilate, Seville, 16th century.  
 10. Central door of Burgos Cathedral, 16th century.  
 11. Puerto del Sarmental, Burgos Cathedral, 16th century.  
 12. Cathedral door, Monreale, Sicily, 1186

**DOOR: NOTABLE EXAMPLES IN ECCLESIASTICAL AND DOMESTIC ARCHITECTURE**

*Nos. 3, 4, and 5 by courtesy of Country Life*

during the First Great War. He later became internationally famous as an air pilot, winning the Schneider Trophy for the U.S.A. in 1925 at 235.57 m.p.h. In 1940 Doolittle returned to active service and in 1942 was promoted lieutenant-colonel. He led the spectacular daylight raid over Tokyo, April 18, 1942, and was appointed commander N.W. Africa air forces the following Feb. Commander of the U.S.A. 8th air force from Dec., 1943, he directed the daylight bombing of Germany. With this force Doolittle arrived in July, 1945, on the Pacific island of Okinawa to operate against the Japanese. His retirement from command was announced in 1946.

**Doom** (A.S. *dóm*, judgement). Originally a sentence on a criminal. It was applied specially to the judgements to be passed at the last day, and thus comes the common phrase day of doom or doomsday. It is used to translate the Greek word *themis*, in both cases the dooms being rather arbitrary judgements of the gods than legal sentences in which a certain reason, order, or custom plays a part. From the cognate word *deem* comes the Manx *deemster*. See Law.

**Doom.** Old English name for the Last Judgement, and for pictorial representations of the same. Dooms were a common feature of cathedrals and parish churches in pre-Reformation days, after which the reaction against everything that suggested idolatry led to the total destruction of all but a very few specimens.

Dooms were often executed in tempera, and were less frequently painted on panels. Indeed, there are records of only seven or eight such paintings in England. One was found during renovation work in Wenham Church, Suffolk, in 1892. A large whitewashed partition which reached to the roof was taken down in pieces and placed in the churchyard. Heavy rain revealed some figures, and careful cleaning disclosed a noteworthy example of a Doom bearing the marks where a crocheted rood cross and a figure of the Virgin and S. John on either side had been fixed. The Doom itself shows beneath the seated figure of the Divine Judge the familiar scenes of the weighing of the souls by S. Michael, with the Devil looking on, Hell Mouth, and the naked souls of the saved awaiting entrance at the gate of Heaven.

Another interesting panel painting of the Doom is in the triforium of Gloucester cathedral.

Instances of the rood cross being affixed to the Doom are extremely rare. Usually the cross stood on a screen beneath the Doom. Consult Wenham and Bulcamp, J. B. Clare, 1906.

**Doom Palm** or **DOUM PALM** (*Hyphaene thebaica*). Tree of the family Palmae. A native of Egypt and Nubia, it has the stem forked several times in old specimens. The fan-shaped leaves are produced in clusters, and from the centre of these arise the spikes of flowers, all males on one tree, and all females on another. The fruits, like large quinces, are in clusters of 100 to 200. Beneath a smooth, polished skin there is a thick layer of fibrous material surrounding the large solitary seed, and this substance, which tastes much like gingerbread, is eaten by the natives. The hard wood is made into domestic utensils.

**Doom.** River and loch of Ayrshire, Scotland. The river issues from the loch into Glen Ness, a deep and narrow ravine, 230 ft. deep, and flows N.W. for 36 m. through picturesque country, to the Firth of Clyde below Ayr. It is mentioned in Burns's famous ballad, Ye Banks and Braes. The loch contains five small islands, on one of which (Castle Island) is a ruin, called Balliol's Castle.

**Doon de Mayence.** One of the heroes of the *gestes* or French romances. He gives his name to the third cycle of Charlemagne legends. See *Chansons de Geste*.

**Doones, THE.** Outlaws who, in the 17th century, inhabited the Badgworthy Valley, Exmoor, on the borders of Somerset and Devon, England. They lived by cattle lifting and blackmail. An outrage at Exford, in which a child was killed and its mother carried off, led to the extermination of the band by moormen and troops. The Doones and the legends surrounding their name provided material for Lorna Doone (*q.v.*), a romance of Exmoor, by R. D. Blackmore.

**Door.** Flat, frequently solid rectangular structure of wood or metal for closing an opening. From antiquity the favourite material

has been wood; the doors of the Temple of Artemis at Ephesus, the Parthenon, and Propylaea are said to have been made of wood, and the doors of Solomon's temple were constructed of olive wood. On the other hand, it is probable that bronze and other metals were used in Babylonia and Egypt, and bronze doors were frequently made in the Middle Ages.

The oldest form of door is the single one suspended on a pair of hinges, but those of the Greeks and Romans were often double doors in two leaves. The ornamentation of doors began, also, at an early period. Those of the Greeks and Romans were often covered with carving in ivory and precious metals. Early Christian sculpture was employed on the

Doom Palm. Tree found in the oases of Egypt and Nubia

decoration of doors. On a fragment of a door dating from A.D. 386, in the ancient basilica of S. Ambrosio at Milan, were represented the Passion and Crucifixion of Christ. Doors in the Middle Ages were skilfully fitted with knockers and locks, but only a few examples remain. Norman doors were, generally speaking, plain, except for a little iron scroll-work on the exterior. They were constructed with a view to guarding against assault, and with this object were placed in a recessed doorway commanded by openings through which arrows could be discharged, or surmounted by projecting stonework which provided a means of aggression from above. There are doorways of this type at Rochester Castle and elsewhere. Iron scroll-work was developed and extended during the Early English period, sometimes covering the whole surface. In the Decorated style panelled doors and scroll-work of floral design occur, and in the Perpendicular period there was further development in panelling accompanied by the disappearance of iron scrollwork.

The Renaissance brought a vast enhancement in the decoration of doors. Sometimes they were decorated with elaborate panels showing figures in relief or intricate tracery. The finest art of Lorenzo Ghiberti and Andrea Pisano was

lashed on the sculptured bronze doors of the Baptistery at Florence. Jacobean architects bestowed their attention rather on the doorways; the doors themselves, decorously panelled, merely setting off most elaborate surroundings in the form of rich columns or pilasters and surmounting friezes and cornices. In common with other details of internal decoration, that of Jacobean doorways suffered a little from over-richness until Inigo Jones and John Webb introduced a severer treatment.

Towards the end of the 17th century the panelling of doors had become greatly simplified. Doors of this period rarely contained more than two panels apiece, sometimes crossed by three horizontal panels at the base, centre, and summit, as in a door at Thorpe Hall, Northants. The 18th century saw another type of treatment. Instead of two large upright panels to a door, there were now frequently six or eight. The moulding of these panels was not too obtrusive, and the component parts of the doorway design—architrave, frieze, and cornice—though often boldly carved and handsome, were more discreet in character than their Jacobean prototypes. The influence of Wren following that of Jones kept the design massive and scholarly. But the tendency in this was ever towards a more delicate type of classic treatment, and when the brothers Adam established their peculiarly refined standard of internal decoration doors were treated according to this prevailing fashion. A beautiful example of the Adam door, with eight panels in a doorway with a classic frieze and cornice, is at Sheen House, Richmond.

**Doorman**, KAREL WILLEM FREDERIK MARIE (1889-1942). Dutch naval officer. Born at Utrecht, April 23, 1889, he was commissioned in 1910. Qualifying as a pilot in 1915, he was appointed to command the Netherlands fleet air arm in 1936, and in 1940 was promoted rear-admiral and c.-in.-c. at Sourabaya. Following the Japanese attack on the East Indies he became c.-in.-c. of the Allied squadron at Sourabaya and commanded at the battles of Bali Straits (*q.v.*) and Java Sea (*q.v.*). He was lost with his ship the *De Ruyter* in the latter action, Feb. 27, 1942.

**Dope**. Slang term for lacquers made by dissolving cellulose compounds in certain solvents, and used in various manufactures.

These solutions yield tough, elastic, and transparent films on evaporation, and the property of yielding such films is the main reason why this class of dopes is employed in aeroplane construction. Dopes may contain 2½-10 p.c. of nitro-cellulose, according to the uses to which the lacquers are to be put. They are applied by dipping, brushing, or spraying. Dopes are used for production of artificial leather, stiffening toe-caps of boots, waterproofing leather, and backing furs to prevent the hair becoming detached. Straw hats and linen collars are treated with dope to render them waterproof and washable, and in the cinematograph industry the nitro-cellulose dopes are used for protecting the film from friction.

The term is also applied to petrol, especially when administered in some special manner to facilitate starting the engine; to preparations employed as admixtures with motor fuel to improve or alter its qualities. Dope has also become extensively used to mean narcotic drugs, such as cocaine and opium, taken by victims of the drug habit; and to the administration of drugs to racing animals. The illegal sale of drugs is known as the dope traffic.

**Doppler Effect**. In optics, the alteration in refrangibility of light due to the relative motion of the observer and the source of light. Pointed out in 1842 by Doppler of Prague, the idea is analogous to that of the alteration in pitch of a locomotive's whistle as the locomotive approaches or recedes: the sound waves arriving in quicker or slower succession respectively. Similarly, the light waves are pressed into a smaller space as the star approaches and therefore become shorter, and the ray they form is more refrangible. If the distance between us and the star is increasing, the waves lengthen, the ray becomes less refrangible. Fizeau showed later that the spectroscopic method detects these differences. The Doppler effect can also be observed with radio waves. See Astronomy; Optics.

**Dorado**. Name for the Swordfish, one of the southern constellations named by Bayer. It is situated between Pictor and Hydrus. The S. pole of the ecliptic is near one of the stars of this group.

**Doran**, JOHN (1807-1878). British author. Born March 11, 1807, he became tutor to several young noblemen and later took the degree of doctor of philosophy at Marburg, and settled down as

miscellaneous writer. His chief works are *Monarchs Retired from Business*, 1857, and *Their Majesties' Servants*, annals of the English stage from Betterton to Kean, 1864. He died Jan. 25, 1878.

**Dorando** (b. 1887). Italian long-distance runner, whose full name was Dorando Pietri. The most notable event of his career was his performance in the marathon race at the Olympic Games held in England in 1908. The course was from Windsor Castle to the stadium at Shepherd's Bush, a distance of 26 m. 385 yds., and the race was run by the pick of the world's long-distance runners. Dorando entered the stadium first, but collapsed on the track. He was assisted past the winning post when J. J. Hayes, U.S.A., was a bare 100 yds. behind.

Immediately after the finish a protest was lodged, Dorando was disqualified, and the race awarded to Hayes. As consolation Queen Alexandra presented Dorando with a gold cup. His time for the course was 2 hrs. 54 mins. 48½ secs., J. J. Hayes covering it in 18 secs. longer. Dorando later ran several marathon races in the U.S.A. on indoor tracks, beating Hayes on the first and third occasions, and losing to Longboat on the second. All three were beaten in a fourth race by a Frenchman, St. Ives.

**Dorcas Society**. Name formerly much in vogue for societies of ladies who made garments for the poor, but seldom used now. The charitable woman at Joppa, referred to in Acts 9, was named Dorcas, hence the use of the word in this connexion.

**Dorchester**. Mun. bor., co. and market town of Dorset, England. It stands on the Frome, 135 m.

Dorchester arms

W.S.W. of London, on two railway lines. The four walks or boulevards occupying the line of the old Roman wall are an attractive feature. Notable buildings are the town hall, market house, county gaol, county hospital, grammar school, and museum, which contains local fossils and British and Roman antiquities. There is a bronze statue, erected in 1889, to William Barnes, the Dorset poet. Dorchester has an agricultural trade, is noted for its ale, and is associated with Judge Jeffreys, who held here the Bloody Assize in 1685. In the town are extensive military

Dorchester, Dorset. View of South Street; on the right is Napier's Mite, an almshouse built in 1816 by Sir Robert Napier; on the left, the post office

barracks. The Durnovaria of the Romans, Dorchester has many indications of early occupation, among which are the remains of an amphitheatre at Maumbury Rings, and Maiden Castle, to the S.W., a large British earthwork, the most perfect examples of their kind in England. Dorchester is the Casterbridge of Hardy's novels. Market days, Wed. and Sat. Pop. 12,000.

**Dorchester.** Parish and village of Oxfordshire, England. It stands on the Thame, near its confluence with the Thames, 9 m. S.S.E. of Oxford. It dates from Roman times. The see of a bishop from 886 to 1050, it has a suffragan bishop under Oxford. It has a fine old abbey church with a famous Jesse window.

**Dorchester, GUY CARLETON, 1ST BARON (1724-1808).** British administrator. Of Irish parentage, he was born Sept. 3, 1724. He entered the army and saw service in Canada; in 1766 he was made lieutenant-governor of Quebec, and in 1775 governor. He defended the land during the war of American Independence until 1778, when he returned to England. In 1782-83 he was commander-in-chief in America; during 1786-96, again governor of Quebec, the Act dividing Canada into two provinces being passed during his governorship. He died Nov. 10, 1808. In 1786 he had been made a baron, and the title is held by his descendants, Dudley Massey Pigott Carleton (b. 1876) having succeeded in 1925.

**Dorchester House.** Former mansion in Park Lane, London. Occupying the site of an earlier house belonging to the earls of Dorset, this magnificent mansion in the Italian Renaissance style was built by Vulliamy, 1851-53. The property of Sir George Holford, it contained a superb

bearing the same name was erected on the site.

**Dordogne.** River of France. It rises on the Pic de Sancy, a mountain in the dept. of Puy-de-Dôme, and at Bec d'Ambès joins the Garonne, the two forming the estuary of the Gironde. It is about 300 m. long, and at its mouth is over 2 m. wide. It flows westward through the depts. of Corrèze, Lot, Dordogne, and Gironde, and is navigable for over 100 m. Its chief tributaries are the Cère, Vézère, and Isle.

**Dordogne.** Department of S.W. France. A hilly inland area of 3,550 sq. m., it is largely covered with forests of pine, oak, and chestnut, or barren heath; in the valleys the soil is fertile. Many cattle and pigs are reared, while the vine, wheat, maize, and tobacco are grown. Some minerals are found. The chief rivers are the Dordogne, Vézère, Dronne, and Isle. The capital is Périgueux. Other places are Bergerac and Brantôme. Dordogne was formed mainly from the old prov. of Périgord in Guienne. It is divided into five arrondissements. In this dept. have been found remains of very early man. Pop. 387,643.

**Dordrecht OR DORT.** Town of the Netherlands, in the prov. of S. Holland. It stands on an

Dorchester House. Former London mansion which stood in Park Lane

collection of pictures. It was rented from the owner by White-law Reid while American ambassador at the court of St. James's (1905-13), and during the First Great War was used as a hospital. In 1928 the earl of Morley, who had inherited it, sold Dorchester House to a syndicate; and in 1930 an hotel

island in the Maas, and is cut by the Merwede and other streams and canals, 12 m. S.E. of Rotterdam. The chief building is the Great Church, a Gothic structure dating from the 14th century. It has a lofty tower, which is a landmark, and its carved choir stalls are perhaps the most notable of its interior features. There is an old town hall restored in the 19th century, and the town has several museums, including one of antiquities housed in one of the gates of the city; there is also a museum containing memorials of the South African War of 1899-1902.

Dordrecht is a river port and a rly. junction. The river and canals afford communication with the sea and with other Dutch ports. A steam ferry connects with places on the other side of

Dordrecht. The Groothoofd Gate, rebuilt in 1618, now containing a museum

the Merwede. There are two parks. The industries are in the main connected with the transport trade, but there are engineering works, as well as sawmills, ship-building yards, sugar refineries, and other industrial undertakings. The town is typically Dutch in appearance, with its many waterways, bridges, and windmills, and quaint old streets and houses. Pop. 62,007.

Dordrecht came into existence about 1000, and its history is closely linked with that of the rise of the Dutch republic. In the Middle Ages it was one of the wealthiest cities of Holland. In 1618-19 the synod of Dort (*g.v.*) met here. German parachutists dropped here in May, 1940, during the German invasion of the Netherlands.

**Doré.** Lake of Canada, in the prov. of Saskatchewan. It has a length of 25 m. and a breadth of 14 m. It is bounded on the E. by the Birch hills, and is the source of the Doré river.

**Doré.** Group of mts. in France in the dept. of Puy-de-Dôme. Included in the Auvergne chain, the loftiest peak is Pic (or Puy) de Sancy, alt. 6,190 ft. Hereabouts are the sources of the rivers Dor and Dogne. The watering-place called Mont Doré is picturesquely placed among these mountains at an alt. of 3,400 ft., and is famous for its hot mineral springs. Pop. 2,100.

**Doré, LOUIS CHRISTOPHE GUSTAVE PAUL** (1833-83). French artist. The son of German parents named Dorer, he was born at Strasbourg, Jan. 6, 1833. In 1848 he was taken by his father to Paris, where he was employed as an illustrator by the *Journal pour Rire*. His Paolo et Francesca,

1863, first brought him into notice and stimulated his ambition to become a great historical painter; the huge religious compositions popularised through the Doré Gallery in London were the outcome. The scale of these betrayed him into serious faults of composition and drawing and his real genius is to be found in his designs for the masterpieces of Dante, Milton, Shakespeare, Balzac, and La Fontaine. Doré was also a sculptor of no mean merit, and at the time of his death in Paris, Jan. 23 1883, was engaged on a monument to the elder Dumas. Consult Gustave Doré, M. Rose, 1945.

**Doria, ANDREA** (1466-1560) Genoese soldier of fortune. His active career began in the military service of various Italian princes, but he made his reputation as a fighting seaman, first as commander of the galleys of the Genoese republic, and later as a commander under Francis I and under Charles V, transferring his support from one side to another as the interests of his native Genoa dictated. Charles V rewarded him with the order of the Golden Fleece and the title of Prince of Meli. A constant occupation of his energies was war fare with the Turkish corsairs who ravaged the Mediterranean. Doria refused the sovereignty of Genoa offered him, but ruled it well on republican lines. He died at Genoa, Nov. 25, 1560.

**Dorian Mode** (*Mus.*). Old church mode beginning on D and using only the "natural" notes, the white keys of the pianoforte. The scale was

with A as its dominant. See Dominant; Mode.

**Dorians.** One of the three great branches into which the ancient Greek race was divided, the other branches being the Aeolians and Ionians. Traditionally the Dorians came from the small district of Doris in N Greece, lying between Mt. Parnassus and Mt. Oeta, and overran virtually the whole of the Peloponnese somewhere about 1000 B.C. The occasion of this irruption into the Peloponnese was the effort, eventually crowned with success, to restore the Heraclidae or descendants of Hercules to the dominion they had lost in the Peloponnese. (See Heraclidae.)

Archaeological evidence confirms this tradition of a Dorian invasion of the Peloponnese, but the exact identity of the Dorians is still in doubt. In historical times the Dorians inhabited, in addition to the bulk of the Peloponnese, Megara, Aegina, Crete, Melos, and other islands of the Aegean sea, the S.W. coast of Asia Minor, and many colonies in Sicily, such as Syracuse and Selinus. Generally, though not invariably, the inhabitants of these parts spoke the distinctive broad Doric dialect. Sparta was regarded as the pre-eminent Dorian state.

**Doric Order.** The first of the three orders of Greek architecture. It is distinguished so far as its proportions are concerned by a certain robustness or masculinity. The Doric capital (*q.v.*) was generally carved out of a single block,

and the drums of which the column was composed were bonded together by wooden dowels. The Parthenon (*q.v.*) is the best example of the Grecian Doric. See Composite Order; Corinthian Order; Greek Architecture; Ionic Order; also illus. pp. 569, 656.

**Doris.** Genus of naked-gilled, marine molluscs, commonly known as sea-lemons or sea-slugs. Twenty-two species of these occur round the British coasts, notably the common Doris, about an inch in length. In appearance it somewhat resembles a small half-lemon, with a pair of ridged tentacles and a circle of leaf-like gills standing out from the body.

**Doris.** Small district of ancient Greece, lying between Mt. Parnassus and Mt. Oeta, the traditional home of the Dorians (*q.v.*).

**Dorislaus, ISAAC** (1595-1649). Anglo-Dutch lawyer and diplomatist. He was born at Alkmaar, N Holland, and educated at Leiden, and about 1627 came to England, where he held for a time a history lectureship at Cambridge. In 1640 and 1642 he was judge advocate, and in 1648 was appointed a judge of the admiralty court. He took a leading part in drafting and carrying through the charge of high treason against Charles I, and was assassinated by royalists whilst on his second diplomatic mission to The Hague, May 12, 1649. He was buried in Westminster Abbey.

**Dorking.** Residential and market town of Surrey, England. Standing on the Mole, immediately below the North Downs, it is 25 m. S.W. of London, by electric rly., also served by buses and coaches of London Transport. Dorking urban district includes Westcott, N. Holmwood, Brockham, Mickleham, and Westhumble; the

Gustave Doré. Christ leaving the Praetorium, one of the most famous of the French master's series of pictures illustrating the life of Christ

National Trust property of Box Hill, and the Norbury estate preserved by Surrey county council.

Dorking. The High Street of this Surrey market town, with the White Horse inn on the right

oil. The sandstone ridge S. of the town affording views across the Weald is almost entirely public space. In the vicinity are Leith and Holmbury Hills. The town has some light industry, but its character is being preserved by planning. S. Martin's church is a beautiful landmark. Market day, Mon. Pop. est. 17,320.

The district is rich in literary and historical associations. The Pilgrims' Way passes through. Fanny Burney lived at Westhumble and met Gen. d'Arblay at Juniper Hill. Nelson is reputed to have stayed at the present Burford Bridge hotel on the eve of Trafalgar; Stevenson stayed there on occasion. Meredith lived at Flint Cottage. Dorking is well known to readers of Pickwick. Disraeli wrote *Coningsby* at Deepdene mansion. At this house, H.Q. of the Southern rly., were planned the transport arrangements for D-day, 1944. E. M. Forster resided near, and Ralph Vaughan Williams in, Dorking. The battle of Dorking was an imaginary combat described in a book (1871) by Sir George Chesney, who pictured the Germans making a victorious invasion.

#### Dorking Fowl.

Breed of fowl deriving its name from the town where it was at one time extensively bred and fattened. It is one of the few surviving old English breeds that have outlived modern introductions, still holding its own as a table bird, especially when crossed with the old English or Indian game. A peculiar characteristic of the Dorking breed is that

Dorking Fowl. Cock of this old English breed of fowl

it possesses a fifth toe—an additional toe on each foot.

There are five varieties: dark, silver grey, white (with rose-comb), red, and cuckoo, though the last three are virtually extinct. The Dorking is not adapted for close confinement, but is ideal for the farm.

#### Dorling,

HENRY TAPRELL. British naval authority and writer (under the pseudonym Taffrail).

Trained in H.M.S. Britannia, 1897, he served with distinction in the Royal Navy, retiring in 1929 but being recalled in the Second Great War. During 1939-42 he was at the ministry of Information, and was then public relations officer to the c.-in.-c., Mediterranean. As Taffrail, he wrote novels and adventure stories of the sea, of which the best known were probably *Pirates*, 1929; and *The Man from Scapa Flow*, 1933. He was an authority on service medals and decorations.

**Dormancy.** Condition in which the life processes of an organism or its parts proceed with such low intensity as not to be obvious. In animal life this condition is also known as hibernation (*q.v.*). Seeds are subject to dormancy imposed on them by surroundings which contain an excess of carbon dioxide or do not offer adequate moisture, oxygen, or heat supply. Some are spontaneously dormant while internal changes are rendering them fit for germination, or changes are proceeding in the seed coats to render these permeable to moisture and oxygen. Whole plants may lie dormant while climatic conditions are unsuitable to growth.

#### Dorman-Smith,

SIR REGINALD HUGH (b. 1899). British administrator. Educated at Harrow and the R.M.C., Sandhurst, he joined the Indian Army and served in the 3rd Afghan War, 1919. Elected Conservative M.P. for Petersfield, 1935, he was president of the National Farmers Union, 1936-37, minister of Agriculture and Fisheries, 1939,

and became governor of Burma in Dec., 1940. After the Japanese invasion of that country he went to India. When in Oct., 1945, civil administration was restored to Burma his term as governor was extended, but he resigned owing to ill health in Aug., 1946.

#### Dormant.

Dormant in heraldry

In heraldry, a sleeping animal, lying down with its head between its front paws. If the head is erect the beast is described as

couchant. See *Heraldry*.

#### Dormer (Lat. *dormire*, to sleep).

In architecture the name given to a window set in the inclined roof of a house. Storm window, porch window, and cripple window are local names for the dormer. Parker's Glossary speaks of the

Dormer window in old chapel, Cleve, Somerset

existence of these windows about the middle of the 14th century, but their real value as architectural features was not discovered much before the 17th century. In Jacobean buildings they contribute to the balance and symmetry of a façade, and in combination with the hipped roof they are a conspicuous and valuable feature of Georgian architecture.

**Dormouse.** Small Old World rodent about 3 ins. long, exclusive of the tail, which is about the same length. It has a very compact body and a large head with conspicuous ears and eyes so prominent that they seem almost to stand out from the head. The fur is tawny on the back and yellowish beneath, with a white patch on the chest. Only one species, *Muscardinus avellanarius*, found all

over Europe, is native to Great Britain. It is usually found in small plantations and hedgerows, where it constructs a nest. It feeds only at night and spends the day asleep in its nest. In autumn it builds a special nest for the winter, and stores it with a supply of nuts and corn. Here it sleeps through the cold weather, only waking up on mild days to feed. It usually hibernates from Oct. to April.

Dormouse. *Muscardinus avellanarius*, only U.K. species

**Dornier.** Firm of German aircraft manufacturers, founded by Dr. Claude Dornier (b. 1884). Most Dornier designs of the Second Great War were bombers of the medium or heavy class, but the firm also constructed various kinds of reconnaissance flying boats. The Do-X (see Aeroplane illus.) of 1929 was the largest aeroplane built to that date. The Dornier 217 (see illus. p. 132) was one of the standard bombers of the Luftwaffe. It was a high-wing monoplane usually fitted with two 1,600 h.p. B.M.W. radial engines. The wing span was 62 ft. 5 ins., and the fuselage (length 56 ft. 6 ins.) accommodated in the nose a crew of four and a heavy armament. Up to 5,550 lb. of bombs were carried further aft. The long slender lines of the earlier Dornier 17 suggested the nickname "flying pencil."

**Dornoch.** Royal, police, parli. burgh, and co. town of Sutherlandshire, Scotland. It stands near the entrance to Dornoch Firth, 58 miles by railway N.N.E. of Inverness, is a favourite summer resort, and has good bathing and golfing. The original cathedral (1222-45), of which only the tower survives, was restored in 1837, and became the parish church; it contains the tombs of the Sutherland family. Dornoch has remains of the former bishop's palace, destroyed in 1570. Near is Skibo Castle. Pop. 2,670.

**Dornoch Firth.** Inlet of the North Sea. It penetrates inland 22 m. between the co. of Sutherland on the N. and Ross and Cromarty on the S. At its entrance between Brora and Tarbat Ness, the distance is 11 m. The firth is a noted fishing ground, large quantities of cod and haddock being caught.

Dornoch and Bonar Bridge are the principal towns on its shores. Navigation is rendered difficult owing to bars and sandbanks. The shores are hilly and forested, except at Tarbat Ness, where they are sandy and low.

**Dorogobush.** Town of Russia, in the Western region of R.S.F.S.R. It is 55 m. E. of Smolensk, on the Dnieper, served by branch rly. It has trade in grain, flax, hemp, wax, skins, leather, wool, and glass. It was an old fortress, the earth ramparts of which are still standing, and has been occupied by Lithuanians and Poles. In the Second Great War the Russians evacuated Dorogobush after the fall of Smolensk on Aug. 14, 1941; they retook it Feb. 23, 1942; had to retreat in July; but finally stormed the town Aug. 30, 1943.

**Doronicum.** Flowering plant of the family Compositae, better known as leopard's bane (q.v.).

**Dorothy** (Gr. *dōron*, gift; *Theou*, of God). Feminine Christian name. It is a variant form of the less popular Dorothea, and its masculine equivalent is Theodore.

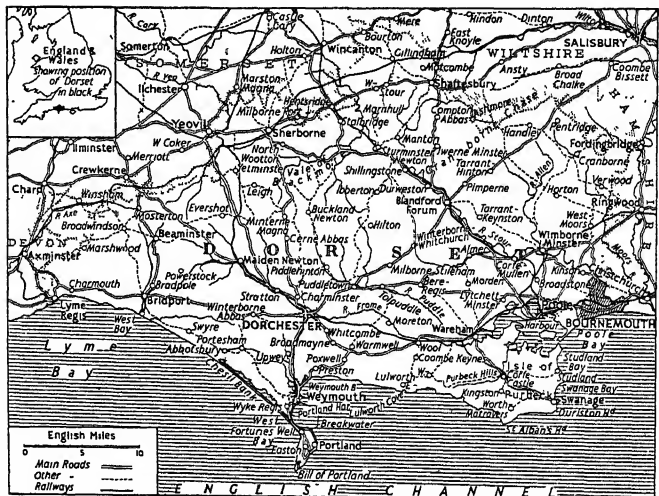

**Dorothy.** Comic opera written by B. C. Stephenson, and composed by Alfred Cellier. A comparative failure when first produced at the Gaiety, Sept. 25, 1886, it was transferred to the Prince of Wales's Theatre, and then to the Lyric, where it had a run of 931 continuous performances. At the Prince of Wales's the title rôle was played by Marie Tempest, and Geoffrey Wilder by Ben Davies. At the Gaiety, Hayden Coffin created the part of Harry Sherwood, and Arthur Williams that of Lurcher.

**Dorpat.** German name of the town of Estonia S.S.R. called in Estonian Tartu (q.v.).

**Dorset** or **DORSETSHIRE.** Southern maritime county of England. It has about 75 m. of bold and picturesque coast on the English Channel, of which the chief features are Chesil Bank, a shingle beach extending nearly 16 m. from West Bay to Portland Bill, St. Alban's Head (440 ft. high), and Poole Harbour. Chalk downs traverse the central and S. parts of the county, on which are pastured the celebrated Dorset horned sheep. The Frome (flowing to Poole Harbour), Stour, and Puddle are the longest streams. Dairy farming is important, the quality of Dorset butter being widely appreciated. Portland and Purbeck stones are largely quarried for building purposes. The cliffs and shore of Lyme Bay are of perpetual fascination to the geologist and here Mary Anning (q.v.) discovered remains of an ichthyosaurus. Fishing is engaged in, but little attention is given to manufactures. At Abbotsbury is a famous swannery. Dorchester is the county town; Poole and Weymouth, the largest, are the chief ports; Swanage and Lyme Regis holiday resorts; Wareham, Sherborne, and Shaftesbury of historic interest. In the N. is the Vale of Blackmore, with its genial climate and famous pastures. Many interesting antiquities include the ruins

Dorset arms

Dorset. Map of one of the principal dairying counties of the south of England. Dorset also produces the Portland and Purbeck stone

of Corfe Castle. Three M.P.s are elected, and one by Poole. Area, 973 sq. m. Pop. 239,352.

**LITERARY ASSOCIATIONS.** The county is particularly rich in these from the time of Aelfric the Grammarian, who was abbot of Cerne towards the close of the 10th century. John Hutchinson, historian of the county, was rector of Wareham; Thomas Spratt, poet and bishop of Rochester, was born at Beaminster; Edward Stillingfleet was born at Cranborne; George Crabbe was rector of Evershot; William Barnes, the dialect poet, was born at Rushay. Sir Thomas Wyatt was buried at Sherborne, Matthew Prior is believed to have been born at Wimborne, and Weymouth was the birthplace of Peacock. T. E. Lawrence was fatally injured in a road accident near Moreton.

Writers who have found inspiration in Dorset scenery and character include Fielding, who inherited the manor of E. Stour and took the vicar of W. Stour as model for Parson Adams in *Joseph Andrews*; Jane Austen, who set scenes of *Persuasion* in Lyme Regis; Wordsworth, who wrote much of *The Excursion* while staying at Race-down Lodge, near Pilsdon. M. E. Francis (Mrs. Blundell) wrote novels and short stories of Dorset life. The chief modern literary associations centre in the novels of Thomas Hardy, who was born at Higher Bockhampton; the Wessex of his books is centred upon the county of Dorset.

**Dorset, EARL, MARQUESS, AND DUKE OF.** English titles borne successively by the families of Beaufort, Grey, and Sackville. John Beaufort, earl of Somerset (d. 1410), the eldest son of John of Gaunt, was created marquess of Dorset in 1397. The title, however, was taken from him later, though in 1411 his brother, Thomas, was made earl of Dorset, being succeeded by his son Edmund in 1441, who was made a marquess, and later became duke of Somerset. His son Henry was beheaded in 1464, and the title became extinct. Thomas Grey (1451-1501), 8th Earl Ferrars and stepson of Edward IV, was created marquess of Dorset in 1475. His grandson, Henry (1510-54), was made earl of Suffolk and, being implicated in Wyatt's rising, was beheaded in 1554, and the title once more became extinct.

Thomas Sackville was created earl of Dorset in 1604. His grandson, Charles, the 6th earl, was the father of Lionel (1688-1761), the

7th earl, who was created duke in 1720. The duke was twice lord-lieutenant of Ireland. With the death of the 5th duke in 1843 the title became extinct. *See* Sackville.

**Dorset, THOMAS SACKVILLE, 1ST EARL OF (1536-1608).** English statesman and poet. Born at Buck-

Thomas Sackville,  
1st Earl of Dorset

hurst, Sussex, son of Sir Richard Sackville, chancellor of the exchequer, he was educated at Oxford and Cambridge, and called to the bar as a member of the Inner Temple. With Thomas Norton he collaborated in *Gorboduc* (also called *Ferrex and Porrex*), the first English tragedy in blank verse, acted 1561; and for vol. ii (1563) of *The Mirror for Magistrates* wrote the Induction and the Complaint of the Duke of Buckingham.

Sackville, whose work influenced Spenser, was Grand Master of Freemasons, 1561-67; and M.P. for Westmorland, 1558; East Grinstead, 1559; and Aylesbury, 1563. Raised to the peerage as Baron Buckhurst in 1567, he was made a P.C. and lord lieutenant of Sussex, 1569; was sent on political missions to France, 1568 and 1571; was commissioner at the trial of the fourth duke of Norfolk, 1572; and announced to Mary Queen of Scots the sentence of death, being thanked by her for the manner in which he discharged the duty. Ambassador to the Low Countries in 1587, he incurred the displeasure of Elizabeth, but received the Garter, 1591. Appointed lord treasurer, 1599, and created earl of Dorset, 1604, he died at the council table in Whitehall, April 19, 1608. His works were edited by R. W. Sackville-West, 1859.

**Dorset, CHARLES SACKVILLE, 6TH EARL OF (1638-1706).** English courtier and wit. He was born Jan. 24, 1638, son of the 5th earl, whom he succeeded in 1677. Two years previously he had been created 4th earl of Middlesex, having succeeded to the title and estates of his maternal uncle, the 3rd earl. After some travel abroad, he returned to England at the Restoration and became M.P. for East Grinstead. He was a favourite of Charles II, but left the court on that king's death. In the Second Dutch War of 1665 he was a volunteer, and his famous lyric, "To all you

ladies now at land," is said to have been written on the eve of the battle of Harwich, June 3. He supported the invitation to William of Orange to become king in 1688, and was made privy councillor, lord chamberlain, K.G., and a lord justice of the realm during William III's absence from England. Though a dissolute prodigal, Dorset was a generous patron of Dryden, Wycherley, and Prior. He died Jan. 29, 1706.

**Dorsetshire Regiment.** British regiment. Originally the 39th Foot, raised in 1702 and later amalgamated with the 54th Foot. The regiment first saw active service in India and earned its first battle honour at Plassey in 1757. For its part in the defence of Gibraltar in 1779-83 it earned the castle and key which now forms part of the badge; and in token of its distinction at Fort Marabout in 1801 was awarded the sphinx on the badge. The Dorsets also took

Dorsetshire Regiment badge

part in the Peninsular, Burmese, Mahratta, and Crimean Wars, and were at Ladysmith in the South African War. Thirteen battalions were raised for service in the First Great War, in which battle honours include Mons, Marne, Ypres 1915-17, Somme 1916-18, Hindenburg Line, Suva, and Shaiba. During the Second Great War, battalions of the Dorsets served in India and France; one battalion landed in Normandy on June 6, 1944 (D-day) and fought through the campaign in N.W. Europe to Berlin. The regiment's motto is *Primus in Indis*, a tribute to its early service in India. The depot is at Dorchester.

**Dorset Square.** London square. Built early in the 19th century, it is situated close to Marylebone railway terminus. It was named after the duke of Dorset, belongs to the Portman estate, and stands on the site of the original Lord's cricket ground.

**Dort, SYNOD OF.** Assembly of the Dutch Reformed Church, which met at Dordrecht in 1618-19 to discuss the chief points of controversy between the Calvinists and the Arminians. The meeting was largely brought about by political partisans, who saw a chance of forwarding their purposes by accentuating the bitterness of theological controversy. It was

notable as marking the turning point when Calvinism began to decline. The five points under discussion were election, the universality of redemption, free will, the operation of divine grace, and the perseverance of the faithful. The synod was largely occupied with disputes as to procedure, but finally adopted a large number of canons condemning Arminian teaching. See Arminianism.

**Dortmund.** Formerly one of the main industrial cities of Germany. The centre of the rich Ruhr coal area 50 m. E.N.E. of Düsseldorf, it was prosperous in the Middle Ages, later much reduced, and then had a rapid rise after 1900. Situated between two main rly. lines from Berlin to the West, linked with the North Sea by the Dortmund-Ems canal, and a junction of air lines, Dortmund was the ideal centre for most of Germany's heavy industries: mining, iron and steel, heavy engineering. Large breweries were widely famous. About 7,000 vessels arrived and departed every year from the canal port, with a turnover of nearly four million tons of goods. The pop. in 1939 was 537,000, tenth highest in Germany.

The narrowly built historic part of the city, surrounded by pleasant parks on the site of former walls, held the Reinoldi church of the 13th century, an outstanding building until heavily bombed in 1944; S. Mary's (12th century; slightly damaged); S. Peter's (14th century; unroofed); a 13th century town hall with many treasures (virtually destroyed); and the guild house (15th century). The Latin Tremonia, Dortmund was first mentioned in 899, became a seat of the emperors, and was distinguished by a special freedom of tax and duties. It was a centre of the Fehmgericht (*q.v.*). It joined the Hanseatic League, waged war on clerical rulers and, though impoverished during the Thirty Years' War, preserved its privileges and rank as a free city until 1803. Then it fell to the prince of Nassau-Orange, was incorporated into the grand duchy of Berg created by Napoleon, and in 1815 with Prussia. During 1923-24 it was occupied by French troops. In the Second Great War, the target of devastating Allied air raids, it was virtually destroyed.

**Dortmund-Ems Canal.** One of the most important canals in Germany. The small river Ems, which flows into the North Sea near

Emden, was canalised to a short distance above Lingen, and a canal was made to Dortmund, in the Ruhr coalfield. Barge navigation began in 1899 over the total length of some 150 m. The canal provides an outlet for the coal and metallic products of Westphalia, and is an alternative route to that provided by the Rhine.

The canal was frequently bombed by the R.A.F. during the Second Great War, the embankments being breached more than once during 1944-45. The canal was re-opened by British engineers in 1946.

**Dory** or **JOHN DORY.** Marine fish, *Zeus faber*, of the Zeidae family, common in the Mediterranean, the

Dory. Fish of the Zeidae family

English Channel, and St. George's Channel, and valued for the table. It is greatly compressed laterally, has a very large head, and is of repulsive appearance. Its yellowish colour, with metallic reflections, seems to justify the explanation of its name as a corruption of the French *jaune dorée*, yellow gilded.

**Dose.** In medicine, the quantity of a medicament ordered to be taken. The British Pharmacopoeia specifies minimum and maximum doses, but these are not final. The study of the quantities in which drugs should be administered is called posology.

**Doseh** (Arab. treading). Ceremony formerly observed in Cairo in connexion with the festival of the Mûlid en-Nebi, the birthday of the Prophet. It took place on the 12th day of the 3rd month of the Mahomedan year in the quarter of the city known as the Abbâsiyeh. Fifty or more of the Sa'diyeh dervishes lay close together on the ground and their sheikh on horseback rode over them. The horse trod upon each prostrate form twice, first with fore feet and then with hind feet. Meanwhile the spectators kept up the cry of "Allâh-lâ-lâ-lâ-lâh-lâh!" If a dervish was injured he did his best to conceal the injury. Those uninjured were regarded as specially

favoured by God. Deaths and injuries having attended the ceremony, it was suppressed by the khedive Tewfik in 1884.

**Dossi, GIOVANNI** (c. 1479-1542). Italian painter. Born in or near Ferrara, he and his younger brother Battista (d. 1548) studied under Lorenzo Costa at Bologna. Giovanni came under the influence of Titian and Giorgione and developed a completely romantic style of his own. The Madonna with Saints, originally in the church of S. Andrea at Ferrara, later removed to the museum of that town, is accounted Dossi's masterpiece; other fine paintings, some of which Battista painted in part, are preserved at Ferrara and Modena.

**Doss-megen-ora.** Group of mts. W. of Urumchi, Sinkiang, Central Asia, connected with the Tienshan range. It is over 19,700 ft. high, and the name means Loftiest of Mountains.

**Dost Mahomed Khan** (1793-1863). Ruler of Afghanistan. His brother, the vizier Futteh Khan, had raised Mahmoud Shah to the throne, but Mahmoud punished the vizier for a robbery committed by Dost. The vizier's eyes were put out, and later he was assassinated.

Dost Mahomed Khan, ruler of Afghanistan

Thereupon Dost led a revolt, as a result of which the kingdom was divided among Dost and his brothers, Mahmoud retaining only Herat. Dost's portion included Kabul, and here he ruled with great ability. He defeated the Sikhs and sought an alliance with England, but when the governor-general of India urged him to give up the attempt to recover Peshawar, he sought relations with Russia. War was declared against him in 1838 by the British, who marched to Kandahar and set up another ameer, Shah Shua. Dost fled to the mountains, was pursued, and in Nov., 1840, surrendered to the British. Two years later he was released, returned to Kabul and consolidated his throne. In 1855 Dost changed his policy of hostility and concluded an alliance with the British. He behaved with perfect loyalty all through the Indian Mutiny, and cooperated with the British in the war against Persia, 1862. He died suddenly, June 9, 1863, after capturing Herat.

**Dostoevsky, FEODOR MIKHAILOVITCH** (1822-81). Russian novelist. Son of a military surgeon, he was born at Moscow, Nov. 11, 1822, and left the St. Petersburg school of military engineering to enter the army. After a few years he resigned to devote himself to literature, and in 1846 published his first novel, known in England as *Poor Folk*. His political interests led him to associate with a group of political dreamers who surrounded Petrashevsky, and with them he was arrested in 1849. Exiled to Siberia, 1850-54, he spent three further years in the army after his return, and turned again to writing, embittered, suspicious, and morbid. In a succession of novels, *The Family Friend*, 1859; *The House of the Dead*, 1861; *The Insulted and the Injured*, 1862, he gave expression to his hatred of bourgeois society and his sympathy with the debased Russian working classes. Despite his success as a novelist in Russia and France, he remained poor, and ventures in newspaper editing only increased his difficulties. In 1867 he fled to Germany to escape his creditors, and lived chiefly at Baden-Baden, where he indulged his passion for gambling. Four years of feverish writing sufficiently restored his finances to enable him to return to Russia. His last years were prosperous, and he died at the height of his fame, Jan. 28, 1881.

Feodor Dostoevsky,  
Russian novelist

Dostoevsky inaugurated a new school of writing. Himself little influenced by other writers, he left an indelible impression on Russian literature. His genius came to fruition in *Letters from the Underworld*, 1864. In his earlier work it is possible to detect the influence of Balzac and George Sand and even the sentimentality of Dickens, but after his Siberian experiences his writing underwent a profound change. His vivid characterisation and deep insight into the psychology of emotion distinguishes the great series of works beginning with *Crime and Punishment*, 1866; continued with *The Gambler*, 1867; *The Idiot*, 1868-69; *The Possessed*, 1871; and ending with *The Brothers Karamazov*, 1880. In these he attempted to justify the ways of God to man, and in the first and

last of them achieves a power of expression which some critics think has never been equalled by any other novelist.

**Bibliography.** Dostoevsky's *Letters to His Wife*, trans. E. Hill and D. Mudie, 1930; Dostoevsky, E. H. Carr, 1931; Dostoevsky, G. Abraham, 1936; *The Breath of Corruption*, I. Roe, 1946; Dostoevsky, J. C. Powys, 1946.

**Dotheboys Hall.** In Dickens's novel Nicholas Nickleby, a private boarding school in Yorkshire. It was controlled by an ignorant bully, named Wackford Squeers, and his wife. Teaching was reduced to a farce and the pupils were starved. The description was no exaggeration. Some hints of this are found in *The Times* of June 29, 1838, the year in which the novel was published, in the form of two advertisements almost identical with that given in the novel. One of the schools advertised was near Kirkby Stephen, Westmorland, and the other near Richmond, Yorks. At both the fee was £20 per year for board, clothes, books, and instruction: there were "no extras and no vacations," and one of the masters "attended daily at the Saracen's Head," as Squeers is represented to have done. The original of Dotheboys Hall is understood to have been at Bowes, near Barnard Castle, by a personal inspection of which, in Jan., 1838, Dickens obtained his facts. The publication of Nicholas Nickleby hastened the end of such places.

Dotterel. A species of plover which breeds in Scotland

**Dotterel** (*Eudromias morinellus*). British bird of the plover family. It still breeds in Scotland, but is becoming rare in England. It is about nine inches long and is brown in colour with black and white markings. It is found on mountain sides and visits ploughed fields in search of grubs and insects.

**Douai** or **DOUAY.** Town of France, in the dept. of Nord. It is on the Scarpe, 18 m. S. of Lille. The hôtel de ville is a fine Gothic building. In the palace of justice the parliament of Flanders met. A museum houses a valuable collection of books, paintings, etc. The chief churches are S. Pierre, with its 16th century tower, and Notre Dame, dating from the 12th century, with altarpiece by Jean Bellegambe. There are a 15th century gateway, the old hall of the parliament of Flanders, and some old houses, but most of the buildings are modern. Douai has colleges and schools of all kinds, including a state college of agriculture. Its industries are mainly ironworking and engineering, the making of glass, chemicals, etc. There is a trade along the river and canals. Pop. 37,258.

Douai has been in existence since the time of the Gauls. Fortified in

Douai. Remains of the old fortifications. Upper picture, the Valenciennes gate, dating from the 15th century; lower picture, the Arras gate

the Middle Ages, it passed from Flanders to Burgundy, and then to Spain, but became French in 1713. During 1562-1793 there was a Roman Catholic university: the town is chiefly known for its English college

(1568–1903), where priests were trained to work for the conversion of England. The Old Testament of the Douai Bible was issued from here in 1610. In the First Great War Douai, with Lille, passed early into the hands of the Germans, who retained it until Oct. 17, 1918. When they realized they could no longer hold the town, the Germans fired several important parts, and entire destruction was prevented only by the rapid approach of the British 8th division. Douai was again occupied by the Germans in 1940 after the B.E.F. of the Second Great War had delivered a counter-attack between Arras and Douai on May 22. The town was liberated by the British 2nd army on Sept. 2, 1944. See Bible illus.

**Douala.** Town and district of French Cameroons, W. Africa. The town is situated on the Cameroons river about 18 m. from the sea, and is the chief seaport of Cameroons. Douala proper, i.e. the port and European quarters, occupies the site of the former Bell Town. Akwa is a large native centre and Dido the residential quarter for the native clerks and workmen employed at the port. These three towns, known collectively as Douala, represented the headquarters of the three native chiefs at the time of the German occupation in 1884.

Douala occupies a position of great importance with respect to maritime trade in W. Africa. The Northern rly. runs from Bonaberi, opposite Douala, northward, and will eventually be prolonged to a point on the Shari river. The Midland rly. leaves Douala in a southerly direction and runs to the Njong river. Douala may become the main outlet for French Equatorial Africa and the Lake Chad region. There is an extensive trade in palm oil and palm kernels, cocoa, and rubber. Douala was captured by a combined British and French force on Sept. 27, 1914. Pop. of district, 77,000; of town, 22,000. See Cameroons.

**Douarnenez.** Town of France. In the dept. of Finistère, it stands on Douarnenez Bay, 12 m. W.N.W. of Quimper, and manufactures fishing nets and ropes. There is an active coasting trade, and many of the inhabitants are engaged in the sardine fishery. Shipbuilding is a minor industry. Pop. 20,564.

**Douarnenez Bay.** Inlet of the N.W. coast of France. In the dept. of Finistère, it lies between Brest Harbour on the N. and Raz Point

on the S. It penetrates inland about 12 m., and is 6 m. wide at its entrance.

**Double.** Word used in several senses, notably for a person who closely resembles another. It is sometimes also used for a ghost. In a military sense, to double is to break into a slow run, i.e. a double march. To bring off a double is to back the winners of two big horse races, usually at a cumulative stake, e.g. the spring double, Lincolnshire Handicap and Grand National; Epsom double, Derby and Oaks; autumn double, Cesarewitch and Cambridgehire. Doubles at lawn tennis and similar court games are matches of two partners against two others—all men, all women, or mixed teams. At bridge a double, according to circumstances, is either an invitation to one's partner to make an overcall (take-out double), or a challenge to the declarer to make his contract (business double), which increases his reward for success or penalty for failure. In other card games, a double by dealer or banker requires the other players to put up double stakes.

**Double-acting Engine.** Mechanism in which pressure acts alternately on each side of the piston during both instroke and outstroke. Both ends of the cylinder must be sealed, and a piston-rod is necessary, passing through a stuffing box which prevents leakage past the rod to the atmosphere. In single-acting engines the pressure of the working fluid (steam, gas, or water) acts on one side of the piston for the outstroke only, the other side being exposed to atmospheric pressure. This simplifies construction of the engine, but limits the amount of power obtainable from a cylinder of a given size.

Steam engines are invariably double-acting, while the large majority of internal combustion engines are single-acting, since these work at much higher pressures and temperatures and problems of leakage and cooling are much more acute. Where great power is involved, however, as in marine oil engines with only a restricted space available, the engine is made double-acting. If also the two-stroke cycle is employed, considerably more power may be obtained than with the four-stroke cycle. Difficulties arise in connexion with adequate cooling, efficient scavenging of the exhaust gases, and correct

injection of the fuel, but these have been mostly overcome. Different types of both four-stroke and two-stroke double-acting engines are in operation, one of the largest developing 12,000 h.p. at 120 r.p.m. in 10 cylinders. See Diesel Engine.

**Double Bass,** sometimes called the bass. Largest and heaviest toned of the orchestral stringed instruments played with a bow. In

Double Bass. Short bow; upper picture, old-fashioned light bow

shape it appears to be a survival of the viol family, having the sloping shoulders and usually the flat back which characterise the viols. Double basses have three or four

strings, tuned as above. Their sounds would thus come an octave lower than the notes written, so that when the violoncello (*q.v.*) and the double bass play from the same notes the effect is of octaves instead of unisons, thus:

The bow retained its medieval shape until recently.

**Double Bassoon** OR CONTRA FAGOTTO. Largest and deepest toned of the wood-wind instruments, bearing the same relation to the ordinary bassoon as the stringed double bass does to the violoncello, but used much more rarely. It is a modern development of the bass shawm or pommer of the Middle Ages, made more convenient for handling by having the tube doubled twice. The side holes are all closed by keys. The useful compass is about

including all intermediate semitones, but skilled players can get

down to B flat below this lower note, and also reach a few notes above the upper G. The double bassoon is used in military bands as well as in orchestras.

**Double Chant.** Chant consisting of four phrases, introduced after the Restoration of 1660. The earlier Anglican chants, single chants, had two phrases only. *See* Chant.

**Double Concerto.** Musical composition scored for two solo instruments and orchestra. Examples are by J. S. Bach for two harpsichords and for two violins; by Mozart for violin and viola; by Brahms and by Delius for violin and violoncello.

**Double Counterpoint.** Counterpoint (*q.v.*) which will flow equally well with the parts inverted.

**Double Entry.** Method of book-keeping so called because every item is entered twice in the ledgers, once on the credit and once on the debit side. The totals, therefore, will always balance, unless an error has been made. It is this fact that makes this form of book-keeping so useful. *See* Book-keeping.

**Double Flat.** In music, a double flat (♭♭) lowers the note to which it is prefixed two semitones. Thus, on keyboard instruments

B double flat

has the same sound as

In theory, this is not quite accurate, but in practice it serves well enough. The double flat (♭♭) is contradicted by ♯♭, or simply ♭. *See* Flat.

**Double Refraction.** Property possessed by some minerals. All crystallised substances may be divided into two principal optical classes: isotropic in which light rays have the same velocity no matter what the direction of its vibration; (2) anisotropic, in which the velocity varies with the direction of vibration. In isotropic substances, when light passes from one medium to another the light wave is merely bent on a change in velocity. In anisotropic media, there are two wave systems set up, each travelling with a different velocity. All anisotropic substances are doubly refracting; the degree is technically expressed as the strength of their double refraction, or their birefringence.

This property is shown by all minerals of tetragonal, orthorhombic, monoclinic, and triclinic systems. Calcite is an example; and the high strength of its double refraction explains its use in the Nicol prism (*q.v.*). *See* Optics; Refraction.

**Double Sharp.** In music, the opposite of a double flat, raising a note two semitones. Its sign is a cross (×) instead of two ordinary sharps (♯♯). The double sharp (×) is contradicted by ♯♯ or simply ♯. *See* Sharp.

**Double Shear Steel.** Type of cutting steel originally used for making cloth cutter's shears. It is still employed for knives of superior quality, owing to its keen cutting edge after hardening. Shear steel is made by piling together and then forging cemented bars or blister bars each about 18 to 20 ins. long. The quality may then be improved by hammering the steel, breaking it through its centre, doubling it back on itself, reheating and re-forging to the required size. The product obtained, double shear steel, is more uniform in composition, and when hardened has a keener cutting edge. *See* Blister Bar; Steel.

**Double Standard.** In ethics, a demand for a higher standard of social and particularly sexual conduct on the part of women than is expected from men.

**Double Star.** For discussion of this phenomenon in astronomy, *see* Binary Star.

**Double Summer Time.** A measure introduced in Great Britain in 1941 by which in Great Britain the clock were advanced

Doubloon. Spanish American gold doubloon, dated 1687  
One-half actual size

two hours (instead of the one hour imposed by Summer Time). Its object was to save fuel and increase industrial production by the maximum use of daylight. The periods of double summer time for the war years were: 1941, May 4–Aug. 10; 1942, April 5–Aug. 9; 1943, April 4–Aug. 15; 1944, April 2–Sept. 17; 1945, April 2–July 15. It was revived in 1947, from April 13–Aug. 10, again to save fuel. *See* Summer Time.

**Douplet or Pourpoint.** Tightly fitting body garment worn by men,

Douplet. Front view of the garment as worn in the 16th century

reaching from the neck to a few inches below the belt. Worn from the 14th to the 17th century, it probably took its name from the fact that it was double and padded (*see* Bombast). The sleeves were sometimes separate articles attached to the shoulder with strings. *See* Costume.

**Double Tenth.** Name sometimes given to the tenth of October (10th month), referring especially to Oct. 10, 1911, when the revolution broke out at Hanyang which was to inaugurate the Chinese republic.

**Doubling.** Conversion of single-strand yarn into ply yarns, whether two-fold or a larger number of folds. A cotton doubler receives single yarn from the spinning mill and turns it out as plied, cabled, or fancy yarn.

In drawing or reducing worsted preparatory to spinning, doubling takes place when slivers of partly drawn material are combined together and re-drawn to equalise the composition of the whole. *See* Spinning.

**Doubloon** (Span. *doblón*, double). A Spanish gold coin originally worth two pistoles, or about 34s. Another doubloon, the *doblón de Isabel*, value 20s. 8d., was issued 1848–68.

**Doubs.** River of France. A tributary of the Saône, it rises in the Jura Mts. and follows a very winding course until it falls into the larger river at Verdun, Saône-et-Loire. For some little way its course is in Switzerland, and for about 30 m. it divides France from that country. On it stands the frontier town of Pontarlier, larger places on its banks being Besançon and Dôle. It flows through some wonderful mountain scenery, and forms the lake of Chaillexon. Its length is 260 m. Part of its course is included in the Rhine-Rhône canal. Its chief tributary is the Loue. *See* Besançon illus.

**Doubs.** Department of E. France. Named from its chief river, it has Switzerland as a frontier on the E. and N.E. Its area is 2,052 sq. m., and it is divided into four arrondissements. Mainly moun-

tainous, with a section of the Jura Mts., it has a plain in the N. There the soil is fertile and the agricultural output includes cattle and dairy produce, especially cheese, as well as wheat, oats, wines, fruit, etc. Elsewhere the ground is not very productive. Much of it is forest land, while peat bogs are numerous. Building stone, iron, gypsum, and salt are found. In addition to the Doubs the chief rivers are the Dessoubre and the Loue. Besançon is the capital; other towns are Montbéliard and Pontarlier. Before the Revolution much of the dept. was part of Franche Comté. Pop. 298,255.

**Douche** (Fr., shower bath). Jet or current of water directed upon the body or its cavities for purposes of cleansing or treatment. Astringent or antiseptic substances may be thus used.

**Doughty**, CHARLES MONTAGU (1843-1926). A British author. He was born Aug. 19, 1843, and

Charles Doughty,  
British author

as a young man indulged his love of travel by wandering through Europe and N. Africa. In Nov., 1876, he started from Damascus with a pilgrim caravan, later attaching himself to groups of wandering Bedouin, reached the oasis of Khaibar, and after enduring hardships and perils gained the Arabian coast at Jidda, Aug., 1878. Ten years later he published *Travels in Arabia Deserta*. Of great general interest for its descriptions of an unknown country, and of archaeological and geological importance, this work was above all notable for the creation of a new prose style, based on the principle of Elizabethan simplicity. Doughty's later output was exclusively poetic, and included *The Dawn in Britain*. 1906; *The Titans*, 1916; and *Man-Soul*, 1920. In all three works the same qualities of style are apparent. Doughty died Jan. 20, 1926. An abridged edition of *Arabia Deserta* was published that year. There are biographies by B. Farley, 1927; D. G. Hogarth, new ed. 1932.

**Douglas**. American aircraft co. founded by Donald W. Douglas in 1920. Four years later Douglas aircraft of the U.S. army completed the first round-the-world flight. In the Second Great War the factories

at Santa Monica, Calif., and elsewhere, produced a succession of outstanding military aeroplanes, notably the Boston (*q.v.*), Havoc (*q.v.*), Dakota (*q.v.*), and Sky-master (*q.v.*).

**Douglas**. Capital of the Isle of Man, a mun. bor. and a watering-place. It stands on Douglas Bay, at the union of two streams, the Dhoo and the Glass. Among its attractions are a promenade, 2 m. long, good sands, bathing, and boating. It has three piers and a harbour, public baths, and facilities for all kinds of sport. Dancing halls are a feature, and there are several theatres and cinemas.

S. George's, built 1761-80, is the oldest of the churches; other are S. Thomas's, S. Ninian's, and a fine R.C. church. The buildings used by the government of the island include the legislative buildings and court house; there are also the town hall, public library museum, and art gallery, while the corporation, one of mayor, aldermen, and councillors on the English model, owns the water supply, market, tramways, drainage system, etc. Douglas is connected by steamer with Liverpool, Fleetwood, Barrow, Glasgow, Belfast. Electric tramways connect it with Ramsey and Laxey. The Villa Marina, an estate of eight acres, has been bought and the grounds laid out. Visitors go to Douglas Head, a promontory with a lighthouse at the S. of the bay, reached by a steam ferry from the pier. In the bay is a tower of refuge.

Douglas was made a mun. bor. in 1895. It was a mere fishing village until its value as a health resort made it popular in the 19th century. During the Second Great War an internment camp for civilian enemy aliens was established here. The town was also a boys' training centre for the Royal Navy, headquarters of the R.A.F. No. 1 school of ground gunnery, an R.A.F. regiment depot, and had a school for aircraft recognition. Market day, Sat. Pop. 20,012.

**Douglas**. Parish and village of Lanarkshire, Scotland. It stands on Douglas Water, 11 m. S.S.W. of Lanark, with a rly. station. Of the 12th century church of S. Bride, the burial place of the Douglas family, the choir and spire survive, while of the ancient castle (Scott's Castle Dangerous) the tower alone remains. Coal is worked in the vicinity. Pop. 2,948.

**Douglas**. Famous Scottish family, now represented by the dukes of Hamilton and Buccleuch, the marquess of Queensbury, the earls of Home and Morton, and others. The name is taken from Douglas in Lanarkshire, and the word in Gaelic means dark water. The earliest lands of the family were in Lanarkshire, some being still owned by the earl of Home, but the great power of the Douglasses was in Galloway.

In the 12th century there lived a William of Douglas, whose grandson, Sir William, being the chief man in that place, called himself lord of Douglas. He owned land in seven counties, as also in

Douglas, Isle of Man. View of this popular holiday resort from Falcon Cliff, showing the sands and the two-mile-long promenade  
Courtesy of L. M. S. Rly.

Northumberland. He was Edward I's prisoner when he died, 1298. More famous was his son, Sir James, known as the Good, and also as the Black, Douglas. He was a staunch friend of Robert Bruce, and led many raids into England. His deeds are told by Froissart and Scott. He was killed in Aug., 1330, in Spain, on the way to the Holy Land.

The Douglas lands came after a time to Sir William Douglas, made earl of Douglas in 1358, and through his wife also earl of Mar. He, too, was actively concerned in feuds and warfare. His son James was a son-in-law of Robert II, and is the Douglas of the ballad of Chevy Chase and the battle of Otterburn. He left no legitimate sons; his lands, with the earldom, passed to a natural son, Sir James Douglas, called the Grim, a great figure on the marches of Scotland.

His son Archibald, 4th earl, was made duke of Touraine by the French king, and was killed at Verneuil in 1424. William, 6th earl, was put to death when quite a youth in 1440, and for a time the family power was broken, this being the object sought by the rulers of Scotland. Some of the estates were seized by the crown; to others, and also to the earldom, a kinsman, James, succeeded. Then came his son, William, who, by marrying a cousin, added another Douglas property to his lands. He was murdered by James II, and with the death of his brother in 1488 the main branch of the family and the title of earl of Douglas became extinct.

The family, however, flourished in other branches. The 1st earl had an illegitimate son, George, who became earl of Angus. The 4th earl obtained some of the Douglas lands when they were forfeited in 1455. The 5th earl of Angus was Archibald, known as Bell the Cat, a great figure of his time, and the 6th was the husband of Margaret Tudor, widow of James IV, and sister of Henry VIII. From him the title passed eventually to William, the 11th earl, who was made marquess of Douglas, 1663.

In 1703 the 3rd marquess was made duke of Douglas. He died without sons in 1761, his death leading to the famous Douglas peerage case between the two sons of the duke's sister and the duke of Hamilton. The sons were said to be impostors, but in 1769 the survivor won his case before the house of lords. He was made Baron Douglas in 1790. Another branch represented by the earl of

Morton is descended from Sir James Douglas of Dalkeith. The dukes of Queensberry of the past were descended from Sir James Douglas of Drumlanrig, as is the present marquess of Queensberry. Castlemains Douglas in Lanarkshire is the property of the earl of Home. In the town of Douglas is the church of S. Bride in which many of the Douglases are buried. See Hamilton, Duke of; Home, Earl of; Queensberry, Marquess and Duke of.

**Douglas, LORD ALFRED BRUCE** (1870-1945). British poet. A son of the 8th marquess of Queensberry, he was born Oct. 22, 1870, and educated at Winchester and Magdalen College, Oxford. As a young man he was exceptionally brilliant, and became a close

Lord Alfred Douglas, British poet

friend of Oscar Wilde (*q.v.*). As a result of the Wilde trial in 1895, he became embittered and quarrelsome; in 1923 he was imprisoned for a libel on Winston Churchill. His first book of poems, *The City of the Soul*, 1899, while revealing the influence of Rossetti and Dowson, showed him as a poet of remarkable promise. He imposed upon himself a poetic form of the most rigid discipline, *i.e.* the Petrarchan sonnet; the sonnet-sequence *In Exile*, 1924, was his most mature as well as his finest achievement as a purist. Editor of *The Academy*, 1907-10, he started in 1920 a weekly paper, *Plain English*, with which *The Academy* was incorporated. His other works include *Oscar Wilde and Myself*, 1914. Collected Poems appeared in 1919; *Autobiography* in 1931, in which year P. Braybrooke published *A Life and Work*. Lord Alfred died at Lancing, March 20, 1945.

**Douglas, SIR CHARLES** (d. 1789). British sailor. Descended from a younger son of the 6th earl of Morton, he entered the navy and was promoted lieutenant in 1753. In 1759 he served in the St. Lawrence and at Quebec, and in 1775 forced a passage through the ice-bound St. Lawrence and relieved Quebec, for which service he was made a baronet in 1777. In the *Formidable* he accompanied Sir George Rodney to the W. Indies, and the victory of the Saints (1782) was largely due to his advice. In 1783 he was com-

mander-in-chief in N. American waters, being there until 1786. In Jan., 1789, he was again appointed, but in Feb. he died suddenly. Douglas introduced many improvements in naval gunnery.

**Douglas, CLIFFORD HUGH** (b. 1879). A British engineer and economist. Born Jan. 20, 1879, and educated at Pembroke College, Cambridge, he became chief engineer to the British Westinghouse company in India and helped to build the Buenos Aires and Pacific rly. in S. America. After the First Great War he went to Canada. There Major Douglas, in books about his system of social credit, secured a reputation as an economist, and was called as a witness by the Macmillan committee in 1930. He saw the cause of social and economic ills in the failure of industry to distribute in wages enough money to buy back production. In 1935 as chief reconstruction adviser to the government of Alberta he introduced a scheme by which each citizen was to receive a basic monthly dividend of 25 dollars in non-negotiable certificates. A proposal by the provincial government in 1938 to adopt the full social credit programme was vetoed by dominion authorities. See Social Credit.

**Douglas, GAWIN OR GAVIN** (c. 1474-1522). Scottish poet and bishop. Son of the 5th earl of Angus, educated at St. Andrews, he became bishop of Dunkeld in 1515, and in 1520, on the fall of his nephew, the 6th earl, he fled to England and died suddenly in London of the plague. He was buried in the church of the Savoy. Douglas wrote two allegorical poems, *The Palace of Honour*, owing something to Chaucer, and *King Hart*. His translation of Virgil's *Aeneid* into Scottish verse was the earliest into any British dialect. Douglas's works were edited by John Small, 4 vols., 1874.

**Douglas, JAMES** (1867-1940). British journalist. He was born in Belfast, Feb. 9, 1867, and after a long journalistic career was appointed editor of the *Star*. In 1920, on the formation of the *Sunday Express*, he became its editor, a position he retained until 1931. In weekly articles, which he continued after he had left the editorship, he constituted himself an emotional guardian of contemporary morality, particularly in the arts. His publications included *The Man in the Pulpit*, 1905; *Down Shoe Lane*, 1930; *The Bunch Book*, 1932. He died Sept. 25, 1940.

**Douglas, JOHN WILLIAM HENRY THOMAS** (1882-1930). An English cricketer. Born Sept. 3, 1882, he was educated at Felsted and excelled as a boxer; he won the middle-weight amateur title at the 1908 Olympiad. Playing cricket for Essex from

J. W. H. T. Douglas, English cricketer

1901, he was captain from 1911. In the M.C.C. tour of Australia, 1911-12, he became captain on P. F. Warner's illness, and was chosen captain in 1920-21. During the Australian visit in 1921 he was superseded by Lionel (Lord) Tennyson. Douglas was a good fast bowler and a valuable defensive batsman (an Australian wag said his initials stood for Johnny Won't Hit To-Day). He met an heroic death in the North Sea, trying to save fellow-passengers in a shipwreck, Dec. 19, 1930.

**Douglas, LEWIS WILLIAMS** (b. 1894). American diplomat, born July 2, 1894, at Bisbee, Ariz. After education at Amherst College and Massachusetts institute of technology, he was elected to the Arizona state legislature in 1923. In 1926 he entered the house of representatives as a Democrat, and in 1933 joined F. D. Roosevelt's administration, but resigned after 18 months. Principal and vice-chancellor of McGill University, Canada, 1938-39, and president of the Mutual Life Insurance co. of New York, 1940, he was in London in 1942, assisting with lease-lend, and later became deputy director of the U.S. war shipping administration. In 1945 he helped to organize policy in the U.S. occupation zone of Germany. He was appointed U.S. ambassador to Great Britain, Feb. 26, 1947.

**Douglas, NORMAN** (b. 1868), British author. He published his first collection of short stories, *Unprofessional Tales*, in 1901, and *Siren Land* in 1911. With *South Wind*, 1917, he established his reputation as a brilliant satirist. A psychological study of island society (the scene of the novel suggested Capri), *South Wind* became a modern classic and inspired a school of imitators. Douglas's deep knowledge and appreciation of the Mediterranean countries pervaded much of his work. Later books included *Together*, 1923; *Experiments*, 1925; *Old Calabria*, 1928; *Late Harvest*, 1946. He

published an autobiography, *Looking Back* (2 vols.), 1933, and an *Almanac*, 1945.

**Douglas, STEPHEN ARNOLD** (1813-61). American politician. Born at Brandon, Vermont, April 23, 1813, the son of a doctor, he settled in Illinois, and as a lawyer had soon a large practice. He became a leader among the Democrats; in 1836 he entered the legislature of the state; in 1840 was its secretary, and in 1843 was sent to the house of representatives. He remained there until 1847, and from then until his death he was a member of the senate.

Douglas took a vigorous part in every controversy, and was especially keen on advocating extension of territory, whether by conquest or expansion. On the slavery question Douglas was from the first a supporter of the doctrine of popular sovereignty, i.e. the right of each state to decide for itself whether it would have slaves or not. This was the policy of the measure of 1854 by which, in opposition to the Missouri Compromise (g.v.), Kansas and Nebraska were admitted to the Union, and of it Douglas was the author.

In 1858 began his verbal duel with Lincoln, by which he is perhaps chiefly known. Both were candidates in Illinois for the senate, the contest between them being made more piquant by the physical contrast between the tall, gaunt figure of Lincoln and the tiny frame of "the little giant." They met in debate in various places, Douglas declaring for popular sovereignty; Lincoln for the right of the Union to abolish slavery in any state. Douglas won the seat; and then in 1860 the two were again pitted, this time for the presidency, Douglas being badly beaten. When war broke out, Douglas supported Lincoln in opposing secession. He died at Chicago, June 3, 1861. Consult S. A. D.; a study in *American Politics*, A. Johnson, 1908.

**Douglas Fir** (*Pseudotsuga douglasii*). Tall evergreen tree of the family Coniferae. A native of N. America, it attains a height of 100-300 ft. Its needle-like leaves are flat, with two white lines on the lower surface, and are spirally arranged on the twigs. The pendulous, oval cones, which vary in length from 2-4½ ins., have scales with three-pronged ends, of which the middle prong is much longer and narrower than the others. A specimen 214 ft. in height was made into a flagpole standing in Kew Gardens, Surrey. The deep yellow timber is strong and durable.

**Douglas of Kirtleside, WILLIAM SHOLTO DOUGLAS, BARON** (b. 1893). British air officer. Born

Lord Douglas, British air force officer

Dec. 23, 1893, he was educated at Tonbridge and Lincoln College, Oxford. In 1915 he served in the R.F.C., and later commanded No. 22 wing, H.Q. A squadron leader from 1920, he was commander R.A.F. station, North Weald, 1928; instructor at Imperial Defence College, 1932-35; director of staff duties, air ministry, 1936-37; deputy chief of air staff, 1940.

In Nov., 1940, he took over fighter command, and next year was knighted. He introduced intruder aircraft operations: pilots of fighter command went over to enemy air bases at night and waited for opportunities to strike at German bombers returning from, or setting out on, raids. In 1944 Sir Sholto became A.O.C.-in-C., coastal command. In 1945 he was air c.-in-c., British air forces of occupation. Promoted marshal of the R.A.F., 1946, he followed Lord Montgomery that year as c.-in-c., British forces in Germany, and military governor of the British zone until 1947. Raised to the peerage in 1948, he was appointed chairman of B.E.A. in 1949.

**Douglass, EARL** (1862-1931). American geologist. Born at Medford, Minnesota, Oct. 28, 1862, he was educated at the university of Dakota. For some years he was a teacher, devoting himself also to geology and palaeontology, on which he began to lecture in the university of Montana in 1890. From 1900 to 1902 he was a fellow of Princeton. In 1901 he began research work in the domain of vertebrate palaeontology under the auspices of the Carnegie museum at Pittsburgh, and in 1909 he made a valuable discovery of dinosaurs near Jensen, in Utah. He died Jan. 13, 1931.

**Douglass, FREDERICK** (1817-95). American anti-slavery lecturer. A mulatto, his mother being a negress, he was born at Tuckahoe, Maryland, and brought up as a slave. Having escaped from his master, a Baltimore shipbuilder, in 1838, by a speech at Nantucket he attracted the notice of the Massachusetts anti-slavery society, which appointed him one of its lecturers. In England, 1845-47, he did

much to enlist sympathy with his campaign for the abolition of slavery. He was the founder of two successful newspapers, the *North Star*, 1847, renamed (1850) *Frederek Douglass's Paper*; and the *New National Era*, 1870. He was U.S. minister to Haiti, 1889-91. He died Feb. 20, 1895.

**Doukhobors** or ДУКХОБОРЫ. A Christian community of non-conforming peasants established in Russia in the middle of the 18th century. The sect practises peace and equality and is opposed to military service. Adherents counsel silent prayer and attach small weight to outward ceremony. Their refusal to recognize man-made laws led to banishment to Transcaucasia by Nicholas I in 1850. In 1895 the male members of the sect were called up for service in the Russian army and showed disapproval by burning their weapons and equipment; they were relentlessly persecuted by the Russian government.

Through the offices of Count Tolstoy and the Society of Friends in England the Doukhobors were permitted to emigrate from Russia in 1899. Eventually about 15,000 settled in British Columbia and Saskatchewan, where the Canadian government granted them 450,000 acres. Though the dominion later took back 360,000 acres, the Doukhobors became a wealthy community and now own property valued at £5,000,000. The sect frequently fell foul of the law in Canada by parading naked, refusing to pay taxes, and burning schools and bridges. In 1945, at a convention at Vancouver they renounced their more extreme practices. The name means spirit fighters, and was applied to the sect by the Russian Orthodox church as a suggestion that Doukhobors warred against the spirit of God.

**Doullens.** Town of France, in the dept. of Somme. It is 17 m. by rly. S.W. of Arras, on the river Authie, and is normally the centre of a trade in phosphates. During the First Great War its central position behind the British lines made it important, and it was here that, after the retreat of March, 1918, the Allied powers placed Foch in supreme command, March 26. A cemetery contains 1,700 graves of British soldiers.

**Doulton, SIR HENRY** (1820-97). A British pottery manufacturer. Born in Lambeth, July 25, 1820, he was educated at University College School, and joined the business of his father, a potter. About 1867 the firm began to

make the ware by which the name is widely known. In 1897 the firm employed over 4,000 persons, and had branches at Burslem, Paisley, Paris, and elsewhere, in addition to the large works at Lambeth. A school of art was opened in connexion with the business. Doulton, who was knighted in 1887, did a great deal to develop artistic pottery. He died Nov. 18, 1897.

**Doulton Ware.** China, stone, and earthenware manufactured in the Doulton potteries at Lambeth, Burslem, Rowley Regis, St. Helens, and Paisley. The firm was founded in 1815, when John Doulton and John Watts acquired an interest in a small pottery in Vauxhall Walk, Lambeth. Doulton had served his apprenticeship at Fulham Pottery, once the working place of John Dwight, master potter of the 17th century. In 1820 Doulton and Watts became sole owners of the business, and in 1826 moved from Vauxhall Walk to Lambeth High Street.

At first the firm was solely concerned with turning out salt-glazed stoneware for industrial and domestic purposes. About 1860, however, Henry, son of John Doulton, started experiments in the production of enamel glaze. At the London international exhibition in 1862 he showed products of a strictly utilitarian nature, well formed but simply decorated vases, jugs, etc. About 1867 came pieces decorated by the sgraffito method—scratched ornamentation filled in with colours. Later, the ornamentation was applied by thin layers of coloured clays, which led to the adoption of the *pâte-sur-pâte* process.

The manufacture of architectural terra-cotta, medallions, and little figures, also falence, was next introduced. The "Lambeth falence" art ware came in 1872; this has a softer body, the biscuit being dipped in coloured glazes and again fired. "Carrara" was first introduced for decorative pieces, but was soon adapted to architectural work. It has a hard, white body, covered with an opaque egg-shell enamel, which takes subdued colours. Dry impasto or vitreous fresco, used for wall decorations, has no gloss, the coloured enamels being painted on terra-cotta slabs.

Stoneware polychrome, having a harder body, and the enamels being painted in clay slabs or blocks before firing, is suitable for outdoor work. Both types are decorated with conventional designs as well as with all kinds of figure pieces.

In 1877 Doulton's acquired an old-established earthenware pottery at Burslem. Here, after long and patient research, secrets of glazing, once known to the old Chinese but hitherto baffling Western potters, were rediscovered. In 1884 the Lambeth works began the manufacture of fine bone china. In 1885 the Society of Arts awarded Henry Doulton the Albert Medal, and two years later he was knighted.

Different methods of decoration are often used on the same pieces of Doulton ware, the sgraffito and *pâte-sur-pâte* and coloured slip framing to hand-painted panels being frequently combined in order to produce desired effects. In all this art work Sir Henry Doulton took a leading part, introducing modellers and painters from the adjacent Lambeth school of art. Most important pieces are signed with the initials of the artists, among whom are numbered George Tinworth (specially known for his modelled figure ware and terra-cotta slabs), the Misses Barlow, W. Gandy, and J. Broad.

In 1925 the production of stoneware pipes was transferred from the original works at Lambeth to a new pottery at Erith, where soon another pottery was established to make large chemical stoneware plants. A rail insulator for use on electric railways, introduced by Doulton's in 1904, is now standard for London underground rlys. and electrified lines at home and abroad. Doulton's

Doulton Ware. Pots and bowls in Lambeth salt-glazed stoneware

developed new stoneware bodies, including heat and thermal shock-resisting stoneware, and special porous ceramic media for filtration, aeration, and electrolytic processes. Standardised insulators are made for switchgear, marine broadcasting, bathing room installations, etc. Doultton House, on a site near Lambeth bridge, was completed in 1940. *Consult:* A. B. C. of English Salt-glazed Stoneware from Dwight to Doultton, J. F. Blacker, 1922.

**Doumer, PAUL** (1857-1932). French statesman. Born at Aurillac, March 2, 1857, he became a professor of mathematics, a journalist in Paris, and was elected a deputy in 1888. As finance minister in 1895 he tried vainly to impose an income tax. He was a successful governor-general of Indo-China, 1897-1902. He was president of the chamber in 1905, defeated by Fallières for the presidency of the republic, became a senator in 1912, a minister of state 1917, and chief of the senate 1927. Elected in 1931 to succeed Gaston Doumergue (*v.i.*) as president of France, he enjoyed office only a few months, being shot dead by a crazy fanatic, Gorguloff, on May 8, 1932. *Pron.* Doo-mair.

Paul Doumer, French statesman

**Doumergue, GASTON** (1863-1937). French statesman. He was born at Aigues-Vives, near Nîmes, Aug. 1, 1863, and after being educated at the lycée of Nîmes entered the legal profession. In 1893 he was elected to the chamber of deputies as member for Nîmes, becoming minister for the colonies in 1902. Senator from 1910, Doumergue held various offices under many leaders before being elected president of the senate in 1923. In June, 1924, he succeeded Millerand as president of the republic, being the first Protestant to hold that office. Retiring into private life at the ex-

piration of his term, 1931, Doumergue was recalled as prime minister after the Stavisky riots of Feb., 1934. He balanced the budget by drastic economies, but in Nov. a new crisis was provoked by his insisting on a scheme of parliamentary reform. His cabinet fell and he retired once more, dying at Aigues-Vives June 18, 1937. *Pron.* Doo-maig.

**Doune.** Police burgh of Perthshire, Scotland. It stands on the Teith, which is here crossed by a twin-arched bridge erected in 1535, 45 m. N.W. of Edinburgh, on the railway. Doune Castle, now a ruin, was occasionally a royal residence, and was defended for Prince Charles by a nephew of Rob Roy, 1745 and dismantled after the battle of Falkirk, 1746. Pop. 822.

Douw. The Young Mother, typical of this Dutch painter's work

**Dourine.** Disease of horses caused by a trypanosome resembling those causing sleeping sickness in man. It is a serious menace in parts of Africa, and is passed from one animal to another at mating.

**Douro** (Sp. *Duero*; anc. *Durius*). River of Spain and Portugal. Rising in the prov. of Soria, S.E. of Burgos, it curves E. and S., then flowing S.W. past Soria, Valladolid, and Zamora, enters Portugal, of which it forms the frontier for 65 m. Running W. for most of its length, it enters the Atlantic near Oporto, after a course of 485 m. With its tributaries, of which the chief are the Esla, Pisuerga, Tua, and Tormes, it drains an area of some 37,000 sq. m. Much impeded by rapids, it is navigable for about 90 m.; is subject to inundations, and its mouth is partly blocked by a bar. It abounds in trout, lampreys, and shad. Its lower course is used for transporting wine from the Paiz do Vinho by sailing-boats to Oporto.

Douroucouli, *Nyctipithecus trivirgatus*, a South American monkey

**Douroucouli.** Group of small nocturnal monkeys, common in South America. They are thick and compact in body, with close fur and rather bushy tails, round heads, and large eyes. The eye-

sockets occupy almost the entire width of the skull. The thumb is relatively short. They live in trees and feed on insects. *See* Monkey.

**Douw** or **DOW**, GERARD (1613-75). Dutch painter. He was born at Leyden, April 7, 1613, studied under the engraver Dolendo, and the glass-painter Pieter Kouwenhoven, and finally entered Rembrandt's studio, where he learned much of his master's treatment of light and shade. Later, however, he developed a minuteness in his work that precluded more than a general application of Rembrandt's principles. The pseudo-realism of his genre pieces has been likened to the pseudo-democracy at that time of the Dutch republic. His paintings include *Dropsical Woman* (Louvre), *Young Man* (The Hague), *Poulterer's Shop* (National Gallery, London). Douw died Feb. 9, 1675.

**Dove.** Name applied vaguely to various species of pigeon (*q.v.*). In Great Britain the stock dove, rock dove, and turtle dove are familiar examples.

Dover, Kent. View from the cliffs (1946), showing the harbour and, left, Dover Castle, standing 375 ft. above the sea. Within the castle precincts are the remains of a Roman lighthouse and a Saxon fortress, while the keep is Norman

**Dove.** Symbolic representation of the Holy Ghost. From an early period the dove has been thus used in Christian art, in accordance with S. Luke's narrative (3, v. 22) of the baptism of Jesus. It was painted white as the emblem of purity, and sometimes a nimbus was placed round its head. Its figure may be seen on many baptismal fonts, and in Roman Catholic churches the pyx, or box which holds the Host, is frequently made in the form of a dove.

**Dove.** British aeroplane type, designed by the De Havilland co. Known also as the D.H.104, the Dove was introduced shortly after the end of the Second Great War for feeder air-lines or similar civil use. Fitted with two D.H. Gipsy Queen engines of 330 h.p., the Dove was a low-wing monoplane (span 57 ft.) with single fin and rudder and retractable tricycle undercarriage. It accommodated 11 passengers and had a maximum speed of 200 m.p.h.

**Dove.** River of Derbyshire and Staffordshire, England. It rises on Axe Edge and flows between the two counties in a S. and S.E. direction to join the Trent after a course of 45 m. Some of the upper reaches are National Trust property. Dove-dale is a famous beauty spot. The lower course meanders through alluvial marshes.

**Dove.** HEINRICH WILHELM (1803-79). A German scientist. Born in Liegnitz, Oct. 6, 1803, he was in 1826 professor at Königsberg. From 1829 he held a professorship in Berlin, and in 1848 was appointed director of the newly established Royal Meteorological Institute. He died April 4, 1879. His main work was the study of meteorology, on which he wrote many treatises.

**Dove-flower** (*Peristeria elata*). Blossom of an epiphytal plant of

the family Orchidaceae. A native of Central America, it is the *Esperitu Santo* or Holy Ghost flower of the Spaniards. The central parts of the white flower bear a resemblance to a dove with extended wings.

**Dover.** Mun. bor., seaport, and market town of Kent, England. One of the Cinque Ports, it stands on the Strait of Dover, 77 miles E.S.E. of London by the main line rly. It is the port of departure for the mail-packet service to France, and a port of call for trans-Atlantic and other liners.

Dover arms

The castle, situated to the N.E. on a cliff 375 ft. above the sea, has a Norman keep and remains of a Saxon fortress; within its precincts are a pharos or light tower and a fortress church. Among public buildings are the town hall (1883), adjoining the old Maison Dieu founded in the 13th century by Hubert de Burgh; Duke of York's military school; and two ancient and several modern churches. Near the site of the round church of the Knights Templars (enclosed at the beginning of the 19th century) stood the Bredenstone, where was held the court of Shepway. Dover College buildings include a Benedictine gatehouse (1132). The rly. from Folkestone to Dover passes through three tunnels, one being pierced in Shakespeare's Cliff (350 ft.).

The harbour, greatly improved since 1891, is enclosed by the Admiralty Pier (1,360 yds.), the Eastern Arm (1,100 yds.), and the Southern Breakwater (1,430 yds.), the last-named being  $\frac{1}{2}$  m. from shore. The works represent a massive line of masonry  $2\frac{1}{2}$  m. in extent and enclosing 690 acres of

water. Known as the National Harbour, this was opened in 1909. The Prince of Wales Pier was opened in 1903. A train ferry dock completed in 1936 enabled goods and passenger trains to be transported to Dunkirk without unloading. Paper making and flour milling are industries. Market day, Sat. Pop. est. 32,000.

Dover (*Duris* or *Dubris*) has taken a prominent part in English history. Here King John made submission to the pope in 1213; three years later the castle successfully withstood a siege by the French; a naval battle was fought off the coast in 1217, in which the Cinque Ports squadron defeated a fleet commanded by Eustace the Monk. Charles II landed here at the Restoration in 1660. The Treaty of Dover was secretly signed May 22, 1670, between Louis XIV of France and Charles II; the English king was to become a Roman Catholic, assist Louis in his war in the Netherlands, and receive a sum of money in return. A tablet on Dover Castle cliff commemorates the first successful cross-Channel aeroplane flight by Louis Blériot, July 25, 1909, which ended here.

Dover in the First Great War was a naval and military base, a dockyard, and a base for ambulance traffic. In the Second Great War it again became a naval and military base; from here the evacuation from Dunkirk was planned and directed, many thousands of the B.E.F. being landed at the port. A centre of the area of Kent which was called "hell fire corner," Dover suffered considerable damage from German aircraft and even more from shells from long-range guns on the French coast. This cross-Channel shelling began on Aug. 12, 1940, during the battle of Britain, and ceased only

on Sept. 30, 1944, with the capture by the Canadian 1st army of the German batteries in the Calais area. Altogether 2,226 shells fell in the town, 464 H.E. bombs, three flying bombs, and three parachute bombs. Civilian casualties were 226 killed and 760 injured. Caves were used as shelters during these attacks. Among buildings destroyed or seriously damaged were the Grand Hotel, Burlington Hotel, and museum. The clearance of demolished buildings in Market Square led to the excavation of the Roman fort of Dubra. *See Cave, illus.*, p. 1867.

**Dover.** Capital of Delaware, U.S.A., and co. seat of Kent. co. Lying 49 m. S. of Wilmington, on Jones Creek, it is served by rly. and airport. It is the seat of the state college for coloured students. In an agricultural and fruit-growing district, it also makes motor car bodies, rubber products, and hosiery. Laid out by William Penn, it became the capital in 1777 and a city in 1829. Pop. 5,517.

**Dover.** City of New Hampshire, U.S.A. It is on the Cochecho river, at the head of navigation for small vessels, 11 m. by rly. N.W. of Portsmouth. Established 1623, it was the first settlement within the present state boundaries, though part of Massachusetts 1641-92. It became a city in 1855. Cotton and woollen goods, machinery, and shoes are made. Pop. 14,990.

**Dover, STRAIT OF.** Channel between England and France, connecting the English Channel with the North Sea. In its narrowest part it is 21 m. across. Matthew Webb swam across the strait in 1875; the feat was repeated by T. W. Burgess in 1911; other swimmers who crossed are noticed under Channel Swimming. Blanchard and Jeffries crossed it by balloon from Dover to the forest of Guinnes in 1785; Blériot crossed it by aeroplane from Baraques, near Calais, to a field near Dover Castle in 1909. The only weather reports published in the U.K. during the Second Great War referred to conditions in the Strait of Dover. The French equivalent is Pas-de-Calais, also the name of a department.

**Dovercourt.** This seaside resort of Essex is part of the borough of Harwich (*q.v.*).

**Dover Patrol.** Section of the British navy based on Dover and Dunkirk throughout the First Great War. Its immortal exploits were the blocking of Zeebrugge on the night of April 23, 1918, and placing the Vindictive in the en-

trance of Ostend harbour, May 10, 1918. The patrol almost daily fought the enemy along the Flanders coast, its naval siege gun force, with the monitors, providing the main heavy artillery support of the left flank of the Allied army. It kept the ways for merchant vessels passing through the narrow seas, and closed the gate against enemy submarines by maintaining a barrage across the Strait of Dover. In appreciation of the patrol's work, the public subscribed approximately £50,000 to erect memorials at Leathercote's Point, St. Margaret's Bay, Dover, at Cape Blanc Nez, France, and at the entrance to New York harbour.

In the Second Great War, the vigilance of the Dover Patrol played a large part in the defence of Great Britain, as well as in helping to keep open the shipping lanes off the coasts. The patrol of the Channel and watch on the Strait of Dover were carried out mainly by destroyers and light craft. In contraband control all neutral shipping passing through the Strait was examined for contraband cargoes that might be directly or indirectly consigned to Germany. After the invasion of the continent in June, 1944, the patrol helped to protect against submarine and E-boat attacks the convoys supplying the Allied forces. The patrol from Dec., 1939, formed part of the Dover Command, which reverted in July, 1945, to its peace-time status as part of the Nore Command.

**Dover's Powder.** Compound powder of ipecacuanha. It consists of powdered opium, one part; ipecacuanha, one part; and potassium sulphate, eight parts. The dose for an adult is 5 to 15 grains (3 to 10 decigrams). It is helpful if taken at the onset of the common cold.

**Dovey or DYI.** River of N. Wales. It rises on the E. slope of Aran Mawddwy and flows S. and S.W. through Merionethshire and Montgomeryshire, and then between Merionethshire and Cardiganshire to Cardigan Bay, which it enters by an estuary 6 m. long. Its total length is 30 m. Machynlleth is on the river and Aberdovey at the estuary.

**Dovrefeld.** Mountainous plateau of central Norway. It is a continuation of the Kiölen range, and forms the watershed for many Scandinavian rivers. It culminates in Sneehätten (7,620 ft.), the average height ranging from 2,650 ft. to 3,600 ft. It is crossed by the

main road from Oslo to Trondhjem, over a pass 3,445 ft. high. It is the home of Norse folklore and a haunt of superstition.

**Dowager.** Originally, a widow with a dower. The title is usually applied to distinguish the widow of a deceased peer from the wife of the actual holder of the title. Thus the widow of a duke is styled the dowager-duchess, the wife of the new duke becoming the duchess. The title seems to have been first used of Mary Tudor, widow of Louis XII of France. Catherine of Aragon, as widow of Arthur prince of Wales, was called princess-dowager—apparently the first use of the word in England. Of late years the term has fallen into disuse, and the widow is distinguished by prefixing her first name to her title, *e.g.* Helen, duchess of Northumberland.

**Dowden, EDWARD** (1843-1913). British poet and critic. He was born at Cork, May 3, 1843, and educated at Queen's College, Cork, and at Trinity College, Dublin, in which university he became professor of English literature in 1867. In 1889

*Edward Dowden*  
Lafayette

he was Taylorian lecturer at Oxford, and during 1893-96 Clark lecturer at Trinity College, Cambridge. In 1896 he delivered a course of lectures at Princeton, New Jersey; these were published in 1897 as *The French Revolution and English Literature*. He died April 4, 1913. The chief of his numerous works are *Shakespeare: a critical study of his Mind and Art*, 1875; *Life of Shelley*, 1886; *Introduction to Shakespeare*, 1893; *History of French Literature*, 1897. *Consult his Letters*, ed. E. D. and H. M. Dowden, 1914.

**Dowding, HUGH CASWALL TREMENHEERE DOWDING, BARON** (b. 1882). British air force officer. Born April 24, 1882, he was educated at Winchester and the R.M.A., Woolwich, and commissioned in the Royal Artillery in 1900. Qualified as pilot in 1913, he joined the R.F.C. and commanded squadrons in the First Great War. He was later chief staff officer in Iraq, temporary A.O.C. in Transjordan and Palestine, and on his return to England was member of the Air Council for supply and research, 1930-1936.

Lord Dowding,  
British air force  
officer

In 1936 Dowding became A.O.C. - in - C. Fighter Command, which controlled the fighter aircraft, the A.A. guns, searchlights, barrage balloons, and the Royal Observer Corps. When in the R.F.C. he had developed radio communication between artillery batteries and aircraft, and this experience proved invaluable in building up the close cooperation between ground and air upon which anti-aircraft defence depended. The achievements of British fighters in the battle of Britain were partly due to his inspiring leadership of the brilliant organization he had built up in three years before the outbreak of war in 1939. Relinquishing his command in Nov., 1940, "Stuff" Dowding went to the U.S.A. for the ministry of Aircraft Production. Until he retired from the R.A.F. on July 15, 1942, he was reviewing aircraft establishments with a view to economy. He was knighted in 1933 and made a peer in 1943. His dispatch on the Battle of Britain was published 1946. He evinced much interest in spiritualism.

**Dowel.** Wooden, metal, or stone member used to unite two parts of a joint or to keep the parts

Dowel. Showing how dowels unite  
two parts of a joint

in proper position with relation to each other. Wood dowels, made from cylindrical hardwood, are widely used in door and window frames, chairs, etc., as an alternative to mortise-and-tenon joints, though they are not so strong. Two corresponding holes are bored in the members to be united; the dowels are glued and inserted into one of a pair of members, and the other member is then put in place and cramped up until the glue sets and hardens. Location dowels are used for cornices and ornamental members on bookcases; the dowel is glued into the loose member and fits into a dry, unglued hole in the fixed member.

Slate or iron dowels, rectangular in section, are used in masonry for mullions, transoms, coping stones, etc. They are cemented into registering holes in the two members. Besides helping to unite the stones, they hold them secure against sliding or other lateral movement. The posts of a doorframe used for an outer door are usually dowelled at the foot into the stone, concrete, or wooden threshold, the dowels being of iron. Dowels in engineering and machinery facilitate the correct positioning of members.

**Dower** (late Latin *dotarium*, gift). In English law, the amount allowed to a widow out of her husband's freeholds which he had not disposed of in his lifetime or by will. She was entitled to a life interest in one-third of these lands, set out by metes and bounds. Dower was abolished by the Administration of Estates Act, 1925.

**Dowie, JOHN ALEXANDER** (1847-1907). Scottish religious impostor. He was born May 25, 1847, at Edinburgh, and was for some years a Congregational minister in Australia, where he called himself the second Elijah, claimed power to heal diseases, and described himself as the First Apostle of Christ and the General Overseer of the Catholic Church. He went to America in 1888 and founded Zion City (q.v.), but in 1906 was deposed for embezzlement and polygamy. He died March 9, 1907.

**Dowlais.** Industrial town of Glamorganshire, Wales. It lies 2 m. N.E. of Merthyr Tydfil and has railway stations. There are ironworks, and the second occupation is coal-mining. Lighter industries have been introduced. Market day, Sat. Pop. 10,250.

**Dowland, JOHN** (1563-1626). British composer and lutenist. During his youth he travelled in Europe and was lutenist to Christian IV of Denmark, 1598-1606. He lived in England during his last years and from 1612 was lutenist to James I and Charles I. His first book of songs appeared in 1597; his third in 1603. In that year appeared his *Lachrymae* or Seven Teares, Figured in Seven Passionate Pavans. In 1612 he published his fourth and last book of songs, *A Pilgrimes Solace*. These four volumes (to lute accompaniment) rank among the finest songs ever written; as regards form and harmonic effect they are ageless. "Weep You No More, Sad Fountains," "Shall I Go Walk in the Woods so Wild?" "Now, O now, I Needs Must Part," are perfect of their kind.

**Down.** Eastern maritime county of Northern Ireland. It has a coast-line of nearly 70 m., excluding inlets. The principal inden-

Down arms

tations from N. to S. are Belfast Lough, Strangford Lough (studded with islets), Dundrum Bay, and Carlingford Lough; the chief rivers are

the Lagan, Bann, and Newry. Mineral springs occur in several parts. Most of the surface is hilly, and in the S. the Mourne Mts. attain a height of 2,796 ft. (Sieve Donard). Much of the soil is cultivated for oats, wheat, potatoes, and flax; fisheries and horse-breeding engage many people, and linen and muslin manufactures, and cotton and flax spinning are leading industries. Traffic facilities through the co. are afforded by the Ulster Railways, The Northern Ireland Road Transport Board, and the Newry and Lagan canals. The principal towns are Downpatrick (county town), Bangor, Newtownards, Newry, Banbridge, Holywood, Donaghadee, Newcastle, and Warrenpoint. Two members are returned to the Imperial parliament and eight to the N. Ireland parliament. Area, 952 sq. m. Pop. 210,687.

**Downham Market.** Urban dist. and market town of Norfolk, England. It stands on the Ouse, 10½ m. by railway S. of King's Lynn. Dairy farming, nursery gardening, and brick-making are industries, and horse and cattle fairs are held. Market day, Fri. Pop. 2,463.

**Downing, ARTHUR MATTHEW WELD** (1850-1917). British astronomer. Born at Bagnalstown, co. Carlow, he was educated privately and at Trinity College, Dublin. In 1873 he was appointed assistant at the Royal Observatory, Greenwich, and was in 1890-91 secretary of the Royal Astronomical Society, becoming vice-president in 1893. In the same year he was elected president of the British Astronomical Association. His work on the Nautical Almanac, of which he was superintendent for a quarter of a century, was of great value, and when in Nov., 1899, the swarm of meteors known as the Leonids was expected to meet the earth, Downing published calculations showing that they would swerve sunward and miss this planet. He died Dec. 8, 1917.

**Downing College.** College of Cambridge University. Founded by a bequest of Sir George Downing, 3rd baronet, of Gamlingay, Cambridgeshire (c. 1684 - 1749), it received its charter in 1800. The buildings, designed by William Wilkins, date from 1807-73. New buildings designed by Sir Herbert Baker were put up in 1931. Ground between the college and Downing Street, once belonging to the society, had to be sold by the university. A small college, Downing has about 180 undergraduates.

**Downing Street.** London street famous as containing the official residence of the prime minister. A small turning out of Whitehall, it was built by and named after Sir George Downing, whose grand son founded Downing College. No. 10 is the official residence of the first lord of the Treasury, who is nearly always, though not necessarily, the prime minister. Sir Robert Walpole was the first premier to live here during his term of office, and all his successors have done so, save Melbourne, Peel, and Salisbury. No. 11 is the official residence of the chancellor of the exchequer, and No. 12 is the office of the Government whips. At No. 14 Wellington and Nelson met for the first and only time. On

the vicinity, and is the reputed burial place of St. Patrick. The seat of the diocese of Down, which was united with Connor in 1441, and Dromore in 1842, Downpatrick has an imposing cathedral, built of unhewn stone, and a number of holy wells. Muslin, leather, and soap are manufactured. Market days, Tues. and Sat. Pop. 3,147.

**Downs.** Ranges of chalk hills in S.E. England. They are usually

Guildford, Maidstone, Newhaven, Arundel, and Shoreham.

The short turf provides pasture for innumerable sheep. The highest points do not reach 1,000 ft. in elevation.

**Downs, THE.** Roadstead in the English Channel, between Deal, on the E. coast of Kent, and the Goodwin Sands. A secure anchorage for vessels, except during southerly gales, it has a length of

8 m., a width of 6 m., and a greatest depth of about 72 ft. In 1639 the Dutch fleet gained a signal victory over a Spanish squadron, and several engagements between the Dutch and English fleets took place here during the 17th cent.

**Downshire,** MARQUESS OF. Irish title borne since 1789 by the family of Hill. Trevor Hill, an

Irish landowner and an English M.P., was made Viscount Hillsborough in 1717. His son Wills, the 2nd viscount (d. 1793), was a politician of some note in the time of George III. During 1768-72 and again from 1779-82 he was secretary of state for the colonies. In 1751 he had been created earl of Hillsborough. He was made a British peer in 1772, and in 1789 marquess of Downshire. Arthur (b. 1894) became 7th marquess 1918. The family estates are at Easthamstead, Berks, and in co. Down.

**Downside Abbey.** English Benedictine monastery and school. It is situated near Bath, and was

Downing Street, London. The Council Chamber at No. 10 arranged for a meeting of the British Cabinet

the opposite side of the street is the block of buildings devoted to the Foreign, Colonial, and Home Offices, built by Sir Gilbert Scott.

**Downpatrick.** County town of co. Down, Ireland. It stands near the S.W. end of Strangford Lough, about 27 m. S.E. of Belfast, and has a railway station. Downpatrick derives its name from a great mound called a "dun" in

divided into the Hampshire, Marlborough, North and South Downs. South of the line of the Kennet-Thames the chalk was uplifted to form a long ridge stretching as far as N.E. France. Subsequent erosion has worn away the top of the ridge, removed the chalk, greensand, and gault formations, and exposed the Weald clay. The lower slopes of the ridge still remain as the North and South Downs, sloping gently to the Thames valley and the English Channel respectively; both these lines of hills present steep scarps to the Weald, e.g. Leith Hill.

The rivers of the Weald have cut outlets through the Downs; in the N the Wey, Mole, Medway, and

Stour, and in the S. the Arun, Adur, Ouse, and Cuckmere have made gaps between the chalk hills. In earlier days roads, such as the Pilgrim's Way followed the ridge to escape the marshes of the lowland, but the main development of traffic routes has been due to the influence of the capital, the roads focussing on London after passing through the gaps, as at Dorking,

Downing College, Cambridge. Interior of the hall, designed by W. Wilkins

J. Palmer Clarke

Downside Abbey, near Bath. View of choir. Downside was raised from a priory to an abbey in 1899

established in 1814. The community was founded at Douai in 1605, and from the first has been engaged in the education of English boys. It was broken up at the French Revolution, and in 1795 the monks moved to England and maintained their school in Shropshire. The present buildings were begun in 1823; in 1899 Downside was raised from a priory to an abbey, and it is now one of the most notable modern Gothic buildings in Great Britain. Cardinal Gasquet was a headmaster.

**Dowser or Water Diviner.** One who claims that he can locate water—and in earlier days metals, oils, etc.—beneath the surface of the ground, with the aid of some form of divining rod (*q.v.*).

**Dowson, ERNEST CHRISTOPHER** (1867–1900). British poet. He was born Aug. 2, 1867, and as a youth spent much of his time in France. A lyrist of great delicacy, he has a permanent place in English anthology. One of his best known poems has the refrain, "I have been faithful to thee, Cynara, in my fashion." He wrote in collaboration with Arthur Moore two novels, *A Comedy of Masks*, 1893, and *Adrian Rome*, 1899. Dowson, whose collected poems were published in 1900, died Feb. 23 that same year.

**Doxology** (Gr. *doxologia*, a praising). Hymn of praise to God. Its basis may be found in certain passages in the N.T., notably in Rom. 16 and Eph. 3. The term is specially applied to the Lesser Doxology, the Gloria Patri, Glory be to the Father, and to the Son, and to the Holy Ghost, sung at the end of each psalm and canticle, except the Te Deum, in the daily service of the Church of England, and of the Roman Catholic Church. Its use dates from the 4th century.

The Greater Doxology is the hymn Gloria in Excelsis Deo at the Eucharist, which also dates from the 4th century.

The last verse of Bishop Ken's evening hymn, beginning Praise God from Whom all blessings flow, is popularly known as the doxology in English-speaking countries.

**Doyle, SIR ARTHUR CONAN** (1859–1930). British novelist. He was born at Edinburgh, May 22, 1859, was the son of one artist, Charles Doyle, the nephew of another, Richard Doyle (*q.v.*), and grandson of a third John Doyle (*q.v.*). He was educated at Stonyhurst, in Germany, and at Edinburgh university, where he studied medicine and graduated M.B. He was in medical practice, 1882–90,

at Southsea and in London, but the success of his early work in fiction caused him to devote himself to literature.

By 1891 Doyle had already produced some notable novels, including the first two Sherlock Holmes stories, *A Study in Scarlet*, 1887, and *The Sign of Four*, 1890; also *Micah Clarke*, 1889, a story of the Monmouth rebellion, and *The White Company*, 1891, one of the finest of all historical novels. With *The Adventures of Sherlock Holmes*, 1892, a collection of short stories first published serially in *The Strand Magazine*, Doyle leapt to the widest popularity; and this book was followed at intervals throughout his life by further stories, long and short, of the same acute master of deduction, even after his creator, on his own confession, had tired of him. (*See Holmes, Sherlock.*)

Further memorable works with historical backgrounds are *The Great Shadow*, 1892; *The Exploits of Brigadier Gerard*, 1896; *Rodney Stone*, 1896; *The Adventures of Gerard*, 1903; and *Sir Nigel*, 1906, a story linked with *The White Company*. Stories of contemporary life include *Round the Red Lamp*, 1894; and *The Tragedy of the Korosko*, 1898. *The Lost World*, 1912, and *The Poison Belt*, 1913, take readers into the realm of scientific fantasy in the company of another striking creation, Professor Challenger. *Through the Magic Door*, 1908, is a series of pleasing essays on books. His occasional dramatic writings include the one-act play, *A Story of Waterloo*, 1894, which provided Irving with a fine character part; *The House of Temperley*, based on Rodney Stone (Adelphi Theatre, 1909), and *The Fires of Fate*, a "modern morality play" (Lyric Theatre, 1909). He also wrote numerous pamphlets and books on public affairs, interesting himself particularly in the case of Oscar Slater (*q.v.*).

In the S. African war, Doyle went out as physician with a field hospital. His history, *The Great Boer War*, was a popular, readable narrative. Of his pamphlet putting Britain's case before the peoples of Europe, 100,000 were distributed; it was printed in twelve languages. He was knighted 1902.

Sir A. Conan Doyle,  
British novelist

His chief activity during the First Great War was the production in six serial volumes of a *History of the British Campaigns in France and Flanders*, completed 1920 and rewritten in more concise form in 1923. It was during this war that his great interest in spiritualism first became generally evident. He was subsequently a recognized leader of the movement, writing and speaking continually on psychic matters and producing a *History of Spiritualism* in 1926.

Active, transparently honest and forthright, a keen lover of sport, and an ardent patriot, Doyle was a writer who always approached his craft in a robust, masculine way, employing a simple but vigorous objective narrative style and revealing a shrewd grasp of human character and motives. He died July 7, 1930. *Consult* C. D., his *Life and Art*, H. Pearson, 1943; *The Real C. D.*, Adrian Conan Doyle, 1945.

**Doyle, JOHN** (1797–1868). British painter and caricaturist. He was born at Dublin, entered the Dublin Society's drawing school, and began a career as a portrait painter while still a boy. Six plates of *The Life of a Racehorse* were his first publication in London, whither he went in 1821. In 1829 he began the long series of political caricatures signed "H. B.," which occupied 22 years. These drawings, many now in the British Museum, are character studies rather than caricatures, and generally excellent likenesses. The original sketch for the large engraving by Walker and Reynolds (1836) of the Reform Bill receiving the king's assent by royal commission, 1832, was Doyle's work. The last years of his life were passed in retirement, and he died Jan. 2, 1868.

**Doyle, LYNN.** Pen-name of Leslie A. Montgomery (b. 1873). Northern Irish humorous novelist and playwright. Born at Downpatrick, he was the first to recapture in fiction the somewhat craggy humour of the Ulster Scot, and his first book of short stories, *Ballygullion*, 1908, was a landmark in Ulster literature. A life-long association with banking—as clerk and manager in country branches—provided him with a background for his work on small-town life. A play, *Love and Land*, was successfully produced in London in 1926 under the title *Persevering Pat*. In spite of a large output of stories, novels, plays, and light verse, he may be

best remembered by *An Ulster Childhood*, 1921, a charming book of autobiographical sketches of an Ulster that long ago disappeared.

**Doyle, RICHARD** (1824-83). British painter and caricaturist. He was born in London, Sept. 18,

*Doyle*

1824, second son of John Doyle, and studied under his father. In 1843 he became a regular contributor to *Punch*; in 1849 he produced the cover which it has retained ever since. He resigned from

*Punch* in 1850 in consequence of its attacks upon the pope and Cardinal Wiseman, Doyle himself being a Roman Catholic. Then he confined himself to book illustration, dying at the Athenaeum Club, from apoplexy, Dec. 10, 1883. The kindly humour of his satire displayed itself in illustrations to Thackeray, Leigh Hunt, Mark Lemon's *Fairy Tales*, etc.

**D'Oyly Carte Opera Company.** Founded in 1875 by Richard D'Oyly Carte (*q.v.*). It was the result of a successful performance of *Trial by Jury*, the first Gilbert and Sullivan opera to be commissioned by Carte. A syndicate was formed to produce Gilbert and Sullivan operas at the *Opéra-Comique*, London, but, following dissensions, Carte built his own theatre, the Savoy, 1881, which was the home of these operas for some 10 years. The company from then owned the copyright of all Gilbert and Sullivan operas. Rupert D'Oyly Carte (1876-1948), son of Richard, took control in 1901, his daughter Bridget in 1947. It was reformed, 1949, as a private co., with Bridget as managing director. See Gilbert and Sullivan.

**Drachenfels** (Ger., dragon's rock). German mt. by the Rhine. It is 8 m. S.E. of Bonn and 1,065 ft. high. At the summit, which can be reached by means of a rack and pinion rly. from *Königswinter* (*q.v.*), are the ruins of a castle erected by Arnold, archbishop of Cologne, early in the 13th century. The mt. is famous in legend

as the site of the cavern in which lived the dragon that Siegfried slew. The wine that is produced

Doyle. Mounting the guard at St. James's Palace in 1849; characteristic humorous drawing by Richard Doyle

here is still known as *Drachenblut*. The castle was destroyed during the Thirty Years' War. The magnificent views from its summit are immortalised in Byron's *Childe Harold's Pilgrimage*. The cathedral at Cologne was built largely of stone obtained from this mt. On the wooded slope is the Gothic *Schloss Drachenburg*, built in 1883. The fall of the *Drachenfels* to the Allies in the Second Great War was announced by the Germans March 16, 1945.

**Drachma.** Greek silver coin, roughly equivalent to the franc. The unit of account, it equals 100 *lepta* and is coined in 10, 20,

Drachma. Silver drachma, slightly reduced, of Alexander the Great

and 50 *lepta*, 1 and 2 drachma pieces in nickel. Since 1940 there have been gold pieces of 20 and 100 drachmas. Drachmas and *lepta* are used also in the currency of Crete. Originally the drachma—a "handful"—was a weight; also the chief silver coin of the ancient Greeks; its modern value in different parts of Greece varied from about 1s. 2d. to 10d. See also *Dram*.

Drachenfels. The castle-crested mountain from across the Rhine

**Drachmann, HOLGER HENRIK HERHOLDT** (1846-1908). Danish author, born Oct. 9, 1846, at

Copenhagen. He had been for some years a student at the academy of arts at Copenhagen when, encouraged by Georg Brandes, he determined to devote himself to literature. A man of extremely impressionable temperament, his songs and lyrics express different moods and attitudes towards life. His first volume of

poems, 1872, was full of youthful rebellion against existing conventions; later his views grew more placid. He wrote novels and plays, but is chiefly remembered as introducing the modern short story into Denmark. His tales of fisherfolk are remarkable for their realism. He died at Copenhagen, Jan. 14, 1908.

**Draco** or **FLYING DRAGON**. Genus of so-called flying lizards, of which there are about twenty species, all found in India and Malaysia. All small, they are remarkable for the length of the hind ribs, which stretch out the skin and form a pair of wing-like expansions. These ribs can be folded back, somewhat like a closed fan. The lizards live in the trees, and, aided by their "wings," take long flying leaps.

**Draco.** A long, winding stream of stars between *Ursa Major* and *Ursa Minor*, and almost encircling the Lesser Bear. According to E. W. Maunder, *Draco* the Dragon (Ptolemaic) is one of the most ancient of all constellations (*q.v.*). *Alpha Draconis* or *Thuban* was the original Pole Star when the constellations were mapped out.

**Draco** (*fl.c.* 620 B.C.). Archon or magistrate of Athens, the first to codify and commit to writing (*c.* 621 B.C.) the laws of the state as formulated in the decisions of its judges. The severity of this code has made the word "draconian" a synonym for unmerciful, but the Draconian code was no more severe than other early codes of law. Its severity was mitigated by Solon, selected archon in 594.

**Dracula.** Fictitious supernatural being, chief figure in an horrific story of the same name

written by Bram Stoker in 1897. A development of the legendary werewolf, with power to change shape at will, the creature assumed human form as Count Dracula, existing on the blood of human beings until they died, whereupon their spirits also were cursed with the same horrible attributes and the same diabolical ingenuity in pursuing their victims and eluding capture. In the story Dracula leaves his Balkan castle in order to practise his black arts in England, notably in London and Whitby. This sensational book had a wide popular success; a stage adaptation was first presented at the Little Theatre in 1927, and a film version appeared in 1931.

**Draft.** In commerce, a term used for an order requesting a bank or person who holds money for another to pay a certain sum to a certain person. It is more elaborate than a cheque, and is a fuller protection against misuse. The word is also used for a rough sketch or a first copy of a business or other document. *See* Banking.

**Draga** (d. 1903). Queen consort of Serbia. As Draga Mashius she was maid-in-waiting to the Serbian queen, Natalie. In July, 1900, she married King Alexander I, and July 11, 1903, she and her husband were murdered at Belgrade by the supporters of the Karageorgevitchs.

**Drag Hunt.** A form of hunting in which there is no quarry, but the hounds follow a trail previously laid by dragging a strongly-scented article or substance along the ground. This kind of hunt meets all the objections of animal lovers to the killing by hounds of foxes, stags, etc.

**Dragon.** Fabulous monster common to the folk-lore of most nations. It is generally in the form of a gigantic reptile with four legs and a fierce (often fire-breathing) head, and frequently furnished with wings. It is the form often taken by the monster overcome by the hero of folk-tales and legends of many lands. In Christian art the dragon has long been accepted as typifying sin. In China, the dragon is the honoured symbol of nature and of man as creator.

**Dragon.** In military use, name applied to a mechanical tractor used for drawing guns, propelled by an internal combustion engine and running on caterpillar tracks. Formerly the name was given to a short musket, orna-

mented with a dragon's head, from which the dragoons derived their name.

**Dragon.** In British heraldry, a monster having a lion-like scaly body, bat-like wings, barbed tail and tongue, and pricked up, pointed ears. It is one of the national badges of Wales. The Continental dragon usually has only two legs, and is of the wyvern (*q.v.*) type. The old Imperial Chinese golden dragon, generally shown as protecting the sun with long feelers projecting from its jaws, had five claws to each foot. Dragons for princes and lesser lights were of different colours and had fewer claws. The Japanese Imperial dragon has only three claws to each foot.

Dragon in heraldry

**Dragon** (*Dracunculus vulgaris*). Perennial herb of the family Araceae. A native of S. Europe, it is similar to the cuckoo-pint, but differs in its taller stem (spotted with purple), its divided leaves, and the more open spathe. The flowers give off an offensive odour.

**Dragon Boats, FESTIVAL OF THE.** Chinese annual regatta. It is held on the fifth day of the fifth moon, approximately corresponding to June 18. It is said to have originated in the suicide of a statesman, Wat Yuen, who was degraded and dismissed by his prince because of his interest in the people. The river into which he threw himself was quickly covered by boats filled with people searching for his body, and each year afterwards crowds went again to the place, throwing offerings of rice into the river.

**Dragonet** (*Callionymus*). Group of brilliantly coloured fish, related to the gobies. There are about forty species, one found

Dragonet, *Callionymus lyra*

in deep water off the British coasts. The fore part of the body is flattened, and the pectoral and dorsal fins are large and conspicuously spined. The females are dull in colour.

Dragon Fish. *Pegasus volans*, small and curious exotic fish

**Dragon Fish** (*Pegasus*). Genus of small fish found around India, China, and Australia. The broad, flattened body is completely covered with small bony plates instead of scales, and the gill cover consists of only one plate. The fish has no teeth and no swim-bladder.

**Dragon Fly** (*Odonata*). Order of insects with net-veined wings. There are about 2,000 known species, of which 43 kinds occur in Great Britain. They are handsome insects, with large heads, conspicuous compound eyes, short antennae, and powerful jaws. The thorax is thick, and in most species the abdomen is long and slender. The four wings are long, transparent, and beautifully veined. Many species are brilliantly coloured.

The earlier stages of the dragon fly's life are passed in the water. The larva is provided with a mask, or jaw appendage, which can be thrust forward to seize its prey, which consists of almost any small aquatic creature within reach. The larva breathes by means of gills placed at the hinder extremity of the abdomen. There is no distinct resting or pupal stage, but after about a year or more in the water the nymph crawls up the stem of a plant, or on the bank of the pond, where presently the skin cracks open down the back and the perfect insect emerges. *See* Insect.

**Dragonnades.** Name given to the persecution of the Huguenots in France just before and after the revocation of the edict of Nantes in 1685. It is so called because dragoons enforced the king's orders against the Protestants.

Dragon Fly. Specimen of *Aeschna cyanea*. Upper picture, demoiselle dragon fly, *Calopteryx virgo*

**Dragon's Blood.** Red resinous exudation from the fruits of a number of palms. Dragon's blood is obtained from some species of *Daemonorops*, the varieties East Indian, Malay, Sumatra, and Borneo being from different kinds of *Daemonorops*. It was formerly used as an astringent in medicine and as a component of love philtres, and is still employed as a colouring matter for varnishes.

**Dragon Tree** (*Dracaena draco*). Tree of the family Liliaceae. A native of the Canary Islands, it

Dragon Tree. A very old specimen of the tree growing in Tenerife

has long, slender, lance-shaped leaves in a crowded head at the summit of the stem, giving it a palm-like aspect. The tree's small, greenish-white, bell-shaped flowers are produced in a large panicle. When of great age, the trunk branches above. There was a great tree of this species at Orotava in Tenerife which was world-famous, for it was believed to have an antiquity greater than that of the Pyramids. In 1402 the trunk had a circumference of 42 ft.; four centuries later Humboldt found that it had increased to 48 ft. In 1827 a great storm subjected it to much injury, and in 1851 it was destroyed. Its age had been estimated at 8,000-10,000 years.

**Dragoons.** Originally mounted infantry trained and organized to fight on foot, using horses only for moving into action. Established in nearly all European armies in the 17th century, dragoons took their name from the dragon, or short musket, with which they were armed. By the end of the 18th century they had developed into cavalry proper.

In the British army there were originally three regiments of dragoons and seven of dragoon guards. The 1st or Royal Dragoons was formed in 1661; the 2nd, or Scots Greys, raised in 1678; and the 6th, or Inniskilling Dragoons, in 1685. Dragoon guards were

the 1st, or King's, raised in 1661; the 2nd, Queen's Bays, the 3rd, Prince of Wales's, the 4th, Royal Irish, the 5th, Royal Inniskilling Dragoon Guards, the 6th, Carabiniers, and the 7th, Princess Royal's, all raised in 1685. The Royal Dragoons were present at Sedgemoor and took up the pursuit of Monmouth's defeated troops. Dragoon regiments earned distinction under Marlborough in Flanders, where they were employed for the first time in a purely cavalry rôle. The Scots Greys, Inniskilling Dragoons, and Queen's Bays formed the famous Union Brigade at Waterloo, capturing a French eagle, a replica of which now forms the regiment's badge. The Heavy Brigade at Balaklava was made up of the 1st, 2nd, and 5th Dragoons.

On the reduction of British cavalry in 1922, the 3rd and 6th Dragoon Guards were amalgamated as the 3rd-6th Carabiniers, and the 4th Royal Irish and 7th Princess Royal's became the 4th-7th Dragoon Guards. Shortly before the Second Great War all Dragoon regiments had been mechanised, the Queen's Bays and the Scots Greys being the last to be converted. Dragoons now form part of the Royal Armoured Corps, though they continue to wear distinctive badges. Mechanised dragoons served in all theatres of the Second Great War, earning particular distinction in N. Africa.

**Draguignan.** Town of southern France, capital of the dept. of Var. It is in a valley by the river Nartuby, an affluent of the Argens,

41 m. N.E. of Toulon, with which it has rly. connexion. It possesses a handsome modern palace of the prefecture, court house, museum, hospital, botanical and zoological gardens. The varied industries of Draguignan include the manufacture of silks, woollens, hosiery, leather articles, brandy, oil, and earthenware. It was founded in the 6th century. Pop. 11,801.

**Drainage.** Term for the removal of water from places in which its presence is harmful to places in which it is harmless.

**LAND OR AGRICULTURAL DRAINAGE.** A few plants thrive well in waterlogged soil. All others, including most of the food-producing plants, require free circulation of air, with sufficient but not excessive moisture, in the soil in which they are rooted. Below a certain depth, varying according to circumstances, the soil is saturated. The surface of saturation is known as the water table. Most plants thrive best when their roots approach but do not reach the water table. Drainage aims at maintaining the water table at or slightly below the level most suited to the plants to be grown, so that their roots will not be waterlogged for more than a few hours even after heavy rain, and yet will be able to absorb the plant food they require, dissolved in moisture drawn up by the capillary action of the soil from the natural reservoir below the water table. It can do almost as much harm to depress the water table too low as to allow it to rise too high.

The limit to which the water table can be lowered by gravity without pumping is determined by the bed levels of the neighbouring streams, rivers, or watercourses. The optimum bed levels for these, having regard to the whole course

Drainage. Semi-detached house drained on combined system, i.e., with all waste water drained to one (soil) sewer. F, fresh air inlet; G, gully; I.C., intercepting chamber; M, manhole; R, rainwater pipe; S, soil pipe; W, waste pipe

Drainage. Terrace houses drained on partially separate system. For explanation of lettering see diagram at foot of facing page

of river, stream or watercourse, should be decided by an engineer with the special training necessary for this highly technical calculation. When the beds have been set to the optimum levels they should be maintained thereat by periodical clearance of silt and vegetation, or, if they have been scoured too low, by refilling. The regulation of the level of the water table in the fields is done by laying a system of main and branch pipes leading from the upper to the lower parts of the fields.

The smallest drains practicable are 2-in. earthenware pipes. These are laid  $2\frac{1}{2}$  ft. to 3 ft. deep, unjointed so that water can seep in, 15 ft. to 20 ft. apart, according to the slope of the ground and the nature of the soil, following the general slope of the ground, starting from the highest points. If the ground is ridge and furrow, the pipes are laid below the furrows. Where two 2-in. drains come together, or the length of one is such that it will collect water beyond its carrying capacity, 3-in. pipes are used. The junction is stream-lined through Y pipes. As obstructions are more likely to occur at junctions than elsewhere, it is best, if levels permit, to lay the large pipe some 3 ins. below the incoming 2-in. pipes. The 3-in. pipes are in turn collected into 4-in. pipes. The 4-in. pipes are often termed main drains, and the smaller sizes branch drains. A 3-in. pipe discharges  $2\frac{1}{4}$  times as much as a 2-in., and a 4-in.  $1\frac{1}{2}$  times as much as a 3-in. A normal 4-in. drain with its branches will drain from 5 to 10 acres, the size of the area depend-

ing on the nature of the soil and the slope of the ground.

The final outfall must be protected by a grating against the entry of rats or other vermin, except when the drain discharges below high tide level in an estuary or on the sea shore, when a flap valve or sluice valve must be provided to prevent the tide from flowing up the drain.

In alluvial flats where ground level is little if at all above high water mark, the water table can be lowered only by pumping. Wind operated pumps are cheapest, but are unreliable. If cheap electric power is available the most convenient pumps for this

purpose are vertical, spindle-float-controlled, motor-driven pumps. They can be so arranged that the pump is always primed while the motor is above any possible rise of water level. Lands reclaimed by embankments from the sea must be constantly drained by pumping.

**HOUSE DRAINAGE.** The drainage of houses is usually divided into two systems (a) for the removal of rain water, (b) for the removal of dirty water, from baths, wash basins, and sinks, and of sewage from W.C.s.

(a) *Rain water* is collected in gutters as it runs off the roofs, and led down by open-top pipes, usually 3 ins. in diameter, to ground level. There it is taken underground through gully traps, in towns into the public sewer; in the country into rain water sewers usually 4 ins. in diameter and to a convenient stream or ditch, or to a soakaway, which is a pit, perhaps filled with loose ballast, from which the water will find its way into the surrounding ground.

(b) *Dirty water and sewage.* Dirty water and sewage are led by pipes to the house sewer. The details of the system are regulated by local authority by-laws. Where a public sewerage system (often known as main-drainage) exists, the house sewage discharges into the nearest public sewer. Where there is none, the house sewer must lead to some form of sewage disposal work. House drainage is explained in the diagrams.

**TOWN DRAINAGE.** Town drainage is the removal of unwanted water from within to outside municipal limits, by open ditches or underground sewers. In England and many temperate climates of moderate and evenly spaced rainfall, it is usual to take rain and waste water in the same sewers. In countries subject to extremely heavy rainfall such as occur during the monsoons, most towns remove rain water in open drains on the surface, and foul water in sewers. In hilly ground the whole removal can be done by gravity without necessity for pumping. In flat

Drainage. Detached house drained on wholly separate system. For explanation of lettering see diagram at foot of facing page

country pumping is usually necessary. The final discharge from the sewers may be into the sea, when precautions must be taken to protect the shore from fouling. This is a cheap method, but it is wasteful of organic matter which ought to be restored to the land, a subject to which more attention is being devoted. In a few places inland, sewage effluent is still allowed to fall unpurified into rivers, if this was already being done in 1876; but this ought to be stopped, harmless waste only being discharged after the sewage has been purified in purification works. Each town presents an individual problem which must be dealt with by an engineer trained in this highly technical subject. See Cesspool; Plumbing; Sewerage.

F. C. Temple, M.Inst.C.E.B.

**Drake, Sir Francis** (c. 1545-96). English seaman. His origins are obscure, but Drake was born probably at Crowndale, near Tavistock. The year is given by some old writers as 1545, by others as 1539. He is believed to have served an apprenticeship on a small coasting vessel, and then to have made a voyage to Guinea and the Spanish Main. In command of the 50-ton craft *Judith*, he sailed with his cousin, John Hawkins, on the trading expedition which barely escaped destruction by the Spaniards at San Juan d'Ulloa, in 1567. The treachery of the Spanish authorities on this occasion fixed in the mind of Drake a determination to wage war upon them as the enemies of his country and his faith. After two voyages of investigation he sailed in 1572, with a small but picked force, sacked Nombre de Dios, crossed the Isthmus of Panama until he came in sight of the Pacific, uttered his characteristic prayer that "Almighty God would grant him life and leave to sail an English ship upon that sea," captured a great Spanish mule-train of treasure, and returned home.

On Nov. 15, 1577, he started on a still more audacious venture—the circumnavigation of the world—with five ships; made his way through the Strait of Magellan (Aug., 1578), discovered that Tierra del Fuego was not a continent, but an island, and then with the one ship that remained to him, the *Pelican* or *Golden Hind*, proceeded to attack one after another the Spanish ports on the Pacific, where no hostile ship had before been seen. After capturing and clearing a great treasure ship, the *Cacafuego*, he sailed to seek a

Sir Francis Drake, English sailor  
From a contemporary portrait

north-east passage. Incidentally he landed in California, where he won from the natives such golden opinions that they proposed to deify him. Failing to find the north-east passage, he sailed across the Pacific to the Spice Islands, passed the Cape of Good Hope in Jan., 1580, and sailed into Plymouth Sound on Sept. 26, bringing vast treasure, which was duly shared by Elizabeth. The Spaniards demanded his punishment as a pirate; the queen knighted him instead. He was the first captain who had in person sailed completely round the globe, and he had taught English mariners their immense superiority over the Spaniards.

In 1585, when the official declaration of war with Spain was imminent, Drake put to sea unofficially with a considerable flotilla, sailed into the port of Vigo, which was put to ransom, crossed the Atlantic to the Spanish Main, fell upon San Domingo and Car-

tagena, which were also put to ransom, captured a great treasure ship, and returned triumphantly to England. In 1587 he commanded the expedition which sailed to Cadiz, burnt the shipping, and postponed the sailing of the Armada for 12 months. In 1588, during the months when the British fleet first awaited and then shattered the Armada, Drake was its inspiring and guiding spirit, though nominally only second in command, his flagship being the famous "little Revenge."

In 1589 Drake was associated with Sir John Norreys in the command of a joint naval and military expedition to Lisbon. It failed of its purpose, not by Drake's fault, and the great seaman was practically shelved. In fact, he wished to destroy the Spanish power utterly, while the queen sought only to humble and despoil Spain, and the failure at Lisbon was used to discredit him and his policy. In Aug., 1595, however, he sailed once more with Hawkins to the West Indies. The cousins were not on the best of terms; the Spaniards were well prepared and on the watch, and the expedition accomplished little. Hawkins died; some weeks later, near the town of Nombre de Dios, on Jan. 28, 1596, Drake himself fell a victim to dysentery, and his body was committed to the Atlantic Ocean, the fitting grave for the mighty seaman.

Drake, more than any other single man, was the founder of England's naval supremacy, the incarnation of the Elizabethan spirit of maritime adventure and resourcefulness, which was only a shade less brilliantly exemplified in Hawkins, Frobisher, Davis, and other captains. It was Drake

Drake continues a game of bowls undaunted by news of the approaching Armada. Scene depicted by Seymour Lucas, R.A., in his painting *The Armada in Sight*

who, as second in command and real director of the operations against the Armada, established the decisive principle of naval warfare that victory is the reward of mobility, seamanship, and gunnery; and who, whenever he could get his own way, applied the master rule of seeking out the enemy fleets and carrying out a strategic offensive in preference to the purely defensive methods, the protection of coasts and home waters, for which landmen, and the politicians dominated by landmen, are always apt to clamour under threat of invasion.

Drake's statue stands on Plymouth Hoe, where he played the famous game of bowls before beating the Armada. His name was given to a former parl. div. of that city. See Armada.

**Bibliography.** Life, J. S. Corbett, 1890; State Papers relating to the Defeat of the Spanish Armada, ed. J. K. Laughton, 2 vols., 1894; Drake and the Tudor Navy, J. S. Corbett, 1898; English Seamen in the 16th Century, J. A. Froude, repr. 1901; Sir Francis Drake's Voyage Round the World, H. R. Wagner, 1927; Life, E. F. Benson, 1927; Life, A. E. W. Mason, 1941.

**Drakensberg** or QUATHLAMBA. Range of mountains in S. Africa, between Cape Province, Basutoland, Orange Free State, and Natal. They form a rampart extending from Griqualand East to Mont aux Sources, the highest peak, 11,000 ft., and thence N.E. to Majuba Hill, 7,000 ft. Another range crosses N.E. Transvaal towards Swaziland. The erosion of the volcanic lavas has produced remarkable escarpments, as at Maclear, Cape Province, and at Mt. Anderson, the highest in the Transvaal Drakensberg, 7,490 ft. The Drakensberg national park is one of the scenic treasures of the S. African Union.

**Drake Strait.** Wide channel between Tierra del Fuego and Graham Land, Antarctica. It connects the Atlantic with the Pacific, and, though well N. of the Antarctic Circle, is encroached on by drift ice.

**Dram** or DRACHM. Unit of weight, being one-sixteenth of an ounce avoirdupois. Before 1864 it formed also the eighth part of 1 oz., apothecaries' weight. The name comes from drachma, and is still used in the Levant, 400 drams making one oke, 44 okes equalling one cantar or kintal or 125 lb. avoirdupois. The term, transformed into dirhem, was used in Arabia for both a weight and a coin. See Pound.

## THE DRAMA: ITS EVOLUTION AS AN ART

S. R. Littlewood, Editor of *The Stage*

*The long history and wide appeal of the drama is here outlined. Cognate articles are those on Comedy; Tragedy; Stage; Theatre. See also the biographies of the great playwrights, ancient and modern, e.g. Sophocles, Shakespeare, and Shaw, and the great actors, Garrick, Kean, Irving, Tree, and others*

Drama (Gr. *dran*, to do) is the art of expression by action. As the verb is to the other parts of speech so is drama in its relation to the other arts. It employs almost all of them, and depends upon them to complete its purpose, abstract action being inconceivable. All the conventions and so-called rules around which controversy has raged spring from this primal fact, and are binding only in so far as they are inevitable. Action itself, for instance, demands that there should be a subject and an object; and reflex action, without which dramatic development is impossible, demands at least two participants.

There must be, as Aristotle said in his Poetic, a beginning, a middle, and an end. This at once distinguishes drama from the life of the world, and makes the need for unity of action obvious. Drama need not in theory be imitative or confined to imitation. If Macbeth and Macduff fight in earnest—as they did on one occasion when played by Macready and Phelps—the result may be no less drama. Reality, however, is in the main technically needless and inexpedient, and the human mind has shown itself incapable, as yet, of presenting an idea that is not imitative—at any rate, in its parts.

The beginnings of drama are to be found in the instinctive pretences, for the mere sake of expression, common to all savage races and many animals. Probably long before the arrival of speech tragedy had taken a set form in the war-dance and comedy in phallic revels, both afterwards merged in the ritual of primitive religions.

**THE GREEK DRAMA.** Historically, the all-important Greek drama is presumed to have developed from the dithyrambs or hymns in honour of Dionysus, god of wild vegetation, fruits, and especially the vine, sung by a chorus dressed as satyrs, who engaged also in mimic dance-stories. A later theory put forward by Prof. Ridgeway is that Greek tragedy sprang from the worship of the dead; but it has not reached large acceptance, and the derivation of the word tragedy—a "goat-song"—suggests the

other view. Arion, of Methymna in Lesbos, who worked with Dorians at Corinth, first composed verses to be spoken by a chorus-leader, mounted upon the sacrificial table in the intervals between the songs. In this way the altar itself was the first stage.

Thespis (c. 535 B.C.), of Icaria, in Attica—who is reputed to have gone from place to place with a company of players on wagons, their faces smeared with wine- lees—introduced a masked actor to engage in dialogue with the chorus-leader. With the amazing speed and curious finality that has characterised nearly all dramatic developments, the theatre of Athens was to produce, in a little over a century, the tragic masterpieces of Aeschylus (525–456 B.C.), who introduced a second actor and made the dialogue the main part of the tragedy; of Sophocles (495–406 B.C.), who introduced a third actor and possible a fourth; and of Euripides (480–406 B.C.).

**Athenian Writers of Comedy.** Contemporary with Euripides, whom he mercilessly satirised, was the great master of the so-called Old Comedy, Aristophanes (448–380 B.C.), followed by 37 forgotten writers of the Middle Comedy. After the conquest of Greece by Philip of Macedon flourished Philemon (c. 330 B.C.), Menander (342–290 B.C.), his contemporary Diphilus, and others representing the New Comedy. All the works of Menander, and all but fragments of other New Comedy writers, are lost, but they still live in the plots of the great Roman comic dramatists, Plautus (c. 251–184 B.C.) and Terence (195–159 B.C.), the latter born at Carthage. Six of Terence's adaptations from Menander remain, though he is said to have adapted 108 more, and to have died of grief on hearing they were lost at sea.

Of the greatness of the Athenian drama, both on its tragic and comic sides, and the incalculable debt owed to it by all subsequent European dramatic art, the general explanation appears to have lain in the blending of religious ceremony with intense civic consciousness under the popular impulse of a great national and (for a time) triumphant struggle. Much

the same thing was to be said nearly 2,000 years after of our own Elizabethan drama. The religious solemnity, strong in Aeschylus, was modified by a more humane grace in Sophocles, and still more so in Euripides, who was to become—through his Roman imitator, Seneca (c. 4 B.C.—A.D. 65)—the father of romantic drama in Europe.

The intense national feeling, however, out of which the Greek drama grew remained to inspire the Athenian theatre from Aeschylus's *Persae* (472 B.C.), written to celebrate the victory over the Persians at Salamis, to Euripides' flight into Macedonia (408 B.C.). The vast open-air theatre of Dionysus at Athens held more than 30,000 spectators, roughly a sixth of the Athenian population, and more than the entire number of free citizens. To be able in any way to impress this huge audience, the actors wore strongly defined masks with a kind of megaphone in the mouth, and, for tragedy, were heightened by the *cothurnus*, buskin or thick-soled boot. Exactly where they stood in relation to the chorus which surrounded the altar of Dionysus has not been fully agreed upon, but they were not enclosed, and upon the "scene" behind them mechanical devices, flying cars for mortals going up to heaven and for gods coming down to earth, and machines for apparitions and murder tableaux (for all deaths happened off the stage), came into use.

#### Unities of Time and Place

Aeschylus himself introduced painted accessories and appropriate costumes. Anything in the way of subtle by-play cannot have been possible, and the size of the theatre and neutral scene were largely responsible for the unities of time and place, strictly observed by the Greek dramatists, but unnecessary where communication with the audience is closer or otherwise easier. These difficulties were, however, balanced by the fact that the stories and characters were known to the audience, taken always, as they were, from familiar legends or recent history.

The interest of the audience was, too, immensely heightened by the fact that every production was a public festival, that the expenses were subscribed as a state service by wealthy citizens, and that the plays were competitive, judged by a publicly appointed jury. Each dramatist supplied a trilogy, or set of three connected pieces dealing with the same subject, and sometimes, as in the case of Euripides'

Cyclops, a satyr-drama as well. Roughly, the best way of suggesting the spirit pervading an Athenian audience in the days of Pericles would be to combine the ritual of a cathedral service with the open-air aspect, popularity, and competitive enthusiasm of a football match.

**ROMAN DRAMA.** Although from many points of view it was, even at its best, a mere echo of the Greek, Roman drama had, until quite recent times, an at least more direct influence upon the drama of Europe. From the first the tendency of the native Italian drama was in the direction of broad farce, this being due to the fact that until Rome as a city began to borrow its art from Greece, the indigenous theatre was almost entirely rural. None the less, in the *Atellane Fables*—so named from *Atella*, in Campania, supposed to be of Oscan birth, and transferred to Rome after the subjection of Campania (210 B.C.)—is to be found the origin of that invaluable tradition of rural comedy, which was destined in its later form, as the *Commedia dell'Arte*, to permeate Europe. By the inherent force of its plots and characters it became one of the main inspirations of modern comedy, and still more of the comic side of modern melodrama, quite apart from being superficially celebrated in the now almost vanished harlequinade.

In their earliest known form the *Atellane farces* already included a gluttonous character (*Maccus*), of whom traces are still to be found in *Pulcinella*; a comic heavy father (*Pappus*); a foolish chatter-box (*Bucco*), and a clever rogue (*Dorsenus*).

As with Greece, serious drama first made its appearance in Rome with a national victory. After the first Punic war, Livius Andronicus wrote tragedies as well as comedies in imitation of the Greek tragedians. Naevius (c. 236 B.C.) followed with similar themes, and Ennius (239–169 B.C.) also wrote tragedies with Euripides as his model. The one Roman tragedian, however, who has influenced later ages was Seneca.

#### Influence of Seneca

Seneca's imitations of Euripides affected all the early Renaissance dramatists of Europe, supplied Ben Jonson with direct models, and are indirectly to be traced in Shakespeare himself. In comedy Plautus and Terence, already mentioned, remained current classics until the time of Molière, who founded his own art largely upon them. With the Empire the Roman drama declined to mere spectacle

and material splendour. The art of dumb show or pantomime (strictly so called) reached its height, a logical consequence of the size of the theatre and the non-participation of the audience in the spirit and purpose of the play. But of all this nothing remains.

**THE MEDIEVAL DRAMA.** From the death of Seneca until the Renaissance—save for isolated exceptions, like the astonishing Latin comedies of the 10th century nun, Hroswitha, of Gandersheim, in Saxony, said by her to have been written "in the style of Terence," but marked by a curiously naïve blend of religious ardour and wholly serious sympathy with extremes of human passion—the drama as a fully equipped art practically ceased to exist. It was violently opposed by the early Christian church—and quite understandably, considering its lamentable degeneration.

#### The Church and the Drama

Things changed, however, when the Church had grown in power. The demand for dramatic expression, above all among the illiterate, became urgent, and pagan festivals, with their essentially dramatic potentialities, still lingered in popular tradition. To meet the demand, plays began to be produced under the control of the Church itself. They were originally part of the actual liturgy—hence the name mystery, or, more properly, ministry plays—extensions of the tropes or short dramatic scenes, such as the uncovering of an empty tomb upon Easter day, and the representation of the manger at Bethlehem at Christmas, introduced into the Mass itself.

Gradually the laity cooperated in these performances, which, under the auspices of the trade-guilds, were brought out into the market place upon pageants, or wheeled stages. Written in the vernacular, and enlivened with racy scenes of common and contemporary life, the mysteries, or miracle plays, as they were also called, became the regular drama of the people. They flourished first in France, and afterwards all over Christian Europe. Ignoring consistency, they brought in God the Father, the Devil, Christ, and figures from every Bible story, together with clowns and characters of their own time. In England three collections of these plays survived—the Wakefield, Chester, and Coventry series—and still possess a high value and beauty, for all their simplicity, as living folk-dramas.

With and after the miracle plays flourished also the moralities, or allegorical sermon plays, of which

Everyman is so fine a type. These drifted after a while, with the Vice as a stock comic-character, into secular channels. Meanwhile both the moralities and miracle plays tended to blend with the performances of wandering mimes, *joculatores*, or jugglers, and *ministeriales* or minstrels. Also, purely secular and destined to reach their highest development long after both miracle plays and moralities had been ousted by the enfranchised drama, the old Italian *Commedia dell'Arte* (or Professional Comedy), and Comedy of Masks, had survived from classic Rome, and were growing into new life.

#### Italian Repertory of Rough Farce

As the travelling companies made their way from town to town, first through Italy, afterwards through France, Spain, Germany, and England, character by character, Harlequin, Columbine, Pantaloon, Pulcinella, and the rest, were building up their repertory of rough farce. As with their Attellane prototypes, it has been claimed that the dialogue of these Italian merry-makers was, in some cases wholly, and in others largely, impromptu. The probability remains, however, that memory played a not unnatural part with performers who were, in the earlier days, often illiterate, and that their stock of scenes to a great extent consisted of the débris of old Greek and Roman classics, orally conveyed, with only a certain amount of "gagging."

**THE RENAISSANCE.** In England, lay performances in the universities and elsewhere, both of Latin comedies and of translations, were encouraged, partly for anti-papal purposes, by Henry VIII and Edward VI. In 1551 appeared the first English comedy, Ralph Roister Doister, based by Nicolas Udall upon Plautus's *Miles Gloriosus*; and in 1562 the earl of Dorset and T. Norton produced the first English blank verse tragedy, *Gorboduc*, or *Ferrex and Porrex*, inspired by Seneca's *Thebais*.

With these plays, and with John Heywood's *Interludes*, the revival of English secular drama may be said to have been launched. With the same speed that characterised the advance of Greek drama, the crude and heavy-footed *Gorboduc* was followed in twenty-six years by the arrival of Marlowe's *Tamburlaine the Great* (1588). Displaying the verse-form that was to be carried to perfection by Shakespeare, always inspired with the fire of an undoubted genius, it was charged at every point with the insatiable

appetite for romantic adventure and the fearless assertion of humanity that was to characterise the Elizabethan drama.

The dramas of Shakespeare himself and those of his chief contemporaries are dealt with under his and their names. Whether one regards the lesser members of that brotherhood as over-praised or under-estimated, the Elizabethan drama as a whole did share certain qualities with Shakespeare himself. It shared his freedom, his delight in humanity, and something, at any rate, of his vigour. Even in the most extravagant gashlines of Webster and Tourneur the exploration of human possibilities is frank and exuberant.

Master of all the human moods, and incomparably beyond his fellows in technical skill, in his power over language, in his knowledge of human nature, and in the patriotism that informed his chronicle plays, Shakespeare was able to unite all these elements into a new form of drama. It was superficially romantic drama, but by the force of his imagination he was able to give his creations the rondure of life itself. They have at will the individual truth of comedy and the universal symbolism of tragedy. Romance was the material common to his time, which he found to his hand. He invested it with the deepest possible humanity, and in this way baffled posterity. Wherever Shakespeare has been understood, impersonal tragedy has become obsolete; but he has left nothing imitable, save the romance.

#### Spanish Drama of Lope and Calderon

Meanwhile an outburst of vast importance to the future of drama was happening in Spain, where Lope de Vega (1562-1635), the most amazingly prolific genius ever known, was writing his 1,500 plays and 300 *autos*, and much else besides, bringing life and elegance and nobility and brilliance both of wit and of intrigue to the Spanish drama. He was to be followed by a finer poet, the soldier-priest Calderon (1600-81), of whose hundred plays the beautiful *Life is a Dream* is the most famous.

Important in itself, the Spanish drama of Lope and Calderon is the more so for having directly inspired the father of French drama, Pierre Corneille (1606-1684), to the writing of *Le Cid*, with which the great age of French tragedy began. At this time the English drama, apart from the gorgeous and often beautiful masques at court and elsewhere, among which Milton's *Comus* is to be counted, was de-

generating, after the Elizabethan blaze, into a condition which made the Puritan suppression of the theatres a partial benefit.

Corneille and Racine (1639-1699) gave to France a classic drama still unrivalled in its blend of fine passion, of form, of dignity in character, of technique of verse, and dexterity of intrigue, within rigid conditions. Needless as seems the strict following of the unities of time and place, and the arrangement of all deaths so that they happened off the stage and had to be narrated, it suited the highly critical and leisured audience of the court of Louis XIV—a very different one from the rough-and-ready throng of high and low that filled the old Globe and Bankside theatres.

#### The Genius of Molière

Just sixteen years younger than Corneille, and seventeen years older than Racine, France's unchallenged master of pure comedy, Molière (1622-73), made his own rules, and was content to be the classics' debtor rather than their slave. To Plautus and Terence he owed much, to the Italian comedians possibly more; but his genius has remained, within its limits, as essentially his own as Shakespeare's. While he ridicules types, and borrows plots, his creations live their own life, and he remains, at the heart of him, unimitated. The so-called English "comedy of manners" of the English Restoration, tainted with the vice of Wycherley (1640-1716) and the sparkling but salacious grace of Congreve (1670-1729), was based upon him and stole freely; but failed to convey the real life of a single one of his characters, or a trace of his essentially sane and pure humour.

**THE 18TH CENTURY.** As to dramatic classics, nothing approaching the output of the century 1550-1650 has since been contributed to the world's store. In England the 18th century produced many fine actors, and one tragedy worth mentioning, Home's *Douglas* (1757), which is said to have been inspired by the Italian Maffei's masterpiece *Merope* (1713). In comedy there were the grace and good humour of Goldsmith's *She Stoops to Conquer* and *The Goodnatured Man*, and the rhythmic brilliance of all Sheridan's dialogue, especially in the perfect polish and form of *The School for Scandal*.

While in other European countries the interest in the drama was declining in favour of the actor,

Germany, delayed by the Thirty Years' War, was having a belated dramatic outburst of its own. This began with the arrival of Lessing (1729-81) as a kind of critic-ordinary to the Hamburg theatre, his championship of Shakespeare against the tyranny of pseudo-Greek classicism, and the consequent inauguration of the "romantic movement" which inspired Schiller (1759-1805), and brought the great mind of Goethe (1749-1832) to bear upon the stage and to produce *Faust*, *Götz*, *Egmont*, and the romantic *Iphigenia*.

**THE 19TH CENTURY.** A French romantic movement, also largely inspired by Shakespeare, though not entirely so, led to the defiance of the classic traditions by Victor Hugo (1802-85) in *Cromwell* and later in *Hernani* and *Marie Tudor* and other cloak-and-sword plays. Under the same influence De Musset wrote his delicate *pro-verbes*. Also here should be mentioned Coppée (1842-1908), a scion of the same romantic movement, Edmond Rostand, whose *Cyrano de Bergerac* (1897) was immediately assured a lasting fame, and Maeterlinck's intimate *Pelléas et Mélisande* (1892).

#### Comedies and Farces

Apart from romance, the vogues of sentimental domestic comedy and melodrama, varied with farce, were on both sides of the English Channel distinctive of the earlier 19th century. The comedies of Augier (1820-89) were largely responsible for inspiring T. W. Robertson (1829-71) to his series of carefully produced domestic comedies that began with *Society* (1865). The influence of Scribe (1791-1861) and of Sardou (1831-1908) with his ingenious arrangements of plot for the exploitation of insincere passion in glamorous surroundings, supplied all sorts of popular and acting successes, but was not for the ultimate benefit of the art of the drama. Dumas fils, with *La Dame aux Camélias* (1852), started the problem-play, dealing half-sentimentally, half-argumentatively, but never quite sincerely, with a thesis of sexual morality.

In England the Robertson comedies supplied the model for the earliest work of Sir Arthur Pinero (1855-1934), who from domestic comedy and finely constructed farce began to deal with more serious matters in *The Profligate* (1889), and established his position as a leading dramatist with *The Second Mrs. Tanqueray* (1893). In this was felt the influence of Ibsen (1828-1906),

who from Norway has had so strong an effect upon European drama. Following up his poetic plays, *Peer Gynt* and *Brand*, with intensely naturalistic comedies, tending ultimately to symbolism, Ibsen not only made for ruthless truth alike of purpose and detail abolishing asides and soliloquies, but also, above all in his comedy of Rosmersholm, introduced the technical design of the gradual revelation of the past by strictly natural means.

**20TH CENTURY DRAMA.** After Sir Henry Irving (d. 1905), no actor emerged who was more important than his material, and from that time Bernard Shaw became beyond question the great man of the theatre. *Plays, Pleasant and Unpleasant* (1898) numbered seven—among them his first brilliant comedy, *Arms and the Man*, originally produced in 1894, *Candida*, and *You Never Can Tell*. Yet he did not become a profit-making dramatist until the establishment of the Vedrenne-Barker management at the Court Theatre (1904-07). He was the only Victorian dramatist whose popularity went on increasing, though Oscar Wilde became a period-classic, and Barrie's *Peter Pan* remained a Christmas institution. The popularity of Shaw's historical plays *Caesar* and *Cleopatra* (1907) and *Saint Joan* (1924) is a reminder that it was he who put an end to the idea that every play dealing with a pre-Jacobean time should be in blank verse. Of other playwrights noted in Victorian days, Galsworthy is read as a novelist and respected as a dramatist, but seldom staged to financial profit. Pinero is occasionally revived; but Henry Arthur Jones, R. C. Carton, Haddon Chambers, Anthony Hope (especially his *Adventure of Lady Ursula*, 1898), Capt. Robert Marshall, and Alfred Sutro are other Victorians deserving of more attention than has been paid them, even in broadcast versions. Somerset Maugham, though he ceased to write for the stage after *Sheppey* (1933), remained consistently in vogue.

#### Replacement of the Actor-Manager

The decline of the actor-manager had already begun with the rise of syndicates before the First Great War—indeed, after the death of Sir Herbert Tree (1917) there was no universally acknowledged personal head of the actors' profession in Great Britain. The replacement of the actor-manager by the producer did not help the discovery

and training of new dramatists. The success of author-managers like Noel Coward and Ivor Novello, both of whom at times achieved complete control over their productions as actor, author, composer, and manager at once, did not result in the development of any general system of author-managership.

#### Between the Two Great Wars

The interval between the First and Second Great Wars was not particularly fruitful of good plays. It may be that the competition of the cinema, particularly after the advent of the talking film to some extent deflected the interest of young authors from the living stage; and the influence of Shaw, preeminent writer of the discussion-play, tended to lead younger dramatists to neglect the imaginative, emotional, and constructional effort needed for the attainment of dramatic power. But for three decades the drama in Great Britain was distinctly lacking in playwrights with fresh, outstanding, and fully-equipped creative genius. The passing of melodrama under the competition of the cinema and the decline of poetic and romantic drama in favour of operette was already marked before the Second Great War. The decrying of sentiment—in spite of the charm of such plays as Monckton Hoffe's *Many Waters* (1928)—led to the production of "comedy-thrillers" of insincere and partial appeal. Frederick Lonsdale turned from the writing of librettos to that of piquant comedies like *The Last of Mrs. Cheyney* (1925) and *On Approval* (1927). Ashley Dukes's *The Man with A Load of Mischief* (1924) was a fine example of ironic comedy.

J. B. Priestley, starting as an original dramatist with *Dangerous Corner* (1932), for a year (1934-35) adventured as a dramatist-manager at the Duchess. He won popular success with *Laburnum Grove* (1933) and *When We Are Married* (1938); but several of his later plays, such as *They Came to a City* (1943), were debate on the Shaw model rather than drama. James Bridie, successful author of *The Sunlight Sonata* (1928) and *The Anatomist* (1931), evolved a kind of modern miracle-play technique with *Tobias and the Angel* (1931) and *Jonah and the Whale* (1932). His *Mr. Bolfry* (1943) was one of the best wartime plays. Terence Rattigan's *Flare Path* (1942), *While the Sun Shines* (1944), and *Love in Idleness* (1945) were wartime successes, and his

French Without Tears (1936) ran for over 1,000 performances.

Emlyn Williams, after winning popular favour with the thriller, *Night Must Fall* (1935), and the autobiographical *The Corn is Green* (1938), turned to more imaginative work in, for instance, *The Light of Heart* (1940) and *The Wind of Heaven* (1945). Ronald Duncan's satirical fantasy *This Way to the Tomb* (1945) struck a new note. Both John van Druten, author of *Young Woodley* (1928), and R. C. Sheriff, author of *Journey's End*, produced the next year, sought their later opportunities and public more in the U.S.A. than in Great Britain. The death of Rudolf Besier in 1942, whose *The Barretts of Wimpole Street* (1930) is likely to survive as a biographical classic, was an especial loss. Esther McCracken's *Quiet Wedding* (1938), followed by *Quiet Week-End* (1941), and *No Medals* (1944) gave her the record in long runs for plays by women. Aimée Stuart (*Summer Snow*, *Jeannie*, etc.), Gordon Daviot (pen-name of Elizabeth Mackintosh) (*Richard of Bordeaux*, etc.), and Daphne du Maurier (*Rebecca*, *The Years Between*, etc.) notably upheld the honours of the distaff side.

#### Repertory Theatres in Britain

During and after the Second Great War a remarkable growth in the desire for good drama in Britain was both met and stimulated by the setting up of repertory centres in London and the country. This movement, although handicapped at almost every point by the scarcity of actual theatres and the impossibility, for the time, of building new ones, led to an increase of provincial repertory theatres from 50 to 250 between 1940-46. Other signs of revived interest were the rise to national distinction (represented by an exchange of visits with the *Comédie Française*) of the Old Vic-Sadler's Wells repertory company with Laurence Olivier, Ralph Richardson, and Dame Sybil Thorndike, the popularity of Donald Wolfit's Shakespearian company both during the war and afterwards, the success of old comedy at the Haymarket under John Gielgud's management, and the creation of the Arts Council (*q.v.*). There was an increasing hunger, shown also in the growth of theatre clubs, on the part of a public to whom the theatre, seriously considered, was something virtually new.

At the same time neither in Europe nor the U.S.A. can any great new dramatic movement be

recorded. The Russian drama, which had given high hopes with Chekhov and his contemporaries, became hampered by political control. Though some American dramatists—e.g. Robert Ardrey with *Thunder Rock* (1939)—had an international appeal, no new great dramatist has arisen since the First Great War. The group of Irish dramatists who made Dublin a nest of genius in the days of Synge and Yeats, found a continuance of style in Sean O'Casey. Yet his plays, from *Junio* and the *Paycock* (1925) to *Red Roses for Me* (1946) have had little influence in Eire itself. Everywhere, including Central Europe, and especially Scandinavia—where neither Ibsen nor Strindberg had successors of equal weight—there was evidence of enthusiasm for good drama; but the immediate effect of both the First and the Second Great Wars was rediscovery rather than creation.

**Drama.** Town of Macedonia, Greece, the ancient Drabescus. It is about 70 m. N.E. of Salonica, in the centre of an agricultural district. It was in the territory ceded to Greece by the treaty of Bukarest, 1913, and was occupied during the First Great War by the Bulgars in Aug., 1916, and recovered by the Greeks on Oct. 8, 1918. Near it is the plain on which was fought the battle of Philippi resulting in the defeat of Brutus and Cassius, 42 B.C. Pop. 29,339. Drama gives its name to a dept.; pop. 139,583.

**Drama League, THE BRITISH.** Founded in 1919 by Geoffrey Whitworth. The object of this organization was to develop and encourage the art of the theatre and to promote a true relation between the drama and the community. It endeavoured to federate all the societies and institutions that practise dramatic art with a serious intention, and by 1944 had affiliated some 5,000 societies that ranged from the smallest village group to the Royal Academy of Dramatic Art (*q.v.*). In 1935 the league moved to new headquarters at 9, Fitzroy Square, London, W.1, where its library housed 50,000 volumes. See *Amateur Theatre*.

**Drambuie.** Liqueur made in Scotland. The principal ingredients are whisky and honey. The recipe is said to have been given to one of the Mackinnons of Skye by a Highland gentleman in the bodyguard of Charles Edward Stuart, as a reward for assisting that prince to escape in 1745, and the recipe has been carefully preserved by successive members of the family.

**Drammen.** Old seaport town of Norway. Cap. of Buskerud co., it is on the Drammen River, where it enters Drammen Fjord, and is a junction 33 m. by rly. S.W. of Oslo. Picturesquely placed, it consists of three formerly separate towns—Bragernæs, Strømsø, and Tangen. It exports wood—some 4,000,000 logs being yearly floated down the river—wood-pulp, paper, and nickel ore. There are large saw-mills, ship-building yards, an iron foundry, and breweries. The pop. of 25,493 makes it the fifth town of Norway.

**Draper** (A.S. from Fr. *drap*, cloth). Originally one who made woollen cloth. Later applied to a dealer not only in cloth but in linen, as woollen-draper, linen-draper; now used generally to denote the seller of woollen, linen, cotton, and silken goods.

**Draper, HENRY** (1837-82). An American astronomer. Born in Virginia, March 7, 1837, he studied medicine in New York, and in 1861 became professor of physiology and analytical chemistry in the university there. His alleged discovery of oxygen in the sun in 1877 has long been disproved. He began the construction of his telescope for astronomical photography as early as 1858, and his work marked a great advance in lunar photography. The first promising autographic pictures of the Orion Nebula were

obtained by him in the autumn of 1880. He was engaged in a spectroscopic study of the stars when he died, Nov. 20, 1882. An endowment at Harvard Observatory by his widow provided for the continuation of this work.

**Draper, RUTH** (b. 1889). American entertainer. She was born in New York, made her first appearance

Ruth Draper, American entertainer

on the stage in 1915, and the following year acted with Marie Tempest in *A Lady's Name* at the Maxine Elliott Theatre, her only performance in a play. It was as a diseuse that she made her reputation. Without scenery and with the minimum change of costume she enacted scenes of tragedy, pathos, and comedy, contriving by change of voice and manner alone to populate the stage. She wrote her own material, and her art, based on acute observation and perfect timing, was at its best in such sketches as *Three Women* and *Mr. Clifford*; *Opening the Bazaar*; *Showing the Garden*. She came to London first in 1920, gave regular seasons until 1939, and returned in 1946. In the U.S.A. the term "drapering" signified her type of performance.

**Draper Catalogue.** Catalogue of the spectra of the 225,300 brightest stars in the sky, compiled at Harvard observatory and published 1917-24. Named after Henry Draper, first American observer of stellar spectra, it made possible the first classification of the stars by their physical characteristics. The Draper classification arranges the stars under the letters O, B, A, F, G, K, M, in order of decreasing surface temperature, most classes being subdivided decimally. Stars of class O are at about 30,000° C., M stars at about 3,000° C. By 1936 the catalogue had been extended to include 272,100 stars; thenceforward the tabular presentation was abandoned in favour of publishing charts with spectral types marked thereon.

**Drapers' Company.** Third of the 12 chief City of London livery companies. Originally the members were makers and sellers of cloth in and near London. They received the first of their seven charters in 1364, and were granted arms in 1439. The roll includes the founders of several noble

families, among them the Pulteneys, earls of Bath; the Capels, earls of Essex; and the Brydges, dukes of Chandos; also many lord mayors, including the first, Henry Fitz-Alwyn.

The guild first met in S. Mary Bethlem hospital church, Bishopsgate. Its first hall was in St. Swithin's Lane.

The mansion in Throgmorton Street of Thomas Cromwell, earl of Essex, was purchased in 1541, and burnt 1666. A new hall was built in 1667, and rebuilt in 1772-74 and 1866-70. From the existing garden a mulberry orchard once stretched down to London Wall. The company has large estates and a corporate and trust income of about £78,000, and administers numerous charities, including a number of almshouses. Since 1886 it has contributed nearly £500,000 for technical and general education at the People's Palace, Mile End Road, the educational side of which has now become Queen Mary College, London University. In 1887 it gave the site and £50,000 for Bancroft's school at Woodford; and it contributed largely to technical schools at various universities. Consult *History of the Worshipful Company of the Drapers of London*, A. H. Johnson, 1914.

**Drapier Letters, THE.** Series of pamphlet letters written by Jonathan Swift in 1724 over the signature M. B. Drapier. In these he protested vigorously and successfully against the job by which a royal patent had been granted to William Wood for coining halfpence and farthings for circulation in Ireland, against the wishes of the Irish parliament.

After the appearance of the first of the letters a committee reported in favour of the patent, but recommended that the amount to be coined should be reduced from £100,800 to £40,000. In his fourth letter Swift used with great force the argument that government without the consent of the governed was the very definition of slavery. A reward was offered for the discovery of the authorship of this letter, and the printer was prosecuted. Swift admitted the authorship, the patent was surrendered, and M. B. Drapier became a popular hero. See *Swift*.

**Draught.** Term used in various meanings. (1) The least depth of water in which a ship can float with-

Drapers' Company arms

out touching bottom. The largest vessels have a draught of about 35 ft. when fully laden. Draught scales are printed on the bow and stern post. (See *Load Line*.)

(2) The current of air passing through a grate or a furnace to promote combustion. Air is necessary to combustion because it supplies the oxygen required to bring about the chemical change resulting in the evolution of heat and flame. By control and regulation of the draught the rate of combustion can be governed. Natural draught is brought about by connecting the fireplace or furnace with the open air by a long pipe or chimney. The column of air within this chimney is ordinarily warmer than the outside air, even in the absence of a fire; consequently this column is less dense and lighter than the free air around. Such free air displaces air in the chimney, forcing it up and out and setting up a circulation which continually brings new air into the room. Kindling a fire in the grate or furnace adds to this circulation, while the extra oxygen then reaching the fuel bed quickens the rate of combustion and makes the fire burn up. The damper in the fret of an open fire grate helps to control draught. This system is further applied in domestic boilers: the furnace is fully enclosed, while the damper is operated automatically by a thermostat to maintain the rate of combustion within the desired temperature range. Forced draught is the supply of air under pressure to the furnace by means of a steam jet in the chimney base (e.g. locomotives), or by the use of fans or blowers. Down-draught is a reverse current in the chimney, which may be brought about by air eddies, the presence of higher buildings, or wind. (See *Chimney*.)

(3) In masonry, that part of the surface or surfaces of a stone block which is chiselled away as a guide to reducing the whole surface to its proper form and proportions. With large stones needing much reduction several parallel draughts are made.

**Draughts.** Game of skill played with 24 disks or draughtsmen on a chequered board of 64 alternate black and white squares. It is of great antiquity, forms of it being known in ancient Egypt, Greece, and Rome. The game was played in the mid-17th century much as it is today. In the U.S.A. it is known as checkers.

Two players have each 12 men, one selecting white, the other

Draughts. Board set out with men ready for playing

black; they are set up in three rows at each end of the board. In Scotland the black squares are sometimes played upon; in England the white. The board is placed so that when playing on the white squares a black square is at the players' right hand; or vice versa. A man is moved one square at a time in a forward diagonal direction, and "takes" an opponent's piece by passing over it whenever there is a vacant square beyond, and removing it from the board. Providing there are vacant spaces intervening, it is possible to move over (and take) several men.

Each player moves alternately, and the game may be won by either forcing all an opponent's men from the board or blocking those that remain in such a manner that it is impossible for him to make another move. When a player succeeds in getting one of his pieces across the board into the last row it is crowned by placing another piece upon it, and becomes a king, thereby acquiring the privilege of moving either backwards or forwards. When it is possible to take a man it is compulsory to do so; the penalty for noncompliance being the huffing (removal from the board) of the offending player's piece by the adversary before he moves.

**Drave** or **DRÄV**. River of Central Europe, forming part of the boundary between Hungary and Yugoslavia. It is the longest of the tributaries of the Danube which flow E. from the longitudinal valleys of the E. Alps (450 m.). Its upper part is ice-bound in winter and the whole stream is subject to spring floods. It is navigable for steamers to Barcs, for boats to the confluence with the Mur, and for rafts from Villach down stream. The river rises in the Puster Thal in Tirol, receives the drainage from the Hóhe Tauern and the Carnic Alps,

and flows in a narrow Alpine valley through Carinthia. Below Marburg (Maribor) the valley widens, while below the Mur confluence there are few towns on its bank owing to danger from floods.

**Dravidian**. Name given to an ancient non-Aryan race in S. India and Ceylon. They are dark, broad-nosed, thick-lipped, curly-haired, and long-headed. The Brahui of Baluchistan, who speak a Dravidian language and are sometimes included among the Dravidians, are short, with olive complexions, brown hair and beard. The Dravidians are by some held to be related to the Australian aborigines; by others to the Negroid race. A style of architecture, often called Dravidian, is preferably designated S. Indian. See India; also Cave Temple illus.

**Dravidian Languages**. Group of languages spoken by the Dravidians in Baluchistan, N. and S. India, the Deccan, and Ceylon. The people are non-Aryan, and their language, although its vocabulary contains a considerable Sanskrit element, has a distinctive grammatical system. It is agglutinative, the first part of a word always remaining unaltered, different relations being expressed by different suffixes glued on to it. For this reason some assign the Dravidian languages to the Turanian or Ural-Altaic family, but others regard them as standing alone and unconnected with any

other linguistic group. The grammar is on the whole simple, and the vocabulary, apart from Sanskrit borrowings, does not indicate a very advanced state of civilization. There is no relative pronoun, and the negative verb is expressed by a special form.

The chief dialects are Telugu or Telinga, Tamil, Kanarese, Tulu, Malayalam. Of these Tamil and Telugu, spoken by the greatest number of people, are the most important. These five dialects are written languages, with special alphabets of Sanskrit origin, the literature consisting mainly of religious and didactic poems, lyrics, epics, and medical works. It contains versions of great Sanskrit epics, the Ramayana in Tamil, the Mahabharata in Telugu. An ethical poem, Naladiyar, of the 10th century, also deserves mention.

**Drawback**. Term meaning the repayment by the public authorities of money already paid as customs or excise duties. This is usually done when articles liable to taxation are exported, or, having been imported, are re-exported, and its object is to enable the trader to compete in foreign markets. Thus a trader, having paid the customary duties on wines imported by him into England, might wish to sell them in Norway. Having complied with the necessary formalities, he would have returned to him the drawback, or money already paid.

## DRAWING: BASIS OF THE FINE ARTS

Gordon Stowell, A.R.C.A. (Lond.)

*This statement of general principles includes an account of the development of line drawing among the book and magazine illustrators of the 19th and 20th centuries. See also Advertising; Art; Caricature; Cartoon; Etching; Lithography; Painting; Perspective; Poster; Wood Engraving; and biographies of artists mentioned*

Drawing is the representation by pictorial or diagrammatic means of objects seen or imagined. The purpose of the diagrammatic sort is to convey accurate information as to construction, materials, dimensions, processes, mechanical action, etc. They are typified in the working drawings of an engineering draughtsman or the architectural designer's plans, elevations, and cross sections. Mechanical means are employed, i.e. rulers, compasses, etc., together with various conventions intelligible only to the specialist for whom they are prepared. A type of informative diagrammatic representation, equally specialised but more generally familiar, is the map.

What is more commonly understood as drawing is the pictorial

kind. This may also be a vehicle of information but only approximates to accuracy, being dependent on the judgement of the artist's eye and the skill of his hand, as well as being further conditioned by his particular emotional or intellectual intention and the limitations and peculiar qualities of his chosen medium. As to the last, if most people think of a drawing in terms of pencil or pen-and-ink and paper, it is because these are the commonest and most accessible tools. But the range of media is without limit. It includes chalk, charcoal, crayon, paintbrush, airbrush, scraper, etching needle, engraver's burin—anything, in fact, that can record an intelligible mark on any surface capable of recording it—

down to a child's finger on a steamy window.

To express himself and his world by drawing is one of man's natural gifts. The practice of drawing is older than that of writing, of which it is the parent. Caves inhabited by prehistoric man are decorated with pictures of extraordinary merit and fidelity of observation (see Altamira; Art, Prehistoric, col. plate), which suggest that he drew for pleasure, as a child draws. Civilization has tended to destroy rather than foster this inborn gift, so far as most people are concerned; but educational reformers have endeavoured to revive the tendency. For example, since 1890, drawing has been compulsorily taught in English primary schools and has become a recognized part of the syllabus of all good secondary schools. The teaching has not been on uniformly intelligent lines, but 20th century methods have been revolutionised by the remarkable results obtained by such original teachers as Thomas Ablett (1849-1945) and Marion Richardson in England, and Cizek (1865-1947) in Austria, in their encouragement of free expression in drawing from memory and imagination and of the enjoyment of the decorative qualities of pattern making for their own sake.

#### Line Drawing

The simplest convention used in drawing is that of line, so universally accepted, today as in ancient Egypt, that we often forget that it is only a convention, that shapes and colours are not in reality bounded by outlines. Pure line, the natural outcome of any pointed instrument such as a pencil, demands a precision of statement more difficult to attain than is commonly supposed. But drawing is still drawing, even when line is dispensed with in favour of solid masses of varying tone values, as in a monochrome painting or an aquatint. Most of the drawings in "half tone" which accompany the stories in an illustrated magazine are of this kind; or they may combine line and mass. Painting itself is only drawing in masses of colour. The arranging, or "composing" of the component parts of a picture may come under the heading of design, but the actual defining of them is sheer drawing; and to the true artist the two are inseparable. Line and colour are often effectively combined, as in the water-colour drawings of the English topographical artists of the late

18th century. Indeed, the artist has unlimited choice of technique and of medium. J. M. W. Turner in his water-colour drawings called in the help of penknives and sponges. The silhouettist can obtain striking effects with scissors and black paper. It is all drawing, in the broadest sense.

#### The Laws of Perspective

As drawings are usually made on a flat, or two-dimensional, surface, the essential problem of the artist is to present on that surface the illusion of three-dimensional reality. He achieves this by following the laws of perspective. These enable him to represent, say, a box as the eye may see it—front, side, and top, all at once. A box is only the simplest example: in the pictorial representation of everything three-dimensional from twenty square miles of landscape (introducing a further complication in what is called aerial or "atmospheric" perspective) to a single human face in profile, the laws of perspective are inescapable.

Correct perspective, correct proportion—these are the elements of good drawing. Where they are deficient the work of the artist is commonly described as "out of drawing." Other means towards the desired end include the correct recording of light and shade, of tone values, of colour values. Refinements in technique may enable an artist to suggest such lesser qualities as the bluntness or sharpness of an edge, the texture of a given surface, or even the relative weights of things.

Drawing is the basis of all painting, sculpture, architecture, and many decorative crafts. Theoretically, and to some extent historically, it aims at an approximate illusion of three-dimensional reality. But in practice, if that were all, a camera can do as much with infinitely less expenditure of human effort. Photographic "likeness" achieved by the human hand may be as much of a technical marvel as that perfect circle which Giotto is said to have drawn freehand, and is equally useless from any other point of view. But, as already stated, all art is consciously or unconsciously conditioned by the individuality of the artist and the limitations of his medium. It is just this variable falling-short of perfection which enables us to distinguish and enjoy the individual qualities of a great draughtsman—the grave eloquence of Holbein's line, the precision of Dürer's or Leonardo's, the rich

dramatic vigour of Rembrandt's, the lyrical grace of Botticelli's, the finesse of Canaletto's, the austerity of that of Ingres. All these and many other great artists are respected for their superb powers of draughtsmanship, whatever other qualities their work may possess. On the other hand, many others, equally great, are recognized as being greater colourists than draughtsmen (e.g. Turner), or have concentrated on other aesthetic qualities such as atmospheric effect or decorative pattern. While yet others (e.g. Blake, El Greco) are great artists by virtue of qualities transcending both their draughtsmanship and their colour. It has been left to the so-called "modern" painters to demonstrate with some emphasis the truth that in a picture which is deliberately and even violently "out of drawing" may yet reside some unassailable aesthetic virtue. The work of Dali and many of the Surrealists is marked by much exquisite draughtsmanship, even judged by the most exacting academic standards. For other "moderns," such drawing is still the basis of their art, but only as a point of departure in their legitimate quest for whatever deeper truths exist that can be revealed by surface appearance.

#### Marvels of Wood Engraving

A popular form of drawing, necessitating the fullest exploitation of the potentialities of pure line, developed in England during the 19th century with the art of book and magazine illustration. It was largely due to the emergence of a school of highly-skilled commercial engravers in wood, led by Dalziel, Swain, and Linton, in whose hands wood-engraving became a thing to marvel at. They made it possible to reproduce a delicacy of touch and depth of tone far beyond the range of the older, more expensive, and more forbidding steel engravings. The basis of the engravers' work was, of course, line; effects of shade, shadow, and tone were achieved by hatchings and cross-hatchings of varied intensity.

The excellence of their work led directly to the establishment of many popular illustrated periodicals from the earliest years of Victoria's reign. The Illustrated London News and the Graphic, pioneers in a new branch of journalism, owed everything to it; but for the most part the draughtsmanship of those artists who anticipated the rôle of the news photographer was much inferior to the craftsmanship of their

Examples illustrating the differing techniques of half-a-dozen of the world's great draughtsmen. 1. Sir Thomas More, crayon portrait by Holbein (1497-1543). 2. Study in chalk of a woman's hands, by Dürer (1471-1528). 3. Woman's head, by Leonardo da Vinci (1452-

1519). 4. Pen drawing from one of the sketch books of Rembrandt (1606-69). 5. Landscape etching by Rembrandt. 6. Pencil drawing of lemon tree, by Leighton (1830-96). 7. Study for The Three Graces, by Pablo Picasso (b. 1881)

**DRAWING: THE ARTIST'S DELINEATION OF THINGS SEEN OR IMAGINED**

engravers. On the other hand, the reputations of several fine artists were secured in the pages of Punch, among them being Leech, Doyle, Tenniel, Keene Du Maurier, and Sambourne. Moreover, books, and especially children's books, began to be more generally accompanied by illustrations from wood engravings. It is notable that Tenniel and Sambourne excelled themselves respectively in their drawings for the Alice books (1865 and 1871) and Kingsley's *The Water-Babies* (1863). The art reached its full flower in the 1860s and 1870s in such journals as *Once a Week*, the *Sunday Magazine*, the *Cornhill*, and *Good Words*, and the delightful line-work of Millais, Sandys, Boyd Houghton, Charles Green, Pinwell, Fred Barnard, etc.

#### Introduction of Photo-Engraving

With the onset of photographic processes of pictorial reproduction towards the end of the century this beautiful art suddenly died out. Not only was photo-engraving much cheaper but it reproduced with infinitely greater fidelity anything the artist liked to draw, in either line or half-tone. The number of illustrated magazines grew beyond counting all over the world, and artists equally innumerable were discovered to supply their needs, as well as the needs of advertisers, who were quick to seize the opportunity for a fuller wealth of pictorial display. Possibly illustrating became too easy; possibly the public became surfeited and over-indulgent; whatever the reasons, a decline in standards of draughtsmanship followed swiftly.

True, the inspiration of the earlier artists lingered into the first two decades of the 20th century and is recognizable in the best black-and-white art of the period. The outstanding genius of Phil May, one of the greatest draughtsmen of any age, lay in a studied economy of line which enabled him to express more exact observation with one stroke of the pen than most of his contemporaries could achieve in fifty. Other illustrators of those days who helped to postpone the eventual decay of good draughtsmanship include Hugh Thomson, Edwin Abbey, W. Heath Robinson, Edmund Sullivan, and H. R. Millar, as well as many of the later Punch artists, e.g. Baumer, Raven-Hill, Fred Pegram, F. H. Townsend, Claude Shepperson, Frank Reynolds. The technique of all these popular artists is worth close study, as are the more mannered styles of Sir

Bernard Partridge, Harry Furniss, H. M. Brock. But by 1920 the heyday of such men had passed. Since then good draughtsmanship in popular art has been increasingly forsaken in favour of decorative or humorous mannerisms, qualities perhaps equally estimable but owing nothing whatever to a great English tradition.

In addition to the accompanying reproductions, examples of good drawing, too numerous to mention, are to be found among the illustrations to this work, but see particularly the examples of Caricature, pages 1770-71.

**Drawing.** In metallurgy, a term with several meanings: (1) "Drawing the temper" or "drawing back" is synonymous with tempering, which has now almost entirely displaced drawing, except in America. (2) In the solidification of castings, the formation of shrinkage or contraction cavities through unsuitable design is referred to as drawing. It may also result from insufficient feeding of the casting. (3) In mechanical working of metals and alloys, drawing is a process for producing rod, bar, or wire, the metal being drawn cold through a die consisting of a tapered hole in a draw plate. This reduces the diameter of the material and increases its length. Seamless tubing may also be produced similarly. Since drawing results in the hardening of the metal, only a limited amount of work can be applied at each operation before the metal becomes too brittle to be worked further. To continue drawing, if so required, the material must then be annealed. Drawing results in a distortion of the structure; it increases tensile strength and hardness at the expense of ductility.

In plastics, drawing is carried out by the extrusion of the material under pressure through a perforated plate (for rods), and, for short lengths of pipe or tube, round a former or core.

**Drawing Room.** Room in which company is received, sometimes known as parlour or reception room. In the 16th century this room, usually situated next the dining-room, began to be known as the with-drawing-room, because the family withdrew to it after meals. A formal reception of guests by a king or queen is also called a drawing room, and at such girls entering society, and women re-entering it as brides, are presented at court.

**Drawing Society,** ROYAL. Founded 1888, incorporated 1902.

The society was the pioneer, in Great Britain, of modern methods of teaching drawing to children. At a time when the official system was one of copying, known as freehand, it urged freedom for the child to draw what it liked in its own way. The methods devised by the founder, T. R. Ablett (q.v.), to use drawing as a means of developing observation, concentration, memory, and general intelligence, met with great success and have been widely adopted. The society examines over 30,000 papers annually from schools in all parts of the world, and for many years has held an exhibition known as the Children's Royal Academy, and awarded medals. Its address is 12, Cromwell Place, London, S.W.7.

**Draw Plate.** Name for a steel plate, through a hole in which, in manufacturing wire, a fine rod of metal is drawn. The hole is usually tapered, while the end of the rod is reduced a little to enable it to enter the draw plate sufficiently far to be seized by the draw bar. See Wire.

**Drayton, MICHAEL** (1563-1631). English poet and dramatist. Born at Hartshill, Warwickshire, a friend of Shakespeare and a shareholder in the Whitefriars Theatre, he is best remembered for the so-called "dry-eyed sonnet," *Since there's no help, come, let us kiss and part*; and the racy *Ballad of Agincourt*. He wrote a charming fairy poem, *Nymphidia*. His *Polyolbion*, a patriotic poetical topography of some 30,000 lines, is packed with allusions of antiquarian interest, but scarcely read. It was first published in its entirety in 1622. Drayton died in Dec., 1631, and was buried in Westminster Abbey. Consult M. D., a critical study, O. Elton, 1905.

**Dreadnought.** Name borne by first-class ships of the British navy almost continuously since 1573. It figured in the fleets which fought against the Armada, in the fights of the Dutch Wars, and in the battles of La Hogue, Cape Passaro, and Trafalgar. The hulk of the *Trafalgar Dreadnought*, launched at Portsmouth in 1799, was moored off Greenwich in 1830 to serve as a hospital for seamen, but she was broken up in 1857.

The ninth *Dreadnought* was the forerunner of the modern battle-

Michael Drayton,  
English poet  
Nat. Port. Gall.

ship. Her features were settled by a committee presided over by Admiral Sir John (later Lord) Fisher. The vessel was laid down at Portsmouth, Dec. 2, 1905, launched Feb. 10, 1906, and left for her trials on Oct. 1, this rate of construction for a large ship never having been approached previously. Her principal dimensions were: length, over all, 526 ft.; beam, 82 ft.; normal displacement, 17,900 tons. Her cost was £1,813,100. She was larger, faster (21 knots), and more costly than any earlier British warship, and was the first of any nationality, larger than a light cruiser, to be equipped with turbine machinery. Armament comprised nothing between ten 12-in. battle guns and 24 3-in. (12-pounders) for repelling torpedo-craft.

All battleships designed for the British navy from 1893 to the time of the Dreadnought had a main armament of four 12-in. guns, but while those provided for up to 1900 had a secondary battery of twelve 6-in., the King Edward class (1901-08) were given four 9·2-in. and ten 6-in., and the Lord Nelson class (1904) ten 9·2-in. The Dreadnought was thus in a large measure the natural development of a well-established tendency. Her ten heavy guns were mounted in five turrets, three on the centre-line and two abreast on the beams, so that eight guns could be brought to bear on either broadside.

By general consent all vessels subsequently designed on similar principles as to armament were up to the first Great War called dreadnoughts. Vessels built on the "all-big-gun" principle but having weapons heavier than the 12-in. were popularly known as "super-dreadnoughts." See Battleship.

**Dream.** An involuntary activity of the mind which occurs during sleep. The fact that dreamers seem to visit distant scenes is one of the origins of the belief in a soul or spirit which can leave the body and wander about at will. In some religions dreams are believed to be inspired by the gods and their interpretation plays a part in the magic of most primitive peoples. Interpretation was first put on a scientific basis by Sigmund Freud in his book, *The Interpretation of Dreams*. His theory explains both the function and structure of dreams and offers a clue to the unravelling of their meaning.

The dream is a defence mechanism the purpose of which is to guard sleep and to prevent the

dreamer from being awakened either by external stimuli or harassing mental impulses and problems. In order to achieve this the mind disguises the disturbing forces in such a way that they no longer demand an active response from the sleeper, e.g. the alarm clock is heard as a peal of bells, or the pangs of hunger are dulled by a dream meal.

#### Freudian Theories

Freud also maintains that all dreams are the expression of some wish. Where the wish is acceptable to the waking mind, sleep is preserved by its apparent fulfilment—the prisoner dreams that he is free; the candidate that he has passed his examination. Where the wish is inadmissible, and has been repressed because it is condemned by conscience, disguise becomes necessary, if sleep is to continue. The forms of these disguises are many and complex. Dangerous ideas may be replaced by apparently harmless symbols, as when sexual impulses are translated into climbing stairs or mountains, or the desire to kill some person is satisfied by dreaming that he has departed for some distant place. Other forms of distortion are alterations of emphasis, so that the most significant features of the dream appear as trivial changes in the feelings which would normally be attached to the dream situation; the use of composite images to represent several persons, objects, or desires; punning (e.g. 180 for "I ate nothing"); remembrance of dreams as far more rational and coherent than they were.

Some types of dream are associated with particular illnesses: feelings of suffocation with disease of the lungs; terrible deaths with heart disease. Some are common to large numbers of people, e.g. dreams of impeded motion, particularly running, which betoken severe mental conflicts. Many individual dreams are determined by the events and moods of the preceding day, and the hidden wishes which they express spring from past situations which resemble those experienced during that day.

When the disturbing stimulus is so powerful that it defeats the distorting mechanisms, the dream images become less and less disguised until the dreamer wakes. He hears the alarm clock for what it is, or is roused by his nightmare. The acute discomfort and anxiety felt during nightmares, and their rapid disappearance, show both

the intensity of the conflicts between forbidden wishes and conscience and the efficiency of the control which prevents disturbance during wakefulness.

The interpretation of dreams can play an important part in the treatment of mental disease. It reveals both the nature and the sources of the patient's difficulties and (since different types of dream occur at different stages of illness) helps the doctor to judge the progress of the cure. See Dunne, J. W.; Free Association; Freud, S.; Psycho-Analysis; Repression; Super-Ego.

**Dream of Gerontius, THE.** Oratorio by Sir Edward Elgar, his opus 38 and one of his most popular compositions. It is for three soloists, mezzo-soprano, tenor, and baritone, with chorus and orchestra, and was first given under Richter at the Birmingham festival Oct. 3, 1900, Marie Brema, Edward Lloyd, and Plunket Greene singing. The words are the greater part of a poem by Cardinal Newman first published in 1865. With variations of metre and mood, the work is a vision of the progress of the soul from deathbed to judgement and purgatory. See Elgar; Newman, J. H.

**Drebbel, CORNELIS VAN (1572-1634).** A Dutch scientist. Born at Alkmaar, he is supposed to have invented the thermometer, but probably he only improved it. His instrument consisted of a glass tube with a column of water which rose and fell according to the expansion and contraction of the air in a bulb with the variations in temperature of the atmosphere. The secret of a bright scarlet dye which he discovered was introduced into France by those who established the Gobelins factory and gave the tapestries their reputation for brilliancy of colour. He also invented a submarine which navigated the Thames between Westminster and Greenwich.

The emperor Rudolf gave him a pension, and Ferdinand II made him tutor to his son, but a revolution in Austria led to his imprisonment. On his release he came to London, where he died. His principal works were two Dutch treatises (Leyden, 1608) on *The Nature of the Elements*, and *Quintessence*, published later in Latin and French. Consult Life, G. Tierie, 1932.

**Dredging.** The operation of excavating material from the bed of a river, harbour, dock,

canal or other water covered area. The chief objects of dredging are to maintain navigation by removing silt, to increase the depth of water, or to form new channels. Dredging is also employed for working over submerged gold and tin bearing strata and in reclaiming land.

Dredging machines are classified according to the means by which they move the material or spoil, such as bucket or ladder, suction or hydraulic pump, spoon or dipper, and grab. The first and second work continuously, the third and fourth intermittently. Some dredgers are fitted with buckets and pumps, some are self-propelling. Self-propelling machines are usually intended for work in exposed positions where the risk

ladder. The top "tumbler" is driven by steam engine through a gearing which includes a clutch or friction gear designed to slip if the buckets strike something very hard and the pull on the chain is excessive. The buckets move downward under the ladder at a speed of 10-20 buckets a minute dependent on whether the gear is in slow or fast speed, scoop up the material as they pass round the lower tumbler, and after ascending the upper face of the ladder over spaced rollers, discharge themselves into a shoot which delivers the spoil into a barge moored alongside.

When at work the dredger is anchored by chains or wires laterally and fore and aft, and is moved in any desired direction

means of powerful centrifugal pumps. Suitable trunnions are interposed between the top end of a tube and its pump, to allow the tube to be raised and lowered. The solid matter is mixed with several times its bulk of water and is separated by settlement in the hoppers of the dredger or dumb hopper barge.

Considerable difficulty sometimes results if the spoil is not thick, and sometimes a sand will not settle. In such cases bucket dredging is preferable as the material raised is almost free of water. The Leviathan, largest of suction dredgers, used in the Mersey, has four pumps which between them in an hour deliver into hoppers in the ship 8,000 tons of sand from a depth of 70 ft.

#### The Huge Dipper Dredger

The clay-cutting dredger is of the hydraulic type, but specially designed to excavate stiff clay. The nozzle end of a suction pipe is surrounded by a large bladed cutter, revolved by a shaft running along the top of the pipe. The blades cut off slices of clay which are sucked up by the pumps. The dipper dredger of a large size is used almost entirely in American waters. In its action it resembles the steam navy. The dipper, which consists of a large scoop—with a capacity up to 15 cu. yds.—mounted on a long arm works over the head of the boat or through a well. It collects its load with a circular upward sweep and dumps it into a hopper barge or on the bank, the load being released through a trapdoor on the bottom of the scoop. It is useful for dealing with loose rock, boulders, tree roots, and other difficult materials and is used extensively on the Panama Canal. The dredger is moored by large vertical sliding posts called spuds, fitted with a broader base which takes part of the downward thrust of the dipper.

The grab dredger excavates by means of a large bucket raised and lowered by chains running over the end of a boom. The bucket is made up of two or more jaws, hinged at the top, which fall open and close over their load under the lifting pull. Grabs are used in restricted situations for removing hard and soft matter. Some grabs weigh as much as five tons and will remove broken rock and large boulders. A self-propelled sea-going hopper type of grab vessel fitted with three grabs will excavate 350 tons of material an hour.

Dredging. A modern bucket dredger loading a 1,500-ton dumb hopper barge in Victoria Dock, London  
By courtesy of the Tisbury Contracting and Dredging Co.

of damage to attendant dumb hopper barges would be so great as to prohibit this form of loading. The spoil is therefore stored in a large compartment inside the dredger, which when full proceeds to the dumping area in deep water and releases spoil by opening valves in the vessel.

The bucket or ladder dredger is used chiefly for clearing mud, sand, conglomerate, chalk, gravel, or stiff clay containing boulders and other hard material. The illustration above is of a dredger of this class. Situated in the hull is a longitudinal well open to the water, spanned near the head by a steel "A" framing which carries a powerful hoisting tackle attached to the free end of a strong ladder girder fulcrated at the higher point of a strong framing situated amidships. An endless chain of 40-50 steel buckets, joined together with strong links, runs round four-, five-, or six-sided tumblers at each extremity of the

by hauling on some of the cables and paying out others. The dredger progresses head first when cutting into the face of a bank, and sideways while working across the face. The full depth, which may be anything up to 70 ft., is attained while going across the cut ("bottom" dredging) or in several stages, dependent on the thickness of the material to be removed, the ladder being lowered after each stage ("top" dredging). Buckets are made in capacities up to 2 cu. yds. each. The largest can deal with boulders up to two tons. These are usually slung with the dredger's crane on being raised, and placed on the hopper's deck, for if they were tipped into the hopper's well they might do serious damage.

The hydraulic dredger is the most efficient machine for removing sand, silt, and other finely divided matter, which it sucks up through long pipes hanging over the side, or into a central well by

The rock breaker, though not properly a dredger, as it does not remove material, is much used to break up rock for removal by bucket or grab machines. The rock is shattered by heavy pointed rams or "pencils," weighing up to 25 tons each and shaped like elongated torpedoes, working through wells in the vessel's hull.

The method used for removing the material raised by a dredger depends upon the nature of the material and the conditions of the work. If the dredger is operating far from land, or if the spoil cannot be turned to useful account, material is usually carried by the dredger itself or by attendant hoppers into deep water, and there dumped. Dredgers working near land—for instance, in a canal or harbour—may find it convenient to deliver the debris on the banks or low-lying ground beyond. The spoil, mixed with a sufficiency of water, is delivered into the top end of an elevated trough-shaped conveyer, supported by the dredger and pontoons, and flows by gravity to the point of delivery, or is pumped through large pipes, kept afloat by pontoons. Another method is to load the spoil into transporter hoppers, tow these to a pump fixed to a floating pontoon, and pump ashore into embanked depressions.

**Dred Scott Case.** Slavery test case in the U.S.A. In 1848 an American negro slave named Dred Scott, belonging to Missouri, sued for his freedom on the ground that, having been taken by his master into Illinois and into the Louisiana Purchase, where slavery was prohibited, he had thus acquired the status of a freeman. The supreme court of Missouri held, however, that on returning to Missouri he had reverted to his original status, and thus had no standing. This decision was upheld by the supreme court of the U.S.A. in 1857. See Slave Trade.

**Dreiser, THEODORE** (1871–1945). An American novelist. He was born to German parents at Terre Haute, Indiana, Aug. 27, 1871, and spent his childhood in poverty. By the generosity of a woman teacher he was sent to the state university of Indiana, and became a successful journalist. His experience as a reporter in big American cities had an important influence on his work, for he saw life as a ruthless struggle for existence. Sister Carrie, 1900, with which he made his reputation, was full of a harsh

realism and revealed his materialistic outlook. His novels were of great length and lacked any attempt at literary style, but were notable for immense vitality and brutal observation. With *An American Tragedy*, 1925, he achieved wide popularity. Apart from novels he wrote autobiography, e.g. *A Traveller at Forty*, 1914; *A Book About Myself*, 1929. He died at Hollywood, Dec. 28, 1945.

**Dreissensia** or **ZEBRA MUSSEL.** Fresh-water bivalve mollusc common in many British rivers and canals. In shape it somewhat resembles a small boat, its name being derived from the stripes on its exterior. It attaches itself by a byssus (bundle of filaments) to wood or stone work and to shells. The name is taken from a Belgian physician named Dreyssen.

**Drenthe** or **DRENTE.** Province of the N.E. Netherlands. Its area is 1,029 sq. m. A sandy and marshy district, it is flat save in the N.E., where there is a ridge of hills. Potatoes are largely grown, peat is cut, and the coarser cereals are cultivated. Sheep, cattle, and pigs are reared. Several attempts have been made to reclaim and improve the land, and colonies for the latter purpose have been founded. Two or three of these have been successful, but the province remains in every way one of the poorest in the kingdom. Emmen, Assen, and Hogeveen are the largest towns. Pop. 261,098.

**Dresden.** The seventh largest German city, capital of Saxony, with a pop. of (1935) 625,174, (1946) 454,000, and an area of 42 sq. miles. It stands on both banks of the Elbe, 110 m. S. of Berlin. On the left bank of the river was the old town, on the right the

Dresden arms

new. Six impressive bridges linked them. For many years a very important industrial centre, the city was distinguished in appearance, comparatively quiet and well planned, hygienic and comfortable residentially. This was due mainly to the buildings put up and improvements made by electors and kings of Saxony, especially by Augustus II, the Strong (1694–1733), and his successors; and partly to the nature of Dresden's industries (cigarette and chocolate making, production of photographic, optical, and pharmaceutical materials, high-

class engineering, etc.). Even the factories were, to a considerable extent, so built as to fit into the ambitious architecture of Dresden. Something like 200,000 persons were employed in about 8,000 enterprises.

Dresden was also an outstanding seat of education. It had a technical university, a musical and theatrical high school, and an art academy. The boarding-schools of Saxony's beautiful capital attracted pupils of both sexes from all over the world; and, on account of its fine art galleries, it had a similar attraction for teachers and students of art.

#### Damage in Air Raids

During the Second Great War, Dresden was spared air attack until the night of February 13–14, 1945, when, in support of advancing Russian forces, the R.A.F. bombed it severely twice, the U.S.A. 8th A.F. heavily bombing it again next day. Six sq. m. of the inner town were left in ruins; thousands were killed (21,000 dead had been recovered from the ruins eighteen months later, and many still remained), for in addition to the town's wartime population of some 400,000, there were approximately 600,000 refugees from the E. The court church, a R.C. baroque building connected structurally with the palace, was half-destroyed; scarcely anything remained of the church of Our Lady (1726–43) with its beautiful dome 312 ft. high; the very impressive opera house (opened 1878) was burnt out; the Royal palace—16th century, much altered between 1889 and 1901—was devastated. The remarkable baroque Zwinger gallery was badly blasted; originally planned as a palace by Augustus the Strong, and connected with a Renaissance palace, it had before the war some of the finest collections in the world of paintings and engravings, ethnological, zoological, mineralogical, etc., collections. Its most famous picture, Raphael's *Sistine Madonna*, was transferred by the Russian occupation authorities to Leningrad in 1946. Plans for a new Dresden, to take twelve years in building, were made in 1946.

Dresden owed most of its classical buildings to M. D. Poeppelmann, Augustus's architect. Besides the Zwinger, the Japanese palace, the church of the Three Kings, and the Prinzen palace, its baroque buildings included the Cosel palace, the church of the Cross (renowned for its boys' choir), the church of S. Anne,

the old town hall, and the town hall of the new town, and these gave Dresden the rare homogeneity that was its distinctive beauty. A number of fine squares (the Theater, the Bismarck, the Albert, the Post, etc.), the old and the new market places, most of which have good monuments or statues, spacious parks, especially the "Great Garden," further embellished the city of the ambitious Saxon kings; the Brühl terrace, overlooking the river from a promenade with an approach adorned with allegorical figures, was a feature few towns had the physical situation to emulate.

The royal collections were magnificent. In one wing of the Royal palace, in the so-called Green Vault, the crown jewels with other valuable specimens of jewelry and the goldsmiths' craft, as well as curios, were shown to the public; the museum of coins, the porcelain, the historical and many other museums contained valuable collections; the Albertinum, once the arsenal, held a rare collection of antiquities. There were houses devoted to the memory of the poet Theodor Körner, and of the

sculptor Johannes Schilling, and a whole range of modern buildings for the state and local government, some of them, like the new town hall, of merit.

The first settlement on the site of Dresden was a Slavonic fishing village, Drezdzane, guarded by a castle of the margraves of Meissen. A German town began to develop shortly after 1200; its first burgo-master was appointed in 1292, and in 1489 it had about 5,000 inhabitants. In 1485 it became the residence of the ruling family who, having introduced the Reformed church in 1539, started to build on a large scale, at first from the point of view of fortifying the town. Augustus II and Augustus III were, simultaneously, kings of Poland and electors of Saxony, and, trying to outdo other and greater sovereign courts in splendour, they gained for their capital the name of "Elbian Florence." Several disasters—e.g. a raging fire in 1685, and a bombardment by Frederick the Great in 1760—were exploited to improve the planning and building of the town. Dresden was the scene of a brilliant victory by Napoleon on Aug. 26–27, 1813. Its fortifications

were pulled down in 1817. Its economic development and its growth in size and population dated from that time.

**Dresden, BATTLE OF.** Victory of Napoleon over the allied armies, Aug. 26–27, 1813. The advance of the Austrian general Schwarzenberg upon Dresden caused Napoleon to hasten back from Silesia. At 6 p.m., Aug. 26, Schwarzenberg, after a heavy bombardment, sent six columns against the suburbs of the city. The assault was repelled by the French at every point, and as night approached the Austrians withdrew. All through the night, during which rain fell heavily, reinforcements were reaching Napoleon, and on the morning of the 27th he opened an attack on both flanks of the enemy. Murat and his cavalry were hurled against the left flank under Metzko and destroyed it, while Ney with the young guard made a violent attack against the right, composed of Russians. When night fell Schwarzenberg ordered a retreat. Napoleon put 96,000 men into the field, while the allied forces amounted to 200,000. The French lost 10,000 killed, wounded, and prisoners; the allies 38,000.

Dresden. Lower picture gives a general view of the city as it was. The three upper pictures show the devastation wrought by the Allied air raids of Feb., 1945. 1. Streets near the town hall (centre). 2. Workers leaving by special trams after a day's toil on the debris in the Johannstrasse, 1946. 3. Sorting debris in front of the ruined R.C. Cathedral (left), 1946

**Dresden China.** Ware made at Dresden and Meissen. In 1709 J. F. Bottger discovered the secret of making this kind of china, and the first was produced in the royal factory at Dresden. The name has remained, although the manufactory was transferred in 1710 to Meissen. The china is remarkable for the fineness of the body and the delicacy of colouring, maroon, apple green, canary yellow, and pale mauve grounds being introduced during 1720-40 in suc-

cession to the early blue and white, with under-glaze painting of flowers and figures. In 1731 Kandler began to model small and large figures and groups, busts and animals. In 1740 the rococo style of decoration prevailed and long persisted, while the figures were mostly of Arcadian shepherdesses and swains, cupids, etc. Large chimney-pieces, candelabras, tables, panels for cabinets, and mural decoration have also been made at Dresden. The mark is two crossed swords and a crown. See China Marks; Pottery.

**Dress** (Fr. *dresser*, to straighten). Anything worn upon the human body. Serving the purposes of equipment, ornament, and protection, its origin has been attributed to the belting of the waist by a pliant bough or a strip of hide for attaching the rudimentary equipment of primeval man. This invention would, in that event, follow the invention of tools, and early palaeolithic culture offers no evidence of more than this custom, still observable among aboriginal Australians. The waist-string, with its variants the leaf-girdle, the fringed belt, and the loin-cloth, is still the sole attire of many primitive peoples. Ornament, the second step in the direction of clothing, even when it served a protective purpose as well, developed under the instigation of religious and sexual psychology, including that form of self-consciousness which culminates in vanity.

The final phase, the clothing of the person, is essentially protective, whether against insects and other animate things, thorns,

rain, sun, cold, and other physical discomforts, the weapons of hostile man, or attacks upon the inviola-

Dresden China. Pair of figures representing flower and fruit sellers, brilliantly coloured, c. 1745. The pieces are  $5\frac{1}{2}$  ins. in height

bility of the person and the sense of modesty. This was in part the offspring, in part the originating cause, of dress. Some of these purposes were and still are fulfilled by body-painting, tattooing, and scarification. Leaf-aprons, an early development in tropical lands, survive in S.E. Asia; felted bark-cloth in Polynesia and equatorial Africa. The use of skins, widespread in Bantu Africa, Central Asia, and Arctic lands, exhibits local developments, as the Gilyak salmon-skin costume and the Aztec feathered cloak. In neolithic Eurasia plaiting and felting were followed by weaving, and this invention, applied to animal and vegetable fibres, was carried along the early cultural routes all over the world. See Costume.

**Dresser.** Fixture in a kitchen or pantry. It consists of a base with cupboards and drawers, a flat top, and a superstructure of shelves for holding plates and dishes upright. A development of the sideboard, dressers were originally side tables, whereon dishes were dressed for the table.

**Dressing.** In metallurgy, a process applied to ores preparatory to extracting the metal. While certain ores when brought up from the mine are in a condition ready for direct introduction into a furnace for smelting, the great majority are rarely in that state. They carry too large a proportion of worthless gangue—earthy or rocky material—and therefore require to be submitted to a preliminary concentration to separate as much as possible of the worthless material from the ore proper.

Sometimes hand breaking and picking over will be sufficient; but generally it will be necessary to crush and perhaps grind the crude ore. It will then usually be possible to effect a further concentration by mechanical means, taking advantage of the difference between the specific gravity of the worthless portions of the ore and those which are rich in metal. The principle adopted is to introduce the whole mass into water in motion, and to keep the mass agitated sufficiently to allow the water to wash away the lighter matter while the heavier, rich portion settles. This operation, termed dressing, is carried out in jigs or buddles.

Another method of wide application is flotation, in which the valuable constituents of the ore are made to float on a water suspension of fine ore. Air bubbles, becoming attached to the minerals, raise them away from the gangue. Dressing is sometimes used to include all the operations of sorting, picking, and otherwise concentrating the ore previous to the beginning of the heat or chemical treatment. Cleaning castings as they come from the moulds, that is removing gates, fins, and sand, in many districts called fettling, is more generally known as dressing. See Casting; Flotation.

**Dressings.** Fabrics employed for the protection of wounds or injuries. Cotton wool, which consists of hairs and seeds of various species of gossypium, contains about 10 p.c. of fatty material; when this is removed, it is called absorbent cotton wool. Bandages are made of buttercloth, calico, crêpe, domette, flannel, muslin, gauze, elastic rubber webbing, etc. Gauze tissue is prepared plain and also medicated with boric acid, iodoform, sulphonamide, mercurio-cyanide, and other antiseptics. Paraffin-impregnated gauze allows exuded matter to escape and does not stick to the wound. Lint can be medicated similarly. Collodion consists of a solution of pyroxylin in alcohol and ether, which when painted on the skin over small wounds rapidly evaporates so that a dry protective covering is left. Collodium flexile contains a small amount of Canada turpentine and castor oil, and makes a more elastic film than simple collodion. Sticking plasters consist of tenacious substances spread on one side of a fabric, and are used for application to the skin, to which they adhere. During the Second Great War the tendency was to use

dressings which could be left in place undisturbed. See Surgery.

**Dressing Station.** Medical aid post for treating casualties near the scene of action in war. Royal Army Medical Corps personnel operated advanced dressing stations which were established as close as possible to the fighting line, but behind the regimental aid posts. Wounds were dressed and minor or extremely urgent operations were performed at the dressing stations before the casualties passed to the Casualty Clearing Stations. In civil defence during the Second Great War the first aid posts acted as dressing stations. See Casualty Clearing Station; Royal Army Medical Corps.

**Dressler, MARIE** (1869-1934). Canadian film actress. Her real name was Leila Koerber, and she was born at Coburg, Ont., Nov. 9, 1869. She first appeared on the U.S. stage in 1886, and after a long and varied career became famous as a screen character actress in Tilly's Punctured Romance, 1914, when she appeared with Charles Chaplin. In her later films she frequently played opposite Wallace Beery (*q.v.*). Her autobiography, *The Life Story of an Ugly Duckling*, appeared in 1925. She died July 28, 1934.

**Dressmaking.** The art or occupation of making dresses. The term is generally used to signify the design, preparation, and manufacture of women's clothing, whether for indoor or outdoor wear. Most of the work carried on in large dressmaking establishments is specialised and offers a wide range of employment. The proprietors or directors of the business or their highly qualified assistants are often the designers of the dresses, and to be successful they must possess both original talent and technical knowledge. There are openings for apprentices, or trainees as they are now styled, who perform the simpler routine work. Then come the improvers and the assistants. The fully-trained hands are usually specialists in blouses, skirts, evening dresses, etc. The cutters and fitters are also specialised workers; and a large establishment employs in addition saleswomen and models or mannequins.

In the U.K. the method of instruction of the trainee has greatly improved since 1920, and closer cooperation exists between the industry and the various trade and art schools. In Feb., 1946, an advisory committee was set up by the L.C.C., composed of

representatives of the National Union of Tailors and Garment Workers and of the London Clothing Association's Education Committee (which organizations cover every branch of the trade), with a view to advising on the technical training of operatives for the clothing trade.

Needlework instruction is given in primary, secondary, and technical schools, and more advanced training by technical and art schools and polytechnics. In some schools courses combine technical with art subjects.

Girls from every walk of life become trainees, usually beginning when they leave school. Trainees are paid from the time they enter a firm's employment, their wage increasing as their training makes them more valuable. The training period in a house making model garments lasts about five years, and at the end of this time the trainee may be placed in charge of a workroom or be promoted to the status of fitter. The higher grade wholesale trade, which undertakes mass production on a large scale, employs far more people than do the houses making model garments. The training period with a wholesale firm usually continues for three years. Wages of fully trained competent operatives are good.

#### In the United States and France

In the U.S.A. a federal law prohibits the employment of any person under 16. There is no fixed period of apprenticeship in dressmaking; but there are state vocational or trade schools to which girls may go after completing their grade school education. In these trade schools there are courses of needlecraft, machine operating, designing, etc., combined with subjects that the trainee would have taken if she had continued her studies in high school. After the pupils have completed their training the schools endeavour to place them in employment. Most work in the garment industry is piece-work, with a guaranteed minimum and fixed rates. New York is one big centre of dressmaking in the U.S.; Chicago is another.

Dressmaking in France is largely confined to the *haute couture* of Paris; there is very little wholesale production. Trainees are not required to pay a premium, and the normal period of apprenticeship is three years. French law insists that any child beginning work at the age of 14 shall attend professional classes for at least three years. Junior trainees in

the fashion houses can attend free evening classes; while those who can afford to do so pay for courses at the *Chambre Syndicale* schools, some of which they attend in the evening, some by day in time granted by their employers. The course includes cutting, dress-making, the technology of fabrics, French, mathematics, domestic science, and general knowledge.

If the pupil in the free classes gains her certificate of professional aptitude, she may seek employment as a second hand. A paying pupil can begin her course at any age and receives a diploma (instead of the certificate of professional aptitude) upon successful completion of the three years' course. A girl who shows special merit is sometimes given a small grant by the *Chambre Syndicale*, if her family circumstances are difficult, to help her through her training. A pupil must hold the certificate or the diploma before she can undertake a further course of four hours a week for one year to prepare herself for the most advanced course of training, given in an *École Supérieure*, extending over two years, and preparing women for employment as workroom overseers, designers, and teachers in the technical schools. Considerable effort is made to attract girls to the industry.

**Dreux.** Town of France, in the dept. of Eure-et-Loir. It stands on the Blaise, 22 m. N. of Chartres. The finest building in the town is the magnificent *Chapelle Royale*, containing the tombs of the Orléans family. It stands on a hill overlooking the town and lies within the ruins of the old castle, and was finished by Louis Philippe, whose mother began it. The rotunda, the main part of the building, built in 1816, stands about 80 ft. high and is surmounted by a handsome dome 43 ft. in diameter. The stained glass and the stone sculptures are specially noteworthy. The *hôtel de ville* is a fine, large building of the 16th century. The Gothic church of S. Pierre, dating from the 13th to 15th centuries, has some fine stained windows, and a richly wrought organ-case of the early 17th century by a local designer, Clément Métézeau. Dreux is a market town for agricultural produce, and has tanneries and manufactures of boots and shoes. In the Middle Ages it was the stronghold of a powerful line of counts. It was several times besieged, notably in 1593, when Henry IV captured it from the Catholic League and

destroyed the castle. The Germans took it in 1870. Pop. 14,184.

The battle of Dreux was the first serious encounter in the religious wars of France. It took place on Dec. 19, 1562, between the Roman Catholics under Montmorenci, the constable of France, and the Huguenots under Condé. The Huguenots could not overcome the resistance of the trained foot soldiers opposed to them, and after a stubborn struggle they fell back in good order under the direction of Coligny. Both Condé and Montmorenci were taken prisoner.

**Drevet, PIERRE JOUBERT** (1697-1739). French engraver. A son of Pierre Drevet, engraver to Louis XIV, he was born at Paris, and studied with his father. His most famous engraving is the portrait of Bossuet, executed in 1723, after the portrait by Rigaud. His religious subjects are also notable. He was insane for the last nine years of his life.

**Drewenz.** River of Poland. A right bank tributary of the Vistula, it flows S.W. to join this river above Torun (Thorn). Almost the whole of the lower Drewenz once formed the frontier between Germany and Poland. In length about 150 m., the river drains the W. end of the Masurian lakes district.

**Dreyer, CARL** (b. 1889). Danish film director. He was born Feb. 3, 1889, and became a journalist and art critic. He then wrote film scenarios, directing his first picture, *Praesidenten*, in 1918. During the next ten years he worked in Germany, France, and Scandinavia, where he was regarded as one of the most prominent European directors. Dreyer never attempted to create popular films; he experimented in psychological pictures and his technique was bold and masterly in its economy, a favourite device being that of an extended use of close-up. His finest productions included *Jeanne d'Arc*, 1923; *Vampire*, 1930 (based on le Fanu's *In a Glass Darkly*); and *Day of Wrath*, 1943.

**Dreyfus Case.** Miscarriage of justice in connexion with Alfred Dreyfus (1859-1935), a captain of artillery in the French army. In Dec., 1894, Dreyfus was sentenced by a court martial, on the charge of telling French military secrets to the German government, and then, under a special law made for the occasion, imprisoned on Devil's Island. He had meanwhile, Jan. 4, 1895, been publicly degraded. The published evidence

appeared defective, and there were strong suspicions that the court martial had been biased by the fact that Dreyfus was a Jew.

The supposed proof of his guilt was a document declared by experts to be in Dreyfus's handwriting, describing information which the writer proposed to place in the hands of a German military attaché. Eighteen months later, Colonel Picquart, a new head of military intelligence, satisfied himself that the document had been written not by Dreyfus, but by Colonel Esterhazy, an impecunious adventurer. Picquart submitted his discovery to his chiefs, Generals

Alfred Dreyfus,  
French soldier

Gonse and Boisdeffre. They declined to take action, apparently on the ground that, since the French war office had been responsible for the trial, the credit of the army and the department would suffer if a fresh inquiry were instituted. A true charge was then brought that the court martial had given its judgement illegally on the strength of evidence secretly laid before it but never submitted to the accused or to his counsel. A fierce newspaper war followed. It became impossible to avoid a court martial on Esterhazy, when fresh evidence was produced that the document was in his handwriting. Nevertheless, Esterhazy was acquitted on Jan. 11, 1898, the judges having refused to admit any reopening of the *chose jugée*.

#### Zola's Spirited Championship

Emile Zola, the novelist, who was supported by Clemenceau, then wrote the public letter called *J'accuse*, charging the government officials with having lent themselves to a deliberate conspiracy for the destruction of Dreyfus, and with now refusing justice in order to shield themselves from disgrace. For this Zola was prosecuted and heavily fined. The *cour de cassation* courageously quashed the proceedings; but on a new trial Zola was again condemned (July 18). Then a member of the intelligence department, Colonel Henry, was forced to confess that he had himself forged certain leading documents in the case, was arrested, and was immediately afterwards (Aug. 31) found in prison with his throat cut. Esterhazy fled from France, and made public some

contradictory "confessions" of his own guilt.

By this time the whole of France was expressing views on the case, often violently partisan, counter-charges of anti-Semitism and anti-militarism being freely directed against public figures.

A revision of the trial could no longer be refused, and in 1899 a fresh court martial was held on Dreyfus at Rennes. This court again pronounced him guilty, though "with extenuating circumstances," on Sept. 9, and condemned him to ten years' imprisonment. This further injustice was, however, prevented by President Loubet granting him a formal pardon. Some years afterwards the *cour de cassation* reopened investigations, and on July 12, 1906, declared the innocence of Dreyfus, who was thereupon restored to the army and promoted. Picquart, who had steadily believed in his innocence and been degraded, was likewise promoted. Dreyfus received the Legion of Honour in 1919. He died July 12, 1935, the anniversary of his rehabilitation 29 years before.

There is a large literature, much of it inconclusive, on the case. A film of Dreyfus was made in 1931, Cedric Hardwicke taking the part, and the case was prominently treated in the film *Life of Emile Zola*, 1938, Joseph Schildkraut playing Dreyfus to Muni's Zola.

**Dreyse, JOHANN NIKOLAUS VON** (1787-1867). German inventor. Born at Sömmerda, Prussia, Nov. 28, 1787, he was interested in firearms, and in 1809-14 was employed by Napoleon at Paris. In 1827 he invented the muzzle-loading needle-gun, and in 1836 the breech-loader, an important factor in the rapid victory of Prussia over Austria in 1866. He died at Sömmerda, Dec. 9, 1867.

**Driffeld** or **GREAT DRIFFIELD.** Market town and urban district of the East Riding of Yorkshire, England. It is a local railway junction 20 m. N.N.W. of Hull, with which it is also connected by a canal, now disused. The church of All Saints has a 15th century tower. This principal town of the Yorkshire wolds is the centre of a large agricultural district; its chief industries concern flour milling, agricultural implements, and sugar refining. Cattle market, Tues.; corn market, Thurs. Driffeld aerodrome was one of the first attacked by German bombers in the Second Great War, July 4, 1940, and was virtually destroyed Aug. 15. Pop. 6,300.

**Drift.** Sheets of sedimentary deposits resulting from the action of floods or rivers which once issued from the melting end of a glacier or ice sheet, hence the more technical term, fluvio-glacial deposits. These deposits are composed of clay, stones, and sand, and thus their composition may be compared with that of moraines. Drift was also deposited as the ice melted without necessarily being transported by rivers. Much of the drift, which covers large areas of England, is a stiff clay, known as boulder clay or till, in which soil the finest crops of wheat are grown. *See* Geology; Glacier.

**Drift.** In aeronautics, the lateral motion of an aircraft to a side wind. To assist in navigation the drift of an aircraft is computed by a drift indicator. In ballistics, drift is the continual deflection of a projectile from the plane of departure due to reaction between the air and the projectile's rotary motion. Drift is to the firer's left in projectiles fired from rifled arms with left-handed rotation.

**Drift and Solid Map.** Two classes of map published by the geological survey of England and Wales. Solid maps show the distribution of the solid rock formations; drift maps the superficial deposits of clays, sands, etc., which have been spread over them by the work of ancient glaciers and ice sheets. On the drift maps the solid rock formations are coloured only in those places where no drift is present. In those parts of England where the superficial drift deposits are of considerable thickness and widely distributed, no solid maps are issued. In E. England, S. of Scarborough, the drift editions are more useful in matters relating to water supply, agriculture, etc., but for mining purposes the solid editions for most areas are more valuable. *See* Map and Map-making.

**Drifter.** Small vessel about 100 ft. long, used in the herring fisheries, and so called because it drifts its nets and does not pull them. During both Great Wars large numbers of drifters were employed on barges, patrols, and in netting channels against submarines. *See* Dover Patrol; Fisheries; Trawler.

**Drifting.** In metallurgy, a ductility test for copper and brass tubes or pipes. The material must withstand drifting or bulging without evidence of either cracks or flaws until the diameter of the bulged or drifted end measures not less than 25 p.c. more than the

original diameter of the tube. This test is a standard inspection test embodied in specifications of the British Standards Institute and the Air ministry.

**Drift Net.** Net of a fine mesh which is kept stretched out by corks on the upper edge, and by lead weights on the lower. The net is made to move through the water parallel with shoals of such fish as herring, mackerel, or pilchards, in such a way that when these fish leave the inshore waters they run into the nets and are caught by their gills and suffocated. For herring the net may be as long as 120 yds.; for mackerel one of about 60 yds. is used. *See* Fisheries.

**Drill** (*Cynocephalus leucophaeus*). Large baboon found in W. Africa. It closely resembles the mandrill, but lacks the red and blue colouring of the face, which in this species is jet black. It is savage and morose in captivity, but little is known of its habits in the wild state. *See* Mandrill.

**Drill.** Exercises in which a body of men is taught to act in perfect unison, either for physical development or for the execution of various movements, at various paces and in various formations, by signal or word of command. Soldiers are also taught to keep time in the handling of their weapons, to keep step in marching, and to salute.

Gradually all these cadenced actions become mechanical, so that by a word an officer can set the military machine in motion or bring it to rest. A well-drilled body of troops moves "like one man," and this subordination of mind and muscle aids discipline, though in excess it tends to destroy initiative.

The system of drill prescribed for the British army was first laid down by Sir David Dundas in *Principles of Military Movements*, 1788, 2nd. ed. 1795; it was modified in 1824 by Sir Henry Torrens in his *Field Exercise and Evolutions of the Army*. The drill in threes, instead of fours, was introduced in 1937. *See* Battle School; Physical Training.

**Drill.** Agricultural implement for sowing. The earliest method of sowing cereal seed was to distribute it broadcast on the surface of the soil by hand. There were serious drawbacks to this procedure: (1) the seed was covered indifferently, much of it failed to grow, and it was always subject to the depredations of birds; (2) it grew from various depths and thus

unevenly; (3) owing to the irregular spacing of the plants, it was impossible to cope efficiently with weeds. From Babylonian times efforts were made to provide some form of machine which would deposit seed at regular depths and with adequate cover of soil.

The true precursor of the drill as it is known today was Jethro Tull's invention in 1701. The essentials of this drill were a series of fixed coulters drawn through the soil at a regular depth, a seed-box and dropper unit which fed the seed into the coulters, the whole being operated from two large running wheels, and horse-driven. Corn sown with this machine thus grew in regularly spaced rows and provided opportunity for weeding the crop; it required less seed and produced greater evenness in the crop. The Hornsby-Leake drill went a stage further by spacing the individual seeds. Drills are adapted to sowing agricultural and horticultural seeds of all descriptions; all are based on Tull's original ideas.

**Drill** (Dutch *drillen*, to bore). Mining tool. Rock drills operated by compressed air are percussion tools, used for breaking rock and making shot holes in mining, quarrying, and tunnelling. Similar tools are used extensively in demolition work and for repairs to roads and pavements.

The drilling action of a pneumatic rock drill is the same as when drilling rock by hand, the drill or chisel being given a sharp blow by a hammer, and then twisted slightly before the next blow is delivered. A small piston driven forward by compressed air acts as the hammer, whilst a valve, also actuated by compressed air, governs the movement of the piston. Rotation is obtained by causing the piston to move over splined rods associated with ratchet gear. Hollow drill steel is used to permit wet drilling, and the cutting edge is of various forms—chisel, cross, rose bits, etc. An average medium drill works at about 1,800 strokes a minute.

Other machines for drilling in rock are the diamond drill and the shot drill. *See* Boring; Mining; Quarrying; also illustration under Diamond.

**Drill** or **DRILLING** (Ger. *Drillich*, Lat. *trilix*, triple-threaded). Strong linen or cotton fabric used to make suits for wear in the tropics. Khaki cotton drill is worn by troops on service in hot climates. The pattern is a twill, often of a round, screw-like

diagonal, and the tightly twisted warp yarn is predominant upon the surface. Cotton drills are used for pockets and frequently for corset making and other purposes for which strong stuff is required.

**Drim.** River of Albania. It is formed by the union, at Kula Llamu, of the White Drim, rising in the Shar Dag, and the Black Drim, issuing from Lake Ochrida—both these sources being in Yugoslavia—and flows into the Adriatic below Alessio, after a course of 110 m. Anciently it was known as the Drilo or Drilon. During the First Great War the gorges of the two streams and of the main river were traversed by the Serbians in their retreat to the sea in 1915.

**Drina.** River of Yugoslavia. It rises near Sirovac among the mts. of Montenegro in several headstreams, the chief of which is the Tara, and flows N., N.W., and then N.E. to effect a junction with the Save, 58 m. W. of Belgrade. The principal of its many affluents is the Lim. Its length is 160 m.

The battle of the Drina between the Austrians and the Serbians in the First Great War, began Sept. 8, 1914, with the Austrian crossing of the river in their second invasion of Serbia. The critical fighting took place among the mountains S. of the Jadar. By Sept. 11 the Austrians held Shabat, while the Sokolska Platinas as far as Petska was in their hands. On Sept. 14 the Serbians, who had been reinforced from the N., attacked the Guchvo heights and carried Kulishte. Southward, on Sept. 16, the Serbians stormed the summits of the Sokolska, and drove the enemy in disorder to the river. Finally both sides, being exhausted, settled down to trench warfare. See Serbia, Conquest of.

**Drinkwater, JOHN** (1882-1937). English dramatist and poet. He was born at Leytonstone, June 1, 1882, and educated at Oxford high school. One of the founders of the Pilgrim Players which developed into the Birmingham repertory theatre, he maintained a lifelong interest in the stage, although for 12 years an insurance clerk. His first play, *Cophetua* (1911) was in verse; his most successful was *Abraham Lincoln* (1918), followed by others in the same historical style, *Mary Stuart*, *Oliver Cromwell*, *Robert E. Lee*. *Bird in Hand* (1928) was a charming village comedy, like

John Drinkwater,  
English dramatist

and a volume *Summer Harvest* (1933) showed him at his happiest with Cotswold subjects; and he turned out topical verse of a high order for national and theatrical occasions. *Inheritances and Discovery*, both autobiographical, appeared 1931-32. As an actor he played Lincoln in his own play of that name and the king in *Henry IV*, part 1. He died March 25, 1937.

**Dripestone.** In architecture, the projecting tablet or moulding on the crown of an arch, window, or doorway. See Moulding.

**Driscoll, JAMES** (1880-1925). British boxer. Born at Cardiff, Dec. 15, 1880, he had more than 50 victories to his credit. He secured the feather-weight championship in 1910, and became the winner outright of the Lonsdale belt for that weight. His two defeats were by Harry Mansfield in 1904 and by Freddy Welsh to whom he lost on a foul in 1910. "Jem" Driscoll announced his retirement from boxing after his drawn battle with O. Moran, Jan. 27, 1913. He died Jan. 30, 1925.

**Driver.** The longest club in a golfer's outfit, with a wooden head and almost straight face, used for tee shots. The beginner should learn to drive with a brassie, and when he can use that club successfully should procure a driver with a similar lie and of equal length to the brassie. Only when the ball "sits up" well is it possible to use the driver through the green. The driver, with the other clubs commonly used in the game, is illustrated in the article on Golf.

**Driver, SAMUEL ROLLES** (1846-1914). A British Biblical scholar. Born at Southampton, Oct. 2, 1846, he was educated at Winchester and New College, Oxford.

**Abraham Lincoln** often revived. In prose Drinkwater wrote *The Pilgrim of Eternity*; *Byron, a Conflict* (1925); *Life of C. J. Fox* (1928). His collected poems (1923)

A member of the O.T. revision company, 1876-84, he was regius professor of Hebrew and canon of Christ Church, Oxford, from 1883 until his death, Feb. 26, 1914. One of the greatest Hebraic scholars of his time, Driver collaborated with F. Brown and C. A. Briggs in editing *A Hebrew and English Lexicon of the Old Testament*, 1906 (based on E. Robinson's translation of the work of F. H. W. Gesenius). His Introduction to the Literature of the Old Testament, 1891, aroused much controversy, but is now generally held to reconcile the higher criticism of the O.T. with a sincere belief in its inspiration and religious authority. His other works include *A Treatise on the Use of the Tenses in Hebrew*, 1874; a revised translation of *Jeremiah*, 1906; *The Parallel Psalter*, 1898; *Modern Research as Illustrating the Bible*, 1909.

**Driving.** Controlling and guiding a horse or horses harnessed to any vehicle. The British have always excelled as whips, as is shown by the records of the Brighton road in the times of the Regency and of the coaching period of the 18th and early 19th centuries. But since, except for short distance commercial hauls, in modern times mechanically propelled have displaced horse-drawn vehicles, driving has become little more than a pastime. Driving a car is considered under *Motoring*.

In driving a single horse the reins should be taken in the left hand, the left or near side rein being held between the forefinger and thumb, and the off-side or

right-hand one between the second and third fingers. The arm should be held at almost a right angle across the body, with the hand about 6 ins. in front of the bottom button of the waistcoat; this will enable the right hand to be easily used when it becomes necessary to employ both hands. In driving a pair, the reins are held in the same manner, but since there are

Driving. How reins should be held when driving a four-in-hand. Top, grip for single reins

two horses to control instead of one the task is more difficult as they may not pull equally. It is impossible to give in words an adequate description of the correct

Drogheda. S. Lawrence Gate on the N. side of the town; it is believed to date from the 12th century

manipulation of the reins in driving tandem or four-in-hand; instruction and practical illustration should be sought from an expert. Tandem, the driving of two horses, one in front of the other, attached to a dogcart, was once greatly favoured, but is now seldom seen except at horse shows.

The term "hands," of which the novice will hear much discussion, implies the exact weight or pressure put upon a horse's mouth in guiding him and the give and take of the driver's hand or hands to the pull of the horse. This is more often a gift than an acquirement. *See Coaching; Horse.*

*Bibliography.* Hints on Driving, C. S. Ward, 1870: Driving, 8th Duke of Beaufort, 4th ed. 1894 (in Badminton Lib.); Driving, F. M. Ware, 1904.

**Driving Band.** Term applied in ballistics to a band of relatively soft metal fixed near the base of a projectile of large calibre. The calibre of the driving band is slightly greater than that of the bore, so that when the piece is fired the band is bitten into by the lands, this making the projectile rotate. The band also acts as a gas check. As a rule it is fitted as close to the base of the shell as is consistent with the strength of the metal to resist the tearing off of the base of the shell. *See Shell; Windage.*

**Droeshout,** MARTIN (fl. 1620-51). English engraver. Probably of Dutch extraction, he came to reside in England before 1623, in which year was published his frontispiece portrait of Shakespeare in the first folio edition of the Comedies, Histories, and Tragedies. Among other portraits engraved by him were those of John Foxe, the martyrologist, and John Donne, dean of S. Paul's.

**Drogheda.** Mun. bor., seaport, and market town of co. Louth, Eire. It stands on the Boyne, 4 m. from Drogheda Bay, and 32 m. N. of Dublin by rly. It has a good harbour and a brisk trade in cattle, sheep, and agricultural produce; linens, cottons, beer, and artificial fertilisers are manufactured. Salmon from the river are sold. Market day, Sat. Pop. 15,180. In 1649 Cromwell entered the town and massacred its defenders; and it was surrendered by James II in 1690. *Pron.* Droïda.

**Drogheda Bay.** Bay on the E. coast of Eire, adjacent to the counties of Louth, Meath, and Dublin. From Clogher Head in the N. to the Skerries in the S. the distance is 25 m. The estuary of the river Boyne forms a deep indentation useful for coastwise shipping.

**Drohobich** (Pol. Drohobycz). Town of Ukraine S.S.R., 40 m. S.S.W. of Lvov. It is connected with that town by rly. and is a junction for lines to the neighbouring oil wells at Boryslaw. Oil refining is the chief industry. Drohobich has a fine Gothic church. The pre-war pop. was 32,622, including many Jews.

**Droitwich.** Mun. bor. and market town of Worcestershire, England. It stands on the Salwarpe, 5½ m. N.E. of Worcester and 126 m. N.W. of London, and is served by two rlys., while a canal connects it with the Severn. It is a market for agricultural produce. The chief industry was once the production of rock salt, but Droitwich is now chiefly known as a watering-place. Its brine springs, known to the Romans, have radioactive properties and are efficacious for rheumatism, neuritis, gout, etc. There are fine baths, hotels, etc., for visitors, and a public park. Droitwich has two old churches. S. Andrew's and S. Peter's. In the older part of the

town the ground has subsided a good deal owing to the pumping out of the brine. Just outside is one of the principal transmitters of the B.B.C. Droitwich became a corporate town in 1554, and is governed by a mayor and corporation. Market day, Fri. Pop. 4,553.

**Drôme,** Département of France.

It lies in the S.E. of the country and has an area of 2,532 sq. m. It is a mountainous region, especially in the Alpine E. The Rhône forms its western boundary, while the Isère, the Drôme, and other tributaries also drain it. Agriculture is the chief industry. Wheat is grown in the valleys, especially in the fertile district of Valloire. Vines are widely cultivated, and olives, figs, and mulberries are important crops. Silkworms are largely produced. Many cattle are reared on the extensive uplands. Valence is the capital and other towns are Die, Nyons, Crest, Romans, and Montélimar. It is divided into four arrondissements, and before 1790 was partly in Dauphiné and partly in Provence. Pop. 267,731.

**Dromedary.** In zoology, the one-humped camel (*Camelus dromedarius*) of Arabia and N. Africa. In common speech the term is used for riding camels as distinguished from the heavier baggage animals. The late Latin name *dromedarius* (classical form *dromas*) comes from Gr. *dromas*, running. *See Camel.*

**Dromio.** Name of two comic characters, twin brothers, in Shakespeare's *The Comedy of Errors* (q.v.); and, by extension, a nickname for a twin.

**Dromore.** Urban dist. and mkt. town of co. Down, N. Ireland. It stands on the Lagan, 17½ m. S.W. of Belfast by rly. An ancient town, Dromore was formerly the seat of a bishopric, which was united to Down and Connor in 1842. Both town and cathedral were destroyed during the insurrection of 1641; the present church contains the tomb of Bishop Jeremy Taylor, its builder. There are castle ruins and a large Danish encampment. Linen is manufactured. Market day, Mon. Pop. 2,229.

**Drone.** Name given to the male of the honey bee. It is recognized

Droitwich, Worcestershire. Interior of large brine swimming bath

by its stouter build, broader head, and larger eyes than those of the queen or workers, and is stingless. It does not work, and its only function is to fertilise the queen. At the beginning of autumn all the drones in the hive are killed or driven out to starve by the workers. *See* Bee.

**Drone.** In music the pipe or pipes, in instruments of the bagpipe class, on which the sustained and unaltered bass tones are produced. The melody pipe is called the chanter. *See* Bagpipe; Chanter.

**Drone-fly.** Large fly (*Eristalis tenax*), so called on account of its close resemblance to a drone bee. It is common on flowers, and its larva, or rat-tailed maggot, lives in muddy water rich in decaying organic matter.

**Drood Controversy.** Name given to arguments concerning attempts to solve the problems raised by Dickens's unfinished novel *The Mystery of Edwin Drood* (q.v.). The uncompleted mystery plot has fascinated many men of letters, among them Andrew Lang, Sir W. Robertson Nicoll, and G. K. and Cecil Chesterton. In the fragment of text Drood was ostensibly murdered by his uncle, Jasper; and the mysterious Datchery, obviously disguised, was equally obviously working to bring home the guilt to the murderer. In 1887 Richard Procter, in *Watched by the Dead*, put forward the theory that Drood was not murdered, but was disguised as Datchery. J. Cuming Walters, in *Clues to the Mystery of E. D.* (1905) adduced evidence to prove that Drood was dead and that Datchery was a woman character, Helena Landless. The controversy may be said to have started from that point, in many books and countless articles, continuing intermittently ever since. Datchery has often been identified with at least two other prominent characters, Tartar and Bazzard; and opinion is likely to remain divided as to whether Drood escaped or perished. A high light of the controversy was a mock trial staged in London in 1913, in which John Jasper was arraigned for the murder of Edwin Drood before G. K. Chesterton as judge and a jury of distinguished literary men with G. Bernard Shaw as foreman. There was a suggestion that this might help to settle the problem for good, but Shaw destroyed all hope of such a result by facetiously

returning a verdict of manslaughter.

**Drop.** Term in ballistics to denote the amount of fall or drop from the horizontal line of fire of a projectile over a given range: the vertical distance between line of departure and trajectory at target range. Drop increases with range, and with a .303 rifle or machine-gun is as follows: 3.1 in. at 100 yds.; 14.4 at 200 yds.; 35 in. at 300 yds.; 67 in. at 400 yds.; 115 in. at 500 yds.; 167 in. at 600 yds. The term drop is also applied to the distance between the comb of the butt of a firearm and the top line of the barrel.

**Drop-Forging** OR STAMPING. A process of forging with two dies, a stationary die attached to an anvil block and a second die fixed to a tup which drops under gravity against the lower die. The dies are recessed so that when placed together they represent the shape of the completed article formed when steel at a sufficiently high temperature is hammered out between them. The process justifies expenditure when a large number of components of identical dimensions and design is to be produced. For parts of simple construction, one pair of dies may prove sufficient. *See* Forging.

**Dropmore.** Hamlet of Buckinghamshire, England. It is 4 m. N.E. of Maidenhead, and  $2\frac{1}{2}$  m. from the railway station at Bourne End. Dropmore is famous for the mansion and grounds here. The gardens, among the most extensive and remarkable in England, include an Italian garden and a pinetum. They were laid out, 1801-05, by Lord Grenville, later prime minister. The Dropmore Papers, published by the Hist. MSS. Comm., contain political correspondence of the time of Grenville.

**Dropped Wrist.** Condition in which the extensors of the hand, i.e. the muscles which bend the hand backwards, are paralysed, and when the arm is raised the hand hangs loosely and helplessly downwards. It may be due to injury or disease of the nerves supplying these muscles, and is not infrequently a symptom of chronic lead poisoning. Treatment depends upon the cause, the outlook for recovery being better when it is due to

injury than when it is the result of disease.

**Dropsy** (Gr. *hydrōps*, from *hydōr*, water). Accumulation of fluid—the watery part of the blood—in the tissues and cavities of the body. Dropsy arises in conditions which impede the normal circulation of the blood and increase the pressure in the vessels, causing fluid to transude through their walls. The commonest conditions giving rise to general dropsy are disease of the heart, kidneys, and liver. Localised dropsy, or *oedema*, may result from local weakness of the vessels, as in varicose veins.

Dropsy is generally first noticeable in puffiness of the eyelids, and in swelling of the ankles. If the swollen tissues be pressed with the tip of the finger, a small depression is produced which persists for a brief interval. In more advanced cases fluid collects in the abdominal cavity, producing the condition known as *ascites* (q.v.), which sometimes leads to great distension of the abdomen. Accumulation of fluid in the lungs causes a "waterlogging" of the organs which may bring about difficulty in breathing, and lead to a cough.

Treatment must be directed towards the underlying cause of the condition, but frequently great relief is afforded by measures which drain the body of fluids, such as the administration of diuretics to stimulate the flow of urine, and of purgatives which cause copious watery evacuations. In severe cases of accumulation of fluid in the abdomen or pleural cavities, tapping may be necessary.

**Drop Test.** In metallurgy, a shock test to a finished component. It is allowed to drop from a specific height on to a base, and should not fracture. A locomotive tire is caused to fall freely, in a running position, from a height depending upon its diameter on to a rail fastened to an iron block of not less than 2 tons. The tire is then turned through 90° and dropped a second time. Such tests are also used to prove the soundness of steel castings.

**Dropwort** (*Spiraea filipendula*). Perennial herb of the family Rosaceae. A native of Europe, N. Africa, and N. Asia, it is a plant of downs and dry pastures. It has an erect, grooved stem, 1-2 ft. high. The leaves are chiefly from the

Dropwort. A perennial herb common on downland

rootstock, broken into many pairs of deeply-toothed leaflets. The small, but numerous, white flowers are rosy on the outside, and borne in panicles.

**Droseraceae** (Gr. *droseros*, dewy). Family of perennial herbs, of wide distribution in marshy places. It consists of five genera and about 100 species. The flowers possess five sepals, a similar number of petals, generally five stamens, and 2-5 styles. They are all insectivorous, catching their prey by various means and digesting the bodies, upon which they mainly subsist. All have poor roots—in one species there is none at all. See Sundew; also Bog Plants illus.

**Droshky.** Russian word meaning a little wagon. A droshky is a light carriage on four wheels and without a covering. The first droshkies were formed of a board

until it is converted into oxide or litharge. The temperature is not allowed to rise sufficiently high to melt the litharge. What in effect is done is, to use the works' term, to convert the lead into a dross. See Lead.

**Droste - Hülshoff, ANNETTE ELISABETH, BARONESS VON** (1797-1848). German poet. Born at Hülshoff, near Munster, Jan. 10, 1797, she came under the influence of her cousin, afterwards archbishop of Cologne. Her principal works are *Poems*, 1838; *The Spiritual Year*, 1851; these entitling her to foremost rank among German women poets. She died at Meersburg, on Lake Constance, May 24, 1848.

**Drouais, FRANÇOIS HUBERT** (1727-75). French portrait painter. Born at Paris, Dec. 14, 1727, he studied under his father, Hubert Drouais, a miniature painter, Van Loo, Boucher, and Natoire. He became an academicien in 1758; and a little later painter to the court. Notable portraits by him are those of the Pompadour (at Orléans) and the Comte d'Artois (Louvre). He died Oct. 21, 1775.

His son, Jean Germain (1763-88), also a painter, born

at Paris, Nov. 25, 1763, studied with his father and with J. L. David (*q.v.*). In 1784 he won the prix de Rome with his *Woman of Canaan* at the Feet of Jesus Christ, and in 1785 accompanied David to Italy. He died at Rome, Feb. 13, 1788.

**Drouet, JEAN BAPTISTE, COMTE D'ERLON** (1765-1844). French soldier. Born at Reims, July 29, 1765, he entered the army as a private in 1782, and had risen to the rank of brigadier-general by 1799. He played a prominent part at Jena, 1806, and in the closing stages of the Peninsular War. Imprisoned in the citadel of Lille for alleged complicity in an anti-Bourbon conspiracy, when Napoleon returned from Elba in 1815 he escaped and seized and held the citadel for his old master. After the Waterloo campaign, in which he took part, Drouet went into exile, but returned to Paris in 1825. In 1834-35 he was governor of Algeria, and in 1843 was made a marshal. He died at Paris, Jan. 25, 1844. He must not be confounded with the revolutionary Jean Baptiste Drouet (1763-1824),

who stopped the flight of Louis XVI to Varennes in 1791, and later, in the convention, voted for the death of the King.

**Drought.** Spell of dry weather sufficiently prolonged to cause serious deficiency in the supply of water. To obtain comparative statistical information, however, certain limiting definitions have been adopted, and to meteorologists absolute drought means 15 consecutive days with rainfalls less than .01 in.; partial drought is 29 consecutive days with mean rainfall less than .02 in.; and a dry spell implies 15 days running with no rainfall above .04 in.

Countries which normally receive most of their rain at one season often suffer from droughts in the dry months. The countries bordering the Mediterranean, and those in similar latitudes on the W. of continents, whether N. or S. of the equator, *e.g.* California and central Chile, have most rain in winter and droughts in summer. Conversely the monsoon type of climate, as in India, brings wet summers and droughty winters. In the British Isles drought is possible in any month but never likely. Entire months have been rainless at several places; in 1944 there was no rain at Sidmouth, Feb. 16-March 31, a triple drought. The type of pressure distribution largely determines the incidence of rainfall or drought. See Climate; Weather.

**Drouyn de Lhuys, ÉDOUARD** (1805-81). A French statesman. Born in Paris, Nov. 19, 1805, he entered the diplomatic service and was employed in the embassies at Madrid and The Hague. In 1840 he became chief of the commercial department in the ministry of foreign affairs but, going into opposition, he lost his place. By Louis Napoleon he was appointed minister of foreign affairs in 1848, and during 1849-51 he was ambassador in London, returning to Paris to be foreign minister. He resigned in 1855, but held the portfolio again 1863-66. On the downfall of Napoleon III in 1871 he took refuge in Jersey. He died in Paris, March 1, 1881.

**Drover.** Variant form of driver, restricted to drivers of sheep or cattle. Before the coming of railways a large class of men in the U.K. was engaged in this occupation, making long journeys on foot with the cattle. See Cattle.

**Drowning.** Death from asphyxia owing to submersion of the mouth and nostrils in water or other fluid. Sometimes shock

**Droshky.** Light vehicle, once the commonest type of hired vehicle in Russian towns

placed across two pairs of wheels, enabling the passengers to sit sideways, as in an Irish jaunting car.

**Drosophila.** Generic name of a small fruit fly, *D. melanogaster*, notable for the ease with which it can be reared generation after generation, and on which much generic work has been done in connexion with the study of heredity.

**Dross.** Impurities formed and separating to the surface of a molten metal or alloy. This dross, or scum, usually consists of oxides formed by contact with the atmosphere and must be removed by skimming to render the metal fit for casting. In certain instances, however, the metal contained in dross can be recovered by the use of fluxes or deoxidisers.

**Drossing Oven.** Furnace used in the manufacture of red lead. In that process pig lead is melted in a low-arched furnace that has a bed formed of firebricks supported on a cast-iron base and provided with openings for introducing the fuel and the metal. The molten metal is rabbled about in this furnace and thus exposed to air

or syncope, caused by sudden immersion in cold water and the state of terror experienced by the individual, combines with asphyxia in causing death. The number and causes of civilian deaths from drowning in England and Wales in 1943 were as follows:

	Accident or Negligence	Suicide
Males ..	965	297
Females ..	227	272
Total ..	1,192	569

**POST-MORTEM APPEARANCES.** The face is usually ashy pale, but in some cases is slightly livid, with rosy patches about the cheeks. A characteristic sign is the presence of fine froth, sometimes tinged with blood, about the mouth and nostrils. *Rigor mortis* comes on early. The condition known as cadaveric spasm, a form of rigidity occurring at the moment of death, is sometimes observed, and articles grasped during the death struggle, such as reeds or plants, may be found firmly clenched in the hands. This is a valuable indication in distinguishing cases of drowning from cases in which the body was thrown into water after death. Internally the air-passages are found to contain a clear or blood-stained froth, and perhaps mud or portions of water-plants. The lungs are voluminous and distended, and when cut into exude a frothy, blood-stained fluid. Minute haemorrhages may be observed beneath the pleura, and the right side of the heart may be engorged with venous blood, the left being comparatively empty. The presence of water in the stomach, particularly if it contains pond-weed, etc., is virtually a conclusive sign of death from drowning, since water rarely enters the stomach of a body immersed after death.

**DIRECTIONS FOR RESCUERS.** Great care and presence of mind are required when endeavouring to rescue a person in danger of drowning who cannot swim, since the rescuer may be clutched and his movements impeded, so that he then runs the risk of being drowned himself. When the drowning person is struggling, the rescuer should leave him for a few seconds until he becomes quiet; then seize him by the hair, turn him on his back, and swim on the back towards the shore, or support him face upwards in this way until a boat arrives. Should the rescuer be clutched, the best plan is for him to take a full breath and allow himself to

be drawn under, when the drowning person may release his grip. If he does not let go, the rescuer must try to break away by forcing his knees against the chest of the drowning person.

**TREATMENT AFTER RESCUE.** When a person is recovered from water in an apparently lifeless condition, artificial respiration should be resorted to as soon as the sufferer is in the boat or has been brought to the shore. The most convenient method of performing artificial respiration is that recommended by Schäfer. The finger is introduced into the mouth in order to clear out any mud or froth, and the patient is then placed face downwards, the head being turned toward the side. The operator kneels either by the side of or astride the patient, and spreading his hands over the lower part of the back and sides of the chest, gradually throws his weight forward so as to exert a firm, steady pressure upon the thorax. He then swings backwards, so as to relax the pressure and allow the lungs to expand. This backward and forward movement should take about five seconds, and should be repeated at the rate of about twelve times a minute. It may be possible to stretch the victim on a plank which is forthwith balanced on a fulcrum such as a barrel or the seat of a boat and is swung see-saw fashion, in the rhythm of breathing, about twelve times per minute. This method helps to restore the blood circulation, upon which recovery from apparent drowning directly depends.

Dru. View of the Aiguille du Dru, near Chamonix

While artificial respiration is being performed further restorative measures should be applied. The wet clothing should be drawn off, the body wiped dry and wrapped in hot blankets, and hot bottles may be placed to the feet, care being taken that these are not so hot as to burn the skin. Friction of the limbs from below upwards is useful. Ammonia may be cautiously held to the nostrils, and a qualified person may give a hypodermic injection of strychnine or coramine. When breathing is established a hot bath is a useful means of restoring the bodily heat. See Artificial Respiration.

**Droxford.** Village of Hampshire, England, 8. m. N. of Fareham. Before the landings in Normandy in 1944 in the Second Great War, the headquarters of Gen. Eisenhower (S.H.A.E.F.) was a train on a stretch of the Southern rly. near Droxford station. Here he was visited by Winston Churchill, Gen. Smuts, Gen. de Gaulle, and British naval, military, and air force chiefs.

**Droydsden.** Parl. div. and urban dist. of Lancashire, England. The town stands on the Rochdale Canal, 5 m. by rly. E. of Manchester. There are cotton and print factories, and dye and chemical works. Pop. 24,070.

**Droysen, JOHANN GUSTAV (1808-84).** German historian. Born at Treptow, Pomerania, July 6, 1808, and educated at Stettin and Berlin, during 1840-51 Droysen was professor of history at Kiel, 1851-59 at Jena, and 1859-84 at Berlin. He died June 19, 1884. Droysen's chosen rôle as an historian was to glorify Prussia and her rulers, which he did especially in his monumental *History of Prussian Policy*, 14 vols., 1855-86; this takes the story down to 1756. Droysen wrote, as an historian, in favour of Prussia's claim to the duchies of Slesvig and Holstein, and as a politician he took part in the Frankfurt parliament of 1848. He wrote a valuable *History of Alexander the Great*, 1833; *History of Hellenism*, 1836-43; *Life of the Prussian soldier Yorck von Wartenburg*, 1851-52.

**Dru, AIGUILLE DU.** Rocky needle or peak in the Mont Blanc chain, near the Aiguille Verte,

J. G. Droysen, German historian

France. The Grand Dru or Pointe Este (alt. 12,320 ft.) was first ascended by Dent and Hartley in 1878; the Petit Dru or Pointe Charlet (alt. 12,244 ft.) by Charlet-Straton in 1879. See Alps.

**Drug.** A medicinal substance obtained from the vegetable, animal, and mineral kingdoms. The term also includes substances as prepared for use in the treatment of disease, but these are better distinguished as pharmaceutical preparations. Sometimes the word is employed to indicate habit-forming substances, such as opium and cocaine.

London is the world's chief port for drugs, hundreds of which arrive in the crude state from all parts of the world. They are stored in special warehouses at the docks, the purchasers generally being exporters. No drug auctions were held during the Second Great War, importation of crude drugs being severely limited by restrictions and lack of shipping space. In many instances home-produced drugs were used in place of imported products. Liverpool is the port for American drugs. Drugs imported wholesale must generally be sorted over—"garbled," as it is known in the trade—to separate the various grades. For example, pieces of rhubarb root of fine appearance are reserved for selling retail to the public, but broken pieces are equally well suited for reducing to powder, or for pharmaceutical preparations. Some drugs, such as aconite, belladonna, digitalis, henbane, lavender, peppermint, etc., are grown in Great Britain. Others require warmer or moister climates for their successful cultivation.

**DRUG HABIT.** Continuous taking of certain drugs produces in some persons an irresistible craving for them, despite their injurious effect upon both mind and body. The commonest instances are addiction to alcohol and tobacco. The less widespread drug habits—such as the taking of opium or cocaine—may originate in taking the drug in the first instance under medical orders, its use being continued because of pleasurable sensations produced. The victims display a progressive deterioration of their moral sense and when in the grip of the habit will lie freely and resort to any deceit to satisfy their craving. Another characteristic feature is the great degree of tolerance acquired after taking a drug for a considerable time, the victim of a drug habit often taking daily an amount of poison which would be fatal to a non-addict.

Opium taking is more frequent in women than in men. Morphia may be injected hypodermically, laudanum drunk, or solid opium eaten; opium smoking is more common in the East than in Europe. Morphia addicts become pale and sallow, and suffer from nausea, vomiting, loss of appetite, sleeplessness, and emaciation. Periods of severe mental depression follow the temporary exaltation at first produced by a dose. The temper becomes irritable, and the moral fibre degenerates. Delusions and hallucinations may occur. The remarkable tolerance that may be established is instanced by De Quincey (*q.v.*), who states that at one period he was taking 320 grains of opium a day, the full pharmacopoeial dose being two grains.

#### The Cocaine Habit

Cocaine is sometimes taken as a constituent of a snuff by persons suffering from nasal catarrh, and in this way the habit is initiated. Both the mental and bodily faculties become affected rapidly and severely. Cocaine takers develop extreme cunning in hiding the drug, to obtain which they will resort to any stratagem.

When the habit is definitely established no will-power can overcome it. The patient should enter a home or institution where he will be weaned from the drug. When the habit has not been of long duration, it may be possible to stop the drug at once, or reduce it very rapidly, but in long-standing cases the symptoms induced by abrupt withdrawal may be severe, and it is generally advisable to reduce the drug gradually.

The habitual taking of chloral hydrate is nearly always started by its use to induce sleep. The symptoms of chronic poisoning which gradually develop are dyspepsia, eruptions on the skin, weakness of the heart and respiration, and impairment of mental power. The acquisition of tolerance is not so marked as with opium, and a slightly greater dose than usual acting on the heart muscle may be fatal.

The taking of *Cannabis Indica* frequently becomes a habit in Egypt, India, and other Eastern countries, where it is absorbed in the form of hashish, bhang, or ganga. It produces symptoms resembling those of mild intoxication, followed by sleep which is often accompanied by pleasant dreams.

To check the serious growth of the drug habit legislation was

enacted in the Dangerous Drugs Acts, 1920 to 1932, to give effect to the Hague Convention of 1912, and the Geneva conventions of 1925 and 1931. The League of Nations drug control organization was transferred to U.N.O. The retail sale of drugs is controlled by the Food and Drugs Act, 1938.

**Drug.** District, subdivision, and town of Central Provinces, India, in the Chhatisgarh division. Area, 4,830 sq. m.; pop. 928,851, five-sixths Hindus. Of the total area about one-quarter is under cultivation, rice and wheat being among the chief crops. The town has small metal and weaving industries, and stands on the Bengal-Nagpur rly. Pop. 8,450, four-fifths Hindus.

**Drugget** (Fr. *droguet*, dim. of *drogue*, poor material). Coarse woollen stuff, woven or felted, sometimes printed with a pattern. It is chiefly used as a protection or substitute for carpets. The name is also applied to a stout fabric of linen warp and worsted weft for rough aprons, etc. In early times drugget was much used for clothing, being sometimes partly of silk.

**Druggist.** One of the titles reserved by the Pharmacy and Poisons Act, 1933, for registered pharmacists or corporate bodies of which the superintendent is a member of the governing body. Other titles reserved by this Act are "pharmaceutical chemist" and "pharmacist" or "member of the Pharmaceutical Society." Registration, not qualification, is the statutory condition for the use of these titles. A person not a registered pharmacist, e.g. an analytical chemist, may use the description "chemist" but not in connexion with the sale of goods by retail. The penalty for an offence in relation to titles is a fine not exceeding £20 and a further £5 for every day subsequent to conviction during which the contravention continues. A qualified druggist carrying on a retail business is authorised to sell poisons. Druggists deal generally in medicinal substances and chemicals required in the arts: in Great Britain they dispense prescriptions. See Dispensing.

**Drugstore.** Often regarded as the U.S.A. equivalent of a chemist's shop, this actually is much more. It dispenses more ices and soft drinks than medicines; it sells light refreshments, postage stamps, stationery, and certain fancy goods. It serves indeed as a sort of teetotal public-house, widely used as a social rendezvous.

**Druid.** Priest among the Celtic peoples, especially those of Britain and Gaul. The Druids were among the bitterest opponents of the Roman invaders, and in Britain were virtually exterminated during the Roman domination. The earliest detailed account of them is given by Caesar in his Gallic War, and his account is probably equally applicable to the Druids of Britain, which was the headquarters of Druidism. They are described as priests and law-givers, among whom all nobles and men of dignity were found.

The chief of them was elected, and no hereditary positions were recognized. They were learned in the natural sciences and astrology, while some of the classic writers describe them as sorcerers and masters of medical knowledge (Pliny); and as soothsayers and bards (Strabo). Their worship was carried on in groves, the oak being their sacred tree, and the oak-grown mistletoe played a particular part in their rites. It was cut with a golden weapon by a Druid clothed in white, was received from the tree on a spotless cloth by another Druid, and borne away by white oxen. Druidic worship entailed human sacrifices at special festivals; the victims being impaled, shot with arrows, or burned in wicker cages; the Druids exercising their peculiar art of divination from the movements of their dying victims, as well as from the flight of birds, etc.

The last stand of the Druids in Britain was made at Mona, or Anglesey, when the Romans are said to have exterminated them and destroyed their sacred groves (Tacitus). After being exterminated in Britain, Druids are mainly heard of in Ireland, where tradition associates them with witchcraft and sorcery.

*Bibliography.* Irish Druids and Old Irish Religions, J. Bonwick, 1894; Origin and Growth of Religion as Illustrated by Celtic Heathendom, J. Rhys, 3rd ed. 1898; Social History of Ancient Ireland, P. W. Joyce, 1903; Les Druids et les Dieux Celtiques, M. H. d'Arbois de Jubainville, 1906.

**Druid.** Arminius, prince of the Cherusci, triumphant after a victory over the Romans, brings back silver booty to his Druid priests

*After the painting by Hermann Frell*

**Druid Circle.** Name in popular usage for a prehistoric stone circle. One, vested in the National Trust, is near Keswick, Cumberland. Regarded by 18th century antiquarians as sites for Druidic worship, the exposed sepulchral dolmens often found with them were called Druid altars. Now recognized to be pre-Druidic, their subsequent adaptation for religious rites by the British priesthood of Caesar's day lacks definite proof. See Stonehenge: Stone Circles.

**Druids, ANCIENT ORDER OF.** Friendly society established on masonic principles and with masonic rites, and so called from an imagined imitation of the ancient Druids. The order was founded in London in 1781, and spread throughout England in independent but allied lodges. These lodges were later organized into groves and presided over by a Great Arch Druid. The order was introduced into the U.S.A. in 1883, where it spread rapidly.

**Drum.** Instrument of percussion, consisting of a hollow body over which a membrane is stretched. In primitive form the body was a gourd, shell, or earthenware vessel, struck often by the finger tips.

Today the drums in use are of two main kinds: (1) Drums of cauldron shape, made of metal, with single head of vellum, used in the orchestra, and known as kettledrums (or Timpani). These are struck vertically by pairs of padded sticks, and produce notes of definite musical pitch. They were formerly used in pairs tuned to the tonic and dominant of the key of the music, but often three or more kettledrums are used in modern music, and they are given melodic as well as rhythmic passages. A pair of small kettledrums is used in cavalry bands.

(2) Drums of cylindrical shape, made usually of wood with two vellum heads. The pitch of these drums is indefinite. The smallest size, the shallow side drum with

By courtesy of Hawkes & Son

metal sides, is played with hard wooden sticks, as is also the deeper military side-drum of wood. The largest is the bass drum, struck horizontally by heavy padded sticks. Of intermediate size is the tenor drum, used in bands of pipers. See Bagpipe; Cymbal.

**Drum.** In engineering, a cylinder, usually of cast iron or cast steel, mounted on a shaft and geared up to an engine, motor, or hand lever. A hoisting or hauling rope or chain is secured to the drum or may be given several turns round it. When the machinery is set in motion the drum, revolving, winds the rope around itself, paying out an equal length when the rope merely passes round it without being secured to it.

**Drumclog.** Hamlet of Lanarkshire, Scotland. It is 6 m. S.W. of Strathaven, near the border of Ayrshire, and was the scene of a victory of the Covenanters over the king's troops under Claverhouse (Viscount Dundee), on Sunday, June 1, 1679. A granite obelisk marks the site of the battle. Drumclog figures in Scott's *Old Mortality*. See Covenanters.

**Drum-Fire.** Expression for a rapid bombardment said by the German Staff account of the battles of Champagne to have been first used on the Champagne front in Feb., 1915. It is, however, much older, and occurs in Tolstoi's description of the Allies' bombardment of Sevastopol in Aug., 1855

**Drum Language.** Method of communication by drum-signals, employed by primitive peoples. It has a possible range of 10 m. Across

Central Africa, from the Nile to Cameroons, it is in daily use for the exchange of news.

**Drumlanrig Castle.** Seat of the duke of Buccleuch in Dumfriesshire, Scotland. It stands on the Nith, 17 m. N.W. of Dumfries. It was built (1679-89) by the 1st duke of Queensberry, and suffered damage at the hands of Prince Charles Edward in 1745. In the grounds are the remains of Tibber's Castle, destroyed by Robert Bruce in 1311.

**Drumlin.** Elongated, oval-shaped hill found in regions which have suffered intense glaciation. It may be a mile or more in length, and up to 200 ft. in height. Where

many occur together a characteristic rolling landscape is produced with streams winding between the hills. Drumlins are composed of boulder clay and often have a core of solid rock. Their elongation

Drumclog. The battle on Drumclog Moor, Lanarkshire, in which the Covenanters defeated Graham of Claverhouse, June 1, 1679

Painting by Sir George Harvey, R.S.A.

indicates the direction in which the overriding ice-sheet was travelling. They are common in S. Scotland, Yorkshire, Ireland, N. Europe, and northern U.S.A.

**Drum Major.** Originally the principal drummer in a military band, the drum major now carries a staff for directing the band. In the regiments of Foot Guards drum majors wear a uniform that is a survival of the dress worn at the beginning of the 18th century.

**Drummond, HENRY** (1786-1860). British banker and politician, one of the founders of the Irvingite or Catholic Apostolic Church. He was born at Alresford, Hants, Dec. 5, 1786, and educated at Harrow and Christ Church, Oxford, became a partner in his father's bank, in 1810 was elected M.P. for Plympton Earls, and from 1847 till his death sat for W. Surrey. He founded the chair of political economy at Oxford, 1825. He died Feb. 20, 1860.

**Drummond, HENRY** (1851-1897). Scottish theological writer and scientist. Born at Glenelg, Stirling, Aug. 17, 1851, of an evangelical family, he was educated at Crieff, Edinburgh, and Tübingen. He was trained for the ministry at New College, Edinburgh, but did not adopt

the title of minister. During 1873-75 he worked with Moody and Sankey, was appointed in 1877 lecturer on, and in 1884 professor of, natural science at the Free Church College, Glasgow, and held the last appointment until his death, at Tunbridge Wells, March 11, 1897. In the intervals of travel he devoted himself to mission work, and to the organization of the Boys' Brigade. His attempts to reconcile science and theology as expressed in his *Natural Law in the Spiritual World*, 1883, and the *Lowell Lectures on the Ascent of Man*, 1894, are now regarded as heterodox.

**Drummond, JAMES** (1835-1918). British theologian. He was born at Dublin and was educated at Trinity College. In 1860 he became colleague to the Rev. W. Gaskell, husband of the authoress of *Cranford*, at Cross Street Chapel, Manchester, and in 1869 he was appointed professor of Biblical and historical theology at Manchester New College, London. He became

principal in 1885 in succession to Dr. James Martineau, and held this position until 1906. In 1889 the college was removed to Oxford. He wrote *Life and Letters of James Martineau*, 1902, to which his colleague, C. B. Upton, contributed the section on Martineau's philosophy. Drummond died at Oxford, June 13, 1918.

**Drummond, THOMAS** (1797-1840). British engineer and administrator. Born in Edinburgh, Oct. 10, 1797, he was educated at its high school and at the R.M.A., Woolwich, and in 1815 entered the Royal Engineers. Having obtained a post on the trigonometrical survey of Great Britain in 1820, he invented the Drummond light, a limelight contrivance for long-distance surveying, and also an improved form of heliostat. Undersecretary for Ireland, 1835-40, he died at Dublin, April 15, 1840.

**Drummond, WILLIAM** (1585-1649). Scottish poet. He was born at Hawthornden, near Edinburgh, Dec. 13, 1585, a descendant of the mother of James I of Scotland. Educated in Edinburgh and France, he studied for the law, but on his father's death in 1610 settled down at Hawthornden to the companionship of his books, the pursuit of his hobby of mechanical invention, and his writings. His best work is in his sonnets, in which he followed closely Italian models; while the lyric beginning "Phoebus, arise," is celebrated. He invented the metre adopted by Milton for his *Hymn to the Nativity*. Drummond (who is always known as Drummond of Hawthornden) was one of the first Scottish poets to write in pure English.

Scholar and Platonist, he was a sincere royalist. The outstanding incident of his life is the visit Ben Jonson paid to him in the winter of 1618-19, his *Notes* on which, published in 1842, have been the cause of much controversy. He died Dec. 4, 1649. In 1893 a memorial to him was erected at Lasswade, where he was buried. The Hawthornden prize (*q.v.*) was founded in his honour. A life by D. Masson appeared in 1873.

**Drummondville.** City of Quebec, Canada. It stands on the St. Francis river, in Drummond co., 65 m. N.E. of Montreal by C.N.R. and C.P.R. The main in-

dustries concern dairy machinery, hosiery silk mills, flax spinning and weaving, cotton mills, and artificial silk. Power is obtained from Lord's Falls and Hemming Falls on the river. Pop. 10,555.

**Drumochter Pass.** County boundary between Perthshire and Inverness-shire, Scotland. A bold, rocky scene, it is traversed by railway at 1,484 ft., the highest point reached by a rly. in Great Britain, and by the A9 main road from Perth to Inverness. A stone commemorates the building of the road by Gen. Wade's army.

**Drunkard's Cloak, THE.** Instrument used in some parts of England during the 16th century for the punishment of drunkards. It consisted of a tub with holes in the sides for the arms to pass through, and was fitted on to the offender, who then had to walk through the streets as an object of public scorn.

**Drunkenness.** State of intoxication. In certain cases it is an offence against the law, and in English law it is no excuse for crime. At the same time, when it is a question of *quo animo*, or with what intention a man did an act, he may escape because he may have been so drunk as to be incapable of forming any intention at all. Thus, a case of homicide may be manslaughter if committed by a man so drunk as not to know what he is doing, though the blow may be struck or the shot fired with apparent deliberation. If a man takes drink to nerve himself to commit a crime he cannot escape the consequences by showing that he was so drunk as to have lost all intention. It is an offence to be drunk in a public place or a licensed house, or to be drunk and disorderly. An habitual drunkard may be ordered to be confined in an inebriates' home by the magistrate.

A person driving or in charge of a motor vehicle in a public place while under the influence of drink to such an extent as to be incapable of properly controlling it must, except when there are special circumstances, be disqualified from driving for at least twelve months.

There is often a close psychological correlation between habitual drunkenness and homosexual tendencies, either overt or repressed. In these cases the habit is acquired in order to numb the pangs of conscience or the distress of being 'different,' and expert psycho-analysis may produce a cure. See *Liquor Control*; *Prohibition*; *Temperance*.

*After Jansen*

**Drury, ALFRED** (1857–1944). A British artist and sculptor. Born in London, he studied at the Oxford school of art, at S. Kensington, and under Dalou. He was first attracted to sculpture by the clay models of Chantrey's works in the Oxford university galleries. His first contribution to the Academy was the *Triumph of Silenus*, 1885; and in 1896 his bronze *S. Agnes* was bought for the Chantrey collection. He was elected A.R.A. in 1900, and R.A. in 1913. Other works include *The Age of Innocence*, 1897; *The Prophetess of Fate*, 1900; *King Edward VII*, 1903; a bust of Reynolds in the quadrangle at Burlington House, 1931; war memorials; statues and decorative work at Leeds. His technique is well shown in child portraits. Drury died Dec. 24, 1944.

**Drury Lane.** Thoroughfare and district in London, W.C.2, largely rebuilt in the 20th century. Extending from the modern crescent of Aldwych (*q.v.*) to High Holborn, the lane was originally known as the *Via de Aldwych*, after a Danish settlement in S. Clement's, which it linked with the hospital of S. Giles's monastery. Its present name derives from Drury Place, a mansion built in the 15th century by a member of the Drury family. In this mansion Essex and his followers planned the abortive rising of 1600. Rebuilt by William, earl of Craven, supposed husband of Elizabeth, the widowed queen of Bohemia, it was renamed *Craven House*; on its site in 1805 Philip Astley built the *Olympia Pavilion*, later the *Olympic Theatre*.

On the W. side of Drury Lane, in Russell Street, is Drury Lane Theatre (*v.i.*), with entrances in Russell Street and Catherine Street, and near by is the disused burial ground of S. Martin's, associated with *Tom-All-Alone's* of Dickens's novel, *Bleak House*. Near Holborn, on the E., is the Winter Garden Theatre, formerly *The Mogul*, and later the *Middlesex music hall*. A serving man of the ancient inn near here, *The White Hart*, gave first warning of the outbreak of the plague which started in the vicinity in 1665. In the adjacent coalyard was born Nell Gwynn, who later lived at a house in Drury Court, pulled down in 1891. Drury Lane was also the birthplace of Anne Clarges, afterwards duchess of Albemarle. On the E. side, S. of Great Queen Street, was Cockpit Alley, later Pit Place. A cockpit

was here, as were the Cockpit and Phoenix theatres.

Once lined with hedgerows and houses of the nobility, Drury Lane became in the 18th century a place of ill repute, its mazy courts and dark abodes the theme of satiric reference by Gay, Steele, Pope, and others. It was the scene of Hogarth's *Harlot's Progress*, *Lewknor's Lane*, renamed Macklin Street, being notorious. Notable residents were the poet Donne, who found hospitality in Drury House; William Alexander, earl of Stirling; Elliston, when lessee of the *Olympic*; Thomas Campbell, in *Vinegar Yard*; Charles and Mary Lamb, in *Russell Court*; and the actresses Anne Bracegirdle, whom Lord Mohun attempted to abduct from her house, and Hannah Pritchard.

**Drury Lane Theatre.** London playhouse, more correctly called *The Theatre Royal, Drury Lane*. The first theatre on the site of the present building was erected in 1661, and opened May 7, 1663, by the *King's Servants*—one of Charles II's two companies of players—under Thomas

Killigrew, with Beaumont and Fletcher's play, *The Humorous Lieutenant*. This theatre was burnt down in 1672. Sir Christopher Wren designed its successor, in which Garrick played. R. B. Sheridan had it replaced in 1794 by a much larger edifice, also destroyed by fire, Feb. 24, 1809.

Benjamin Wyatt was the architect of the 4th and present theatre, opened Oct. 12, 1812. On its boards Edmund Kean achieved his first great triumph as *Shylock* on Jan. 26, 1814, and there he appeared for the last time, March 12, 1833. Drury Lane won new prestige from Macready's brief management during 1842–43. It was here that he produced Brownings' *The Blot* on the *Scutcheon*. Under the management of Augustus Harris, and afterwards of Arthur Collins, the huge building was associated with immensely popular pantomimes and melodramas. In 1917 Sir Thomas Beecham began seasons of grand opera. The theatre was reconstructed in 1921–22 and reopened with *Decameron Nights*.

Many musical plays were given here, notably *Rose Marie*, 1926; *The Desert Song*, 1927; *Show Boat*, 1928; *Cavalcade*, 1931; and Ivor Novello's series, *Glamorous Night*, 1935; *Careless Rapture*, 1936; *Crest of the Wave*, 1937; *The Dancing Years*, 1939. Throughout the war the theatre was the headquarters of the *Entertainments National Service Association (Ensa)*. Part of the structure was damaged by German bombs, Oct. 15, 1940. Drury Lane reopened in 1946 with a production of Noel Coward's *Pacific 1860*, and *Oklahoma* was staged here in 1947. Consult *Theatre Royal, Drury Lane*, W. Macqueen Pope, 1945.

**Druses.** A Syrian people inhabiting the W. slope of Lebanon, anti-Lebanon and Hermon, and Hauran (Druz), mts. known as the *Jebel-Druse*. Occupying some 100 towns and villages and scattered elsewhere amongst other races, their total number is estimated to lie between 100,000–200,000. They are probably a mixture of different stocks, with

Drury Lane Theatre. Main entrance in Catherine Street. Top, Wren's, the second theatre on the site

a preponderating Arab element, the language spoken by them being Arabic. Others regard them as Iranians. They are under sheikhs or village headmen, themselves subordinate to ameers, both, together with the landed proprietors, forming a kind of supreme council. The vine, olive, and tobacco plant are cultivated, and silk-worms reared.

Religion of the Druses is a curious mixture of Mahomedanism, Judaism, and Christianity, but they pride themselves on being Muwahiddin, believers in one god. This one god is said to have manifested himself ten times in the flesh, the last time in the person of Hakim, the Fatimite caliph of Egypt (996-1021), who is expected to reappear as the Messiah. From his disciple and supporter Darazi, the name Druses is supposed to be derived. The people are divided into Akilis (learned), who alone possess knowledge of the sacred books and mysteries; and Jahilis (ignorant). They believe in the transmigration of souls, the soul passing from one body to another until perfect.

Forced to submit to Murad III in 1588, under their chief Fakred-din in the early 17th century the Druses enjoyed their greatest prosperity. Beshir (c. 1786) kept himself in power by offering his services to various rebels, being finally obliged to quit the country when the Porte reconquered Syria in 1840. The adoption of Maronite Christianity by another Beshir led to civil war. Druses and Maronites were put under a separate kaimakan or governor, but after the Damascus massacre of Christians in 1860, the Lebanon district was placed under a Christian governor. Turkish misrule led to fresh disturbances in 1895-96, which, as the Turks made some concessions, were followed by a period of comparative quiet. A revolt in 1925 against the French, who had been given the Mandate over Syria after the First Great War, was put down with extreme severity.

Druses. Women of this Syrian people of the Lebanon wearing their characteristic costume

#### Drusilla, LIVIA (d. A.D. 29).

Wife of the Roman emperor Augustus. She was previously the wife of Tiberius Claudius Nero, whom Augustus compelled to divorce her. Her elder son by the first marriage became the Roman emperor Tiberius, while her second son, with whom she was pregnant at the time of the divorce, was Drusus. She is not to be confused with Drusilla, wife of Felix, procurator of Judaea before whom S. Paul preached; nor with the daughter of Germanicus.

**Drusus, MARCUS LIVIUS** (d. 109 B.C.). Roman statesman, colleague of Gaius Gracchus in the tribuneship, 122 B.C. Won over by the senate, he vetoed the bills brought forward by Gracchus for founding colonies, and himself offered others making far greater concessions. His son, of the same name, tribune in 91, made proposals dealing with the distribution of public lands and rearrangement of the jury-courts. Having aroused suspicion by suggesting that the franchise should be extended to the Italians, he was assassinated.

**Drusus, NERO CLAUDIUS** (38-9 B.C.). A Roman soldier, son of Livia Drusilla by her first husband, Tiberius Claudius Nero. Her second husband, the em-

peror Augustus, conceived a great liking for Drusus, who became one of his most distinguished generals, and, between 13 and 9, conducted campaigns in Germany which extended the Roman dominion to the Elbe. He was the father of the emperor Claudius. This Drusus was called Senior, to distinguish him from his nephew, the son of Tiberius, who was poisoned at the instance of Sejanus (q.v.).

**Drusy Structure.** Term applied to a structure common to ore deposits formed at shallow depths, also to certain rocks. A druse is an unfilled portion of a vein or cavity in a rock. Druses often contain crystals with perfectly developed faces and vary in size from microscopic cavities to large caverns.

**Dryad** (Gr. *drys*, oak). In Greek mythology, nymph associated with trees. A dryad was supposed to live only as long as the particular tree with which she was associated. See Nymph.

**Dryas** (*Dryas octopetala*). Perennial dwarf shrub of the family Rosaceae. It is a native of Europe, Asia, and N. America. The short stem is embedded in the soil, and the numerous spreading and closely packed branches lie along the surface, bearing many tufts of oblong, toothed, evergreen leaves. The white flowers are 1½ ins. across, and the fruits are provided with long, feathery awns.

**Dryburgh Abbey.** Monastic ruin in Berwickshire, Scotland, on the Tweed, 4½ m. S.E. of Melrose. Generally stated to have been founded in 1150, it suffered at the hands of Edward II in 1322, was partially destroyed by Richard II in 1385, and almost totally demolished by the earl of Hertford in 1544. After the Reformation the property passed to the earl of Mar. The existing remains include the chapter house, parts of

the large and beautiful church, and traces of the monastic buildings. Sir Walter Scott and several of his relatives are buried in S. Mary's aisle. The 1st Earl Haig was buried in the adjoining burial place of the Haigs of Bemersyde, 1928. In 1918 the abbey was presented to the nation by Lord Glenconner.

Dryburgh Abbey. S. Mary's aisle, containing the tomb of Scott

**Dry Cell.** In electricity, a type of cell in which the solution is converted practically into a solid by the addition of chemicals of gelatinous materials which vary according to the type of cell. The advantages of dry cells are portability and cleanliness. A familiar use is in torches. *See* Cell, Electric.

**Dryden, JOHN** (1631-1700). English poet. Born at Aldwinkle, Northamptonshire, Aug. 9, 1631, he was educated at Westminster and Trinity College, Cambridge. Being possessed of a competence from his father's estate, he decided upon a literary career, and, to satisfy popular taste, he began to write plays, continuing to do so, chiefly for financial reasons, all the rest of his life. He wrote twenty-two in all, but he had no real gift for dramatic composition, and apart from certain isolated passages, Dryden's plays add nothing to his reputation. The best known are perhaps *The Indian Emperor*, 1665; *The Conquest of Granada*, 1670; and *Marriage à la Mode*, 1672. The plays are tainted with the licentiousness which characterises the Restoration drama.

Dryden's career in poetry proper began in 1659, when he published some verses on the death of Cromwell. A subsequent effort in 1660, *Astraea Redux*, a poem on the restoration of the monarchy, has laid Dryden open to the charge of trimming, but panegyric prompted by the passing of a great man is not necessarily inconsistent with an expression of welcome towards a new order of things after the gloomy years of Puritan rule. A much finer effort is the *Annus Mirabilis*, 1667, a poem on the wonderful year of 1666 which saw the end of the Great Plague of London, the Great Fire, and the Dutch War. A long period of writing for the stage ensued, and it was not until 1681 and 1682 that Dryden published his three great satires *Absalom and Achitophel*, *The Medal*, and *MacFlecknoe*. The first is an attack upon Lord Shaftesbury. He is Achitophel counselling the young duke of Monmouth, who is Absalom, to rebellion against his father. When Shaftesbury was tried for high treason and acquitted, his friends had a medal struck to celebrate the occasion. This provoked from Dryden the second satirical poem, considerably inferior to the first. The rival partisans engaged the minor poet Shadwell to reply in kind. Shadwell's effort was so vulgar and scurrilous that it provoked yet a third poem from Dryden entitled *MacFlecknoe*—from the name of

an obscure Irish bard—a masterpiece of subtle satire, which completely overwhelmed the unfortunate Shadwell.

Dryden's next poems, *Religio Laici*, 1682, and *The Hind and the Panther*, 1687, show him in quite a new light. The first appears to have been written in defence of the Church of England, while the second is in defence of the Church of Rome, to which he had in the meantime become a convert. The "milk-white hind immortal and unchanged" is the latter, while the spotted panther is the former. During the closing period of Dryden's life appeared his two noble odes, the *Ode for St. Cecilia's Day*, 1687, and *Alexander's Feast*, 1697; several verse translations of classical poets, and a number of miscellaneous writings, including a paraphrase of some of Chaucer's *Canterbury Tales*.

*John Dryden*

*After Kneller*

Up to the revolution of 1688 Dryden had enjoyed some degree of prosperity, having been made Poet Laureate in succession to Davenant, and receiving several other government appointments. Quite early in life he had married Lady Elizabeth Howard, daughter of the duke of Berkshire. The advent of William III deprived him of his laureateship and other offices. He died May 1, 1700, and was buried in Westminster Abbey.

There are echoes of the Elizabethans in the poetry of Dryden, but he belongs essentially to the classical school of poetry, which in the matter of form, at any rate, was brought to its highest point of

perfection by Pope in the next century. Less polished than Pope, Dryden has much more vigour in his poetry. The same quality of vigour is shown in the admirable prose of the prefaces to his plays. *See* English Literature.

**John McBain**

**Bibliography.** Works, ed. with Life, Walter Scott, 1808, revised by G. Saintsbury, 1882-93; *Poetical Works*, ed. W. D. Christie, 1870; *Johnson's Lives of the Poets*, ed. P. Cunningham, 1854; *Johnson's Dryden*, ed. A. J. F. Collins, 1914; *Character of J. D.*, A. Lubbock, 1925; *Life*, C. Hollis, 1933; *Letters*, ed. C. E. Ward, 1942.

**Dry Farming.** Special method of growing crops. In regions where the annual rainfall is under 20 ins., such as large tracts of Africa, Australia, and North America, they cannot be successfully grown on ordinary lines. To deal with such cases dry farming has been introduced. The essential feature is summer-tillage every other year, or once in three years, so as to store up moisture in the soil for the use of the crops that follow. Disk-harrowing, followed by deep ploughing and again by pressing with fluted rollers, removes all moisture-stealing weeds and produces a finely divided surface layer of "mulch," which checks evaporation and conserves the water in the soil. Most cereals do well, but barley, being shallow-rooted, is not to be recommended. The founder of the method was H. W. Campbell of Nebraska. *See* Agriculture.

**Drygalski.** Islet in Davis Sea, Antarctica. Off the coast of Queen Mary Land, it is about 9 m. in diameter. It was discovered by Sir D. Mawson, Jan. 21, 1914.

**Drygill Shales.** Group of sedimentary rocks on Caldbeck Fell, Cumberland. Like the Dufton shales on the W. Pennine slope in Westmorland, they represent isolated residual outcrops of strata deposited in late Ordovician time, when the Sleddale group of Conistoun limestones was being laid down farther S. over the Lake district.

**Drying Machine.** Apparatus for removing moisture from textile materials. Excess moisture is removed from loose textile materials by centrifugal dryers, and also by squeezing rollers and afterwards passing the material through hot-air chambers upon conveyers. Cloth may be semi-dried by suction in passing over a cylinder, and further dried by transit over steam-heated cylinders. Drying cylinders for textile fabrics are arranged horizontally or vertically at will, and the speed of driving is adjusted to suit requirements. *See* Woollen.

**Dry Point.** Process of etching. It is closely akin to line engraving, in the preliminary stages of which it was often used, especially in outlining the general disposition of a subject. The tool is a steel rod tapering at one or both ends to a strong, fine, sharp point. With this the etcher draws with a firm hand, the point scratching a line of exquisite sensitiveness on the copper plate, and raising, as it goes along, a very distinct burr on the sides of the furrow, which lends particular quality to early prints from the plate.

**Dryptosaur** (Gr. *dryptein*, to tear; *sauros*, lizard). Extinct N. American reptile of the genus *Dryptosaurus*, alternatively called *Laelaps*. It was a carnivorous, beast-footed dinosaur, living in Montane in Upper Cretaceous times, and allied to the English megalosaur. It was 20 ft. long, rapacious, and sharp-toothed; it used the hind limbs and tail in kangaroo fashion. See *Dinosaur*.

**Dry Rot.** Diseased condition of timber due to the ravages of certain species of fungi, especially *Merulius lacrymans*. This fungus rapidly consumes the woody tissue, the affected parts ultimately becoming dark brown, dry, and powdery, with splits both along and across the grain. A certain degree of moisture is essential to the growth of the fungus; the timber must have a moisture content of over 20 p.c. When growing actively in still, damp air the fungus forms soft, white cushions, but under drier conditions becomes a thin, greyish skin.

A single plant of *Merulius lacrymans* puts forth millions of reproductive spores, which, being of microscopic size, may be borne about by the air, or conveyed imperceptibly from infected to sound timber by workmen's boots, clothing, timber, etc.; or the disease may be propagated by the dispersion of infected sawdust, or by the creeping of the fungus from one piece of timber to another, even when the pieces are separated by some material from which the fungus can derive no sustenance, but which it will use as a bridge, such as brick or stone. The common idea that the fungus eats away the interior of beams which outwardly appear sound is almost entirely erroneous. Thus, in the old roof of Westminster Hall some of the beams and rafters were hollowed to mere shells, but it was found that the damage was due to a boring beetle. Dry rot cannot

develop (though it may long remain latent) in wood to which air-currents have free access, and which has a moisture content of 20 p.c. or less.

Conformably to this assumption, architects and builders are legally required to provide effective ventilation and otherwise prevent dampness by inserting damp-proof courses, concreting foundations, and forming dry areas. Steeping the wood in creosote, corrosive sublimate, etc., has been recommended as an additional precaution against dry rot. The dry rot of oak-built ships is usually due to another species of fungus. See *Brickwork*; *Building*.

**Drysaltery.** Term applied to the business of a drysalter or the articles sold by him. These consist of heavy chemicals (borax, salt, soda, sulphur, etc.), dye-stuffs (alkanet, indigo, etc.), gums (arabic, shellac, kauri, resin), oils (paraffin, linseed oil, boiled oil, turpentine), and crude drugs (linseed, senna, Epsom salt, Glauber's salt, etc.). Drysalters also sell pickles, preserved meat, and sauces.

**Dry Walling.** Uncemented wall used in stone-producing districts as a cheap form of boundary for fields. The stones are laid dry and the strength of the wall depends entirely on the ability of the builder to produce a good bond by correctly fitting the roughly cut stones. The wall is strengthened by bedding on the top course or adding an improvised coping.

**Dual.** Grammatical form originally used in some languages to express the idea of things naturally thought of in pairs, as the eyes and feet. It was then extended to other objects associated in twos (two men, two books). It is found in Sanskrit, ancient Greek, Arabic, and Hebrew, and traces of it occur in Anglo-Saxon.

**Duala.** This town in the Cameroons is described under its more usual French form Douala.

**Dual Control.** Method whereby either of two pilots may control an aircraft. The rudder and control levers are duplicated as are the engine throttle and switches. Dual control is essential on aircraft used for teaching pilots; in training aircraft there is a full set of controls in the pilot's seat and a duplicate in the passenger's seat, so that either the pupil or instructor can fly the aircraft. Large bombers and air liners are usually fitted with dual controls, so that the captain can hand over to the second pilot. Motor vehicles

with duplicated controls are used for instructing car drivers.

**Dual Ignition.** Arrangement by which two forms of ignition apparatus are fitted to an engine. One system is by accumulator and coil for starting purposes, and by magneto for the subsequent operation. The term is sometimes applied to the system of fitting two sparking plugs to the engine cylinder in order to produce two sparks simultaneously and thus facilitate the ignition of the explosive mixture.

**Dualism** (Lat. *dualis*, containing two). The assumption of two principles, as opposed to monism, the assumption of one. It may be applied to man (anthropological), to God (theological), to the world and existence (cosmological, metaphysical). Anthropological dualism regards man's body and soul as two distinct existences; theological dualism assumes two first principles, a good and a bad, eternally in conflict; cosmological dualism lays down two original substances or entities, mind and matter, thinking substance and extended substance, of which everything is composed.

In the ancient philosophies dualism appeared as the opposition of matter and form, later as a contest between objectivity and subjectivity, the last attempt to reconcile them being that of neo-Platonism. Descartes was the first of modern philosophers to substitute for this the dualism of mind and matter, and from his time the question how their relation to each other as manifested in experience is to be interpreted has engaged the attention of thinkers without any satisfactory or generally accepted explanation being reached. The reaction against idealism, which amounted to an abolition of dualism, has led to the reassertion of the latter by some philosophical writers.

**Dual Monarchy.** Name given to the empire of Austria-Hungary (*q.v.*), formed in 1867 by the union of Austria and Hungary. For half a century the two countries were joined under the same ruler, emperor of Austria and king of Hungary. As a result of the First Great War they became separate in 1918.

**Duars.** Another spelling of the name of a district in the Himalayas described under Dooars.

**Dubarry.** The mistress of Louis XV of France is described as Barry, M. J. B., Comtesse du.

**Dubawnt.** River and lake of the N.W. Territories, Canada. The river rises from Wholdaia

Lake, almost on the border of Saskatchewan, and flows almost due N.N.E. to Dubawnt Lake. Issuing from this, it bends round to the N. again and then turns E. until it falls into Chesterfield Inlet, in Hudson Bay. Its length is about 580 m. The lake is really an extension of the river and is about 1,650 sq. m. in extent. Other lakes on the course are Aberdeen and Baker. The river's main tributary is the Thelon, which joins it as it turns E. The Dubawnt Basin forms part of the Barren Grounds, almost treeless and frequently frostbound, even during certain summers. The river was discovered in 1770.

**Dubbin.** Dressing applied to leather to soften it and render it waterproof. It is composed of Russian tallow softened with cod-liver oil and is especially used for waterproofing heavy boots.

**Dubbo.** Town of New South Wales, Australia. In Gordon co., it stands on the Macquarie river, 278 m. by rly. N.W. of Sydney, and is the trade centre of a vast pastoral and coal and copper mining area. Pop. 9,100.

**Dubica.** Town of Yugoslavia. It is situated on both banks of the Una, one portion being in Croatia and the other in Bosnia. The Croatian town is served by the main line rly. from Zagreb to Belgrade.

**Dubissa.** River of Lithuania, S.S.R. It joins the Niemen W. of Kovno (Kaunas). It came into prominence in 1915 during the fighting between the Russians and Germans when the latter attempted to overrun the Baltic provinces. After heavy fighting

along the river line, the Germans broke through the Russian positions on July 20.

**Dublin.** An eastern maritime county of Eire, in the province of Leinster, with about 72 m. of coast-line including indentations. Dublin Bay is the largest inlet, the Liffey, which debouches into it, the chief river, and Howth Head the most prominent cape. Lambay and several smaller islands near the coast are included in the county. Mountains occur in the S. (Kippure, 2,473 ft.), but the surface is generally a gently undulat-

ing plain, almost entirely under cultivation, wheat, oats, barley, and potatoes being the chief crops raised; the N. and W. parts contain much pasture land. Mineral products include lead and copper ores, and granite; fishing is a thriving industry, and the leading manufactures are whisky, beer, and hosiery. The Eire state rlys. afford communication. After Dublin city, Dun Laoghaire, Swords, and Balbriggan are the most important towns. Its area is 385 sq. m. Pop., exclusive of Dublin city, 129,241.

## DUBLIN: THE CAPITAL CITY OF EIRE

H. L. Morrow

*All the principal towns of Eire are noticed under their own headings, as are the counties, rivers, etc. See also Dublin Society; Dublin University; Dublin Gate Theatre; Abbey Theatre; Phoenix Park, etc. For the events of 1916-20 see Ireland: History*

The city of Dublin, capital of Eire, has a population of just over half-a-million—almost one-sixth of the population of the 26 counties of Ireland formerly comprising the Irish Free State. Situated on Dublin Bay, at the mouth of the Liffey, 61 m. W. of

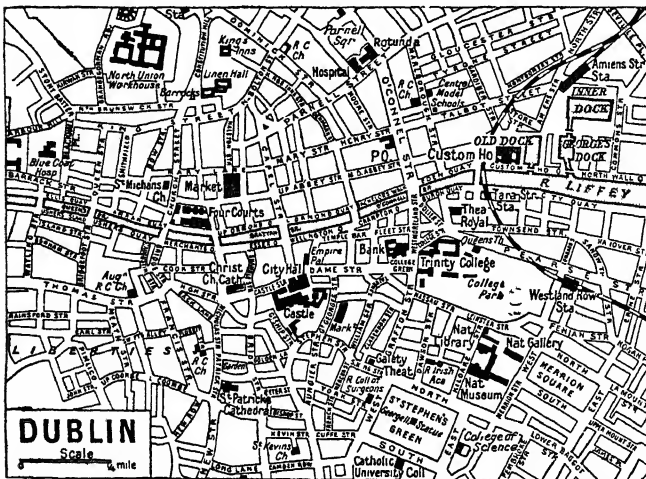

Dublin city arms

Holyhead, it is the centre of Eire's government, major industries, and two most famous universities, and of the social and intellectual life of the country. It is a city with an historic and dramatic past, happily enshrined for the most part in buildings which, escaping damage both in Ireland's domestic struggles and in the two Great Wars

(despite a few German bombs dropped in the city on May 31, 1941), remain intact. If its acknowledged architectural beauties of Georgian squares and mansions are here and there marred by a degeneration into the slums depicted so vividly in the autobiography and plays of Seán O'Casey, the city is still, surprisingly, the Irish capital of Swift and Sheridan, Grattan and Tom Moore, no less than of James Joyce's Ulysses. Its most famous exports today—it has been justly remarked—are whisky, porter, and playwrights, among the last-named being Bernard Shaw, J. M. Synge, Seán O'Casey, and Denis Johnston.

The name is from the Irish *Dubh-linn*, meaning black pool, suggested by the pool made by the confluence of the Liffey with its tributary, the Poddle (now part of the city's sewerage system). On the establishment of the Irish Free State in 1922, the capital became known officially (which is by no means to say generally) as *Baile ath Cliath*, or Town of the Hurdle Ford, an Irish name of probably greater antiquity than *Dubh-linn*, and now used as the city's post-mark. To the Romans (who seem never to have crossed the Irish sea) the place was known as Eblana. Legend connects it dimly with S. Patrick, the national apostle, who is said to have caused a miraculous fountain to well up there to refresh his parched fellow-missionaries.

It was not, however, until the coming of the Danes at the beginning of the 9th century that Dublin emerged from semi-legend. Here in 840 the Danes under

Dublin. Plan of the capital of Eire, showing the situation of the Castle and other principal buildings

Dublin. 1. O'Connell Bridge, one of ten bridges over the Liffey. 2. Bank of Ireland, built for the 18th century House of Parliament. 3. Custom House. 4. The Four Courts. 5. S. Patrick's Cathedral, of which Swift was dean, 1713-45

Thorkils—no mere plunderer but a man of vision—built their first great fortress in Ireland. Though Thorkils was put to death by the resentful Irish the fortress he had established remained for just over eleven hundred years the chosen centre for successive invaders and “alien” administrations. It was at Clontarf, now one of the city's northern suburbs, that Brian Boru, the famous Irish chieftain, defeated the Danes in 1014 and finally destroyed Danish power in Ireland. Twenty-four years later the remnants of the Danish garrison, by then converted to Christianity by the Irish, laid the first stones of the church of the Blessed Trinity, now Christ Church Cathedral.

By the time Henry II landed in Ireland in 1171, Dublin had become recognized as the most important city of the country. Henceforth it was to be regarded by the English as the seat of English government in Ireland, which it remained in effect until the establishment of the Irish Free State in 1922. From Henry's time to the death of Elizabeth, after which, for over 300 years, no really effective resistance was put up by the Irish people as a

whole, it was the capital of the Pale—that part of the surrounding country, as Dr. D. A. Chart has put it, “still resisting absorption by the Irish.”

Modern Dublin is divided by the Liffey into two districts of almost equal sizes. In *Dáil Eireann* (*q.v.*) it is represented by two constituencies, Dublin North and Dublin South, the former returning eight and the latter seven deputies. Its pop. is 468,103. In the second half of the 18th century the Wide Street Commissioners undertook a town-planning scheme far ahead of its time. Among the thoroughfares laid out were those known today as O'Connell Street, Westmoreland Street, and Dame Street. Thanks to the genius of its late 18th century architects (most of them English or continental), in the older parts of the city are admirably designed, imposing, residential squares, such as Stephen's Green, Merrion Square, Fitzwilliam Square, Mountjoy Square, and Rutland (now Parnell) Square, all of which are probably unsurpassed in Great Britain, though their pleasing houses now mostly serve as flats and (in some cases) tenement dwellings swiftly falling into decay.

The city's 18th century architects—among whom were James Gandon, Francis and Richard Johnston, Robert Parke, Thomas Ivory, Sir William Chambers, and Richard Cassels, the German—made full use of the Liffey, which provided them with an admirably adaptable 3-m. waterfront stretching from the docks of the North Wall as far west as the Phoenix Park. Here, on the north bank of the river, are the Custom House, Gandon's Doric masterpiece, completed 1791, and his equally impressive Four Courts in the same style. Both these buildings suffered considerable interior damage in the “troubles” of 1916-22.

For the rest, the quays, stretching westwards as far as Kingsbridge station, terminus for both W. and S., are picturesquely lined with trees and narrow 18th century dwelling houses of four and five storeys, now turned into shops and offices, though still retaining dignity. The river is spanned by ten bridges, notable among them O'Connell Bridge, leading from Westmoreland Street to the wide sweeping thoroughfare of O'Connell Street (formerly Sackville Street), and the Metal

Bridge, an almost semi-circular single-span footbridge of cast-iron, over 100 years old.

The city's most imposing thoroughfare is O'Connell Street, named after Daniel O'Connell, "The Liberator." On the score of its proportions this can claim to be one of the finest streets in Europe. Badly damaged in both 1916 and 1922, its only building of note architecturally is the G.P.O., an imposing Ionic structure by R. Johnston, completed 1818, and the scene of the last stand by the rebel garrison during the Easter Week insurrection of 1916. Nelson's Pillar, focal point for tram and bus services, has escaped demolition at the hands of anti-British extremists (unlike the statues of William III and George III elsewhere in the city). At the N. end of the street is a striking statue of Parnell by Saint-Gaudens. The O'Connell statue by Foley and Brock, at the S. end, while imposing in dimensions, is in the tradition of civic sculpture.

Architecturally, Dublin's most pleasing cluster of buildings is at College Green, confluence of Dame Street, Westmoreland Street, and Grafton Street, with Keane's and Saunderson's long, gracefully-vermicated façade of Trinity College (usually wrongly attributed to Chambers) and the exquisitely curved façade of the Bank of Ireland, begun in 1729, the work of various hands, including Gandon and F. Johnston. This latter building housed Ireland's 18th-century parliament. Leinster House, in Kildare Street (designed by Cassels, who came to Dublin in 1720), once the magnificent home of the Dukes of Leinster, now accommodates Dáil Éireann and the Senate. Flanking it on Leinster Lawn are the National Gallery and the modern government buildings. St. Stephen's Green, laid out as a public park of some 22 acres, is lined with fine examples of late 18th- and early 19th-century architecture, including the headquarters of the Royal College of Surgeons of Ireland.

On the western outskirts of the city is the famous Phoenix Park, covering 1,760 acres and believed to be the largest city park in the world. Here are situated the zoological gardens (founded in 1830 and famed for its breeding of lions); the racecourse; the U.S. legation; the papal nunciature; and Arus an Uachtarain, residence of the President of Éire, formerly the viceregal lodge. The

city is rich in churches of architectural interest. Most important are the two Protestant cathedrals—S. Patrick's and Christ Church. In the former, founded in 1190, lie Jonathan Swift and his "Stella," side by side. Christ Church was founded in 1038 and rebuilt by the Normans in 1172; it contains the tomb of Strongbow, who led the Norman invasion of Ireland. S. Michan's, near the Four Courts, dates from the 12th century and is remarkable for its vaults, where may be seen bodies which have lain for centuries without betraying signs of decomposition. S. Werburgh's, a Norman foundation, boasts a Grinling Gibbons pulpit, a massive memorial to the Geraldines, and the tomb of Lord Edward Fitzgerald, the 18th-century rebel leader. All these are now Protestant. The only R.C. church of antiquity is S. Audeon's, dating from the 13th century and containing the oldest church bells in Ireland. The R.C. pro-cathedral, consecrated in 1815, is modelled on the church of S. Philippe du Roule in Paris.

Dublin boasts two of the finest small art collections in Europe—the National Gallery of Ireland and the municipal collection of modern art. The former, opened 1864, contains an outstanding assembly of 17th-century Dutch canvases, including works by Rembrandt, Hals, Rubens, and Ruysdael; while the municipal gallery houses the famous collection of French impressionists and the modern English school presented to the city by Sir Hugh Lane in 1907.

For a city of its size, Dublin has an unusual wealth of museums and libraries. The National Museum and the National Library are both state institutions which have greatly added to their pre-1922 legacies, considerable as these were. Oldest and largest of the libraries is that of Trinity College, founded 1601, which numbers among its treasures the famous illuminated MS. known as the Book of Kells. Trinity Library still shares privilege of copyright with the British Museum and the Bodleian, by which it may demand a free copy of all books published in Britain. The Royal Irish Academy in Dawson Street has probably the finest collection of ancient Irish MSS. in the world, including the *Annals of the Four Masters*, and the *Leabhar Breac*.

Dublin's chief educational institutions are Trinity College (see

Dublin University) and the National University, the R.C. university in whose foundation J. H. Newman (*q.v.*) played an important part. There are also the Royal College of Physicians and the Royal College of Surgeons, while the Rotunda hospital's midwifery school has international recognition.

From the earliest years of the 18th century Dublin has been a centre for drama and music. Handel's *Messiah* was given its first performance here—in 1743, under the composer's direction. Henry Irving first appeared here. Since its foundation in 1903, the Abbey Theatre has continued to provide the world with both players and playwrights; since 1929 it has received a state subsidy of £1,000 a year. Besides supplying Dublin's finest spectacle—the August horse show—the Royal Dublin Society has for over half a century provided its members with some of the finest chamber music recitals in the world.

Dublin is Éire's transport centre. There are daily sailings between Dun Laoghaire and Liverpool and Holyhead; and air services to and from Liverpool, Manchester, and London. The Port and Docks Board, created in 1898, did much towards transforming Dublin into the considerable port it now is, making possible the rise of the ship-building industry. *Consult* *Glamour of Dublin*, D. L. Kay, 1918; *Dublin under the Georges*, 1714-1830, C. Maxwell, 1936; *Dublin Old and New*, S. L. Gwynn, 1936; *As I was going down Sackville Street*, O. St. J. Gogarty, 1937.

**Dublin Bay.** Inlet of the Irish Sea. It penetrates the E. coast of Éire as far as Dublin, a depth of about 10 m., and from its entrance at Howth peninsula on the N. to Dun Laoghaire on the S. is 6 m. Owing to its difficult navigation numerous lighthouses have been erected along its shores. The Liffey is the principal river discharging into the bay. The Hill of Howth at its N. end (562 ft.) and Killiney Hill at its S. (480 ft.) form conspicuous landmarks at the entrance. Its depth varies from 2½ to 10 fathoms.

**Dublin Gate Theatre.** Dublin playhouse and company. It was founded by Hilton Edwards and Michéal MacLiammoir in Oct., 1928, for the production of plays of unusual interest, and for experimenting in methods of production. Over 300 productions were launched, and dramatists whose work

became famous in Great Britain and America included Denis Johnston, Lord Longford, Seán O'Casey, Paul Vincent Carroll. In 1935 the company had its first London season at the Westminster Theatre, when *The Old Lady Says "No!"* and *Hamlet* drew enthusiastic audiences. The company visited Malta and Athens in 1938 and toured in the Balkans during 1939.

**Dublin Society, ROYAL.** Irish learned society. Founded in 1731 for the advancement of agriculture, industry, science, and art; incorporated by royal charter in 1750. Its activities include the holding of agricultural shows at Ball's Bridge—including the Dublin horse show; the granting of premiums for the encouragement of horse-breeding; lectures on scientific, agricultural, and general interests; recitals of chamber music; art scholarships and prizes; publication of transactions and proceedings. Formerly at Leinster House, its headquarters since 1929 has been at Ball's Bridge.

**Dublin University.** Irish university, consisting of Trinity College, Dublin. It was founded in 1591, under Protestant auspices, and still contains the Divinity school of the Church of Ireland, but has been undenominational since 1873. It is governed by a chancellor, board, senate, and council; the executive head is the provost. There are senior fellows, junior fellows, and scholars, and its courses resemble those of Oxford and Cambridge. The arrangements of the original Trinity College were modelled on those of Trinity, Cambridge. Undergraduates, as a general rule, must reside for a certain period in college, or in the vicinity. The normal degree course is four years; those therein being known as junior freshmen, senior freshmen, junior sophisters, and senior sophisters. The buildings, which are entered from College Green, are very extensive. Parliament Square contains the chapel, dining-hall, and examination hall, while in Library Square is the library with a priceless collection of manuscripts.

Among the modern buildings are the museum, and those of the medical school, in the college park. The college has also various museums and laboratories, as well as botanic gardens. Women have been eligible for degrees since 1904, and for them there is residential accommodation in Trinity Hall. Swift, Goldsmith,

Burke, and Berkeley, as well as the great Irish orators and statesmen, were students. In the 19th and 20th centuries may be mentioned Lecky, Dowden, Mahaffy, Bury, and Joly.

**Dubno.** Town of S.E. Europe, lying E. of the Curzon Line. It is 32 m. W. of Ostrog and 85 m. N.E. of Lwow. It was seized by Poland from Russia in 1920, and incorporated in the Volhynia co. of the restored republic; but was included in the Ukraine territory occupied by Soviet Russia after the German invasion of Poland, Sept., 1939. The principal industries of Dubno are tanning, brick-works, and tobacco manufacture. In the Middle Ages assemblies of Polish nobility were held here. In the First Great War Dubno fell to the Austrians in Sept., 1915, but was recaptured by the Russians on June 9, 1916, during Gen. Brusilov's offensive. The pop. before the Second Great War was about 14,000, mainly Jewish.

**Dubois, GUILLAUME** (1656–1723). A French statesman and cardinal. Born at Brive, Limousin, Sept. 6, 1656, he was educated by the monks in his native town, and entered their order. He completed his education at Paris, where he secured the post of tutor to the prince, who became the regent, Philip of Orléans. After 1715, when Philip became regent, Dubois was his chief counsellor.

The great work of the priest was to reverse the traditional policy of Louis XIV. He was strongly hostile to Spain, and brought about an alliance between France, Great Britain, and Holland. Dubois secured the archbishopric of Cambrai, and was made a cardinal in 1721. He remained chief minister when Louis XV came of age, but almost at once died at Versailles, Aug. 10, 1723. *Consult* Memoirs of Cardinal Dubois, P. Lacroix, Eng. trans. E. Dowson, 1899.

**Du Bois, WILLIAM EDWARD BURGHARDT** (b. 1868). American negro author and publicist. He was born at Great Barrington, Mass., and studied at Fisk university, Tenn. Further scholarships took him to Harvard, where his doctor's thesis, *The Suppression of the Slave Trade*, became the first volume in the *Harvard Historical Studies*, and later to Berlin university. He was professor of economics and history from 1896 to 1910 at Atlanta university, where he produced a monumental series of studies of the American negro. Du Bois came into conflict

with Booker Washington, whose educational policy for the negro differed from his; out of this controversy arose the National Association for the Advancement of Coloured Peoples, of which Du Bois became director of publications and research. Under his editorship its literary organ, *The Crisis*, introduced to the American public the first work of many distinguished negro writers. An autobiography, *Dusk of Dawn*, appeared in 1940.

**Dubovka.** Town of R.S.F.S.R. It stands on the right bank of the Volga, 32 m. N.N.E. of Stalingrad and in the region of that name. There are tanneries and mustard factories, and considerable trade is done in salt. Pop. 17,000.

**Dubricius** (d. 612). Welsh saint. Many unverified stories are related of him, as that he crowned king Arthur and exhorted the troops before the battle of Mount Badon. He probably founded the bishopric of Llandaff, and is regarded as one of the chief saints of Wales. His relics were translated from Bardsey Island, where he died, to a shrine in Llandaff cathedral in 1120. His festival is kept on Nov. 14.

**Dubrovnik.** City and seaport of Yugoslavia. Situated on the Dalmatian coast of the Adriatic Sea, it is 38 m. W.N.W. of Cattaro, and was formerly part of the Austro-Hungarian empire, when it was known as Ragusa. The city, which is surrounded by a wall with numerous towers, is divided into two nearly equal parts by the Corso, once an arm of the sea. Notable buildings include the palace of the former rulers, the customs house, formerly the mint, the cathedral, completed in 1713, and a Dominican monastery. It is the seat of a bishopric. As the harbour is impeded by sandbanks, large vessels use Gruz, 4 m. N. Oils, silk, leather, and liqueurs are the principal imports.

Subject at varying times to neighbouring states, Dubrovnik, together with much of the surrounding district, became in the 16th century a republic under the suzerainty of Turkey and rose to be a great commercial centre. In 1667 earthquake destroyed a large area and with plague killed a fifth of the population. The little state was extinguished in the Napoleonic wars and in 1814 Dubrovnik passed to Austria-Hungary. After the First Great War it became part of Yugoslavia. In the Second Great War the Italians occupied the port on April 17,

1941. They withdrew on the formation of the Croatian kingdom; but reoccupied the town in Sept. Bombed by the Allied air forces in 1943, it was liberated by Marshal Tito's troops on Oct. 20, 1944.

**Dubuque.** City of Iowa, U.S.A., the co. seat of Dubuque co. It stands on the Mississippi, 168 m. W.N.W. of Chicago, and is served by several rlys. An important river port and rly. centre, it communicates with the E. bank of the river by three bridges and with other ports by steamer. An R.C. archbishopric, it is the seat of the university of Dubuque, Wartburg theological seminary, and the state institute of arts and sciences. In a coal, zinc, iron, and lead mining district, it is the chief manufacturing centre in N. Iowa; it has meat packing plants, foundries and machine shops, rly. workshops, flour and lumber mills, and makes steel hulls, cars and wagons, agricultural implements, furniture, and leather. First settled in 1788 by Julien Dubuque, a French prospector, it was refounded in 1833, incorporated 1839, and chartered a year later. Pop. 43,892.

**Ducange, CHARLES DU FRESNE, SIEUR (1610-88).** French scholar. Born at Amiens, Dec. 18, 1610, and educated by the Jesuits, Ducange became a lawyer. He passed most of his life in study in Amiens and Paris, where he died Oct. 23, 1688. He edited the works of several French and Byzantine historians, Joinville among them, but his great work is his Latin glossary, 1678, which is really a compendious dictionary of medieval Latin. It has been frequently revised and enlarged, and the last edition was published at Nîort, 1883-87. He also compiled a Greek Glossary published in 1688.

**Ducat.** Coin, generally of gold, which circulated widely on the Continent in medieval times; value, 9s. 4d. It was first coined in silver, by Roger II, of Sicily, 1140. The gold ducat of Florence, coined in 1252, was followed by that of Venice, 1283. The name is derived from the word *ducatus* on Roger's money, referring to his duchy of Apulia. From Italy the coin and the name went to Hungary, Bohemia, Austria, and Germany. Its use ultimately spread to Russia, Spain, Denmark, and Holland; to Hanover, as late as George III's reign, and in 1887 to England, as a trial decimal gold coin, worth 10 pence. See Sequin.

**Duccio di Buoninsegna (c. 1260-1319).** Sienese painter. The only extant work indisputably by

this painter is the altar-piece for the high altar at Siena cathedral, now in the cathedral museum, representing the Virgin and Child surrounded by angels and saints. The back of this piece was composed of panels, some of which are now in the National Gallery, London. Duccio was the first Sienese painter to abandon the Byzantine tradition. He died Aug. 3, 1319.

**Duce, IL (Italian, the leader).** Title assumed by Benito Mussolini (*q.v.*) shortly after he formed his fascist government in Italy in 1922.

**Duchenne, GUILLAUME BENJAMIN AMAND (1806-1875).** French physician. He was born at Boulogne, Sept. 17, 1806, and educated at Douai. He then studied medicine in Paris until 1831 when he returned to his native town to practise. With the publication of *L'Electrisation Localisée*, 1855, and of *Physiologie des Mouvements*, 1867, he established his claim to be considered the founder of the science of electro-therapeutics. He specialised in the study of nervous disorders, particularly locomotor ataxia, and was a pioneer in the use of electricity as a cure for muscular diseases. He died Sept. 17, 1875.

**Duchess of Malfi, THE.** Tragedy in 5 acts by John Webster. Probably written in 1612 and produced about 1623, the plot was taken from Painter's Palace of Pleasure. Webster delighted in horror of a peculiar kind, and in this masterpiece he created passion, terror, and contrasting flashes of pathos. The duchess is represented as the victim of the sadistic Duke Ferdinand. In one of the most memorable scenes she is deceived by the counterfeit image of her murdered husband and children, and as the drama moves to its climax she is tormented by a dance of madmen, and finally strangled. The play contains passages of magnificent poetry, and has held the stage for more than three centuries. Modern revivals were at the Lyric Theatre, Hammersmith, 1919; Embassy Theatre, 1935; Haymarket Theatre, 1945.

**Duchess Theatre.** Playhouse in Catherine Street, Drury Lane, London, W.C.2. This theatre was opened Nov. 25, 1929, its first production being *Tunnel Trench*. Among later successes were J. B. Priestley's *Laburnum Grove*, 1933, and *Time and the Conways*, 1937; Emyln Williams's *Night Must Fall*, 1935; Norman Macowan's *Glorious Morning*, 1938. The Ballet Rambert held seasons here, 1938-39. The theatre can seat 494.

**Duck OR DUKW** This type of troop and store carrier of the Second Great War is described under Amphibious Craft.

**Duck** (Mid. E. *dukan*; Ger. *tauchen*, to dive). Name usually given to the largest group of birds of the order Anseres (of the family Anatidae), which includes swans, geese, and ducks. There are over 40 genera of ducks and nearly 200 species. They are distinguished by short legs, webbed feet, and a depressed and expanded beak. All the species are more or less aquatic, and most are powerful flyers. They are mainly herbivorous, with the exception of the merganser, which lives on fish, but frogs and worms are also readily eaten. The plumage is dense and compact, so that the water readily runs off it. As a rule, the male, or drake, has more showy plumage than the female, for which the term duck is commonly reserved. All the species lay uniformly coloured eggs.

Ducks are found all over the world, but are most numerous in the northern regions. They associate in flocks, and the majority migrate farther N. for the nesting season. On the wing the flock assumes a wedge-shaped formation. The numerous breeds of domesticated ducks are believed to have descended from the mallard, or wild duck, which breeds quite freely in captivity. All domesticated ducks interbreed with the wild duck; and their offspring is fertile, which goes to prove that the species is identical. The polygamous habits of the domesticated duck, the wild duck being monogamous, are probably merely the result of living under non-natural conditions. Domesticated ducks may be classed as ornamental, and those intended for the table. The ornamental are mainly species of British and foreign wild ducks maintained on lakes and in parks.

Fewer than a dozen European breeds can be regarded as of practical utility for the table or for supplying eggs. The Aylesbury is by far the most esteemed and most commonly bred variety in Great Britain. Its plumage is pure white, and it carries its boat-shaped body almost level with the ground. As it matures rapidly and attains a weight of 8-10 lb., it is much in demand for table purposes. The Rouen is simply a cultivated mallard. In plumage almost identical with the wild bird, it often weighs 11 lb., and its flesh is much superior to

that of any other native breed. But it is not altogether in favour outside France, for it matures so slowly that it often costs more in food than it fetches in the market. The Pekin duck, which came originally from China, may be re-

Duck Bill. Oviparous mammal of Australasia

cognized by its yellowish-white plumage and its very upright carriage when walking, the legs being set very far back. A large specimen will weigh as much as 9 lb., but it is as an egg-layer that the breed is valued. The Indian runner is also a prolific layer of eggs, and these are often preferred for sale as those of the hen. It is not useful as a table bird since it seldom weighs more

than 4 lb. Swedish and Flemish ducks are also bred to a limited extent in Britain, and possess good table qualities.

The demand for ducklings far exceeds that for older birds, which are apt to be oily and strong in flavour, and the breeder should, therefore, aim at mating the birds early, Oct. being the best time. As ducks are not good sitters, the eggs are usually taken to be hatched under a hen or in the incubator. See Poultry Farming.

**Duck** (Dutch *doek*, linen cloth). Untwilled fabric, lighter and finer than canvas, used for clothing, sails, wagon covers, bags, etc. It is usually made of linen, sometimes of cotton. The word also denotes the creamy tint of linen yarn during bleaching

**Duck Bill, DUCK-BILLED PLATYFUS, OR DUCKMOLE.** Small web-

Ducking Stool. Example in the Priory Church, Leominster

footed and oviparous mammal (*Ornithorhynchus anatinus*), with a snout like the bill of a duck. It is about 18 ins. in length. No ears are visible above the fur, though the hearing is acute; the nostrils are placed near the tip of the bill. The hind feet of the male are armed with hollow spurs, communicating with poison glands, and probably used for fighting in the nuptial season. The adult duck bill has no teeth, but instead two pairs of horny plates on each jaw. It is peculiar to Australasia. See *Ornithorhynchus*.

**Ducking Stool.** Instrument formerly in use in Great Britain and in certain parts of the U.S.A. for the punishment of scolds. It consisted of a chair fastened to the end of a beam which, projecting over a pond or river, worked on a pivot from a post at the water's edge. The victim, usually a woman, was tied in the chair, and ducked by lowering the beam. The last record of its infliction was at Leominster, 1809.

**Duck-Shooting.** Sport mostly practised on the E. shores, inlets, estuaries, and broads of Great Britain. It may roughly be divided into (1) shooting with stanchion guns fixed in single or double handled punts; (2) from a punt with an ordinary gun while the birds are in flight; (3) and following on foot by open streams or drains.

The British wild ducks principally met with are the mallard, shoveller, gadwall, pochard, teal, and widgeon. These generally feed on fresh waters, and are therefore more valuable for eating purposes; scaup, eider, and the long-tailed ducks seldom leave the sea, and are useless as food. Wild ducks are very difficult to approach, and when using a punt it is necessary to lie flat along the bottom directly birds are sighted, and to remain in that position until after the shot.

Duck. 1. Mallard or wild duck, which breeds freely in captivity. 2. Rouen duck, much favoured in France. Its plumage is similar to that of the wild variety. 3. White Aylesbury ducks, the most esteemed and most commonly bred variety in Great Britain (from a drawing by Harrison Weir)

It is the practice in some countries to mask the bows of the boat with green leaves and branches; and in some instances decoy birds (*q.v.*) are used to induce the wild ducks to come near. *Consult* First Lessons in the Art of Wildfowling, A. Chapman, 1896.

### Duckweed

(*Lemna*). Genus of minute, scale-like flowering plants of the family Lemnaceae. They are annual aquatic plants, floating on the surface of ponds and ditches, and consisting of a green disk, with or without a simple root or roots, forming sheets of green scum. They sometimes produce elementary flowers in the clefts of the margin, but rarely seeds, and are propagated by budding and by bulbils which hibernate in the mud.

Duckweed. A thick-leaved species, *Lemna gibba*

**Duckworth, Sir Dyce** (1840–1928). British physician. Born Nov. 24, 1840, and educated at

Sir Dyce Duckworth, British physician  
Elliott & Fry

Liverpool. he afterwards studied medicine at Edinburgh university and S. Bartholomew's hospital. After being an assistant surgeon in the navy, he settled down to a consulting practice in London. He was made consulting physician to Edward VII, when prince of Wales, treasurer and then senior censor of the Royal College of Physicians, and consulting physician to S. Bartholomew's and the Seamen's hospitals. During 1904–10 he was medical referee to the Treasury. Knighted in 1886 and made a baronet in 1909, he died Jan. 20, 1928.

**Duckworth, Sir John Thomas** (1748–1817). British sailor. Born at Leatherhead, Feb. 28, 1748, he entered the navy when 11 years old and was present at Quiberon Bay. He was promoted commander in 1780, and in 1793 was appointed to the *Orion*, in which he greatly distinguished himself at Ushant, June 1, 1794. Knighted in 1801, in 1803 he was commander-in-chief of Jamaica, was promoted vice-admiral 1804, and defeated the French off San Domingo in 1806, for which he received a pension of £1,000 a year.

In 1807 Duckworth was sent to Constantinople to dictate conditions to the Porte. With the assistance of the French, the Turks had strengthened the fortifications of the Dardanelles, but Duckworth forced the straits, Feb. 19, destroyed a squadron of frigates, and anchored 8 m. from Constantinople, where he was held up by wind and current and obliged to retreat. He was governor of Newfoundland, 1810–13, and was made a baronet in 1813. He died Aug. 31, 1817.

**Duckworth, Wynfrid Laurence Henry** (b. 1870). British anthropologist and anatomist. Born at Liverpool, June 5, 1870, he was educated at Birkenhead School, Dinan, and Jesus College, Cambridge. He studied medicine in London and anthropology in Paris. Lecturer in physical anthropology, 1898–1920, and reader in human anatomy, 1920–40, at Cambridge, he then became master of Jesus College until 1945. His publications included *Morphology and Anthropology*, 1904; *Prehistoric Man*, 1912.

**Duclaux, Madame**. This British authoress is also known under her maiden name of Agnes Mary Frances Robinson, and is so described in this work.

**Du Cros, Sir William Harvey** (1846–1918). British business man. Born June 19, 1846, he belonged to a Huguenot family that had migrated to Dublin from Montpellier in 1702. He was educated for the medical profession in Dublin, but soon turned his attention to the pneumatic tire industry, and later founded the motor manufacturing business of W. and G. Du Cros. Unionist M.P. for Hastings, 1906–08, he died Dec. 21, 1918. His son Sir Arthur Philip Du Cros (b. 1871), who became a baronet in 1916, was Unionist M.P. for Hastings 1908–18; Clapham 1918–22. He founded the Dunlop Rubber Company and instituted the motor ambulance movement in the First Great War.

**Ducrow, Andrew** (1793–1842). British equestrian performer and mimic. Born in Southwark, Oct. 10, 1793, the son of a celebrated strong man, he was early trained to equestrian and other circus feats. In 1808 he was chief equestrian and rope-dancer at Astley's; and in 1813 gained fame as a pantomimist in the part of Florio the dumb boy, in *The Forest of Bondy*. After touring the Continent, he returned to Astley's, which he eventually took over. On June 8, 1841, the building was

totally destroyed by fire. His mind gave way under the shock, and he died Jan. 27, 1842. It was Ducrow who, while watching Hamlet, urged the players to "cut the cackle and come to the 'osses."

**Ductility**. The property of metals through which they undergo plastic deformation—drawing out through a die, rolling into sheet, etc. The ductility of a metal is tested by stretching it under load until it breaks. This tensile test is usually carried out on a test piece 2 ins. long, ductility being expressed as the elongation per cent on 2 ins. All metals are ductile to some degree, although the property can be changed by varying the heat treatment. In general a cast metal will be less ductile than metal which has been annealed; a metal hardened by quenching will lose ductility. Gold and silver are the most ductile pure metals, while many alloys of copper, such as the bronzes and brasses, are more ductile than the pure metal. From the engineer's point of view, low ductility on a tensile test of a metal which is normally very ductile is an indication of a metallurgical defect.

**Duda, El**. Track junction 13 m. S.E. of Tobruk, Libya. El Duda was the most advanced point reached by the besieged Tobruk garrison in Dec., 1941. Three German counter-attacks failed to dislodge the British and Imperial forces from this position. On June 16, 1942, the Germans occupied El Duda, whereupon part of the British 8th army again withdrew behind the defences of Tobruk.

**Dudeney, Mrs. Henry** (1866–1945). British novelist. Daughter of Frederick Whiffin, she was born

Mrs. Henry Dudeney, British novelist  
Russell

Oct. 21, 1866, and educated at Hurstpierpoint. In 1884 she married Henry Ernest Dudeney (1857–1930), author of *The Canterbury Puzzles*, *Amusements in Mathematics*, etc. She died Nov. 21, 1945. Her novels include *The Maternity of Harriott Wicken*, 1902; *The Orchard Thief*; *Rachel Lorian*; *Set to Partners*; *The Secret Son*; *Seed Pods*; *Quince Alley* (her own favourite); *Brighton Beach*; *Put up the Shutters*.

**Dudley**. Co., parl., and mun. bor. of Worcestershire, England. In a detached portion of the co., it is

Dudley arms

Black Country; there are coal and iron mines all around, with which the chief industries are connected—ironworks, brass foundries, engineering works, etc. Cycles and beer are also made and stone is quarried.

The buildings of the town include the parish church, a town hall, school of art and grammar school. There is a hospital, founded by Joseph Guest, a technical college, and a geological museum. There are the ruins of the castle around which the town grew, part of the grounds being now a zoo. Himley Hall, between Dudley and Wolverhampton, ancestral home of Lord Dudley, was sold to the West Midlands Coal Board in 1947. Adjacent to Dudley, but in Staffordshire, are Brierley Hill and Kingswinford, while Netherton is another industrial suburb. Dudley existed before the Norman conquest, and was a borough in medieval times, being represented in parliament in 1295. Its present incorporation dates from 1865. It is governed by a mayor and council, and elects an M.P. Market day, Sat. Pop. est. 58,700.

**Dudley, EARL OF.** English title held by the family of Ward since 1860. In much earlier times there was a baron of Dudley, who lived in Dudley Castle. The first baron, who lived in the 14th century, was named Sutton, but his descendants took the name of Dudley from their residence. Among them were Elizabeth's favourite, Robert Dudley, earl of Leicester, and other noted men of Tudor times. The barony remained in the family until its ninth holder died without sons in 1643. It passed then to his granddaughter, the wife of a wealthy goldsmith, Humble Ward, created Baron Ward of Birmingham, 1644. Their son Edward succeeded to both titles; but in

1757 the barony of Dudley fell into abeyance.

Meanwhile, another branch of the Wards was becoming prominent, and John Ward, another descendant of Humble, who had inherited the barony of Ward, was made Viscount Dudley in 1763. His grandson, John William Ward, 4th viscount (1771–1833), was foreign secretary in 1827–28. In 1827 he was made earl of Dudley, but the title became extinct on his death in 1833. Another descendant of Humble Ward, William Ward (1817–85), inherited much of his great wealth, and in 1860 was made earl of Dudley. His son, William Humble, 2nd earl (1867–1932), was

Dudley, Worcestershire. Castle ruins, in which Norman work prevails; it was destroyed by fire in 1750

lord-lieutenant of Ireland, 1902–06, and governor-general of Australia, 1908–11. William Humble Eric Ward (b. 1894) succeeded as 3rd earl in 1932. He was a director of Westminster Bank, G.W.R., and Phoenix Assurance. The wealth of the Wards is due to the possession of rich coalfields round Dudley. The earl's eldest son is known as Viscount Ednam.

The title must not be confused with the barony of Dudley (created 1439–40) and that of De L'Isle and Dudley (1835).

**Dudley, DUKE (1599–1684).** English ironmaster. Natural son of the fifth Baron Dudley, he was educated at Balliol College, Oxford. In 1619 he was placed in charge of his father's ironworks at Pensnet, Worcestershire, where he experimented with coal as furnace fuel. In spite of successful demonstrations, in 1651 he was forced to abandon his attempts. During the Civil War he was colonel in the king's army, and general of ordnance to Prince Maurice. In 1665 he published his work *Metallum Martis* or *Iron Made with Pit-Coale*, etc., but was careful not to

describe his process. He died at Worcester, Oct. 25, 1684.

**Dudley, EDMUND (d. 1510).** English lawyer. He studied at Oxford and Gray's Inn, and early gained the favour of Henry VII. While very young he was made a privy councillor, and in 1504 became speaker of the house of commons. Working with another lawyer, Richard Empson, he enriched himself and the king by a system of extortion based mainly on antiquated penal statutes. The day after Henry VIII's accession, Dudley and his colleague were arrested. They were attainted Jan. 21, 1510, found guilty of constructive treason, and were executed on Tower Hill, Aug. 17.

**Dudley, SIR HENRY BATE (1745–1824).** A British journalist. Born at Fenny Compton, Warwickshire, Aug. 25, 1745, he was the son of a clergyman named Bate. Educated at Queen's College, Oxford, he entered the Church of England and became, in succession to his father, rector of North Fambridge, Essex. However, he took his duties very lightly, and it is as a journalist and society figure that he is known. He was editor of the *Morning Post* from 1772 to 1780, and afterwards founded the *Morning Chronicle*. His writings were often violent, while his behaviour was eccentric; always ready for a duel, he was called the fighting parson, and he spent at least one term in prison. In 1784 he took the name of Dudley on succeeding to some money, and in 1813 he was made a baronet. At one time he lived in Ireland, where he had livings and was chancellor of the diocese of Ferns. He died at Cheltenham, Feb. 1, 1824. The friend of Garrick and of other notables of the time, Dudley wrote the words for several comic operas to music by Arne and Shield.

**Duel** (Lat. *duellum*, old form of *bellum*, battle, from *duo*, two). Single combat engaged in by arrangement after challenge, and carried through on a recognized method of procedure, to settle a private quarrel or vindicate personal honour.

Historically the duel derives directly from the old legal method of settling disputes by ordeal by battle. The legal sanction given to decisions so arrived at commended the method to the popular mind, and the issue of a duel came to be accepted as a definitive settlement of a dispute between individuals over matters with regard to which they deemed it either undesirable or useless to appeal to law

Duel. Sword and Dagger Fight, a masterly representation of a sixteenth century duel, from the painting by John Pette, R.A.

France is the country of origin of the modern duel. It was forbidden in civil matters as early as 1305, but without effect, and in the next two centuries duelling was generally prevalent. Francis I sent a challenge to Charles V of Germany, and although it was not accepted, this royal example was enough to sanction a fashion peculiarly congenial to the national temperament. It grew under Charles IX and became almost a mania under his successors, the third and fourth Henrys and Louis XIII. despite more than one ordinance and edict threatening penalty of death to principals and seconds alike. Rosland's picture of Cyrano de Bergerac and his brother cadets is no caricature of the young gallants of that day who mistook swashbuckling for chivalry, and who doffed cloak and drew rapier on any pretext or none. These hot-heads found a quarrel everywhere, and soon were not content with one second apiece, while the second for his part ceased to be content with looking on to see fair play. In the reign of Louis XIV the dukes of Nemours and Beaufort fought a duel in which four friends joined in on each side. Three of the ten were killed, including Nemours, and all the other seven were wounded. The duel had almost grown into a battle. As in Italy, as pictured by Shakespeare in *Romeo and Juliet*, again, no exaggerated caricature, so in France duelling became an intolerable evil.

Despite the spectacular encounter mentioned, Louis XIV has the credit of doing much to suppress the practice, by establishing a supreme court of honour, and still more by insisting on the punishment of all who disregarded the edict against it. As a practice, chiefly indulged in by

the aristocracy, the Revolutionists ignored it in their legislation, and during the first Republic and the first Empire it almost died out. It was revived, however, with the Restoration, and remains a custom in France, resorted to for the most part by ebullient editors and politicians and not often a bloody business, although as late as 1900 M. Marlier, a municipal councillor, was killed by M. Ferrette, a deputy, in Paris. A bill to stop duelling was submitted to the French Chamber in 1920.

In England duelling dates back as a custom to the beginning of the 17th century, in the latter part of which, after the Restoration, it experienced a great revival. Beau Fielding went out with Sir Henry Colt, the member for Westminster, in Feb., 1696, and wounded the baronet, who succeeded in disarming his opponent. The 5th Lord Byron killed Mr. Chaworth in 1765, and the duke of York met Colonel Lennox in 1789. Mr. Christie killed Scott, editor of *The London Magazine*, Feb. 16, 1821, and on March 21, 1829, the duke of Wellington had a bloodless encounter with the earl of Winchelsea. On July 3, 1843, Colonel Fawcett died of wounds received two days before in a duel with his brother-in-law, Lieut. Munro. The case led to action by the Prince Consort with regard to the military etiquette of duelling, in obedience to which alone Munro had gone out. In the event it was ordained in the articles of war that any officer who participated in a duel, whether as principal or as accessory or who did not do his best to prevent a duel, should be cashiered and the regulation is still in force.

In the German army, up to the revolution of 1918 at least, officers

were required to submit disputes to a council of honour which arranged the matter if possible, and, if not, supervised the conditions of the encounter. The German students' duels are a more or less harmless form of university amusement. By English law duelling is an offence amounting to murder or manslaughter in the event of a death, and Major Campbell was hanged, in 1808, for having killed Captain Boyd in the previous June. In 1813, again, when Lieut. Blundell was killed in a duel, his opponent, Mr. Maguire, and both the seconds engaged, were convicted of murder and sentenced to death. In the event they were pardoned, but cashiered. On Oct. 19, 1852, when E. Barthélemy shot M. Cournet, an ex-officer of the French navy, at Crown Farm, between Windsor and Egham, both principals and seconds were refugees. Barthélemy, notwithstanding ferocious professions of Republicanism, was always suspected by other French refugees of being in the pay of the French police, and the cause of the duel was political.

**Duet** (Ital. *duetto*). Composition for two single voices or instruments, occasionally a double theme for a single instrument. In instrumental music the expression is used generally for a work for two similar instruments, e.g. two flutes. When written for different instruments, e.g. violin and flute, the more correct term is duo.

**Dufauere, JULES ARMAND STANISLAS** (1798-1881). French advocate and politician. Born at Saujon, Charente-Inférieure, Dec. 4, 1798, he was minister of the interior in 1848 and 1849. After a long period of office he was minister of justice, 1871-73, and again 1875-76. From March 9 to Dec. 12, 1876, he was premier at a period of particular difficulty, when feeling ran high between the parties of Church and State. Both the president, Marshal MacMahon, and the senate were opposed to the premier's policy, and he resigned, only to return to office once more as premier late in 1877, until Feb. 1, 1879. He died in Paris, June 28, 1881.

**Duff, ALEXANDER** (1806-78). Scottish missionary.

Alexander Duff, Scottish missionary

Born in Perthshire, April 26, 1806, he was educated at St. Andrews. In 1829 he went as a missionary to India. the first sent by the Church of Scotland, and

at once began the task of associating educational with evangelistic work. He set up schools and colleges, had much to do with founding Calcutta university, and for a time edited the Calcutta Review. At the disruption of 1843 Duff followed the leaders of the Free Church, and in 1851 he was its moderator, as he was again in 1873. Later he was professor of missions at New College, Edinburgh, and travelled all over the world. Duff, who is commemorated by Duff Hall, Calcutta, died Feb. 12, 1878. *Consult* Life, G. Smith, 1879.

**Duff, Sir Mountstuart Elphinstone Grant** (1829-1906). British author and politician. Born Feb. 21, 1829, at Eden, Aberdeenshire, he was educated at Edinburgh and Balliol College, Oxford, and was called to the bar at the Inner Temple, 1854. M.P. for the Elgin Burghs, 1857-81, he was under-secretary of state for India, 1868-74, and for the colonies, 1880. During 1881-86 he was governor of Madras. He will be best remembered for his series of Notes from a Diary. Other works include: Studies in European Politics, 1866; Notes of an Indian Journey, 1876; Sir Henry Maine, a brief memoir, 1892; Ernest Renan, 1893; and a biog. notice of Baron de Tabley in that writer's Flora of Cheshire, 1899. He died Jan. 12, 1906.

**Duff Cooper.** This British politician and diplomatist is noticed as Cooper, Sir Alfred Duff.

**Dufferin, Lady** (1807-67). Irish song writer. Eldest daughter of Tom Sheridan, and granddaughter

Lady Dufferin,  
Irish song writer  
By courtesy of John Murray

of R. B. Sheridan, she married in 1825 Commander Price Blackwood, who succeeded his father in 1839 as Baron Dufferin (d. 1841). She then devoted herself to educating her son, the future marquess of Dufferin and Ava (*v.i.*). In 1862 she married the earl of Gifford, then on his death-bed. She died at Highgate, June 13, 1867. Her best known poem is The Irish Emigrant, 1845. *Consult* Songs, Poems, Verses, with Memoir of the Sheridan Family, ed. by her son, 1894.

**Dufferin and Ava, Frederick Temple Hamilton-Temple Blackwood, 1st Marquess of** (1826-1902). British administrator. Born at Florence, June 21,

1826, son of the 4th Baron Dufferin and a descendant of R. B. Sheridan, he was educated at Eton and Christ Church, Oxford. He succeeded in 1841 to his father's Irish title, and in 1850 was made a British peer as Baron Clandeboye. He went as special commissioner to Syria in 1860 to inquire into the religious massacres, was appointed under-secretary for India in 1864, for war in 1866, and was created an earl in 1871. Governor-general of Canada, 1872-78, and viceroy of India, 1884-88, he became ambassador at Rome, 1888-92, and in Paris 1892-96. In 1888 he was created marquess of Dufferin and Ava.

After an exceptionally brilliant career, Lord Dufferin's later years were clouded by his unfortunate action in 1897 in accepting the chairmanship of the London and Globe Finance Corporation, of which Whitaker Wright (*q.v.*) was managing director, without adequate inquiry into its affairs, over which he had no control, but for the disastrous collapse of which he had to share the blame. This and the death of his eldest son, the earl of Ava, who was killed at Ladysmith in 1900, led to a breakdown in health, and he died at Clandeboye, Feb. 12, 1902. His Life was written by Sir A. C. Lyall, 1905.

Terence John Temple-Blackwood (1866-1918) succeeded his father as 2nd marquess. He was succeeded by his brother, Frederick Temple-Blackwood, who became speaker of the Northern Ireland Senate, and was killed in a flying accident at Meopham, Kent, July 21, 1930. The 4th marquess fell in action, March 25, 1945, his son Sheridan Frederick Terence (b. 1938) succeeding.

**Duffy, Sir Charles Gavan** (1816-1903). Irish nationalist and colonial statesman. He was born at Monaghan, April 12, 1816. In 1842, with John Dillon and Thomas Davis, he founded the Nation, the organ of the Young Ireland party. M.P. for New Ross, 1852-55, he afterwards emigrated to Australia. He became a member of the Victoria house of assembly, 1856, was twice minister of land and works, and in 1871 prime minister of Victoria. Knighted in 1873, he died at Nice, Feb. 9, 1903. He published the popular anthology, Ballad Poetry of Ireland, 1845.

**Duffy, George Gavan** (b. 1882). Irish politician and lawyer. He was born Oct. 21, 1882, and educated in France and at Stonyhurst. Practising as a solicitor in London, he was called to the Irish

bar in 1917, and the following year became Sinn Féin M.P. for S. Dublin. He prepared the defence of Casement, and was a signatory of the Irish treaty, 1921, and foreign minister in the provisional govt. of 1922. He became justice of the high court, 1936, and its president ten years later.

**Dufy, Raoul** (b. 1877). French painter. As a young man he was influenced by the *fauve* painters Matisse, Vlaminck, and Derain. His illustrations were prized by collectors of de luxe editions, e.g. woodcuts for Le Bestiaire, 1911; line blocks for Mallarmé's Madrigaux, 1920; etchings for Montfort's La Belle Enfant, 1930. His gay and witty designs influenced interior decoration and fabrics during the 1920s.

**Dugdale, Thomas Cantrell** (b. 1880). British painter. Born at Blackburn, June 2, 1880, he was educated at Manchester grammar school, and studied art at S. Kensington and in Paris. A member of the New English art club, he exhibited regularly at the Royal Academy, being elected A.R.A., in 1936 and R.A. in 1943. One of the foremost British portrait painters, he is represented in the Tate Gallery, London, and many provincial galleries.

**Dugdale, Sir William** (1605-86). English antiquary. Born at Shustoke, Warwickshire, Sept. 12,

William Dugdale  
From a portrait in the Bodleian Library

1605, he came to London in 1635 to collect materials for his Antiquities of Warwickshire (1656). His royalist leanings led to his receiving several heraldic appointments, which he used for county "visitations." He was made Garter king-of-arms and knighted in 1677. He published a History of S. Paul's Cathedral, 1658; collaborated in a history of religious foundations, Monasticon Anglicanum, 1655-73; compiled a History of Embanking and Draining of Fens and Marshes, 1662; and The Baronage of England, 1675-76. He died Feb. 10, 1686. *Consult* Life, Diary, and Correspondence, ed. W. Hamper, 1827.

T. C. Dugdale,  
British painter

**Dugong** (*Halicornes*). Genus of herbivorous aquatic mammals of the order Sirenia, known as sea-cows. They are found in the Red Sea, and around the E. Indies and Australasia. From 8 to 12 ft. long, they resemble miniature whales, but are not true cetaceans.

**Dug-out.** Primitive form of boat or canoe. In forest regions riverain tribes, familiar with floating logs, probably soon developed a method of hollowing out a tree trunk by means of fire or an adze. See Boat illus.; Canoe illus.

**Duguay-Trouin, RENÉ** (1673-1736). French sailor. Born at St. Malo, June 10, 1673, in early youth he gave up clerical studies and took to the sea, where he distinguished himself in the war against England and Holland. He obtained a commission in the French navy in 1697 and fought with distinction in the War of the Spanish Succession, capturing Rio de Janeiro in 1711. He died at Paris, Sept. 27, 1736.

**Duhamel, GEORGES** (b. 1884). French author. Born in Paris, June 30, 1884, he became a doctor. Soon he was one of the founders of a society known as L'Abbaye, a group which lived on communal principles, each member supporting himself with a trade as well as practising his art. This experience was of short duration, and Duhamel later joined the Unanimités (*q.v.*). He wrote several volumes of verse, of which *Selon ma Loi*, 1910; *Compagnons*, 1912; and *Élégies*, 1920, are the most notable. His experiences as an army surgeon during the First Great War evoked the humanitarian prose volumes *Vie de Martyrs*, 1914-16, and *Civilisation*, 1917, which won the Goncourt prize in 1918. He was awarded the grand prix of the French Academy in 1930. This was the year of *Salavin*, a psychological study, translated 1936. He is best known for his famous family saga, translated as *The Pasquier Chronicles*, 1937, to which he added *Cécile among the Pasquiers* in 1940. Duhamel published some 50 volumes of novels, short stories, essays, travels poetry, and plays. During the Second Great War he made himself a national spokesman in *Why France Fights*, 1940.

**Duhamel, JEAN PIERRE FRANÇOIS GUILLLOT** (1730-1816). French metallurgist. Born near Coutances,

he was officially appointed to visit the mines of Forez and two years later the Harz. By his discoveries and inventions he greatly improved steel manufacture in France. During 1781-1811 he held the professorship of mining and metallurgy at the French school of mining. In 1795 he was appointed inspector-general of mines.

He died Feb. 19, 1816.

**Duiker Bok.** Small S. african antelope of the genus *Cephalophus*. There are nearly 40 species, varying in size from the dimensions of a hare to those of a small donkey. They have short straight horns, usually with a crest of hair between them, and are of light and graceful form.

**Duisburg-Hamborn.** City of Germany, in N. Rhine-Westphalia. It stands between the Rhine and the Ruhr, 15 m. N. of Düsseldorf, and owes its great growth in the 19th century to collieries. Before its virtual destruction in the Second Great War it was the greatest inland port in Europe, centre of transit of the Ruhr industry. It had iron foundries, engineering and shipbuilding works, and made cotton goods and soap. Pop. pre-war, 431,256.

Duisburg was once a Roman station. For centuries it was part of the duchy of Cleves, which was joined to Brandenburg in 1614. During the troubles of 1919-20 there were risings in the town. Raids by the R.A.F. began in 1940 and were numerous. Troops of the U.S. 9th army captured the city after days of severe fighting on March 30, 1945.

**Dujana.** Former state of India, now merged in E. Punjab. Its founder was Abdul Samand Khan, a Pathan soldier of fortune, employed under Lord Lake. Opium and grain are the chief products. Chief town, Dujana, 37 m. W. of Delhi. Area, 100 sq. m. Pop. 30,666, four-fifths Hindus.

**Du Jardin, KAREL** (1822-78). Dutch landscape painter. Born probably at Amsterdam, he studied under Nicolaas Berchem and at Rome. On his return to Holland he met with great success, but he preferred to make Italy his home, and died in Venice. Nov. 20, 1878. His landscapes are Italian rather than Dutch in feeling. The National Gallery, London, possesses a representative example of this painter's work.

**Dukas, PAUL** (1865-1935). A French composer. Born of Jewish parentage Oct. 1, 1865, he studied at the Paris Conservatoire. His most important orchestral work, the *Symphony in C*, appeared in 1896, and the following year he established his reputation throughout Europe and the U.S.A. with *L'Apprenti Sorcier*, a descriptive work by which he is best known. His setting of *Ariane et Barbe-Bleue* (Maeterlinck) was first performed at Paris in 1907. Dukas died May 18, 1935.

**Duke** (Lat. *dux*, leader). Title of nobility. The word was first applied to military commanders in the early Roman empire.

Later, as in the Frankish empire, a duke was a civil and military official. There were also territorial dukes, who ruled over large districts, e.g. Saxony. Gradually all the dukes became territorial. In Great Britain duke is the highest title of nobility. The first English duke was Edward the Black Prince, created duke of Cornwall in 1337. The first Scottish duke was David, son of King Robert III, who was made duke of Rothesay in 1398. See Peerage.

**Duke-Elder, SIR (WILLIAM) STEWART** (b. 1898). British ophthalmic surgeon. Educated at St. Andrews and London universities, he became demonstrator of anatomy at Edinburgh royal infirmary, 1922, and St. George's hospital, London, 1923. He was ophthalmic surgeon at various London hospitals, surgeon-oculist to King George VI, consulting ophthalmic surgeon to the army, and examiner in ophthalmology at the Royal College of Surgeons and Physicians. He was knighted in 1933. His publications include *Text-book of Ophthalmology* in 3 vols.; *The Practice of Refraction*, 1943.

**Duke of Cornwall's Light Infantry.** English regiment. Originally of two battalions, the old

32nd and the old 46th Foot, it was raised in 1702 and served as Marines in the defence of Gibraltar, 1704. It took part in the battles of Dettingen and Fontenoy, the conquest of Canada (1759-60), the capture of Copenhagen (1807), the

Dugong. Sea-cow of the Indian Ocean. It feeds on seaweed

British duke's coronet

Duke of Cornwall's L.I. badge

Peninsular War, the Waterloo campaign, the second Sikh War, and the Crimean War. A great episode in the regiment's record was its defence of Lucknow during the Indian Mutiny. Later it took part in the Egyptian campaign (1882), the Nile expedition (1884), and the Burma and Tirah expeditions. In the S. African War the regiment was commanded by Sir Horace Smith-Dorrien. The nicknames, Red Feathers and Murray's Bucks, are popularly associated with the regiment. The former dates from the American War, when the old 46th, after surprising the Americans at Brandywine, stained the feathers of their headgear red in order that they might be more easily identified by the enemy. The latter commemorates a colonel of the regiment.

Fifteen battalions of the Duke of Cornwall's Light Infantry were raised for service in the First Great War and earned the honours: Mons; Marne, 1914; Ypres, 1915, '17; Somme, 1916, '18; Arras, 1917; Passchendaele; Cambrai, 1917, '18; Sambre; Dorian, 1917, '18; Gaza. The regimental memorial for the war is a statue of Cornish tin at Bodmin.

In the Second Great War this was one of the first British units to make contact with the enemy in France in 1940. After Dunkirk, the regiment went to N. Africa, and suffered heavy casualties at the defence of Tobruk in June, 1942. A later battalion served with the 1st army in Tunisia and was amongst the troops who advanced from Medjez el Bab in the closing stage of the campaign. Another battalion with the 8th army in Italy saw hard fighting at Cassino. Units landed in Normandy June 23, 1944, and a month later were in action against the crack Adolf Hitler division. The regiment served throughout the campaigns on the Continent, and formed part of the column which unsuccessfully attempted to relieve the 1st airborne division at Arnhem. The regimental depot is at Bodmin.

**Duke of Wellington's Regiment.** Regiment of the British army raised in the West Riding of Yorkshire in 1702 as the 33rd Foot. It first saw active service at Almansa in 1707. It later fought at Dettingen, and for its services in the Mahratta War earned a special

set of colours, the badge of the elephant, and the battle honour Hindustan. It later fought in the American War of Independence, capitulating at Yorktown. In 1794 the duke of Wellington assumed command, hence the title later awarded by Queen Victoria. The regiment served under Moore at Corunna and was with Wellington in the Peninsular campaign and at Waterloo. It fought in the Crimea, the Abyssinia expedition, and the Boer War.

In 1881, the 33rd Foot was amalgamated with the 76th and given the official title of the Duke of Wellington's (West Riding) Regiment; in 1920 this was altered to the Duke of Wellington's Regiment (West Riding). The regiment raised 21 battalions in the First Great War, and gained the battle honours: Mons; Marne, 1914, '18; Ypres, 1914, '15, '17; Hill 60; Somme, 1916, '18; Arras, 1917, '18; Cambrai, 1917, '18; Piave; and Suva. In the Second Great War the regiment served in the battle of France, and in Africa, Italy, and Burma. Units of the regiment landed in Normandy shortly after D-day, and fought throughout the 1944-45 campaign on the Continent. The regimental depot is at Halifax.

**Duke of York Islands.** Group of islands in the Bismarck Archipelago (*q.v.*). They were a German possession, known as New Lauenburg, until captured by Austrians in the First Great War, Sept., 1914. Later the territory was held under mandate by New Zealand. Area, 22 sq. m.

**Duke of York's School.** Formerly known as the Royal Military Asylum, this school founded at Chelsea by Frederick, duke of York, in 1801-03, was transferred to Dover in 1909. It is a resident secondary school for the sons of warrant officers, n.c.o.s, or men who are serving, or have served, in the army or of officers who originally enlisted on normal engagement in the regular army and afterwards were promoted to commissioned rank. Boys can be registered when eight years of age but are not admitted before nine or after 12. Before selection all boys

are required to attend an educational, general, and medical test. Preference is given to sons of soldiers who have been killed in action.

**Duke of York's Theatre.** London theatre, in St. Martin's Lane, W.C., designed by Walter Emden and known as the Trafalgar Square Theatre, opened 1892. Here was produced *The Master Builder* by Ibsen. Re-named and reopened in 1895, the theatre staged several plays by Barrie—*The Admirable Crichton*, *Peter Pan*, *What Every Woman Knows*. Later successes were *Romance* (1,049 performances), 1915; *Daddy Long-Legs*, 1916; *London Calling*, 1923; *Jew Süss*, 1929; *London Wall*, 1931; *Is Your Honey-moon Really Necessary?*, 1944.

**Dukeries.** District in the N.W. of Nottinghamshire, England. It covers about 100 sq. m. and stretches from just N. of Mansfield

Dukeries, Nottinghamshire. The Duke's Drive, showing some of the trees for which this district is famous

to Worksop. It is usually entered from Edwinstone, where a rly. line crosses the district. Ollerton is another centre. Including the remains of Sherwood Forest, it has some fine woodland scenery.

Coal mines have been opened in the southern part of the district. The name is due to the fact that in the 18th century four dukes resided here. At Welbeck Abbey was the duke of Portland; at Clumber the duke of Newcastle; at Thoresby, now the seat of Earl Manvers, the duke of Kingston; and at Worksop Manor the duke of Norfolk.

**Dukes, ASHLEY** (b. 1885). A British dramatist and manager. Born at Bridgwater, May 29, 1885, he was educated at Silcoates school and at Manchester and Munich universities. After being dramatic critic for leading journals, he wrote plays, including *The Man with a Load of Mischief*, 1924; *One More River*, 1927;

Duke of Wellington's Regiment badge

The Dumb Wife of Cheapside 1929; The Mask of Virtue, 1935; Mandragola (from Machiavelli), 1939; Parisienne (from Becque), 1943. In 1933 he opened the Mercury Theatre, London, where his wife, Marie Rambert (*q.v.*), instituted the ballet club. Dukes was appointed to supervise theatrical production in the British zone of Germany in 1945. His critical works include Modern Dramatists, 1911; The World to Play With, 1928. The Scene is Changed, 1942, is autobiographical.

Ashley Dukes,  
British dramatist  
and manager

**Duke Town.** Former name of Old Calabar, situated on the Calabar river, Nigeria. See Calabar.

**Dukinfield.** Mun. bor. of Cheshire, England. It stands on the Tame, and is mostly within the parl. bor. of Stalybridge and Hyde. It is on two railway lines, 6 m. E. of Manchester. The principal buildings are the town hall, free library, technical school. There are churches, schools, a public park and recreation grounds. The borough unites with Stalybridge, Hyde, and Mossley in a joint system of tramways and lighting. The chief industries are cotton manufacture, calico-printing, iron-working, engineering, and coal-mining. A bridge across the Tame connects Cheshire with Lancashire. Market day, Mon. Pop. 19,311.

**Dukla Pass.** Pass over the Carpathian Mts. between Polish Galicia and Slovakia. The Germans in occupation were driven from it by Czechoslovak troops, Oct., 1944.

**Dukw.** This type of troop and store carrier of the Second Great War is described under Amphibious Craft.

**Dulac, EDMUND** (b. 1882). Franco-British artist. Born at Toulouse, Oct. 22, 1882, he came to England in 1905 and became a British subject seven years later. He gave his first exhibition of water-colour drawings illustrating the Arabian Nights at the Leicester Galleries in 1907, and subsequently achieved a wide popularity

Edmund Dulac,  
Franco-British artist

by his illustrations of fairy tales, of Shakespeare's The Tempest, Poe's The Bells, and other poems. He also produced portraits, published cartoons, and designed stage costumes and décor.

**Dulanty, JOHN WHELAN.** Irish diplomatist. Educated at Manchester university, he became secretary to the faculty of technology there in 1908. In 1910 he was educational adviser to Indian students in northern universities of England, and became honorary director of the United Irish League of Great Britain. After holding civil service appointments, *e.g.* as principal secretary, ministry of Munitions, in 1917, he was appointed Irish commissioner for trade in Britain in 1926, and in 1930 became high commissioner for Ireland in London.

**Dulce.** Gulf or inlet of the Pacific Ocean, between Costa Rica and Panama. At its entrance are the points of Matapalo on the N. and Burica on the S.

**Dulciana** (Lat. *dulcis*, sweet). Organ stop. The pipes in it are open and of small scale, possessing a delicate tone. Its invention is ascribed to Snetzler (18th cent.). The pipes are usually of 8 ft. pitch, but are sometimes 16 ft. or even 4 ft. See Organ.

**Dulcimer** (Lat. *dulcis*, sweet; Gr. *melos*, song). Musical instrument, from which the pianoforte has been evolved. It consists of a trapeze-shaped sounding-board, over which metal strings are stretched. These are struck by two hammers with flexible stems, and heads of which one side is hard and the other padded. The dulcimer, or cimbalom, is an important feature in Magyar bands.

**Dulcin, OR SUCROL.** Substance with a pure, sweet taste, about 200 times as intense as that of cane sugar. It is used as a sweetening agent. Dulcitol or melampyrite, sometimes called dulcin, is the alcohol corresponding to galactose. It is obtained from Madagascar manna, *Melampyrum nemorosum*, and other plants. From Madagascar manna it is extracted by treatment with boiling water; from *Melampyrum nemorosum* by boiling the plant, dried when flowering, with water, adding milk of lime to the decoction

until it is just alkaline, again boiling, and then decomposing the filtered liquid with hydrochloric acid. The dulcitol then separates out and is purified by recrystallisation. It is produced artificially by the action of sodium amalgam on lactose and galactose.

**Dulcinea del Toboso.** In Cervantes's Don Quixote, the imaginary lady to whom the Don consecrates himself—an idealisation of a farm girl, Aldonza Lorenzo. She is shown to him by Sancho Panza as a country wench riding an ass, and he is persuaded that she is the victim of enchantment.

**Dulong and Petit's Law.** Formulated in 1818. It stated that the specific heat of an element multiplied by its atomic weight is approximately equal to 6.2. This law proved useful in determining the atomic weights of metals, especially platinum, iridium, and others whose salts are non-volatile. It does not apply to some non-metals that are solid at ordinary temperatures. The specific heat varies with the temperature, decreasing with the fall in

Dulcimer, covering 3 octaves. There are 4 strings to each note, and the instrument contains 21 bridges  
By courtesy of Barnes & Mullins

temperature, and the law is no longer as useful as it was.

**Dulse** (*Rhodymenia palmata* and *Dilsea edulis*). Two fleshy, purple seaweeds of the family Rhodophyceae, growing on rocks in shallow water. The name belongs more especially to the first mentioned, which is used as food by the Scottish Highlanders and the Irish, who call it dilhsk, and when dried as a chewing tobacco substitute.

Dulse. Leaves of this edible seaweed

**Duluth.** A city of Minnesota, U.S.A., the co. seat of St. Louis co. At the W. end of Lake

Superior, 152 m. N.N.E. of St. Paul, it is served by several rlys., and shares with Superior, Wis., one of the best natural harbours in the world, whose annual tonnage is exceeded in the U.S.A. only by New York's. The harbour, formed by Minnesota Point, and a similar projection from Wisconsin, has an area of 19 sq. m. and a shore-line of 49 m. The mouth of the St. Louis, almost enclosed by other land projections, forms an inner harbour.

Duluth draws also on the richness of natural resources in its environs: iron ore, coal, lumber, and grain. One of the largest wholesale centres in the N.W., it makes iron and steel, machinery and metal goods, forest products, textiles, leather, chemicals, and glass. Its civic centre, the North Shore Drive, and its own site on steep slopes overlooking Lake Superior, make it one of the most beautiful cities in the U.S.A. Municipal government is by a mayor and council. Originally settled by French traders, the future town received impetus when J. J. Astor's American Fur Company established a trading post at Fond du Lac. It was incorporated as a city in 1870. Pop. 101,065.

**Dulverton.** Market town and parish of Somerset, England. It stands on the Barle and near the S. edge of Exmoor, 20 m. W. of Taunton. It has a railway station. Set in the midst of lovely scenery, it is a fishing and hunting centre. Near is Pixton Park. Dulverton is referred to in Blackmore's *Lorna Doone*. Pop. 1,502.

**Dulwich.** London residential suburb. Part of the borough of Camberwell, it lies S.E. of the city, between Denmark Hill, Herne Hill, and West Norwood on the W., and Peckham Rye, Nunhead, Forest Hill, and Upper Sydenham on the E. The oldest part, which retains much of its rural charm, is known

as the Village, and contains the buildings much restored, of the college founded by Edward Alleyn, the chapel of which has served as the parish church and as a chapel of ease, the rest of the quadrangle containing almshouses. Dulwich Park, 72 acres, was presented to the public by the college trustees in 1890. Dulwich picture gallery, which was notable for its perfect quiet, as well as for its artistic treasures, was temporarily closed owing to severe damage by German bombs in 1944.

On a site occupied by the Grove Hotel stood the Green Man, a noted hostelry in the 18th century, in the grounds of which was a well producing the once famous spa-water; and here, later, was Dr. Glennie's Academy, which had Byron for a pupil. Anciently known as Dilwyshe, Dulwich was a manor belonging to the abbey of Bermondsey, presented after the dissolution to Thomas Calton, from whom it was purchased by Edward Alleyn. S. Stephen's church, College Road, designed by Sir Charles Barry, was built in 1869, in the Early English style; S. John's, a Gothic structure, in E. Dulwich, dates from 1865. Dulwich is served by electric railway (3 stations. N., E., and W.) and London Transport. It elects an M.P. Pop. 60,629.

**Dulwich College** OR THE COLLEGE OF GOD'S GIFT. English public school at Dulwich, founded and endowed by Edward Alleyn, the actor, in 1619. The property, which is land in S.E. London about 3½ m. in length by 1½ m. in breadth, increased enormously in value, and in 1857 a new scheme was approved by parliament. This provided for two schools, Dulwich College proper, and Alleyn's, which later became a public school in its own right.

Former pupils are called respectively Old Alleynians and Alleyn's Old Boys.

The college contains four sides, classical, modern, science, and engineering. It has ample buildings, laboratories, workshops, etc., and extensive playing fields. The new buildings of red brick in the Italian

Dulwich College. Buildings in the Italian style designed by Sir Charles Barry and opened in 1870

style were from the designs of Sir Charles Barry. They are in College Road, and were opened in 1870. Dulwich College proper takes 820 boys, Alleyn's 640, most of them day boys from residential suburbs, but there are four boarding houses. There are a number of scholarships to the school, and from it to the universities.

**Dulwich Gallery.** Collection of pictures housed in a building near old Dulwich College. Noel Joseph Desenfans (d. 1807), a London dealer, left his pictures, originally collected for King Stanislaus of Poland, to his friend, Sir Peter Bourgeois, R.A. (1756-1811), who in turn bequeathed them to Dulwich College. Madame Desenfans commissioned Sir John Soane to design a building, which was opened in 1814. The collection of about 450 pictures is exceptionally rich in examples of the Dutch school; it is also noted for Watteau's *Bal Champêtre*, Reynolds's *Mrs. Siddons as the Tragic Muse* (whether original or replica is a moot point), and Gainsborough's *Mrs. Sheridan* and *Mrs. Tickell*. There are also characteristic works by Rembrandt, Adrian van Ostade, Cuyp, Doré, Murillo, Velazquez, and other masters. The gallery was severely damaged by German bombs in 1944. The pictures, however, had been removed for safety to Wales.

**Duma.** Representative state council of the former Russian Empire. It formed, with the half-elected and half-nominated council of the empire, or second chamber, the Russian legislature. The Duma, created Aug. 6, 1905, numbered 442 members. The electoral system was analogous to that of Soviet Russia, members being elected indirectly for five years, the elective assemblies of towns or districts sending delegates to a general electoral assembly, which chose the members of the Duma. These received a guinea a day for expenses during the session, and the cost of the journey to and from St. Petersburg (now Leningrad) once a year.

Dulwich. View of Dulwich Village, which retains a rural aspect, from the corner of Gallery Road

The Duma could not touch "the fundamental laws of the Imperial Administration," but within its sphere were the making of new laws, the modification of existing laws, the national budgets, the construction of state rlys., and any matters submitted to it by Imperial Decree. The chamber could be summoned or dissolved by the ukase of the emperor. No measure was submitted to the tsar for his sanction until it had been passed by both the Duma and the council of the Empire. The course of its brief history was stormy. The military revolution of Nov. 7, 1917, transferred the government of Russia to commissioners set up by Lenin, and the Duma ceased to exist. *Consult* History of Russia, V. O. Kluchevsky, 5 vols., 1931.

**Dumaguete.** Town of the Philippine Islands, capital of the prov. of Negros Oriental. It stands on Negros Island at the entrance to Tañon Strait, 90 m. (direct) S.S.E. of Bacolod. Its chief trade is connected with turtles and cotton. Pop. 16,500.

**Dumangas.** Town of the Philippine Islands, in the prov. of Iloilo. It stands on Dumangas river, near the S.E. coast of Panay Island, and has tobacco and linen industries. Pop. 12,400.

**Dumanjug.** Town of the Philippine Islands, on Cebu Island. It stands at the mouth of the Dumanjug river, 38 m. S.W. of Cebu town, and carries on a brisk trade in maize and other produce of the district. Pop. 22,000.

**Dumas, ALEXANDRE (1802-70).** French novelist and dramatist, whose full name was Alexandre Dumas-Davy de la Pailletterie. He was born at Villers-Cotterets, July 24, 1802, his father being the illegitimate son of a French noble, the Marquis Alexandre Davy de la Pailletterie, who had settled in San Domingo, and of a negress named Marie-Cessette Dumas. The father became a general in the French republican army.

About 1822 Dumas went to Paris. His first success was with a play, *Henri III et sa cour*, 1829; and competent French critics citing this piece, together with *Christine*, *Charles VII*, *La Tour de Nesle*, and *Mademoiselle de Belle-Isle*, claim for him an even higher place as a dramatist than as a teller of tales.

But to the majority of readers throughout the world Dumas is the author of that fantastic and unwearying romance, *The Count of Monte Cristo*, 1844-45, which translations have almost made a classic in numerous lan-

guages. To many English-speaking readers the most familiar of his other works are *The Three Musketeers*, *Twenty Years After*, *Memoirs of a Physician*, *The Queen's Necklace*, *Taking the Bastille*, *Chicot the Jester*, *The Black Tulip*, and other romances. Many are unfamiliar with what is beyond question Dumas' masterpiece, *Le Vicomte de Bragelonne* (26 vols., 1848-50), prodigious in extent, and scarcely rivalled in literature as a piece of pure, sparkling, and unflagging narrative.

He has set his name to a thousand or twelve hundred volumes: dramas, romances, books of travel, historical scraps, compilations on art, crime, and cookery. Clearly there was a good deal of hocus-pocus, of literary legerdemain, and worse, in the career of this amazing man. The air was charged with stories of Dumas' "ghosts," assistants, and collaborators—Maquet

*Alexandre Dumas*

and others. It may be said (1) that Dumas, who could keep half-a-dozen plots going at once, and was burdened with few scruples as to their origin and evolution, seems to have taken help from all quarters; (2) that, whatever tasks he may have assigned to his jackals, his own brain during many years was probably equal to the creation of what is best in the wonderful romances; and (3) that not one of these associates or auxiliaries, unassisted by the master, proved his rival in any field.

The day came when the power of the great man waned. This was the day of the shifts, schemes, devices to which none but a Dumas would or could have risen or descended. He put his name to any MS. that was brought to him, started impossible newspapers, lent himself to the wiles of advertising

Paris tradesmen. He died at Dieppe, Dec. 5, 1870.

**Bibliography.** Complete Works, ed. M. Levy, 277 vols., 1860-84; *Memoirs*, Eng. trans. E. M. Waller, 1907; *Lives*, P. H. Fitzgerald, 1873; H. Parigot, 1892; A. F. Davidson, 1902; H. A. Spurr, 1929; *Dumas: the Incredible Marquis*, H. S. Gorman, 1930.

**Dumas, ALEXANDRE, FILS (1824-95).** French novelist, dramatist, and academician. Born July 27,

1824, he was the natural son of the famous romancer, whose dramatic genius he inherited, but with whom otherwise he had little in common. When only twenty-four he made a sensation with a novel of passion, *La Dame aux Camélias*. After this he wrote other novels (e.g. *Diane de Lys*, 1851, *L'Affaire Clémenceau*, 1866); but the success of the dramatised versions of *La Dame* and *Diane* turned his energies to the stage, and it is as a playwright rather than as a novelist that he keeps his distinctive place.

Dumas was firmly convinced of the utility of the stage for the discussion of ethical questions and as an agent of social reform, and his plays, notably *La Question d'Argent*, *Le Fils Naturel*, *Le Père Prodiges*, *L'Ami des Femmes*, *Les Idées de Mme. Aubray*, *Une Visite de Noces*, are problem plays. While as plays they suffer at times from overstress of didactic purpose, Dumas' keen sense of the stage generally saved him from sinking into the mere preacher, while his incisive wit and brilliant style further contributed to his popular success. He died at Paris, Nov. 27, 1895. *Consult* A. Dumas, fils, J. Claretie, 1882; *Nouveaux Essais de Psychologie Contemporaine*, P. C. J. Bourget, 1885.

**Dumas, JEAN BAPTISTE ANDRÉ (1800-84).** French chemist. Hewas born at Alais, in the dept. of Gard, July 14, 1800, where he was apprenticed to a pharmacist. In 1823 he was appointed assistant to Thénard at the École Polytechnique, Paris, and shortly afterwards succeeded Robiquet as professor of chemistry at the Athenaeum.

J. B. A. Dumas,  
French chemist

Here he investigated experimentally the atomic theory enunciated a few years previously by Dalton. A study of compound ethers was followed by investigations concerning other organic compounds. He established that the organic acids form homologous series, *i.e.* series which differ from each other in chemical composition by multiples of carbon and hydrogen. He subsequently devoted more attention to physiological subjects, such as the phenomena of nutrition, the formation of sugar in the organism, and the composition of blood. A prolific writer, master of the French mint, and from 1875 an Academician, he died at Cannes, April 11, 1884.

**Du Maurier, DAPHNE.** British novelist and dramatist. The daughter of Sir Gerald Du Maurier, she was educated in Paris, and wrote her first novel, *The Loving Spirit*, in 1931. She wrote a successful biography of her father: *Gerald, A Portrait*, 1934; this was succeeded by a study of her family, *The Du Mauriers*, 1937. The novel *Rebecca*, 1936, proved an outstanding success as a play and film; *Jamaica Inn*, 1936, and *Frenchman's Creek*, 1941, were adapted for the screen. The scene of much of her work was laid in the West of England. Her play *The Years Between*, ran for over a year at Wyndham's Theatre, 1945.

**Du Maurier, GEORGE LOUIS PALMELLA BUSSON** (1834-96). British artist and author. Born in

Paris, March 6, 1834, he studied chemistry at University College, London, subsequently setting up as an analytical chemist. In 1856 he became an art student, first in Paris and then in Antwerp. In 1865 he joined the staff of Punch and began his famous series of social satires. In 1881 the Royal Society of Painters in Water Colours elected him a member. His sight failing rapidly towards the close of his life, he took to novel-writing, and produced Peter Ibbetson, 1892; Trilby, 1894 (serially in Harper's Magazine); and The Martian, published posthumously. Trilby, largely a reminiscence of Du Maurier's student days in Paris, enjoyed an extra-

ordinary success. Other volumes illustrated by him included Thackeray's *Esmond*, 1869; F. C. Philips's *As in a Looking-glass*, 1889. He died at Hampstead, Oct. 8, 1896. A review of his art and personality, by T. M. Wood, appeared in 1913.

His elder son, Guy Louis Busson Du Maurier (1865-1915), wrote a successful play *An Englishman's Home*, produced in London, 1909. He was killed in France, March 11, 1915.

**Du Maurier, SIR GERALD** (1873-1934). British actor. The younger son of George Du Maurier,

Sir Gerald Du Maurier, British actor

he was born in London, March 26, 1873, educated at Harrow, and made his stage debut in 1894 at the Garrick Theatre. He appeared in the original production of *The Admirable Crichton*, 1902, as the first Captain Hook in *Peter Pan*, 1904, and as Raffles in the play of that name, 1906. Leading a school of naturalistic acting to which some applied the term under-acting, he achieved an outstanding reputation by portrayals of well-groomed and imperturbable heroes in modern dramas; best remembered are *Bulldog Drummond*, 1921; *The Last of Mrs. Cheyney*, 1925; *Interference*, 1927; *Cynara*, 1930. He was also the original Dearth in Barrie's *Dear Brutus*. He made a reputation as actor-manager and producer, notably at Wyndham's Theatre; and appeared in a film of Galsworthy's play *Escape*, 1931. Knighted in 1922, he died suddenly April 11, 1934. *Consult* Gerald, *A Portrait*, D. Du Maurier, 1934.

**Dumbarton.** Royal, mun. and parl. burgh, also a seaport and the county town of Dumbartonshire. Scotland. It stands where the river Leven falls into the Clyde, 15½ m. W.N.W. of Glasgow. The town is well served by rlys. Buildings of note are the municipal group, in baronial style, 1899. the county buildings, 1844 and later enlarged; the Old Academy

Dumbarton. The Rock of Dumbarton, showing the castle where Wallace was imprisoned in 1305

and burgh hall, 1865; the Denny memorial; and public library. The R.C. church of S. Patrick (said to have been born near) has the only carillon in Scotland. The castle stands on a basalt rock 250 ft. high. The chief industry was once glass making, but is now shipbuilding; there are also iron foundries, boiler tube works, an aircraft factory, and a distillery. Dumbarton was both a Celtic and a Roman town; it was the capital of the 6th century kingdom of Strathclyde, and received a royal charter in 1222. There is a fair in Aug. Market day, Tues. One M.P. is returned for Dumbarton and Clydebank. Pop. 22,000.

**Dumbarton Oaks.** Eighteenth century mansion near Washington, U.S.A. Here on Aug. 21, 1944, in furtherance of the Moscow Declaration (*q.v.*) of 1943, representatives of Great Britain, the U.S.A., and the U.S.S.R. met for preliminary discussions as to the structure and aims of a new international league to enforce peace. The Anglo-American-Soviet talks resulted in a large measure of agreement and the drawing up of a draft framework. The Russian delegation withdrew on Sept. 29, and a Chinese delegation took its place. (Although China was at war with Germany and Italy as well as with Japan, the U.S.S.R. was not then at war with Japan.) The conference ended on Oct. 7, the Chinese delegate having approved the draft, which formed the basis for the deliberations of the San Francisco Conference (*q.v.*) at which the United Nations (*q.v.*) organization was born.

**Dumbartonshire** OR DUMBARTONSHIRE. Western county of Scotland. It is almost entirely surrounded by water—E. by Loch Lomond, W. by Loch Long, and S. by the Clyde estuary, a small detached part of it lying between Stirling and Lanark. The

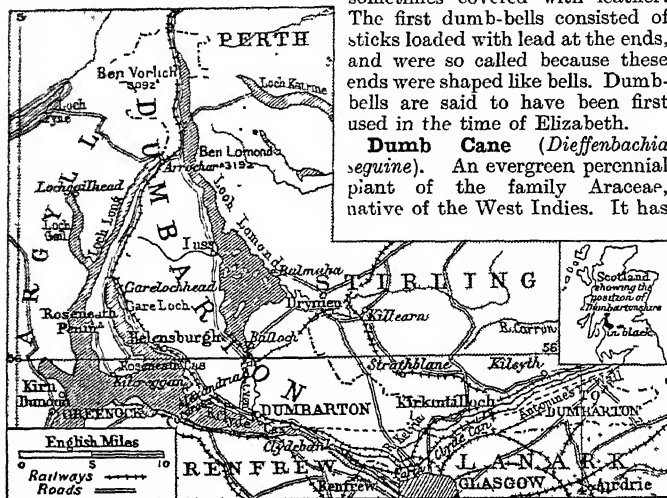

Dumbarton arms

Dumbartonshire arms

surface is mountainous in the W. (highest point Ben Vorlich, 3,092 ft.), and generally hilly elsewhere, except in the S. where the soil is well cultivated. The mountain, glen, and loch scenery is magnificent. The chief rivers, after the Clyde, are the Leven and Kelvin.

Dumbartonshire. Map of this western county of Scotland; a small detached part lies between Stirling and Lanark

Roseneath Castle, on Roseneath peninsula, is a seat of the duke of Argyll. Cattle and sheep rearing, engineering and shipbuilding are thriving industries, cotton goods, glass, and sewing machines are manufactured, and along the Vale of Leven are many bleachfields and dye works. Coal, iron, and slate are the principal mineral products. British Railways (Scottish region) and the Forth and Clyde Canal serve the county.

Dumbarton (the county town), Clydebank, and Kirkintilloch are the largest towns; Helensburgh and Kilcreggan are health resorts. A second M.P. was allotted in 1948. Formerly Dumbartonshire was part of the old Scottish territory of Lennox. Land area, 246 sq. m. Pop. est. 158,800.

LITERARY ASSOCIATIONS. Tobias Smollett was born near Renton, where a 60-ft. column was erected to his memory. David Gray, the poet, was born at Merkland, Kirkintilloch, and died there at the age of 23. He is buried in Kirkintilloch churchyard. Many associations linger about Loch Lomond, notably with Scott's Rob Roy.

**Dumb-Bell.** Short iron or wooden bar with a knob at each end, used as an aid to health and by athletes as part of their training. Dumb-bells are grasped one

in each hand, and a series of exercises is then carried out. It is claimed that their use brings every muscle of the body into play. Iron dumb-bells, which are most in use, weigh from 4 lb. to 6 lb. each, but heavier ones are occasionally employed. They are sometimes covered with leather. The first dumb-bells consisted of sticks loaded with lead at the ends, and were so called because these ends were shaped like bells. Dumb-bells are said to have been first used in the time of Elizabeth.

**Dumb Cane** (*Dieffenbachia seguine*). An evergreen perennial plant of the family Araceae, native of the West Indies. It has

a fleshy, cane-like stem, about 6 ft. high, and oblong, deep green leaves spotted with white. The juice is acrid and poisonous. Old-time planters are said to have punished refractory slaves by compelling them to bite the stem, which rendered them speechless for several days, owing to swelling of the mouth parts.

**Dumbness.** Inability to articulate. It may be acquired, but in the vast majority of cases it is congenital. Acquired dumbness, although occasionally a symptom of mental disease or of an apoplectic stroke, is more often a manifestation of hysteria. The two Great Wars produced examples. Acquired dumbness may also be due to tumours, organic disease of the sound-producing apparatus, such as of the vocal chords, or complete paralysis of the chords following diphtheria. In the hysterical form the patient can cough loudly; in the other varieties coughing is impossible or feeble. Specialised psychological treatment is indicated for the hysterical variety. Recovery is usual from dumbness following diphtheria. Operation may restore the power of speech where dumbness is due to a tumour. If the whole larynx has to be removed, speech can be regained by wearing an artificial larynx.

Congenital dumbness may be due to mental deficiency or to absence from the brain of the speech centre. Dumbness in children, however, is due much more frequently to deafness, congenital or acquired in infancy. The child cannot speak because it has not the use of its ears to guide its speech. Even partial deafness occurring in childhood may cause dumbness. It is important to ascertain whether the deafness is marked or comparatively slight. Any middle ear disease or adenoids should be dealt with to improve the hearing up to its maximum. Tongue-tie may be a missed cause. *See Deafness.*

**Dum-Dum** OR DAMDAMA (Hind. raised mound). Town and municipality in the Barrackpore subdivision of the 24 Parganas, Bengal, India. It is 7 m. N.E. of Calcutta. Its government ammunition factory, much expanded during the two Great Wars, has given the name to soft-nosed bullets. Dum-Dum was the headquarters of the Bengal artillery of the East India co. from 1783 to 1853, when a move was made to Meerut. The mess-house of the artillery is now known as the Outram Institute, where the bust of Outram stands on the verandah. In Barrack Square is a monument to the officers and men killed in the retreat from Kabul, 1841-42. After the recapture of Calcutta in 1757 the treaty restoring the British settlements was signed in Dum-Dum, where Clive had a house. The headquarters of the Calcutta Flying Club, Dum-Dum had an airport which took the international traffic from Europe to the Far East and Australia. Pop. about 30,000.

**Dum-Dum Bullet.** Popular term for all projectiles of small calibre which expand or flatten easily in the human body, such as a bullet with a hard envelope which does not entirely cover the core, or is pierced

Dum-Dum Bullet. Top: the projectile, and sectional view showing cavity in the nose. Lower: the bullet after impact

with incisions. This class of bullet was invented to meet a demand for a projectile that would stop the rush of savages on whom the small-bore rifle-bullet of the ordinary type makes little impression. Controversy centred upon an invention of Captain Bertie Clay, of the ammunition factory at Dum-Dum, near Calcutta, and so the name has stuck to bullets, such as the official mark IV, which mushroomed on impact. This bullet actually shot better for having a cavity in the nose, but at Bisley, in 1899, it was pronounced to be dangerous to the firer, as the lead core separated from the envelope, and in the Boer War a return was made to mark II, the original cordite cartridge.

The first Hague Conference of 1899 prohibited the use of such bullets in any war between the signatories. Italy alleged that the Abyssinians used these bullets in the war of 1935-36. The development of air warfare led to considerable relaxations in the rule prohibiting both dum-dum and explosive bullets, and the Hague Air Warfare Rules of 1923, never, however, adopted, expressly allowed the use of such bullets against aircraft. See Bullet.

**Dumfries.** Royal, parl., and mun. burgh, river port and co. town of Dumfriesshire, Scotland. It stands on the Nith 74 m. S.E. of Glasgow by railway, and it is on the main trunk road from the South. In 1929 Dumfries, known as the Queen of the South, amalgamated with Maxwelltown, to which it is joined by four bridges, one built in the 13th century by Devorgilla, mother of John Balliol. Dumfries has its supply of electricity from the grid, as well as a surplus of water from its own water undertaking. It flourishes industrially, having factories for hosiery, spinning, and rubber products. Dumfries academy is a fine secondary school. Prominent buildings are the municipal chambers, the county buildings, and the Crichton Royal Institution for the Insane. A mausoleum was erected in 1815 in S. Michael's churchyard, containing the remains of Burns. There is a marble statue of the poet (1882) in front of Greyfriars

Dumfries arms

church, not far from the scene of the murder of Comyn by Robert Bruce in 1307. Market day, Wed. Pop. 25,000.

**Dumfriesshire.** Border county of Scotland, with coast-line of about 21 m. along Solway Firth. Hills (highest summit, White Coomb, 2,695 ft.) line the N., W., and E. boundaries, whence the surface declines to Lochar Moss, a marshy expanse in the S., now largely reclaimed. The county includes three sections—Nithsdale, Annandale, and Eskdale; these dales contain fine holms for pasture besides arable land. The rivers are well stocked with salmon and trout. Lochs Skene and Urr and the cluster around Lochmaben are the chief lakes; the first gives rise to the Grey Mare's Tail waterfall. Lead ore underlies the Lowther Hills in the N., and sandstone,

Dumfriesshire. Map of the south-western border county of Scotland, which has a coast-line of 21 miles along the Solway Firth

limestone, and coal are worked. Agriculture is not extensively followed, but cattle and sheep are reared in good numbers on the abundant pastures. Moffat is visited for its mineral springs. The co. has good communications by road and rail. Dumfries (co. town), Annan, Langholm, Lockerbie, and Moffat are the largest towns. Gretna Green (q.v.) is in the S., near the border with England. One member is returned to parliament. Area 1,072 sq. m. Pop. est. 81,500.

**LITERARY ASSOCIATIONS.** Dumfriesshire claims many associations with Scottish and English literature from the time of Hector Boece or Boethius, the 16th century historian, who, like Ben Jonson, belonged to an Annandale family. James Crichton, the Admirable Crichton, was born at Eliocho House, Sanquhar. W. J. Mickle, poet and translator of Camoens, was born at Langholm, and Allan Cunningham was born at Keir. The richest poetic memories of the county are associated with Burns, who passed the last eight years of his life at Ellisland, Sunnyside and Dumfries, where he died and is buried. The soldier author, Sir J. Malcolm, was born at Burnfoot, Westerkerk. Edward Irving was born at Annan. The greatest man of letters native of the county was Thomas Carlyle, born at Ecclefechan.

**Dumfries.** Weir built across the Nith to provide a water supply for grain mills

Dumfries. Weir built across the Nith to provide a water supply for grain mills

**Dumont, François (1751-1831).** French miniature painter. Born at Lunéville, he studied under Girardet, and became an academicien in 1788. Most of his miniatures are portraits, and include those of the

dauphin (Louis XVIII) and Madame Vigée Le Brun, both in the Wallace Collection. He also painted historical pieces in miniature.

**Dumouriez**, CHARLES FRANÇOIS (1739-1823). French soldier. He was born at Cambrai, Jan. 25, 1739.

At the age of 18 he entered the French army and fought in the Seven Years' War. Having been sent on a mission to Poland and Sweden, he fell into disgrace; was recalled, and imprisoned for some months in the Bastille. When the Revolution broke out, with Mirabeau he took the popular side, and became minister of foreign affairs. He resigned office to take command of the army of the north against the duke of Brunswick, whom he defeated at Valmy, Sept. 20, 1792, and on Nov. 6 he won another victory at Jemappes. In 1793 he was badly beaten by the Austrians at Neerwinden, March 18, but arrested the commissioners sent to inquire into his defeat. Accused of conspiring for the restoration of the monarchy—at least he had tried to persuade his troops to march against Paris—he took refuge with the Austrians, and for some years wandered about Europe with a price on his head. He finally settled in England, where he died near Henley-on-Thames, March 14, 1823.

**Dumper**. A lorry or truck which transports its load (usually soil, etc., after excavation) and discharges it mechanically ("dumping" it). By means of a hydraulic ram or a screw, the body of the vehicle is tipped to incline it to the rear or to one side, and the rear or side wall swings on hinges to permit the contents to discharge. Other dump trucks are fitted to discharge the load from the bottom. *See* Excavation.

**Dumping**. Originally, the act of throwing down a large quantity of material in a heap, as in shooting rubbish. In economics the term is applied to a practice adopted by some countries, *e.g.* formerly Germany, of producing goods in vast quantities with the assistance of bounties or tariffs, and then exporting them to other countries; thus flooding the market and underselling the manufacturers there with the object of killing their industry and securing control of the market.

Chas. F. Dumouriez  
French soldier

A series of Acts and finally the change in British policy from free trade to protection put an end to dumping in the U.K. The Safeguarding of Industries Act, 1921, introduced a customs duty—sometimes 33½ p.c., sometimes 50 p.c.—to protect "key industries"; *e.g.* optical glass, scientific instruments, and wireless valves. The Finance Act, 1925, imposed duties, usually of 66½ p.c., on motor cars, musical instruments, clocks, watches, and cinematograph films. These were known as the McKenna duties, having been originally introduced by R. McKenna as chancellor of the exchequer in 1915. The Import Duties Act, 1932, effected the final change, imposing a duty of 10 p.c. on all imported goods not specially exempted, and giving the Treasury power to impose additional duties on luxury goods and on goods likely soon to be largely produced in the U.K.

**Dun**. Celtic word meaning hill or fort. The dun was either a circular row of large stones on the top of a hill, or a regular building, known as a "Danish" fort, with a double wall. It is a common prefix in towns of the British islands, sometimes altered to dum-, don-, *e.g.* Dundalk, Dunbarton, Doncaster.

**Dunajetz**. River of Polish Galicia. Rising in the Carpathians it flows N. to join the Vistula. It is chiefly notable for battles in both Great Wars. On April 28, 1915, an Austro-German force under Mackensen began to drive the Russians out of the Cracow region. After desperate fighting on the Dunajetz and elsewhere, the outnumbered Russians made what was by May 11 a general retreat to the San.

When Germany invaded Poland in 1939, two armies struck in the south through Silesia and Galicia. German forces captured Cracow on Sept. 6, and soon were beyond the Dunajetz and advancing on Lwow. In Jan., 1945, the 4th Ukrainian army took the offensive W. of Sanok, broke through strong German defensive systems, and advanced 50 m. in four days, forcing the Visloka and Dunajetz rivers.

**Dunant**, HENRI (1828-1910). Founder of the Red Cross. He was born at Geneva, May 8, 1828. Following the French and Sardinian armies as a doctor in the war against Austria in 1859, he was oppressed by the misery of the wounded at Solferino; and *Un Souvenir de Solferino*, published

1862, was a passionate appeal to all nations for protection of men wounded in battle. Supported by Napoleon III, Florence Nightingale, and Genevese citizens led by General Dufour, Dunant acted as secretary of an international conference which on Aug. 29, 1864, signed the Geneva Convention establishing the Red Cross. Getting into financial difficulties, Dunant found a home in a hospital at Heiden on Lake Constance, where he died Oct. 30, 1910, almost forgotten except that in 1901 he had been first recipient (with F. Passy) of the Nobel peace prize.

**Dunaverty**. Promontory and bay of Argyllshire, Scotland. It is 5 m. N. of the Mull of Kintyre. On the promontory there formerly stood a castle, belonging to the Lord of the Isles, which was several times besieged.

**Dunbar**. Royal and mun. burgh and seaport of East Lothian, Scotland. It stands at the mouth of the Firth of Forth, 29 m. E.N.E. of Edinburgh on the railway. A popular health resort, Dunbar has good golf and excellent bathing. It is one of

Dunbar arms

the driest and sunniest spots in Scotland. Of its two harbours the Victoria Harbour (W.) is a refuge for ships in distress. The herring fisheries are important, and other industries include rope and agricultural implement making. The old parish church has a notable carved pulpit and communion table. There are ruins of the old castle, captured by Edward I in 1296 and successfully defended against the English in 1338 by Black Agnes, the countess of Dunbar. The battle of Dunbar (21.) took place close to the town. These historic events indicate the strategic position of the town on the east coast route now followed by the rly. to Edinburgh. Market day, Tues. Pop. 5,062.

**Dunbar**, BATTLE OF. Fought Sept. 3, 1650, between the English and the Scots. Cromwell, seeking to crush finally the cause of Charles II, had invaded Scotland. With 16,000 men he approached Edinburgh only to find the Scots under David Leslie in a strong defensive position. Anxious to keep in touch with his supplies on board ship, Cromwell fell back to Dunbar. Then a second time he advanced to Edinburgh, but again

the Scots were in a strong position, and again he retired to Dunbar.

This time Cromwell was followed by the Scots. He encamped on Sept. 1, on the low ground near the town and the coast, while Leslie on the hills sent a force to bar the road to England. Sickness was rife among the English troops, who numbered barely 11,000 effectives as against 20,000 Scots, and their position was perilous when the Scots, urged on by the ministers who were with the army, left their position of vantage in order to attack.

The Scots at first stood with their backs to England, and between them and the English was a stream called the Broxburn. Cromwell opened the engagement before daybreak on Sept. 3, by sending some of his horse and foot across the stream. The Scots were not yet ready, so the English had time to take up a position with the sea behind them and the hills in front. The infantry under Monk advanced, as did the horsemen on either side of them; but the Scots, now fully ready, met their assault firmly. For a time there was no advantage, but at length Cromwell led up his reserves. This was decisive. The Scottish right broke, and the infantry in the centre was also routed, and the English horsemen came round their flank. The sun was only just rising when Cromwell called out "Let God arise, let His enemies be scattered." The Scots were followed as they fled, and altogether 3,000 of them were killed. About 10,000 more with their arms, artillery, and baggage, were taken. The English losses were slight.

**Dunbar, PAUL LAURENCE** (1872-1906). An American poet. He was born at Dayton, Ohio, to parents of pure negro descent who had been slaves. He earned his living as a lift boy and then as an assistant at the library of Congress, but later gave his whole time to writing. Oak and Ivy 1890, and Majors and Minors 1895, attracted the attention of W. D. Howells, who made them known to the American public and wrote an appreciative introduction to *Lyrics of Lowly Life*, 1896. Dunbar's best work is in his poetry, but he also wrote short stories and novels. A complete collection of his poems was published in 1913, seven years after his death from tuberculosis.

**Dunbar, WILLIAM** (c. 1460-c. 1520). Scottish poet. He is believed to have been born in East

Lothian and educated at St. Andrews. Becoming a member of the Franciscan order, he travelled as an itinerant friar through Scotland, England, and part of N. France. He entered the diplomatic service, which took him to Germany, Italy, and Spain. Between 1500-05 he received a pension from King James IV as court laureate, but was unsuccessful in his efforts to obtain a benefice. The king's marriage with Margaret, daughter of Henry VII, occasioned Dunbar's most famous poem, *The Thistle and the Rose* (1503). Dunbar is not heard of after the battle of Flodden; he may have fallen on the field, but was certainly dead by 1530.

His poems also disappeared about this time, to be discovered some 200 years afterwards by Allan Ramsay in a country house. His poetical genius, influenced by Chaucer, was many-sided; the rich allegorical poem *The Thistle and the Rose* is far removed from the grim humour of *The Dance of the Seven Deadly Sins*, or the serious pieces, such as *The Passion of Christ*. Lament for the Makaris and a tribute to London are well known. Dunbar's poems were edited by W. M. Mackenzie, 1933.

**Dunblane.** Town and police burgh of Perthshire, Scotland. It stands on Allan Water, 5 m. N. of Stirling on the railway. It has a hydropathic establishment and a mineral spa. Once the seat of a bishopric, its cathedral is one of the few which escaped destruction at the Reformation; restored in 1893, it is now the parish church. Robert Leighton, bishop 1661-70, is commemorated by the Leightonian library, Bishop's Walk and Bishop's Well. The Queen Victoria Military School (opened 1908) is 1 m. N. of the town, and the battlefield of Sheriffmuir (1715) is 2 m. to the E. Many of the people work in the woollen mills. Market day, Thurs. Pop. 4,421.

**Duncan.** City of British Columbia, Canada. It stands 42 m. N. of Victoria, Vancouver Island, on Cowichan river, and is served by rly. The centre of a residential, ranching, and farming district, it is near the Prince of Wales's Fairbridge Farm school of 1,000 acres in the Koksilah Valley. Pop. 2,189.

**Duncan** (d. 1040). King of the Scots. He succeeded his grandfather Malcolm II as king in 1034.

Little is known of him except that he was slain by Macbeth, thane of Cawdor, Cawdor Castle being the traditional scene of the crime. Shakespeare's version of the tragedy is based on legend.

**Duncan, ADAM DUNCAN, VISCOUNT** (1731-1804). British sailor. Born at Lundie, Angus, July 1, 1731, he entered the navy in 1746. He was present at the actions of the Basque Roads (1757), Goree (1758), and the blockade of Brest (1759). After his return to Great Britain

Viscount Duncan,  
British sailor  
After Hoppner

(1761) he saw no further service until 1778, when he was appointed to the Suffolk. In 1782 he became first lord of the Admiralty, and in the Blenheim took part in the relief of Gibraltar.

In 1795, promoted admiral, he hoisted his flag on the Venerable as commander-in-chief in the North Sea. In 1797 he blockaded the Dutch off Texel by a masterly piece of bluff, and on Oct. 11 obtained a decisive victory over the Dutch fleet off the village of Camperdown. For this he was created Viscount Duncan of Camperdown. He died suddenly Aug. 4, 1804. See Camperdown, Battle of.

**Duncan, SIR ANDREW RAE** (b. 1884). British industrialist and politician. Educated at Glasgow university, he held a number of industrial appointments, as vice-president of the Shipbuilding Employers' Federation, 1920-27; chairman of executive committee of British Iron and Steel Federation, 1935-40, and from 1945; chairman of Central Electricity Board, 1927-35. He was appointed a director of the Bank of England in 1929, and of Imperial Chemical Industries in 1939. High sheriff for the county of London, 1939-40, he entered parliament as National member for the City of London, and was minister of Supply, 1940-41 and 1942-45. Sir Andrew was chairman of a number of royal commissions, e.g. those which inquired into the Nova Scotia coal industry in 1925 and 1932, and the Sea-Fish Commission for the U.K., 1933-35.

**Duncan, ISADORA** (1878-1927). American dancer. Born at San Francisco, May 27, 1878, she passed her childhood in poverty, and at 21 appeared as a dancer at Chicago, without attracting much

Dunblane arms

attention. Struggling against severe hardships, she made her way to Europe with her family, determined to impress upon the theatre her personality and her ideals of dancing. These derived through nature from Greek art. Her dancing was a sincere expression of her own pagan temperament. In an age devoted to ballet, she acquired enthusiastic disciples, and through Fokine (*q.v.*) influenced the development of the Diaghilev ballet. She became famous throughout Europe and set up dancing schools in Paris, Moscow, near Berlin, and in the U.S.A. Her art failed to impress her fellow countrymen, and her last years were spent in unhappy circumstances in Europe. Two of her children were drowned in the Seine as result of a motor accident, and she herself was accidentally killed while motoring near Nice, Sept. 14, 1927, her scarf catching in the wheel of the car and strangling her. A biography by S. Stokes appeared in 1928; in the same year her autobiography was published.

Isadora Duncan,  
American dancer

**Duncan, Sir Patrick** (1870-1943). South African administrator. Born at Portree, Banffshire, Dec. 21, 1870, he was educated at George Watson's College, Edinburgh university, and Balliol College, Oxford. In 1894 he joined the board of Inland Revenue, where he became private secretary to Lord Milner. When the latter became governor of the annexed republics in South Africa, Duncan was appointed treasurer of the Transvaal, in 1903 colonial secretary, and in 1906 lieutenant-governor. Settling in South Africa, he practised as an advocate of the supreme court, and in the first election for the Union parliament was returned for a suburb of Johannesburg. In the administration of 1921-24 he held the portfolios of the interior, public health, and education, and in Gen. Hertzog's cabinet of 1933 was minister of Mines. Governor-general of the Union from 1936, his term of office was in 1941 extended for another five years, but he died July 17, 1943.

**Duncansby Head.** Promontory of Caithness, Scotland, the N.E. extremity (210 ft. high) of the mainland. Off the head are the Stacks, three small rocks, and

about 2 m. to the W. is John o' Groats' House.

**Dunciad, THE.** Satiric poem by Alexander Pope, first published anonymously, May 28, 1728. The poet, who had been vulgarly abused by hack-writers of the time, unmercifully retaliated on them in this poem.

**Duncker, MAXIMILIAN WOLF GANG** (1811-86). German historical writer. He was born in Berlin. Oct. 15, 1811, became professor of history at Halle in 1842, and sat as a Liberal in the Prussian legislature, 1849-52. Appointed professor at Tübingen, 1857, he resigned the post to enter the ministry of state in Berlin in 1859. He was director of the Prussian state archives, 1867-74. He died July 21, 1886. His chief works are *Origines Germanicae*, 1840; *Geschichte des Alterthums*, 1852-57, Eng. trans. in two portions as *History of Antiquity*, E. Abbott, 1877-82; *History of Greece*, S. F. Alleyne and E. Abbott, 1883-86.

**Dundalk.** Urban dist. and co. town of Louth, Eire. It stands on Castletown river, near Dundalk bay, 54 m. N. of Dublin by rly. At this important rly. centre there are railway locomotive works, and ironfounding, brewing, linen, boot and shoe making, tobacco and cigarette making are active industries; agricultural and dairy produce are exported. Market day, Mon. Pop. 15,466. Here in 1315 Edward Bruce proclaimed himself king, and was killed in battle in the neighbourhood in 1318. The town surrendered to Cromwell in 1649 and to Schomberg in 1689.

**Dundalk Bay.** Inlet of the Irish Sea. It penetrates the E. coast of Eire, co. Louth, about 6 m., and at its entrance between Cooley Point on the N. and Dunany Point on the S. its width is 7 m. It receives the waters of the rivers Dee, Glyde, Fane, and Castletown, and other smaller streams. The bay affords excellent anchorage in a depth of 4 to 6 fathoms. Several fishing villages stand on its shores.

**Dundas.** Town of Ontario, Canada. In Wentworth co.,

it is on Desjardines canal which connects with Lake Ontario, and is served by the C.N.R. Industries include heaviest iron working machinery and small tools, clothing, blankets, knitted goods, and chinaware. Pop. 5,276.

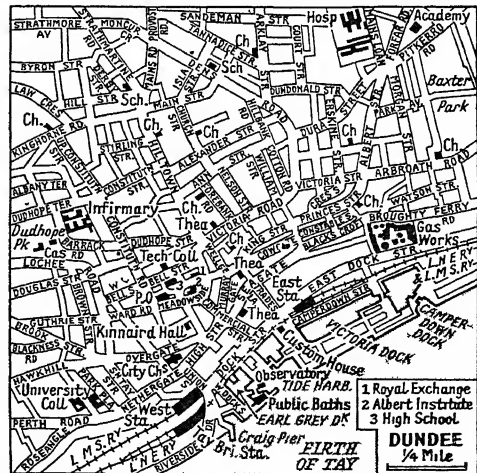

**Dundee.** Fourth largest city of Scotland (1940 official estimate); parl., royal, and co. burgh, and

Dundee arms

seaport of Angus. It stands on the N. shore of the Firth of Tay, 59½ m. N.N.E. of Edinburgh, and is well served by railways. The Tay Bridge opened in 1887 in place of an earlier structure destroyed in 1879, is 3,593 yds. long. Prominent buildings include the city chambers (1933), royal exchange (1853-56), custom house (1843). The Albert Institute, which commemorates the prince consort, contains the art gallery, free lending library, museum, and reference and commercial libraries. There are also a central reading room and sculpture gallery and five branch libraries situated in the various districts.

The Town Churches—three beneath one roof—are the most notable of many churches. Educational institutions are represented by the university college, founded in 1880 by Miss Baxter and Dr. J. B. Baxter, opened in 1893, and incorporated with the university of St. Andrews in 1897; the technical institute, endowed by Sir D. Baxter and opened in 1888; the high school with museum; Morgan and Harris academics.

Dundee, Scotland. Plan of the city, showing the chief public buildings and the docks

Dundee has a commodious harbour extending for 2 m. along the river, with a dock area of 38 acres. The annual trade of the port is about £7,000,000. The city is the centre of the Scottish jute industry, while its hemp and flax factories are among the most extensive in the world. Other industries include engineering, shipbuilding, dyeing, and fruit preserving, Dundee being noted for its marmalade. The largest public parks are Baxter Park, 37 acres; Balgay Hill, 36 acres; Lochee Park, 25 acres; and Caird

Dundee. The Town Churches : churches of S. Mary, S. Paul, and S. Clement under one roof, and the 12th century tower. Top, Caird Hall, built 1914-23

Park, 178 acres. Dundee Law, the hill in the centre of the town, is a landmark. Two members are returned to parliament. Market days, Tues. and Fri. Pop. est. 179,000.

Dundee (Lat. *Taodunum*, hill or fort on the Tay) was besieged by Wallace in 1297, and sacked by the marquess of Montrose, April 4, 1645. In 1651 Gen. Monk burned the town and massacred a large number of the inhabitants. It was among the first Scottish towns to adopt the doctrines of the Reformation, and here Wishart preached during the plague epidemic of 1544.

**Dundee, JOHN GRAHAM OF CLAVERHOUSE, VISCOUNT** (c. 1649-89). Scottish soldier. The eldest son of Sir William Graham, he belonged to the family that had acquired the estate of Claverhouse, near Dundee. He was educated at St. Andrews and served in France and Holland, distinguishing himself in 1674 at the battle of Seneff, where he is

Graham of Claverhouse, Viscount Dundee  
After Lely

said to have saved the life of the prince of Orange. He was sent as a cavalry leader to Scotland, 1678, with orders to enforce conformity to the established church, and by his relentless repression of the Covenanters earned the name of "Bluidy Clavers." In 1688 he was created Viscount Dundee by

James II. He was an ardent supporter of the Stuart cause, and was mortally wounded at the battle of Killierankie, July 27, 1689. The title became extinct when his son died in the same year. The use of "Bonnie Dundee" as an epithet for Graham dates from Sir Walter Scott's song, the original old ballad of that name being concerned solely with the town of Dundee. See Covenanters; consult also Lives, C. S. Terry, 1905; M. Barrington, 1911; G. Daviot, 1937; A. and H. Tayler, 1939.

**Dundonald, THOMAS COCHRANE, 10TH EARL OF (1775-1860).** British admiral. He was born at Annsfield, Lanark, Dec. 14, 1775, the eldest son of the 9th earl. In 1793 he entered the navy, and in 1801 he captured a Spanish frigate. In 1806 he became M.P. for Honiton and in 1807 for Westminster, and as a Radical became known by his denunciation of abuses in the navy. Having taken part in the attack on the French squadron in the Basque Roads, 1809, he contended that he had not been properly supported by Gambier, the admiral in command. A court martial was held, by which Gambier was acquitted and Cochrane consequently discredited.

In 1814 he was unjustifiably arrested with others in connexion

with a false rumour affecting the funds, and was sentenced to a year's imprisonment and a fine of £1,000. He was struck off the navy list, expelled from the house of commons, and ignominiously removed from the Order of the Bath. The amount of his fine was raised by popular subscriptions.

In 1817 Cochrane accepted the command of the Chilean navy and carried out a series of daring and brilliant exploits. In 1823-25 he commanded the Brazilian, and, in 1827-28, the Greek navy. In 1831 he became 10th earl of Dundonald and in 1832 was granted a "free pardon" for a crime which he had not committed and restored to his rank in the navy. In 1847 he was reinstated in the Order of the Bath. He was an early advocate of the use of steam in the navy, and was the author of the famous secret war plan, by which he claimed that he could destroy any fleet or fortress in the world. He died at Kensington, Oct. 31, 1860, and was buried in Westminster Abbey. Consult Dundonald's Narrative of Services in the Liberation of Chili, Peru, Brazil, 1859, and Autobiography of a Seaman, 1860.

**Dundreary, LORD.** Character in Tom Taylor's comedy, *Our American Cousin*.

can Cousin, first produced in New York, 1858. Originally designed as a subsidiary part, it was so developed by its creator, E. A. Sothorn, that it became the chief character. Dundreary is a good-natured but foolish man of fashion, conspicuous for his side-whiskers.

**Dundrum Bay.** Inlet of

co. Down, N. Ireland. It extends from St. John's Point to distance of 9 m. Dundrum Harbour is on the N. of the bay. On St. John's Point is a lighthouse.

**Dune.** Hill formed of sand which has been drifted by wind action. Dunes are common in deserts and near sandy sea shores. Most dunes move under the influence of the prevailing wind, and in their steady progression may overwhelm villages and even

Lord Dundreary, as impersonated by E. A. Sothorn

Dullish Cove, a distance of 9 m. Dundrum Harbour is on the N. of the bay. On St. John's Point is a lighthouse.

towns. Eccles Church in Norfolk was buried in 1839, in 1852 its tower reappeared, and now its foundations can be seen, the dunes responsible having moved on. Dunes may be anchored by planting them with coarse grass, trees, etc., or covering them with rubble. The size of dunes varies considerably. In S. Iran heights of 700 ft. have been recorded; many in the Libyan desert are over 300 ft. above their base.

Isolated dunes are usually crescentic in shape and are known as barchans. The horns of the dune point downwind, and the leeward (or concave) side is steeper than the windward. They move by the sands' being blown up the latter slope, whence it rolls or is carried by eddies on to the leeward surface, so building forward. Transverse dunes are elongated mounds which lie normally to the direction of the prevailing wind. Longitudinal or seif dunes are long ridges which broaden and rise to form chains of summits at regular intervals; they are remarkably constant in direction and range 60 or more miles. They often stand on whale-backs of sand up to  $\frac{1}{2}$  m. broad. Consult *The Physics of Blown Sand*, R. A. Bagnold, 1941.

**Dunedin.** City of South Island, New Zealand. Founded in 1848 by Scots settlers, who gave it the old Gaelic name for Edinburgh, it stands on Otago harbour, about 8 m. S.W. of Port Chalmers, and is the commercial and administrative centre of Otago prov. It has excellent communications by rail and sea, and there is an air service to Invercargill. A strip of open

country, known as the Town Belt, lies within the city limits. The manufacture of woollen goods, refrigerating works, boot making, foundries, and rolling mills are the chief industries. Dunedin is a great educational centre and has a university, technical college, and many public and private schools. Buildings include the Anglican and Roman Catholic cathedrals, the public library, art gallery, Queen Mary maternity hospital, and the university and early settlers' museums, the last-named housing the finest collection of pioneer relics in the dominion. Pop. 90,000.

**Dunedin, ANDREW GRAHAM MURRAY, VISCOUNT (1849-1942).** A British lawyer and politician. Born Nov. 21, 1849, he was the only son of the crown agent for Scotland. Educated at Harrow and Trinity College, Cambridge, he became an advocate in 1874 and a Q.C. in 1891. In the same year chosen M.P. for Buteshire, he entered the Unionist ministry as solicitor general for Scotland. In 1895 he was again appointed to that position, and in 1896 was promoted to lord advocate. During 1903-05 he was secretary for Scotland and a cabinet minister.

Dunedin. Plan of the city, which lies on Otago harbour, 15 miles from the open sea

In 1905 Murray left parliament to become lord justice general and lord president of the court of session, Scotland, and was made a peer as Baron Dunedin. In 1913 he was appointed a lord of appeal in ordinary, and in 1926 created a viscount. Retiring in 1932, he died Aug. 21, 1942, the peerage becoming extinct.

**Dunes, BATTLE OF THE.** Fought on the dunes outside Dunkirk between the French and the Spaniards, both supported by English contingents, June 4, 1658. To relieve Dunkirk, then besieged by the French, the Spaniards sent an army under Don John of Austria, one of its leaders being the great Condé. With it were five English, Scottish, and Irish regiments under James, duke of York. To aid France Cromwell had sent six regiments of his Ironsides.

The French were arranged in the conventional order of battle, cavalry on the wings and infantry in the centre, the English being on the left centre. The Spaniards had a line of infantry in front with the horsemen in column behind. On their left was the canal to Bruges, and the French stood with their backs to Dunkirk. The battle began with the advance of the English foot against the Spaniards' strongest position, a sand hill held by veterans. In spite of heavy losses they reached the hill and drove back the Spaniards. A few of the royalist English horsemen tried to save the day, but supports arrived for the Ironsides, and soon this wing of the Spanish army was completely broken. On the other wing, the Spaniards and their allies offered a poor resistance. The victory led to the fall of Dunkirk.

Dunedin, New Zealand. The Octagon, a central open space, with the Protestant cathedral, S. Paul's, and (right) the town hall

**Dunfermline.** Royal and mun. burgh of Fife, Scotland, on the Firth of Forth, 17 m. N.W. of Edinburgh. It gives its name to a parl. division. Since 1911 the burgh has been extended to include the naval base at Rosyth. It was a favourite residence of Scottish kings, and the Benedictine abbey, founded by Malcolm Canmore in 1072, was their burial place from the 11th to the 14th century.

#### Dunfermline arms

Charles I was born here. The ballad of Sir Patrick Spens opens: "The king sits in Dunfermline town." The abbey was partly demolished by Edward I, and except for the nave, which did duty as the parish church till 1821, was dismantled by the Reformers in 1560. In Pittencrieff Glen, which, with the estate and an endowment yielding £40,000 per annum, was presented to the burgh in 1903 by Andrew Carnegie, a native, are the ruins of Malcolm Canmore's castle and palace. The garden city between Dunfermline and Rosyth is a famous example of town planning. The town is celebrated for table-linen, and is also engaged in silk weaving. Market day, Tues. Pop. est. 37,600.

**Dungannon.** Urban dist. and market town of co. Tyrone, N. Ireland. It is 40 m. W. of Belfast by rly. It was the ancient residence of the O'Neills, titular kings of Ulster, who founded castles and an abbey of which no traces remain. There is a grain trade and linen and muslin manufactures. It returned two members to the Irish parliament, and from 1601 to 1885 was represented by one in the parliament in London. Market day, Thurs. Pop. 4,000.

**Dungaree.** Name given to a coarse Indian calico. From it comes the word dungarees, for a working garment of this material.

**Dungarpur.** Former Indian state, now in Greater Rajasthan, bounded N. by Udaipur. The surface is wild and rugged in the N. and E., the remaining portions being made up of jungle forest, stony

tracts, and a little arable land. The chief rivers are the Mahi and Som. Products are stone and timber. Dungarpur was founded as Vagad in 1179 by a scion of the house of Mewar. The ruler, called Maharawal, was entitled to a salute of 15 guns. The chief towns are Dungarpur (the capital), Sagwara, and Galliakot. Area, 1,460 sq. m. Pop. 274,282, Hindus and animists.

#### Dung Beetle

OR DOR BEETLE. Name given to species of *Geotrupes*, family Scarabaeidae. Several are common in Great Britain. They lay their eggs beneath dung, portions of which they carry down as food for the larvae, thus acting as scavengers. About 1 in. long, shiny black above, and metallic blue

Dung Beetle,  
*Geotrupes*  
*stercorarius*

Dunfermline. The New Abbey Church, built in 1821 on the site of the old abbey, of which a tower and some remains are seen on the right

beneath, they fly about at dusk in summer with a droning sound.

**Dungeness.** Low promontory on the S. coast of Kent, England. It has a lighthouse, coastguard station, Lloyds' signalling station, and small fort. It has been the scene of many wrecks, and off here Tromp defeated Blake in 1652 during the first Dutch war.

**Dunhill.** THOMAS FREDERICK (1877-1946). British composer. Born at Hampstead, Feb. 1, 1877, he entered the Royal College of Music in 1893 as a composition scholar. One of Stanford's most successful pupils, he was assistant music master at Eton, 1899-1908, and again during the Second Great War; he also taught at the R.C.M. The composer of one perfect song—a setting of Yeats's *The Cloths of Heaven*—he wrote also the music of the comic opera *Tantivy Towers*, 1931. Besides children's operas (e.g. *The Enchanted Gar-*

*den*) he wrote piano pieces, part songs, and arrangements of traditional songs. His orchestral works included a set of elegiac variations (in memory of Parry) and a symphony. In 1928 he published a critical work, *Sullivan's Comic Operas*. He died at Scunthorpe, March 13, 1946.

**Dunite.** Massive granular crystalline rock, a species of peridotite. It consists almost wholly of opaque olivine, with some chromic iron, and is named from Dun Mt., near Nelson, New Zealand, which is surmounted by this rock.

**Dunkeld.** Ecclesiastical and market town of Perthshire, Scotland. It stands on the Tay, here spanned by a seven-arched bridge, 15½ m. by rly. N.N.W. of Perth. The chief object of interest is the ruined cathedral, presented to the nation in 1918 by the duke of Atholl. This was built in the 11th or 12th century, but was partially destroyed at the Reformation. The ruins include a beautiful nave, a chapter house, and a tower, as well as the choir, which has been restored to serve as the parish church. Dunkeld is the seat of an R.C. bishop. Near is Dunkeld House, a residence of the duke of Atholl. The town has a modern town hall, and in the market square is a fountain commemorating a duke of Atholl. A mile away, across the Tay, is the village of Birnam. Pop. 946.

**Dunkers** OR TUNKERS (Ger., *dippers*). Sect of Baptists founded in Germany by Andrew Mack, in 1708. About 1720 they fled under persecution to America, where their leader, Conrad Peysel, founded a settlement at Ephrata, about 50 m. from Philadelphia. Men and women dwelt apart, marriage was forbidden, and strict vegetarianism practised. Divided into three sects, the Dunkers have numerous independent congregations in the United States of America.

**Dunkery Beacon.** Hill on Exmoor, Somerset, England. About 5 m. S. of Porlock, it is 1,707 ft. high, the highest point on the moor. It is 12 m. in circumference, its slopes are covered with trees, and on the summit is a large cairn. The lighting of the beacon on Dunkery is described in Lorna Doone.

**Dunkirk** OR DUNKERQUE. Seaport of France. It stands on the Strait of Dover, near the Belgian boundary, in the dept. of Nord. 40 m. N.W. of Lille. The flat district around it is called the Watteringues. One of the chief ports of France it lies in French Flanders; it has outer and inner harbours,

floating basins, dry docks, quays, and ample accommodation for shipping. Normally the port ex-

Dunkirk arms

ports the coal of Belgium and N.E. France, the manufactures of the industrial region therein, and the agricultural produce of other adjacent areas. Wool is a main import. Shipbuilding is carried on, while other industries include the manufacture of machinery, soap, and shipping accessories. There are oil refineries, saw mills, and flour mills.

The old buildings include the church of S. Eloi, with a modern façade and a detached belfry, and the pilgrim chapel of Notre Dame des Dunes. The church of S. Jean-Baptiste was founded in the 15th century. The Place Jean Bart is named from a statue of the seaman of that name. Outside the old town are St. Pol-sur-Mer and Rosendael. Malo-les-Bains is a watering-place. Pop. 10,575.

Dunkirk, meaning the church in the Dunes, was at first two small settlements around chapels named after S. Eloi and S. Gilles. It was taken and retaken by France and Spain, having passed to the latter country with the other lands of the duke of Burgundy. During 1653-62 it was in English hands. In 1713, by the treaty of Utrecht, its fortifications were pulled down, but later it again took its place as a seaport and a fortress. It was besieged by the English in 1793.

During the First Great War Dunkirk was heavily bombed by air and bombarded from sea and land.

After the withdrawal of the B.E.F. in 1940 (*v.i.*), Dunkirk became one of the German invasion ports and was frequently bombed by the R.A.F. In Sept., 1944, the British drive across Belgium to Antwerp isolated the German garrison at the port, who were penned into a perimeter roughly that held by the B.E.F. in 1940. An attempt to break out and cut the Allied line of communication was defeated on Sept. 8-9, but dense minefields held up the investing

troops. In Oct. a 60-hour truce was arranged for the evacuation of civilians, and the port was then subjected to an intense artillery and air bombardment. Czechoslovak troops contained the garrison until its surrender on May 11, 1945. The port was reopened in Aug., 1946.

On March 4, 1947, a 50-year treaty binding Great Britain and France in alliance for mutual protection against a revival of German aggression was signed at the sous-préfecture, Dunkirk, by Ernest Bevin and Georges Bidault, the respective foreign ministers of Great Britain and France.

## THE DUNKIRK EVACUATION, 1940

A. D. Divine, D.S.M., War Correspondent and Author

*One of the most significant episodes of the Second Great War is here described and assessed by a writer who was decorated for his own part in the Dunkirk operations. His book, Dunkirk, was published in 1946*

For all those who lived in Britain through the Second Great War, and for many others, the word "Dunkirk" signifies that astonishing series of operations which, in May and the early days of June, 1940, brought the British army back through Belgium and France with its allies disintegrating on either flank, and safe to the ports of England.

Dunkirk has been called a miracle. It was—a planned miracle, a masterpiece of desperate planning, of brilliant improvisation, of sheer genius in the handling of inadequate material.

By the German break-through along the Meuse on May 14 the British lines of communication, which ran transversely from Belgium across France to Le Havre,

were endangered. On Sunday, May 19, the lines of communication were severed; German motor cycle patrols were descending on Abbeville, and Boulogne was already close to investment. By Monday, May 20, so swift was the turn of disaster, a plan for "emergency evacuation across the Channel of very large forces" was evolved, which envisaged the use of Boulogne, Calais, and Dunkirk. By the Thursday Boulogne had fallen, Calais was invested, and on the left flank the armies of Belgium were crumbling.

Operations in this area came under the Dover Command. The late Admiral Sir Bertram Ramsay, then Vice-Admiral, Dover, had assembled a nucleus staff of sixteen men. Working in one of the dynamo rooms in the subterranean tunnels of Dover Castle, they made a fresh plan and called it after the room in which they worked.

Admiral Ramsay had at Dover one flotilla of old "V" and "W" (1917) destroyers, the Channel minesweepers, a handful of armed yachts and miscellaneous small craft. On the transport side he had 15 cross-Channel and Irish Sea packets at Dover and in the Downs, and another 20 in reserve at Southampton. Behind these were the resources of the Admiralty and the ministry of Shipping. The ministry had carried out a rapid census of all suitable ships in British harbours. The Admiralty had initiated movements of ships from the north to reinforce Admiral Ramsay's thin flotillas. As early as May 14, the Small Vessels Pool had issued through the B.B.C. an order for all owners of

Dunkirk, France. The port after its reopening in August, 1946; reconstruction after the Second Great War had scarcely begun

1 British and French troops waiting in the sand dunes for their turn to be picked up and carried to England by one of the vessels of all sizes which rallied to the task of rescue 2 French troops on board a British

*After the painting by Charles Cundall A.R.A., an Official War Artist*

craft of 30 feet and upwards to lodge details of their ships.

On the black Thursday of May 23 the Germans overwhelmed the defence of Boulogne, and Admiral Ramsay lost seven of the eight ships of his Dover flotilla—sunk or damaged—in the magnificent heroism of that evacuation. On the afternoon of Sunday, May 26, the final decision to evacuate the British army was taken. At 6.57 p.m. Operation "Dynamo" was put into motion.

#### Fall of Calais

Two hours before, the Germans had overwhelmed the heroic resistance of the defenders of Calais and entered the citadel. The two armoured divisions that for four tremendous days had been held outside that battered port were free to throw themselves against the western flank of what was now to be known as the Dunkirk perimeter. On the eastern flank the Belgian armies, perilously short of ammunition, were beginning to disintegrate before the hammer blows of the German armour. The situation of the French, with a command divided, uncertain, and incompetent, was precarious in the extreme.

Boulogne and Calais, Ostend and Zeebrugge were lost. There remained Dunkirk; and a long series of raids, culminating in one of vicious fury on the Saturday night, had destroyed the port. In the 25 miles of long, straight sand beaches, shelterless, naked, exposed, between Mardyck Fort and Nieuport, there were only the two moles of the Dunkirk entrance channel. The eastern—the mole proper—was a narrow wooden structure barely wide enough for three men to walk along its decking—never designed for berthing ships. Off the beach along most of its length was a wide strip of shallows. Outside that lay the narrow Dunkirk channel, barely 800 yards of deep water before the outer sandbanks closed it from the sea. The entrances to that channel at the east and at the west were commanded by the guns of Nieuport and of Calais.

Admiral Ramsay's problem was to lift from those beaches 370,000 men. Nothing in all history, nothing in the long record of previous evacuations, matches the scale either of effort or of courage and determination that made Dunkirk possible. By Sunday the ships that the Admiralty had sent to replace Admiral Ramsay's lost Dover flotilla were already in operation. With them came more

ships—paddle-minesweepers from the south and from the east, trawlers, drifters, flak ships from the Thames, armed yachts and the rest. The work of Sunday afternoon showed the critical need of small craft to ferry men across the shallows to the channel. The Small Vessels Pool came into action in the Thames, the east coast, and the south coast ports. The ministry of Shipping supported it. By the Monday afternoon there had started that extraordinary procession of small boats to Margate, Ramsgate, and Dover that was to swell within forty-eight hours into the strange armada of deliverance.

Swept channels were organized and kept clear; patrols were provided against the E-boats that the Germans sent to harass the movement; the R.A.F. did what it could to provide a screen; and in a vivid crescendo of energy the totals rose. Less than 6,000 men were rescued on the Monday, yet by midnight on the Tuesday 45,000 men had already reached safety. In the next twenty-four hours 38,000 men were embarked. On Thursday May 30, the total was 45,955.

#### Casualties Among the Ships

Ships were lost to the shell fire of the forts and the mobile guns of Calais. Ships were battered and held up by the guns of Nieuport; they were hit by shellfire as they lay beside the mole; they were sunk by bomb, hit by low flying aircraft; they were lost in collision and to mines, and by wreck and stranding. The small craft on the beaches suffered with them; they were swamped by soldiers unused to the sea; they were ripped apart by bullets; always they were under the direct and deadly peril of the air.

By the Saturday the tally of disaster had grown so great—three destroyers were sunk within little more than an hour and four more damaged—that daylight loading had to be abandoned. Yet the night work was so brilliant, so swift, that the totals scarcely fell. Destroyers were carrying 1,400 men at a single trip; cross-Channel steamers as many as 3,000. When a signal from the Admiralty terminated Operation "Dynamo" on Tuesday, June 4, 337,000 men had come to safety. Of these, the 38 destroyers used in the operation carried 91,624. The Fleet minesweepers and the paddle-minesweepers between them rescued 49,780, the naval-manned Dutch skoots 20,284. The four main

naval categories alone lifted a total of 161,688, and to this must be added those taken off by the host of smaller naval craft. Of the Merchant Navy the cross-Channel steamers had the highest record—61,867 men in all. The French, with four cross-Channel ships, a handful of coasters and a small number of naval craft, rescued 30,000 men.

On the evening of May 28, Mr. Churchill had said in the House of Commons, "I expect to make a statement to the House on the general position when the result of the intense struggle now going on can be known and measured. This will not, perhaps, be until the beginning of next week. Meanwhile the House should prepare itself for hard and heavy tidings." The tidings he was able to give were instead a record of achievement that was the first great message of hope.

**Dunkirk.** City of New York, U.S.A., in Chautauqua co. A port of entry on Lake Erie, it is 40 m. by rly. S.W. of Buffalo. Besides being pre-eminent in the lake trade, it is the centre of an agricultural and grape-growing region. Industrial products include stainless steel, motor and aircraft parts, agricultural implements, locomotives, boilers, and radiators. There are oil refineries. Settled in 1809, Dunkirk was chartered as a city in 1880. Pop. 17,713.

**Dun Laoghaire.** Seaport and urban dist. of co. Dublin, Eire, formerly known as Kingstown after George IV, who landed therein 1821. It stands on the S. side of Dublin Bay, 6 m. S.E. of Dublin, by rly. and tram. It is the port of departure and arrival for steamers between Eire and Holyhead and Liverpool. The harbour, begun in 1817, made it a port. Pop. 42,105. *Pron.* Dunleary.

**Dunlin** or **Ox Bird** (*Erolia alpina*). Species of shore bird belonging to the Sandpiper group. It breeds rather rarely in Great Britain, and is usually seen about estuaries. It is about 8 ins. long, and greyish coloured in winter, but in the breeding season the male is clad in chestnut and black.

**Dunlop, JOHN BOYD** (1840–1921). Scottish inventor. Born in Ayrshire, Feb. 5, 1840, he began to practise as a veterinary surgeon at Belfast. About 1888 the idea of an inflated tire occurred to him. This Dunlop tire was placed on the market by the Pneumatic Tyre and Booth's Cycle Agency. A patent was taken out for the wire edge attachment by the Dunlop Rubber

Co.; this expired in 1904. Dunlop died Oct. 23, 1921. See Cycling; Tire.

**Dunmore.** Borough of Pennsylvania, U.S.A., in Lackawanna co. Adjoining Scranton on the N.E., it is served by the Erie and other rlys. In an anthracite coal district, it has rly. workshops, and makes rail coaches, silk yarn, and bricks. Settled in 1783, as Buckstown, it was renamed in 1840 and incorporated as a borough in 1862. Pop. 23,086.

**Dunmore, JOHN MURRAY, 4TH EARL OF (1732-1809).** British administrator. Son of William, the 3rd earl, he succeeded to the title in 1756 and was a Scottish representative peer 1761-69. In 1770 he went to America as governor of New York and in 1771 Virginia also was placed under his authority. In 1774 he became involved in a struggle with the Indians, often called Dunmore's War, and a little later he carried on a civil war with the Virginians. He returned to England in 1776, and during 1787-96 was governor of the Bahama Islands. He died in May, 1809, at Ramsgate.

**Dunmow.** The name of two parishes in Essex, England. Great Dunmow stands on the Chelmer, 8 m. W. of Braintree by railway. Roman remains have been unearthed here. Market day, Tues. Pop. 2,882. Little Dunmow, also on the Chelmer, is 1½ m. S.E. of Great Dunmow.

**Dunmow Flitch.** Annual custom at Little Dunmow, Essex, of presenting a flitch of bacon to any married couple who can give satisfactory proof that they have not repented of their marriage for a year and a day after its celebration. Formerly the couple took an oath before the prior; nowadays a jury of neighbours is called. The custom was revived by Harrison Ainsworth, author of the novel, *The Flitch of Bacon*, 1854.

**Dunnage.** Loose planks of wood, matting, and other packing materials used in a ship's hold to pack the spaces between stowed cargo and prevent it shifting when the vessel rolls. In sailing ships dunnage was laid in the bottom of holds to raise the cargo above the bilge water.

**Dunne, FINLEY PETER (1867-1936).** American humorist. Born at Chicago, from 1891 to 1900 he attracted notice by contributing to the *Times-Herald*, of Chicago, a series of sketches in which, speaking as Martin Dooley, an Irish-American publican, he commented on social and political topics in

genially, sometimes pungently, humorous fashion. Dunne's works include *Mr. Dooley's Philosophy*, 1900; *Opinions*, 1901; *Observations*, 1902; *Dissertations*, 1906; *Mr. Dooley Says*, 1910; *On Making a Will*, 1920. He died April 24, 1936.

**Dunne, JOHN WILLIAM (1875-1949).** A British inventor and thinker. He was born in Ireland, Dec. 2, 1875, served in the South African war, and took up aeronautical experiments. He invented the aerofoil named after him and designed and built the first British military aeroplane. In 1906 he worked on balloons. He died Aug. 24, 1949.

His book *An Experiment with Time*, 1927, attracted much attention. From a detailed analysis of the dreams of his helpers, Dunne found that about half the matters dreamed of were in the past and half in the future of the dreamers. He argued that time has no reality, but that the conscious mind can perceive only a part of it; and claimed that if his reasoning held a fallacy no one had so far detected it. In *The Serial Universe*, 1934, he outlined the theory of serialism, with graphical illustrations.

**Dunn Laboratory.** Institution at the university of Cambridge devoted to the study of the scientific principles of nutrition. The laboratory was erected in 1929 by the Medical Research Council, which undertook the financial responsibility for its equipment and maintenance, the cost of the building being defrayed by a gift from the trustees of Sir William Dunn. The principal object is to investigate the physiology of human nutrition. Its first director was Dr. Leslie Harris.

**Dunnottar.** Town and parish of Kincardineshire, Scotland. It stands on Carron Water, 1 m. S.W. of Stonehaven. At Dunnottar in 1793 Walter Scott met Robert Paterson, the stonemason original of *Old Mortality*. Pop. 2,255.

Dunoon. Ruins of the old castle and the statue of Burns' Highland Mary

Frith

**Dunnottar Castle.** Ruined stronghold about 2 m. S.E. of Stonehaven, Kincardineshire, Scotland. It is situated 150 feet above the sea, and dates from the 7th century. In one of its dungeons, known as Scotland's Black Hole or

Dunnottar Castle. Ruins of a stronghold besieged by Cromwell

Whigs' Vault, in 1685, during the Covenanters' rebellion, 167 men, women and children were incarcerated. Cromwell laid siege to the castle when he invaded Scotland, but did not take it until the Scottish crown jewels, placed in it for safe keeping, had been secretly removed to Kinneff Church. The castle was dismantled in 1720.

**Dunois, JEAN, COMTE DE (1402-68).** French soldier and popular hero. Born at Paris, Nov. 23, 1402 a natural son of Louis, duke of Orléans, and brother of Charles VI, he was known as the Bastard of Orléans. Originally intended for the church, he became a soldier, and first came into prominence by defeating the English and raising the siege of Montargis in 1427. His next exploit was the defence of Orléans, which he held until succoured by Joan of Arc, with whom Dunois now set himself to the task of clearing the country of the English. The task was not interrupted by the capture and death of the Maid of Orléans. The taking of Chartres in 1432 enabled Dunois to expel the English from Paris; by 1450 he had driven them from Normandy; and by 1455 Guienne was once more French. He died

at St. Germain-en-Laye, Nov. 24, 1468. A sympathetic portrait of Dunois is drawn in Bernard Shaw's play *St. Joan*.

**Dunoon.** Town and police burgh of Argyllshire, Scotland. It stands on the W. shore of the Firth of Clyde, 8 m. W. of Greenock. Formerly a small fishing village, it is now one of the most popular watering-places on

the W. coast. It includes Kirn and Hunter's Quay, and with these the town has a frontage of three miles on the firth. There is a statue to Mary Campbell, the "Highland Mary" loved by Burns, who was born here. The Cowal Highland gathering, which includes the contest for the world's pipe band championship, is held on the last Sat. in Aug. Hunter's Quay is the headquarters of Clyde yacht racing. Pop. 12,361.

**Dunraven Castle.** Seat of the earl of Dunraven, on the coast of Glamorganshire, Wales, near Bridgend. In 1946 the castle and park were leased for 21 years to the Workers Travel Association as a holiday resort.

**Duns.** Police burgh, county and market town of Berwickshire, Scotland, 55 m. S.E. of Edinburgh by railway. The original town of Duns or Dunse was situated on Duns Law (713 ft.), which has traces of the encampment set up by the Covenanters in 1639. Linen is manufactured and there is trade in flour and grain. Market day, Tues. Pop. 1,913.

**Dunsany, EDWARD JOHN MORETON DRAX PLUNKETT, 18TH BARON** (b. 1878). Irish author.

Born July 24, 1878, he was educated at Eton and Sandhurst, and succeeded to the title in 1899. He served in the S. African and the First Great Wars, and travelled extensively in the Far East. He was Byron professor of English literature at Athens university, 1940-41. A prolific writer of short stories, novels, and plays, his work was distinguished by a deep vein of fantasy and whimsical imagination. Earlier collections of stories included *The Gods of Pegana*, *Time and The Gods*, *A Dreamer's Tales*, *Tales of Wonder*, *The Charwoman's Shadow*, *Tales of Three Hemispheres*; among later publications the best known were probably the *Mr. Jorkens* series; *Up in the Hills*, 1935; *My Ireland*, 1937; *Patches of Sunlight* (autobiography), 1938; *The Story of Mona Sheehy*, 1939; *While the Sirens Slept*, 1944; *The Year*, 1946. His plays include *The Glittering Gate*, 1909; *The Gods of the Mountain*, 1911; *The Laughter of the Gods*, 1919; *If*, 1921; *Lord Adrian*, 1937. Of

his radio plays the most memorable were *Time's Joke*, *Atmospherics*, *The Aurora Borealis*.

**Dunsinane.** Peak (1,012 ft.) of the Sidlaw Hills, Scotland, 8½ m. N.E. of Perth. On it are traces of an ancient fort known as Macbeth's Castle. Shakespeare has immortalised the defeat here of Macbeth by Siward, earl of Northumbria, in 1054.

**Duns Scotus** (c. 1265-1308). Medieval schoolman. Little but legend exists as to his personal history. He is often referred to as a native of Duns, Berwickshire, but, as with Johannes Scotus Erigena (*q.v.*), his birthplace is variously assigned to England, Scotland, and Ireland. He appears to have been professor of theology at Merton College, Oxford, to have joined the Franciscans, and about 1304 to have gone to Paris, where, in contention with the Dominican upholders of the teaching of Thomas Aquinas, his dialectical skill won for him the name of Doctor Subtilis (the Subtle Doctor), and where he popularised the theory of the Immaculate Conception of the Virgin Mary, since 1854 a dogma of the R.C. Church. Sent to contend against the Beghards and Dominicans at Cologne, he died there, Nov. 8, 1308. His tomb, in the Minorite Church of S. Pantaleone, was inscribed: *Scotia me genuit, Anglia me suscepit, Gallia me docuit, Colonia me tenet* (Scotland bore me, England adopted me, Gaul taught me, Cologne holds me).

The writings of Duns Scotus testify to his familiarity with the works of Porphyry, Boethius, Aristotle, Plato, and the Arabian and Jewish schoolmen. They concern philosophic grammar, logic, metaphysics, and theology. His commentaries on the *Sententiae* of Peter Lombard are the more often referred to. The edition of his works publ. at Lyons in 12 vols., 1639, by Luke Wadding, an Irish Franciscan, is incomplete; another ed. appeared in Paris, 1891-95.

While his teaching appears to be no longer binding on Franciscans, his views have influenced modern theology and philosophy. To him theology was a practical

science, faith an act of will, and will the controller of the intellect. Though intentionally orthodox, his philosophy has its effects in modern materialism. An exponent of the inductive principle, he anticipated Bacon and Newton. In logic a quodlibetarian, one who, stating the pros and cons of an argument, leaves his hearers to draw their own conclusions, he influenced conceptualism.

From Duns Scotus and Thomas Aquinas arose respectively the schools of Scotists and Thomists, opposed especially in regard to the Immaculate Conception, and generally as to free will, grace, and kindred topics. The Scotist views were later adopted by the Jesuits. The term dunce, originally a Duns man, was applied as a term of contempt by Thomists to Scotists. See Aquinas; Concept; Nominalism; Realism; Scholasticism.

**Dunstable.** Mun. bor. and market town of Bedfordshire, England.

It stands at the entrance of one

Dunstable arms

of the gaps of the Chiltern Hills, 37 m. N.W. of London by two railway lines. The church of S. Peter and S. Paul is a part of the Augustinian priory founded by Henry I in 1131. Here Cranmer held in 1533 the court which dissolved the marriage of Catherine of Aragon. Dunstable is situated at the crossing point of Watling Street and Icknield Way, and is thought to have been a Roman station.

Dunstable. Parish church of S. Peter and S. Paul, part of the priory founded in 1131

Formerly a centre of straw plaiting, engineering, printing, rubber manufacture, and plastic products are among its industries. Market days, Wed. and Sat. Pop. 16,500.

**Dunstaffnage.** Ruined castle of Argyllshire, Scotland. It stands at entrance to Loch Etive, 3½ m.

N.E. of Oban, and dates from the 13th century. The traditional seat of the kings of Dalriada, it was wrested from the MacDougalls by Robert Bruce in 1308, and was garrisoned for the crown during the risings of 1715 and 1745. It figures in Scott's *Lord of the Isles*, and was for a time the prison of Flora Macdonald. The Stone of Destiny, which now forms part of the coronation chair at Westminster Abbey, reposed here before its transference to Seone.

**Dunstan** (c. 924-988). English saint, archbishop, and statesman. The son of a Wessex nobleman, he was born near Glastonbury and educated at its abbey. He went to the court of Athelstan and became a skilled musician, but, accused by rivals of practising the black arts, retired as a monk to Glastonbury, and is said to have worked in metal. He was made abbot c. 945. Chief adviser of King Edred, he was banished to Flanders by Edwy, c. 956, but on Edger's accession his powerful career began; he was made bishop of Worcester 957, of London 959, and archbishop of Canterbury 960. Until the murder of Edward in 978, he was the chief counsellor at court and the moulder of ecclesiastical policy. He tried to reform monasteries according to strict Benedictine principles, rebuilt churches, encouraged literature and handicrafts. Historians utter no adverse criticism against Dunstan, and legends have gathered round his name. May 19 was the date of his death in 988 and is that of his festival.

**Dunster.** A market town of Somerset, England. Situated 23 m. N.W. of Taunton by the

Dunster, Somerset. Old wooden Yarn Market in the High Street

ry., just off Exmoor, it is a quaint old town, an architectural composition often photographed. Dunster Castle, owned until 1949 by the Luttrell family, dates from the 12th cent., and the Yarn Market, a wooden structure, from the beginning of the 17th century. Market day, Fri. Pop. 839.

**Dunsterville**, LIONEL CHARLES (1865-1946). British soldier. He was born at Lausanne, Nov. 9,

L. C. Dunsterville, British soldier  
Ellott & Fry

1865, and was educated at Westward Ho!, where he had a school-fellow Rudyard Kipling, who made him the hero of *Stalky and Co.* He joined the Royal Sussex Regiment in 1884 and was on active service in India and China. During the First Great War he held appointments in India and Mesopotamia (Iraq), and as a major-general commanded "Dunsterforce" in 1918, when he marched across Persia to Baku in an attempt to preserve the oil wells from Turks and Bolsheviks. He retired in 1920 and died at Torquay, March 18, 1946. He wrote *The Adventures of Dunsterforce*, 1920; *Stalky's Reminiscences*, 1928; *More Yarns*, 1931; *Stalky Settles Down*, 1932.

**Dunvegan.** Sea-loch on the N.W. coast of the Isle of Skye, Scotland, penetrating inland for  $7\frac{1}{2}$  m., with a breadth of  $2\frac{1}{4}$  m. On the E. shore is Dunvegan Castle, long the seat of the Macleods.

**Dunwich.** Coast parish and village of Suffolk, England. It stands on the North Sea,  $4\frac{1}{2}$  m. S.S.W. of Southwold. The chief town and harbour and at one time the only see of East Anglia (dating from the 7th century), Dunwich has suffered severely from sea encroachments, which at various periods swept away the palaces and houses and blocked up the harbour. The last remains of the ruined church of All Saints fell in 1920. Near by, on the edge of the cliff, are the ivy-clad ruins of a 13th century Franciscan priory. Pop. 174.

**Duodecimal** (Lat. *duodecim*, twelve). System of notation in which 12 and not 10 is the base. Duodecimal arithmetic is used for measuring builders' work and for computing areas in feet and inches. The group 12 is taken as the unit, representing 1 foot. Thus, with square measurement, the first component is 1 sq. ft.; the second component is one-twelfth of a sq. ft. and is termed the "part" or "prime"; the third component is  $1/144$ th of a sq. ft. and is called the "second." Further subdivisions are termed "thirds," "fourths," etc. When only the first three components are used they are called feet, parts, and

inches respectively. The notation is one tick after the numeral denoting the part, and two ticks after that denoting the second. Thus the linear measurement 9 ft.  $7\frac{1}{2}$  ins. is expressed as 9 ft. 7' 6", representing 9 feet, 7 primes, 6 seconds. The linear prime is equal to 1 inch; the linear second to one-twelfth of an inch.

In cubic measurement the prime is equal to 144 cu. in., and the second to 12 cu. in. The principle of subdivision by 12 thus applies throughout. Addition, multiplication, and division, are carried out directly without having to convert into decimal notation and then turn the figures back again into feet and inches. Proposals have been made to apply the duodecimal system more widely, and the convenience of such a method in dealing with British money calculations is claimed. To correspond with the duodecimal pence-shillings ratio, the half-sovereign would contain 12 shillings.

**Duodecimo** (Lat. *duodecim*, twelfth). Designation originally applied to a book each sheet of which was folded so as to make 12 leaves. Commonly it will measure 7 ins. by  $4\frac{1}{2}$  ins. The word is abbreviated 12mo or 12°. See Paper, Sizes of.

**Duodenum** (Lat. *duo-deni*, twelve each). Section of the small intestine. It is a fixed part of the alimentary canal, immediately next to the stomach, its fixity contrasting with the mobility of the stomach and of the rest of the small intestine. It is U-shaped, and its length is twelve fingers' breadth, whence its name.

Ulcers occur in the duodenum in two forms, acute and chronic. The acute form is a sharply cut hole in the lining of the gut. Every chronic ulcer begins acutely, but assumes a thicker rounded edge. It is not clear what causes the ulcer, although it is known that the condition is closely associated both with septic infection and with the acidity of the gastric juice. The ulcer usually forms where the acidity of the gastric contents of the duodenum is greatest, above the duct by which enter the alkaline, and therefore neutralising, bile and pancreatic juice. Septic infection may arise either by swallowing the germs or by way of the blood or lymph stream. The disease is more common among men than women, and appears to be due, at least in some degree, to worry.

Characteristic symptoms include periodical pain, often to the right

of the pit of the stomach, often going through to the back. It is felt two or three hours after food, and is often relieved by eating. In serious cases there may be internal bleeding, or the wall of the gut may be perforated, allowing the contents of the stomach to enter the abdominal cavity. Either condition demands immediate surgical treatment.

**Dupanloup, Félix Antoine Philibert** (1802-78). A French bishop. Born near Chambéry, Jan. 3, 1802, he was ordained priest in 1825. He was placed in charge of the Little Seminary at Paris in 1837, and founded the Academy of S. Hyacinthe. He energetically advocated freedom of education, and in 1849 became bishop of Orléans.

He became the leader of the Gallican party against the Ultramontanes, and strongly opposed the definition of the infallibility of the pope, though he submitted to the decree when it was promulgated. He was conspicuous by his self-denying labours during the siege of Paris. He died Oct. 11, 1878.

**Dupin, André Marie Jean Jacques** (1783-1865). A French jurist and statesman. Born at Varzy (Nièvre), Feb. 1, 1783, he is usually called the elder, to distinguish him from his two brothers, also eminent lawyers. In 1815 he opposed the proclamation of the young king of Rome as emperor. Elected to the chamber of deputies in 1826, he assisted in the revolution of 1830, and was made *procureur-général*. In 1832 he was president of the chamber and in 1848 led the young count of Paris into the chamber and proposed him for king. He eventually took office under the second empire, declaring that he "belonged to France, not to parties." His book, *Libertés de l'Eglise Gallicane*, 1824, was condemned by the Congregation of the Index at Rome. Dupin died in Nov., 1865.

**Dupleix, Joseph François** (1697-1763). French administrator. Born at Landrecies, Jan. 1, 1697, he was the son of a merchant. As a youth he went on voyages to India, where, about 1720, he settled. He was associated with the French East India co., trading also successfully on his own account. In 1730 he was made governor of Chandernagore, and in 1741 governor of Pondicherry, and chief official in French India.

The career of Dupleix in India is the story of a great plan thwarted. He saw the chance of

Dupleix. From the statue in Landrecies

France, and he took vigorous action. Repudiating terms arranged by his colleague Labourdonnais, he kept Madras, but failed in an attempt on Fort St. David. Then came the peace of 1748. Turning his attention to the Carnatic, Dupleix managed to depose one ruler, and set up another, and within a year his candidates appeared masters, not only of the Carnatic, but also of the Deccan.

The appearance of Clive changed the position entirely, the defence of Arcot in 1751 marking the turn of the tide. Unsupported by officials in France, Dupleix struggled on gallantly for a time, but in 1754 he was recalled to France, where he was allowed to live in obscurity and poverty until his death, Nov. 10, 1763. See Clive, Robert; India; consult also Lives, G. B. Malleson, 1890; E. Guérin, 1908; Dupleix et l'Inde Française, A. Martineau, 1928.

**Duplicate Bridge.** Variation of contract bridge, used for all tournaments and matches. In a duplicate game the same hands are played by all the competitors. They are normally dealt at the first table where they are to be played, and at the conclusion of a hand each player collects his 13 cards, lists them on a slip of cardboard to provide a check, and puts cards and slip into a slot on a board marked N., E., S., or W., according to his position at the table. Another slip records the result of the play at that table.

In a match for teams of four, the N.-S. cards will be held by one team at one table and the E.-W. cards by that team at the other

setting up there, by the aid of the natives and their constant rivalries, a great French empire, and he devoted considerable abilities to that end, the scheme including the expulsion of the English. In 1744 war broke out between Great Britain and

France, and he took vigorous action. Repudiating terms arranged by his colleague Labourdonnais, he kept Madras, but failed in an attempt on Fort St. David. Then came the peace of 1748. Turning his attention to the Carnatic, Dupleix managed to depose one ruler, and set up another, and within a year his candidates appeared masters, not only of the Carnatic, but also of the Deccan.

**Dupont, Pierre** (1821-70). French poet. Born at Lyons, April 23, 1821, he settled in Paris, and became a contributor of verse to periodicals. His *Deux Anges*, 1842, was crowned by the Academy. But his popularity, wide though transitory, was gained by his songs, many of them political, of which he wrote both words and music. He died July 25, 1870.

**Duppel.** Village of Slesvig, N. Germany. It stands on the mainland, opposite Sonderburg on the Danish island of Als. In 1848 and 1864 the Danes held it against the Germans. In the war of 1848-49 the Danes succeeded in keeping back their foes. In March, 1864, however, the Prussians laid regular siege, the final assault being delivered on April 18. It was successful, and many Danes were taken prisoners.

**Dupplin Moor.** Locality on the Earn, Perthshire, Scotland, the site of a battle fought Aug. 12, 1332. A party of Scottish nobles, among whom was Edward Baliol, deprived of their estates, took refuge in England. To recover their possessions they sailed from Ravenspur to Kinghorn. The Scots, under the earl of Mar, met them on Dupplin Moor, but their archers did such deadly work that the Scots fell back in disorder. The battle resulted in Baliol's temporary restoration.

**Dupré, Jules** (1811-89). French painter. Born at Nantes, April 5, 1811, he was the son of a potter,

Dupré. Typical landscape by Jules Dupré, French painter of the Barbizon school

who taught him to decorate his wares, but he was otherwise self-taught. His first landscape, a forest scene, was shown at the Salon of 1831, and he then began a life-long connexion with the Romantic group. His technique is imperfect, but he ranks high among the Barbizon school, excelling in his portrayals of the tragic aspect of nature. He died at L'Isle-Adam, Oct. 6, 1889.

**Dupuy, CHARLES ALEXANDRE** (1851-1923). French politician. He was born at Le Puy, Nov. 5, 1851, became a teacher, and entered politics as a Republican in 1885. He was thrice premier: April-Nov., 1893; May, 1894-Jan., 1895, this term including the murder of President Carnot; and Nov., 1898-June, 1899, a period of confusion owing to the Dreyfus case. In 1900 he was chosen senator for Haute-Saône. He died July 23, 1923.

**Dupuytren's Contraction.** A condition resulting from chronic inflammation of the palmar fascia, the dense fibrous tissues in the palm of the hand, leading to permanent flexion or bending of the fingers into the palm. It is most often seen in elderly males, and is sometimes associated with pressure on the palm caused by occupation. The disease may run in families. No cause is known. Surgical measures are the only form of effective treatment, but relief by cutting the fibres is usually followed by recurrence. The condition is named after Baron Guillaume Dupuytren (1777-1835), a French surgeon.

**Duquesne.** City of Pennsylvania, U.S.A., in Allegheny co. On the Monongahela river, it is 10 m. S.E. of Pittsburgh by the Pennsylvania rly. It manufactures iron and steel. Settled in 1885, it was incorporated as a borough 1891, chartered as a city 1917. Pop. 20,693.

**Duquesne, ABRAHAM, MARQUIS** (1610-88). French sailor. Born at Dieppe, the son of a naval officer,

he entered the merchant service, in which he saw much fighting in the war with Spain and won a high reputation. Peace having been signed with Spain, he obtained a

Marquis Duquesne, French sailor

high position in the Swedish navy, which he led to victory against the Danes near Gothenburg. Again in

France, he won glory in 1650 by compelling the surrender of Bordeaux. His greatest successes were his two defeats of the Dutch fleet in 1676—off Stromboli and in the Gulf of Catania, where de Ruyter lost his life, April 20. Duquesne died Feb. 2, 1688. *Pron.* Du-cane.

**Duralumin.** Important alloy of aluminium and one of the earliest heat-treatable non-ferrous alloys to be discovered (about 1909). Pure aluminium is not strong enough to be widely used for engineering work, but the addition of small amounts of other elements will give it properties similar to those of steel. A typical duralumin contains about 4 p.c. copper, 0.6 p.c. manganese, 0.6 p.c. magnesium, 0.5 p.c. iron, 0.5 p.c. silicon. As cast the alloy is brittle, but annealing at 350-400° C. softens it, so that it can be worked. More frequently it is forged, stamped, pressed, or rolled at about 450° C. Quenching keeps the copper, magnesium, silicon, etc., in solid solution; and the alloy remains soft and ductile. This solution, however, is supersaturated and, after ageing for some time at room temperature, the alloy becomes much harder because of precipitation of the minor constituents as compounds. Worked, quenched, and aged, duralumin will have a tensile strength about 27 tons per sq. in. and an elongation of 20 p.c. Its strength and lightness make it invaluable for aircraft construction. Resistance to corrosion is increased by coating with a thin layer of high purity aluminium. *See Alloy; Aluminium.*

**Dura Mater** (Lat., hard mother). Dense fibrous membrane which surrounds the brain and spinal cord. It is the outermost and the thickest of the meninges or three coverings of the brain. *See Brain; Meninges.*

**Durance.** River of France. It is formed by the union of three streams that rise in the Alps and unite near Briançon. It then flows in a S.W. direction through the departments of Hautes Alpes and Basses Alpes, afterwards forming the boundary between Vaucluse and Bouches-du-Rhône. It joins the Rhône below Avignon, its length being 220 m. The Durance is used to supply Marseilles with water. A canal extends from the river at Perluis to the city, a distance of 97 m.

**Durand, ASHER BROWN** (1796-1886). American painter and engraver. He was born of French

parentage at S. Orange, New Jersey, Aug. 21, 1796. Having studied art, he worked in painting portraits, history, genre, and landscape with fair success, and engraved Trumbull's picture *The Declaration of Independence*. He is known as the founder of the American National Academy. He died Sept. 17, 1886.

**Durango.** State of N.W. Mexico. It lies S. of the state of Chihuahua, and is mainly mountainous, paralleling the Sierra Madre, which penetrates the W. portion. Agriculture is carried on where possible, and timber, wheat, vegetables, cotton, and sugar are produced. The staple industry is mining, and silver, gold, copper, iron, and other minerals are worked, especially silver. Durango is the capital. Area, 42,272 sq. m. Pop. 483,829.

**Durango.** City of Mexico, the capital of Durango state. Originally called Guadiana, and sometimes known as Ciudad de Victoria, it stands in the Guadiana valley, 570 m. N.W. of Mexico city. The seat of a bishopric, it has a fine cathedral, a government palace, a public library, a college, and other buildings. A flourishing mining and commercial centre, its industrial establishments include cotton, woollen, sugar and flour mills, and foundries. Pop. 33,408.

**Durani.** Name bestowed by Ahmad Shah upon his native Abdali clan when establishing an empire in E. Afghanistan in 1747. It has since become the tribal name of the dominant Afghans. His attempted national fusion by associating Afridi, Mohmand, Orakzai, Yusufzai, and others under the appellation of Bar Durani failed.

**Duranty, WALTER** (b. 1884). Anglo-American journalist. Born May 25, 1884, he was educated at Harrow and Emmanuel College, Cambridge. He became Paris correspondent of the New York Times, and in 1921 went to Russia as correspondent of that paper. The ensuing years saw his daily dispatches and feature stories become widely popular, and he was awarded the Pulitzer prize in 1931 for the best piece of reporting of the year. His publications include *I Write as I Please*, 1935; *One Life, One Koppek*, 1937; *The Gold Train*, 1938; *The Kremlin and the People*, 1942, U.S.S.R., 1944.

**Durazno.** Dept. in Central Uruguay, S. America. It lies between the rivers Yi and Negro. The surface is diversified and the

Durazzo, Albania. View from the sea showing the landing place and, in the centre, the palace

soil fertile; many cattle, sheep, and horses are reared. Area, 5,525 sq. m. Pop. 95,148. The capital is San Pedro del Durazno, which is connected by rly. with Montevideo, 127 m. to S.S.E. It stands on the Yi. Products are grain and cattle. Pop. 15,000.

**Durazzo** or **DURRES**. Seaport of Albania, the ancient Dyrrhachium. It stands on the Adriatic, 60 m. S. of Scutari (Shkoder), and is now an inconsiderable place, but extensive ruins attest its former greatness. Founded 621 B.C. by Corinthian and Coreyean colonists under the name of Epidamnos, it was renamed Dyrrhachium by the Romans, who made it the port

opposite Brundisium on the W. side of the Adriatic, and later constructed from it the highway across the Balkans to Byzantium. In 1501 it passed to the Turks, who held it until 1913. On Good Friday, April 7, 1939, Italian troops landed at Durazzo during the invasion of Albania. Used as an Italian base port in the Italo-Greek war (Oct., 1940–April, 1941), Durazzo was bombed by the Allied air forces in 1940, during the Italo-Greek war, and in 1943. The town was liberated by Albanian partisans on Nov. 20, 1944. It is a port whose trade in oil, timber, and fruit is capable of much development. Pop. 8,739.

**Durban.** Commercial capital of Natal, S. Africa. The third largest city and the premier port in the Union, it is situated on the N. shore of a land-locked bay, and was founded in 1824 by the Dutch.

In 1835 it was occupied by British settlers, who named it after Sir Benjamin D'Urban, governor of Cape Colony. Covering an area of 70 sq. m., Durban is laid out on garden city lines and contains an impressive town hall, public library, museum, public gardens and parks, racecourses, magnificent promenade and marine drive, and is within easy distance of a number of fine bathing beaches. Durban is both a highly industrialised city and a popular holiday resort. Its harbour, 7 sq. m., ranks as one of the finest ports in the S. hemisphere. It is the chief port of entry for the rich gold centres of the Transvaal and Orange Free State, a gateway to the Natal hinterland, and the headquarters of a whaling industry.

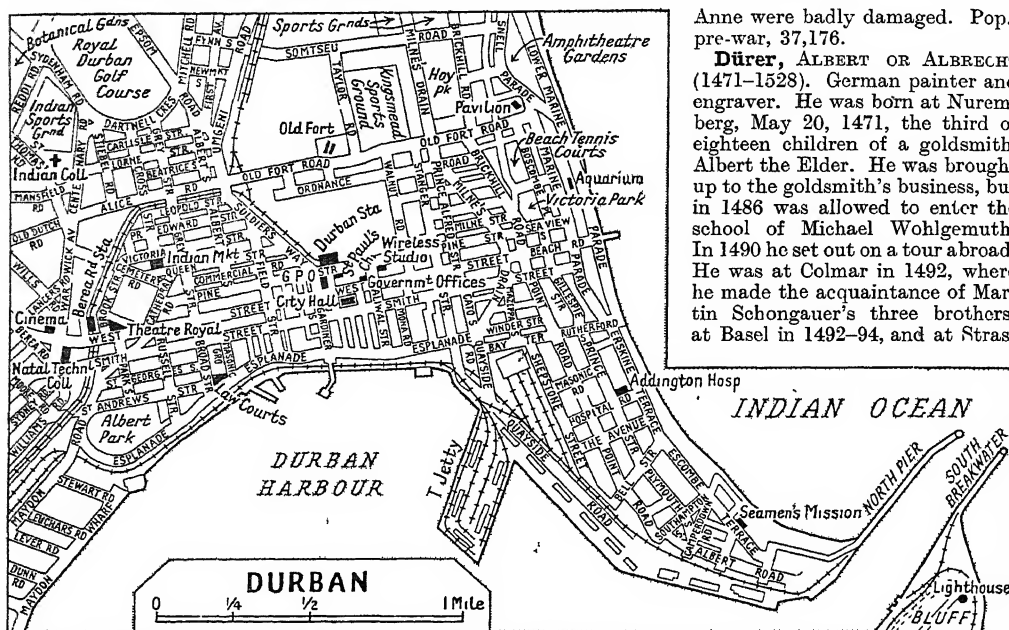

During the Second Great War Durban was an important staging point to the Middle and Far East, particularly in 1942, when the

Durban, Natal. 1. Esplanade and docks of one of the finest ports in the southern hemisphere. 2. West Street, an important thoroughfare. 3. Post Office, with its clock tower. 4. City Hall, erected in 1910

Durban, Natal. Plan of the city. Most of it lies on the N. shore of a landlocked bay, reached by a 450-ft. wide passage between a low sandy spit and a bold cliff, the Bluff, whose summit is 195 ft. above sea level

Mediterranean was closed to Allied shipping. More than 500,000 British troops passed through the port during the war, a large proportion of them being temporarily accommodated in a vast transit camp at Clairwood on the outskirts. The harbour, turned into a first class naval base, docked and repaired 6,000 vessels ranging from merchantmen to battleships. Over 5,000,000 tons of cargo were handled yearly. A new aerodrome was built at Reunion, 8 m. S. of the city. Pop. 357,304 (European 124,792). See Africa in N.V.

**Durbar** (Pers. *dar*, door; *bar*, admittance, court). Term used in India for the court, council, or council chamber of an Indian ruler, for an official reception or audience, or for a great state ceremony. Specially magnificent durbars were held at Delhi on the proclamation of Queen Victoria as empress of India in 1877 and of Edward VII and George V as emperor in 1903 and 1911 respectively. The last was attended by King George and Queen Mary in person.

**Durbin, DEANNA** (b. 1922). A Canadian-born U.S. film actress and singer. Edna Mae Durbin was born at Winnipeg, Dec. 4, 1922. With an extraordinary voice for a child, she made an instant impression in a short film, *Every Sunday* (in which Judy Garland appeared), in 1937, and the same year was starred in *Three Smart Girls*. She

was allowed to play completely natural rôles in *A Hundred Men* and *A Girl and Other Films*, singing both grand opera and light ballads. From 1940 she became the conventional Hollywood heroine of musical films, but kept her popularity. She essayed more sophisticated parts in *The Amazing Mrs. Holliday* and *Lady on a Train*.

**Durchmusterung** (Ger., examination). Name for the modern telescopic star catalogues. Among the more famous are the Bonn *Durchmusterung*, which enumerates 324,189 stars (Argelander), and the Cape *Durchmusterung* (Schönfeld and Gill), comprising 454,875 stars.

**Düren.** Town of Germany, in North Rhine-Westphalia, on the river Roer, 20 m. E. of Aix-la-Chapelle (Aachen). Its industries are chiefly textile manufactures, including cloth, carpets, etc., but paper and iron goods are also made. It has been a chartered town since about 1300 and was of importance much earlier. It was part of the duchy of Julich, and became Prussian in 1815. In the Second Great War the town hall and the church of S.

Anne were badly damaged. Pop., pre-war, 37,176.

**Dürer, ALBERT OR ALBRECHT** (1471-1528). German painter and engraver. He was born at Nuremberg, May 20, 1471, the third of eighteen children of a goldsmith, Albert the Elder. He was brought up to the goldsmith's business, but in 1486 was allowed to enter the school of Michael Wohlgemuth. In 1490 he set out on a tour abroad. He was at Colmar in 1492, where he made the acquaintance of Martin Schongauer's three brothers, at Basel in 1492-94, and at Stras-

bourg in 1494; he returned to Nuremberg to find that a marriage had been arranged for him with the daughter of Hans Frey, this being celebrated on July 7. The story told by Pirkheimer, Dürer's intimate friend, as to the greedy, idle, and passionately jealous disposition of his wife Agnes is neither borne out nor contradicted by Dürer's silence in regard to his married life.

In the winter of 1494-95 Dürer made his first journey to Venice, which appears to have been unfruitful. His second visit was undertaken late in 1505, at the invitation of the Nuremberg merchants established in the city, who desired him to take part in the decoration of their bourse, the *Fondaco de' Tedeschi*. During his sojourn, which lasted till 1507, he was cordially received by the nobles, philosophers, and poets; less cordially by the painters, of whom only Giovanni Bellini gave him the hand of friendship. He began in Venice *The Feast of the Rosary*. On his return to Nuremberg he produced the following paintings at short intervals: single figures of Adam and Eve, 1507; The

*Albrecht Dürer*  
Self-portrait

Massacre of Ten Thousand Christians, 1508; The Virgin with the Iris, 1508; The Adoration of the Trinity, 1511. Between 1512-19 he was in the service of the emperor Maximilian. In 1520-21 Dürer made a journey to the Netherlands, probably to obtain the continuance by Charles V of the pension granted him by Maximilian. On his return he devoted himself to unceasing labour until his death on April 6, 1528. He was buried in the graveyard of S. John Nuremberg, and his house there was made a Dürer museum.

His friend Melanchthon said of the artist that his least merit was his artistic genius; and the friends he attracted to himself. Luther, Melanchthon, and the rest, suggest the attractiveness of his personality and the extent of his culture. Dürer was less a painter than a designer; his colour is more truthful to the model than original or beautiful. But in power of design, in nobleness of imagination, in his application of scientific theory to practice, in the introspective quality of his portraits, he has few, if any, equals. As a copper-plate engraver he is supreme; one can cite *The Arms of Death*, 1503; *Adam and Eve*, 1504; *The Great Horse and The Little Horse*, 1505; *The Knight, Death, and the Devil*, 1513; and the series of *The Passion*, not to be confused with the woodcuts of *The Great Passion* and *The Little Passion*. His famous woodcuts include the series of *The Apocalypse*, 1497; the 20 scenes of *The Life of the Virgin*, 1511; and a number illustrating the writings of

Albert Dürer. Examples of the artist's engraving. Left, *The Arms of Death*, 1503; right, *The Great Horse*, 1505. See also Drawing illus.

Maximilian I. Dürer also published *Four Books on Human Proportion*, 1528. See illus. to *Book-plate*; *Charlemagne*; *S. Christopher*.

**Bibliography.** *Life*, W. B. Scott, 1869; *Life and Works*, M. Thausing, Eng. trans. ed. F. A. Eaton, 1882; *Literary Remains of A. D.*, W. M. Conway, 1889; *Life and a selection of Works*, F. Nuchter, Eng. trans. L. D. Williams, 1911; *Lives*, M. Friedlander, 1921; *P. de Colombyer*, 1927; *Complete Edition of Woodcuts*, ed. Kurth, 1927; *Albrecht Dürer*, A. Panofsky, 1944.

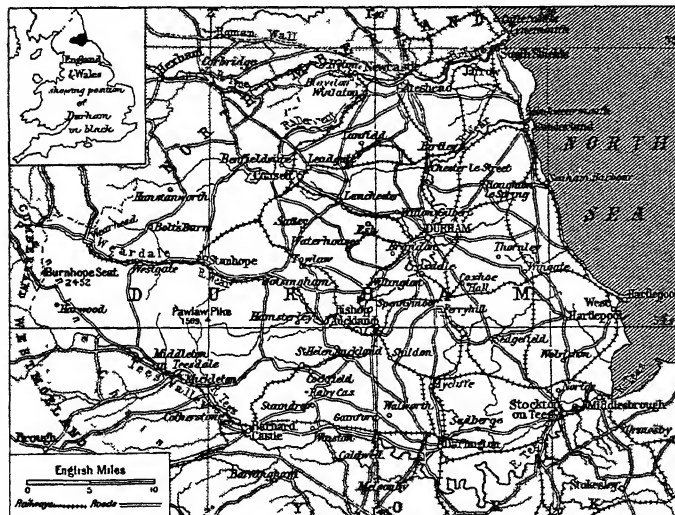

**Duress** (Lat. *duritia*, hardness). Term used in English law. It means compulsion by means of threats or imprisonment. The court will not allow anyone to retain the advantage of a gift or contract so obtained.

**D'Urfey**, THOMAS (1653-1723). English dramatist and song writer,

born at Exeter of Huguenot ancestry. His works comprise both tragedies and comedies, but the latter, which include *The Fond Husband*, 1676; *Squire Oldsapp*, 1679; and *Sir Burnaby Whig*, 1681, were the more popular. Like other dramatists of his time he was attacked by Jeremy Collier in his *Short View of the Immorality of the English Stage*. He was also a prolific writer of songs, of which two series were published, entitled *New Collection of Songs and Poems*, 1683; and *Wit and Mirth, or Pills to Purge Melancholy*, 1719-20. He won the favour successively of Charles II, James II, William and Mary, and Anne, but he died in poverty, Feb. 26, 1723. R. S. Forsythe published a study of his plays, 1916-17; C. L. Day of his songs, 1934.

**Durham**. County palatine and N.E. county of England. With about 33 m. of coast line, its area is 1,015 sq. m. Branches of the Pennine Chain, the highest summit of which is Burnhope Seat, 2,452 ft., enclose a series of fertile valleys in the W., whence the surface slopes away to the E. Immense coal-measures occupy the centre, annual production of coal being one-seventh of the U.K. total. The Wear, Tyne, and Tees, all navigable in part, are the chief rivers, and in the valley districts the soil is arable and well cultivated. In addition to coal, large quantities of lead, iron, limestone, millstone, granite, salt, etc., are obtained. The most attractive scenery is in the W., much of the central moorland being marred by industry.

Durham is noted for horses and shorthorn cattle, and sheep-rearing is carried on. Its manufactures include shipbuilding, sail-making,

Durham. Map of the coal-mining county of north-eastern England, notable also for its shipbuilding, ironworks, and manufacturing industries

and the production of chemicals, glass, woollens, and earthenware; there are also numerous blast furnaces, iron works, and machine shops.

Durham is the county town; the ports are Sunderland, Stockton-on-Tees, the Hartlepoons, Jarrow, and South Shields; other towns are Gateshead and Darlington. Apart from 8 for boroughs, the co. returns 10 members to parliament. Pop. 1,486,175. Durham formed part of the early kingdom of Northumbria. The regal authority of the bishops of Durham was finally withdrawn in 1836.

**LITERARY ASSOCIATIONS.** These start with the Benedictine monastery at Jarrow, founded by Benedict Biscop, but its greatest name is that of the Venerable Bede (*q.v.*), who was born near Wearmouth. Richard de Bury, author of *Philobiblon*, and bishop of Durham, died at Auckland and was

buried in Durham cathedral. At Stanhope, in Weardale, Joseph Butler, its rector, wrote *The Analogy of Religion*. Joseph Ritson, antiquarian writer, was born at Stockton; Elizabeth Barrett Browning at Coxhoe Hall. Scott's Rokeby has much about Barnard Castle and the upper Tees valley.

**Bibliography.** *The County Palatine of Durham: a Study in Constitutional History*, G. T. Lapsley, 1900; *Victoria Hist. of the County of Durham*, ed. W. Page, 1905-07; *Hist. and Antiquities of the County Palatine of Durham*, R. Surtees (1816-40), repr. 1908, etc.; Durham, A. Temple and G. Manley, 1942.

**Durham.** City, mun. borough, and county town of Durham, England. It stands on the river Wear, 287 m. N.N.W. of London, and has a railway station. The older part of the city is on and about a hill round which the river bends; the newer parts are on the other side of this.

The glory of Durham is the cathedral, and near it, on the river peninsula, is the castle. The present cathedral, which replaced an older one, was begun in the 11th century, and much of it is Norman; this includes the nave and the restored chapter house. The Galilee chapel

Durham city arms

(*q.v.*) is a notable feature, as are the central tower and the chapel of the nine altars. There are a valuable library and some relics of S. Cuthbert. The cloisters and other parts of the monastic buildings still exist. The first castle was built by William the Conqueror, but little of this remains. Much of the present building, which is the headquarters of the university, is old, and some portions are highly interesting.

Other objects of interest in the city are some of the churches and the bridges across the Wear,

especially Framwellgate, of the 14th century. Elvet Bridge, leading to the suburb of Elvet, is also old, and on it are still a few houses. The churches include S. Margaret's, S. Oswald's, S. Mary le Bow, S. Mary the Less, and S. Giles. The town hall dates from the 16th century. The grammar school is an old foundation; its present house dates from 1844. At Ushaw is the R.C. college of S. Cuthbert.

The city lives largely on the business brought by the presence of a cathedral, a university (founded 1833 by Bishop Van Mildert), and the county headquarters. It has some industries, including the manufacture of carpets, organs, soft drinks, and confectionery; also printing. There are many coal mines in the neighbourhood. Durham has been a chartered town since 1179, and is governed by a mayor and corporation. It was represented in parliament by two members from 1673 to 1885, and one until 1918, when the representation was merged in that of the county.

The city owes its origin to the monks of Lindisfarne, who looking for a place of safety.

Durham. Sanctuary knocker at the cathedral

Durham. The cathedral, seen from across the River Wear. The Lancet and Perpendicular work of the two western towers, and that of the central tower, is imposed upon the original Norman architecture, among the finest of its period in England

Photochrom

considered this to be such, and settled here in 995 with the bones of S. Cuthbert. A church was built which became a cathedral, the bishopric being removed hither from Lindisfarne. Market day, Sat. Pop. 19,370.

**Durham.** City of North Carolina, U.S.A. The co. seat of Durham co., it is 26 m. by rly. N.W. of Raleigh. It is the seat of Duke university, founded 1924, and of several colleges. The centre of a tobacco and cotton growing region, it makes cigarettes and textiles, also fire escapes. Settled in the 1850s, it was incorporated 1867. Pop. 60,195.

**Durham, JOHN GEORGE LAMBTON, 1ST EARL OF (1792-1840).** British statesman. Born April 12, 1792, he was the son of William Lambton of Lambton Castle, Durham, to whose estate he succeeded as a child. From Eton he entered the army, but forsook that service for politics, becoming an M.P. for the county of Durham in 1813. Prominent among the Whigs, to which party his family had been long attached, he advocated parliamentary reform. His enthusiasm as a reformer earned for him the popular name of Radical Jack.

In 1828 Lambton was made a peer, and in 1830 entered Grey's cabinet as lord privy seal. He had a large share in drafting the Reform Bill of 1832 and in the negotiations that preceded its passage into law. In 1833, differing from several of his colleagues he left office, but still held a strong position in the country. He was ambassador at St. Petersburg (1835-37), and then went as governor-general to Canada, after the rebellion of 1837. It is his work thenceforward that has chiefly endured. He was armed with unusual powers, which he exercised freely, but the result was hardly satisfactory. Brougham attacked him for sending eight rebels to Bermuda, and parliament decided that the step was illegal. Unsupported by the cabinet, Durham had no course but to resign, and to return to England.

Durham then prepared his famous Report on the Affairs of British North America (1839), described as "one of the greatest state papers in the English language," and certainly one of the most influential. Therein he advised the union of the two Canadas, responsible government, the building of an intercolonial rly., and other liberal measures

afterwards approved and carried out. He died at Cowes, July 28, 1840. In 1833 he had been made an earl, and his successor was his son, George. The title is held by his descendant John Frederick Lambton, 5th earl (b. 1884, succeeded 1929). *Consult* Life and Letters, S. J. Reid, 1906.

**Durham, MARY EDITH (1863-1944).** British writer. Born Dec. 8, 1863, and educated at Bedford College and the Royal Academy of Arts, she illustrated the reptile volume of the Cambridge Natural History. Early in the 20th century she travelled widely in the Balkans; a champion of the Albanians, she yet criticised some of their customs and condemned the blood feuds of the northern clans. During the Balkan War, 1912-13, she did relief work in Albania, publishing an account of her experiences, *The Struggle for Scutari*, 1914. Her other books, authoritative history of the Balkans, include *Twenty Years of Balkan Tangle*, 1920; *The Serajevo Crime*, 1925; *Some Tribal Origins. Laws, and Customs of the Balkans*, 1928. She was a fellow of the Royal Anthropological Institute. She died Nov. 15, 1944.

**Durham Light Infantry.** British regiment, of which the two battalions were formerly the 68th and 106th regiments of light infantry. The former was raised in 1756 as a 2nd battalion of the 23rd regiment, becoming

in 1758 a separate corps numbered the 68th. Organized as a light infantry regiment in 1808, it was called the 1st battalion Durham Light Infantry in 1881. The battalion fought in the West Indies in 1761, and was granted the motto "Faithful" for its services against the natives in St. Vincent. It took part in the ill-fated Walcheren expedition (1809), in the Spanish campaign of 1811, in which it earned distinction at Salamanca and Vittoria, and in the Crimean War it fought at Alma and Inkerman.

The 2nd battalion, raised in 1826, served in the Mahratta War 1844, and the Persian War, 1856. Other important service included the Maori campaign, the Egyptian War, 1885, and the South African War, when it fought at Colenso, Spion Kop, Pieter's Hill.

The D.L.I. raised 37 battalions in the First Great War, and served in France, Italy, Macedonia, Egypt, and Archangel. Amongst the battle honours gained were: Aisne, 1914, '18; Ypres, 1915, '17, '18; Hooge, 1915; Loos; Somme, 1916, '18; Arras, 1917, '18; Messines, 1917; Lys; Hindenburg Line, and Sambre. A memorial to the regiment was erected at Warlencourt, near Bapaume, where one of its battalions put up a desperate resistance during the first battle of the Somme in 1916. The regiment helped to crush the attempted invasion of India by Amanullah, Ameer of Afghanistan in 1919.

D.L.I. served in all theatres of the Second Great War. In the North Africa campaign, units were attached to the 50th division and earned particular distinction at Gazala and Mersa Matruh. In the Italian campaign they were at the crossing of the Volturno, in the Monte Cassino attacks, and in the bitter battles of the Gothic Line. The regiment participated in the invasion of Normandy in 1944 and served throughout the campaigns on the Continent. The depot is at Newcastle-upon-Tyne.

**Durham University.** English institution of higher learning, founded in 1832. Its constitution was modified in 1908, when it was divided into two parts, one at Durham and the other at Newcastle-upon-Tyne. Originally it was a Church of England society, and the Durham division still remains so, its colleges being mainly occupied in preparing candidates for the Anglican ministry. These are University College,

and three halls—Bishop Hatfield's, S. John's, and S. Chad's—and the dean and chapter of Durham are the governors. There is also a hostel for women students, and women are admitted to all degrees except the theological.

The Newcastle division consists of King's College, constituted in 1937 by the merger of Armstrong College with the college of medicine. The former was founded in 1874; the latter, dating from 1832, was united with the university in 1852, and removed to new buildings opened by George VI in 1939.

The university has seven faculties: arts, letters, theology, law,

Durham University arms

medicine, science, and commerce. Except theology and Oriental languages, King's teaches all the normal university subjects and is the only provincial university institution which adds to these all the six special subjects of fine art, architecture, Romano-British archaeology, agriculture, naval architecture, and mining. The concentration of university and hospital teaching in one central group of buildings at Newcastle was completed by the establishment of the dental department of the medical school and the dental hospital (founded 1895) in the grounds of the Royal Victoria infirmary. The buildings were opened in 1931 under the name of the Sutherland dental school. Instruction in forestry is given at Chopwell; there are two stations, Cockle Park and Offerton Hall, for agricultural research, as well as a marine biological station at Cullercoats. Codrington College, Barbados, is affiliated to Durham university.

**Durian** (*Durio zibethinus*) Large evergreen tree of the family Bombacaceae. It is a native of Malaya and the Indian Archipelago. The prickly fruit, as large as a man's head, is greatly esteemed by the Malays and Chinese, but for Europeans it is an acquired taste. At the right point of ripeness it is a sort of vegetable custard, and equal to the finest nectarines and pears. But it has an indescribable odour which fills many with disgust, though its flavour is most tempting to the palate.

**Durra.** Name for the seeds of Indian millet (*q.v.*), also known as Guinea corn.

**Durres.** Albanian seaport, described in this work under its Italian name, Durazzo (*q.v.*).

**Dursley.** Parish and town of Gloucestershire, England. It is 15 m. by rly. S.S.W. of Gloucester, and stands at the foot of the scarp of the Cotswolds. It makes Diesel and petrol engines, carpets, and agricultural and electrical machinery. Pop. 5,355.

**Duruy, JEAN VICTOR** (1811-94). French historian. Born in Paris Sept. 11, 1811, he became a professor at the École Henri IV, and produced in 1843-44 his *Histoire des Romains* (rev. and Eng. trans. 1883-86). Minister of public instruction 1863-69, he did much to reorganize the system of education, setting up the *conférences publiques* which still exist. Elected to the academy in 1884, he died Nov. 25, 1894.

**D'Urville Sea.** Portion of the Antarctic Ocean. It lies off Adélie Land, on the Antarctic Circle, in long. 140° E., and contains Commonwealth Bay. It was named after the French explorer, Dumont d'Urville (1790-1842), by the Mawson Antarctic Expedition of 1911-14.

**Duse, ELFONORA** (1859-1924). Italian actress. She was born in a rly. carriage near Venice, Oct. 3, 1859, to parents who belonged to a travelling company. At the age of four she appeared in *Les Misérables*; at 14 she played Juliet at Verona. Her first success came in 1878 and the next year she was a leading player in Rossi's company, winning at Florence further success as Frou-Frou. As Marguerite Gautier in *La Dame aux Camélias* at Rome, 1883, she was recognized as one of the greatest living actresses a reputation confirmed by her subsequent performances at Vienna, Berlin, London, New York, and in South America. Her finest impersonations, mostly tragic or highly emotional characters, included Magda, *La Tosca*, Santuzza in *Cavalleria Rusticana*, Mirandolina in *La Locandiera*, Paula in *The Second Mrs. Tanqueray*, Nora in *A Doll's House*, and the heroines in several of d'Annunzio's dramas written for her. She retired before the First Great War, reappeared in London in 1923, and died at Pittsburgh April 21, 1924. Among Lives, that by Arthur Symonds, 1927, may be noted.

**Dusius.** Demon among the ancient Gauls mentioned by S. Augustine. It was suggested by John Brand (1744-1806), in his *Observations on Popular Antiquities* that the exclamation, Deuce, commonly accepted as signifying the devil, is really derived from the name of this Dusius. See Demonology.

**Dussek, JOHANN LADISLAUS** (1761-1812). Bohemian pianist and composer. Born at Caslov Feb. 9, 1761, the son of a musician, he studied music at Iglau and Prague and gained a great reputation as pianist, composer, and

teacher. He was successively organist at Mechlin, Bergen-op-Zoom, and Amsterdam. After 1786 he was a fashionable pianist and teacher in Paris, and from 1790 to 1800 in London, which he left to avoid his creditors. He was afterwards in the suite of a Prussian prince and later in that of Talleyrand. He died March 20, 1812. The playing of Dussek was distinguished by its beauty of tone, and he was a prolific composer of music for the pianoforte. *Pron.* Dooshek.

**Düsseldorf.** City and most densely populated district of Germany. The city stands on the right bank of the Rhine, at the confluence of the Düssel, 24 m. N.N.W. of Cologne. Its importance in modern times was derived from two factors: it was first developed as an outstanding art centre under the Palatinate electors to whom it belonged until 1795, and then was chosen as a business and residential centre by industrial magnates of the Ruhr. The number of inhabitants grew from under 20,000 in 1815—when it was ceded to Prussia—to 213,000 in 1900, and 539,905 in 1939.

Around the old, inner town, with narrow, winding streets and picturesque remnants of the Middle Ages, Düsseldorf stretched in broad and impressive areas, with beautiful parks, including the Hofgarten, in a crescent of about 4 m. diameter round a bend of the river. Old buildings were the church of S. Lambert (1294-1394), a tower of the old ducal palace (1290-99), S. Andrew's (1622-29), the Reformed Church (1648), S. Maximilianus (1659), the town hall (1567, renewed 1737). But most of the buildings laid waste by numerous bombing attacks during the Second Great War were of modern origin; e.g. the Wilhelm Marx House, the first German skyscraper, the academy of art, art gallery, law courts, some 30 churches (mostly R.C.), branches of all the great banks of Germany, and administrative buildings of the big industrial combines.

Several huge bridges—all destroyed during the Second Great War—linked Düsseldorf with its western suburbs. Its wide squares and parks were adorned with good monuments, e.g. of Wilhelm I, Bismarck, Moltke, and of the painters Cornelius and Schadow under whom a century ago its art school won international fame. Düsseldorf was famous for its gay life, masked balls, and theatre; it owed much of its reputation to

Eleonora Duse,  
Italian actress

Düsseldorf, Germany. Pre-war air view of the city, showing the bridge over the Rhine which was built during 1896-98

its greatest son, the lyric poet Heine. Though it lost many art treasures when the electors moved to Munich, it still harboured a precious collection and held frequent exhibitions. Economically it was the heart of world-wide iron and steel industries, and had in its suburbs local industries in tubes, engineering, wood, chemicals, and food. It was because of their importance for armaments that Allied bombers nearly wiped out the city in the Second Great War.

Mentioned first in 1159, Düsseldorf was raised to a town by Count Adolf of Berg in 1288, and to a princely residence in 1511. It fell in 1609 to one of the Palatine counts, later electors, of whom Johann Wilhelm founded the art gallery and the new town, and Karl Theodor in 1767 created medical and law colleges, a library, and an academy of painting. It was captured by the French in 1795, and added to Prussia in 1815. The French occupied it 1921-25. Troops of the U.S. 1st army entered Düsseldorf, April 18, 1945. In 1946 it was designated capital of the new province of North Rhineland and Westphalia.

**Dust.** Name generally applied to the microscopic, insoluble particles dispersed throughout the atmosphere. These solid particles may be present as products of imperfect combustion of fuel, grains of sand swept up by winds from the desert, vegetable and animal residues, or mineral material from the disintegration of rocks in the earth's surface. An increase in the solid (as well as the liquid) content of the air produces an increase in atmospheric obscurity, which eventually results in haze or smoke fog. In perfectly clean air

objects above the horizon may be visible at distances up to 100 m.

Certain particles of matter act as nuclei upon which water vapour condenses with resulting formation of cloud and rain. In 1880, a Scotsman, John Aitken, devised an instrument to count the number of such nuclei present in air by utilising this discovery of the conditions necessary for change of state from vapour to liquid in the atmosphere. Measurements with Aitken's apparatus have since demonstrated that the numbers of these condensation nuclei vary over enormous limits. Four million per cu. cm. have been observed in a city, and only two for the same volume over the ocean. These nuclei consist of smoke and sea spray, as well as dust from the earth's surface.

Volcanic dust is composed of minute mineral fragments ejected during volcanic eruptions. Sometimes called ash, it comprises the pulverised forms both of lava and of sedimentary rock dislodged from vent-walls. The distance from the originating centre at which any particle settles on land or sea is determined by the relation of its mass and maximum elevation to the force and duration of the wind.

Dust from the great Iceland eruption of 1783 destroyed the crops in Caithness, Scotland. After the eruption of Soufrière, St. Vincent, in 1812, 3,000,000 tons of dust fell 100 m. away on Barbados in May. The Tomboro eruption in Sumbawa, 1815, distributed 50 cubic m. of material—185 times the mass of Vesuvius—over 1,000,000 sq. m. The most impalpable particles may float in the upper air for long periods, being indeed a predominant source of

atmospheric dust everywhere. At Krakatoa, Malay archipelago, Aug. 26-27, 1883, the dust-column, rising to 17 m., caused darkness for 150 m. around. Some of it completed the circuit of the earth in 15 days, and remained floating at high elevations for three years in a belt between 60° N. and 10° S., producing remarkable sunsets seen in all parts of the world.

Vast areas in Nebraska and Kansas, U.S.A., are covered with ancient volcanic dust up to 30 ft. thick. When such deposits, formed in geological time, are subsequently consolidated, they are called tuffs. Submarine eruptions are attended by similar phenomena, producing volcanic muds.

The inhaling of dust is responsible for chronic disease of the lungs and air passages, a condition termed pneumokoniosis, increasing susceptibility to tuberculosis. Those most frequently affected are miners, quarrymen, earthenware and pottery workers, cutlers, file makers, etc. The evil is reduced to a minimum by efficient ventilation, the use of hoods which prevent the dust from rising to the worker, or outlet shafts which draw it away as formed. In some processes it is possible to keep the dust down by sprinkling with water. The wearing of respirators is also of value. See Haze; Pollution. Consult Dust, S. C. Blacktin, 1934.

**Dust Bowl.** A region in the Great Plains of U.S.A., E. of the Rocky Mts., where the combination of a series of abnormally dry years and intensive ploughing has destroyed the original protective grass and humus cover and has laid bare the unconsolidated soil beneath to wind erosion. Somewhat similar conditions are found in parts of E. Africa, where large herds of cattle are destroying the grass cover, and also in Australia. See Soil Erosion.

**Dust Figures** OR LICHTEBERG FIGURES. These are obtained by imparting an electrical charge to a point electrode located just above an insulating surface which is covered with a badly conducting powder such as lycopodium dust. The nature of the discharge from the point is made evident by the form assumed by the powder, and varies according to whether the point is positively or negatively charged.

**Dust Precipitation.** Term for the removal of dust particles in the waste gases passing up the chimney stacks of industrial plants, e.g. cement factories, mines, etc. A potential of about 50 kv. is main-

tained between a central conductor CC and a concentric conductor DD, and on becoming charged the dust particles are attracted to the electrodes. The latter are periodically shaken to loosen the precipitated dust, which is removed from the bottom of the stack as indicated in the diagram.

**Dust-storm.** A phenomenon produced by the passage of a very turbulent, though not necessarily very strong, wind over dry sandy or dusty soil. The arrival of a major dust-storm is usually marked by a wall of dust which may extend upwards for several thousand feet. In such storms visibility is greatly reduced. The distance to which dust derived from the desiccated surface of exposed soil is transported is determined by the force and duration of the wind. Local air-eddies which raise "March dust" are dust-storms in miniature. They especially characterise the dry desert-winds of wide, arid regions, occurring generally in thundery weather. The result of dust-laden wind-drift long continued is seen in such deposits as the clayey loess, sometimes 2,000 ft. thick, of N. China.

In central Asia the noonday sun is often obscured by fine, yellow loess-dust. On April 2, 1892, a dust-cloud, mostly of loess feldspar, covered 2,000 m., and was driven 400 m. out into the China Sea. The Sahara is another area subject to dust-storms. A storm of March 9-12, 1901, transported 1,800,000 tons of fine Saharan dust across Europe towards Russia.

In the Sudan the name *haboob* is applied to the whirling dust-storms which frequently occur. Amongst the winds which give rise to dust-storms are the *khamisin* of Egypt, the *sirocco* of the Mediterranean lands, the *harmattan* of N.W. Africa, and the *simmoom* of the African and Arabian deserts. See *Sandstorm*.

**Dusun.** Primitive people of Indonesian stock living in N. Borneo. Numbering 117,482, they form the largest sub-division of the Murut group. They have absorbed an immigrant Chinese strain, and adopted buffalo-drawn ploughs and irrigation. Tall, slender, long-headed, they are darker than the land Dyak of the Klemantan group.

**Dutch Auction.** Auction at which the property is offered at a price higher than the seller will accept. The price is lowered until a purchaser bids, when the lot is at once knocked down, or sold, to him at the sum last mentioned by the salesman. See *Auctioneering*.

**Dutch Church, THE.** Predominant Protestant church in the Netherlands. Holland was the first country in Europe to accept the principle of toleration for all forms of religion, and to subsidise out of the state funds all religious denominations which were willing to accept its bounty.

At the time of the Reformation Protestantism assumed the form of what is known today as the Reformed Church. From 1648 to 1795 it was recognized as the state church of Holland. After the Revolution all churches received equal recognition, but the Reformed Church never lost its prestige. It is the church to which the queen belongs. The constitution of the Dutch Reformed Church is based on the Presbyterian model. Each local congregation is governed by a consistory composed of deacons and elders. The local churches are grouped into 1,430 parishes and 44 *classes* or presbyteries. From these 10 provincial synods are formed, and in addition there is a general synod representing the whole country composed of 19 members, which acts as a final court of appeal.

The theology of the Dutch Church has always been Calvinistic, its creed having been based originally upon the Confession of Faith of the Synod of Dort, 1619; but strong humanistic philosophical currents from abroad managed to force their way into the actual theology of the church, as a result of which, though the majority of the members remained orthodox, a minority retained its position within the church only owing to the fact that the authority of the general synod was substituted for that of the scriptures. Schismatic movements ensued in 1834 and 1886, resulting in the establishment of the Reformed Churches of the Netherlands, essentially Calvinistic as to creed and organization.

The Dutch Reformed Church joined the other denominations in resistance to the Nazi occupation authorities (1940-45): in addition, it insisted that the prayer for the queen, as legal head of the church, should be used regularly. After the Second Great War, the general synod revised its opinion on its own

authority and decided to try to re-constitute the church on its original creedal basis. The church has over 2,700,000 members in the Netherlands, and its influence in the Dutch empire and in South Africa is extensive.

**DUTCH REFORMED CHURCH IN THE U.S.A.** The earliest Dutch settlers in America carried with them the religious principles of the Reformed Church founded in Holland after the Reformation, and a church was organized in 1628, gradually strengthened by the stream of immigrants.

The church was at first served by ministers from Holland, and was regarded as forming part of the presbytery of Amsterdam. In the 18th century, however, the American church sought and with some difficulty obtained its independence and its right to educate and ordain its own ministry. Some secessions took place as the result of the new policy, but the breach was subsequently healed, and in 1812 a constitution was adopted which still remains in force. In its polity the American church adopted the Presbyterian mode of church government used in the mother church in Holland (with some minor modifications), with its consistory for the local church, its presbytery or *classis* for the district, and its synod for the province. The doctrinal basis of the church is strongly conservative and Calvinistic, being based on no fewer than five creeds: the Apostles', the Nicene, the Quicumque Vult, the Belgic Confession (1561), and the canons of Dort (1618-19). The Heidelberg Catechism (1560) is used as a manual of doctrine, and acceptance of its statement is required of all seeking membership of the church. The Dutch Reformed Church has its main strength in New York.

**Dutch East Indies.** These former colonial possessions of the Netherlands are described in detail under *Indonesia*.

**Dutch Harbour.** United States naval and air base on Fox Island, one of the Aleutian group of islands, Alaska. On June 3, 1942, the Japanese raided Dutch Harbour from the air and did considerable damage. See *Aleutian Islands*.

**Dutch Liquid** or **ETHYLENE DICHLORIDE** ( $C_2H_4Cl_2$ ). Heavy oily liquid with a sweetish taste and pleasant smell, similar to chloroform. Discovered in 1795 by four Dutch chemists, it is prepared by the direct combination of ethylene and chlorine. It is a relatively

Examples of the kinds of picture most favoured by the school: portrait group, homely genre, landscape, coastal seascape, and cattle picture. 1. The Syndics of the Guild of Clothmakers, Rembrandt (Ryks Museum, Amsterdam). 2. Courtyard of a Dutch House, de

Hooch (National Gallery, London). 3. The Music Lesson, Metsu (Nat. Gall.). 4. The Forest, van Ruysdael (Louvre, Paris). 5. Village with Waterfalls, Hobbema (Nat. Gall.). 6. The Meadow, Paul Potter (Louvre). 7. Coast Scene—Calm, W. van de Velde (Nat. Gall.)

**DUTCH SCHOOL OF PAINTING: TYPICAL 17th CENTURY MASTERPIECES. See next page**

inexpensive solvent for oils, fats, waxes, certain resins, and gums, and when mixed with about one-third of its volume of carbon tetrachloride is used as a non-inflammable insecticide in vapour form. It has been used as an anaesthetic.

**Dutch Metal.** Alloy of copper and zinc, and therefore technically a brass. The proportion of the copper may range from 77.75 to 84.5 p.c. The colour varies from a pleasing pale yellow to a dark yellow, according to the proportions used. It is a very ductile metal and much used in the preparation of Dutch gold leaf, which is made by rolling down small cast bars to ribbon, beating under a steam hammer to a certain thinness, annealing, pickling in dilute sulphuric acid, boiling in solution of argol, washing and drying, and then beating with hand hammers, as in the manufacture of gold leaf proper. Dutch leaf is largely used for gilding purposes, being much cheaper than gold; while its colour can be preserved for a long time by painting with transparent lacquer. The colour is sometimes changed to red, violet, or green, or other shade by adding to the lacquer a small quantity of pure aniline dye. *See Alloy; Brass.*

**Dutch School of Painting.** Name given by critics and historians of art to describe particularly the Dutch painters of the 17th century. Their works, though varying greatly in quality, possess certain common characteristics distinguishing them from those of contemporary painters in other European countries, e.g. Italy or Spain, and indeed from Netherlands painting of earlier or later periods. This unique flowering of artistic genius was contemporaneous with, and expressive of, the sturdy growth of the Dutch republic. Individual painters with remarkable gifts of craftsmanship followed one another in almost bewildering profusion, each contributing something to the development of the "school." Yet by the 18th century the impulse had spent itself: not one Dutch painter of any note arose to take the place of the famous 17th century masters.

The thriving Dutch merchants, whose churches were plain and unadorned, lavished their love of beauty upon their homes; and the painters, who were their neighbours and fellow townsmen, were ready to paint, at a modest remuneration, suitable pictures for those homes. Thus, in contrast to

the great altarpieces and frescoes of the Roman Catholic countries, Dutch pictures tended to be small "easel" pictures intended for small rooms. Their subject matter was mostly restricted to homely themes based on the familiar life of the period and place, themes such as their purchasers best understood. The three most popular classes were local landscapes or seascapes; portraits, either of individuals or of official groups (*doelen* pictures), e.g. Rembrandt's *The Syndics* (*see illus.*); and scenes of everyday life in homes, courtyards, streets, farms, inns, and churches. Paintings in the last group are known as *genre* paintings.

In short, whereas in Italy art was the handmaid of the church and the wealthy noble, in the 17th century Holland it ministered to the pride of the bourgeois in his country, his house, and his possessions. The Dutch school neither attempted nor produced any great mythological, heroic, historical, or religious painting. Rembrandt's *Madonna and Child*, for example, is a literal representation of a Dutch peasant woman sitting by a Dutch crib, and is treated almost as objectively as his equally fine painting of a flayed ox hanging outside a butcher's shop.

Nor was there any encouragement to the painter to interest himself in purely aesthetic problems. Rembrandt's attempt to introduce artistic values into a *doelen* picture commissioned by a company of the Civic Guard was the initial cause of his financial disaster. Nevertheless, many painters of the Dutch school from Rembrandt and Vermeer downwards evinced an enthusiastic preoccupation with problems of *chiaroscuro* and the rendering of light, especially in painting interiors. For the rest, they were content to apply their superlative craftsmanship to an interpretation of life as their bourgeois patrons saw it.

Four men dominate the school: Rembrandt (1607-69), the greatest artist in paint the world has known; Frans Hals (1580-1666), whose portraits have a vitality and a mastery of technique which place him in a class by himself; Jacob van Ruisdael (1625-82), the most profound of landscape painters; and Jan Vermeer of Delft (1632-75), whose rendering of the subtleties of light in portrait, *genre*, and landscape, place him among the world's greatest craftsmen.

Other famous names are those of Gerard Terborch (sometimes called the "pocket Velazquez"), Gabriel Metsu, Pieter de Hooch, Jan Steen, Adrian Brouwer, Nicolas Maes, Gerard Dou, all *genre* painters; Albert Cuyp, Hercules Segers (originator of the "bird's-eye view"), Aart van der Neer, J. van de Capelle, Meindert Hobbema, all landscape painters; Ludolf Bakhuizen and Willem van de Velde, painters of seascapes and shipping; and Paul Potter, painter of cattle. They and many others have sometimes been known, from their limitations of scale and subject, as the "little masters." Biographies of most of them are in this encyclopedia.

Echoes of 17th century painting are discernible in the work of later Dutch painters, e.g. Josef Israels (1824-1911) and the three brothers Maris—Jacob (1837-99), Matthew (1839-1917), and William (1843-1910); but otherwise the later story of painting in the Netherlands is merged in the mainstream of European art history and no longer constitutes a particular school. *Consult Dutch Painting, R. H. Wilenski, new ed. 1945. See illus. in preceding page.*

Gordon Stowell, A.R.C.A.

**Dutch Wars.** Name usually given to three naval and commercial wars between England and the United Provinces (Netherlands) in the 17th century. The first, during Cromwell's government, broke out in spring, 1652, as a consequence of trade rivalry, the recently passed Navigation Act, the English insistence on the right of search, etc. It was notable chiefly for the exploits of individual commanders like Blake and Tromp. The Dutch suffered severely from the effects of blockade, but the war roused little popularity in England except in the fleet and the mercantile classes, and peace was concluded in April, 1654.

The second Dutch War, March, 1665-July, 1667, springing from similar causes, was remarkable for the English victory off Lowestoft in the four days' battle at the beginning of June, 1665, and the episode in which de Ruyter sailed up the Medway and burnt shipping in Chatham harbour. It gained in interest later through the diary of Pepys, at that time at the Navy office. By the treaty of Breda, New Amsterdam (subsequently renamed New York), captured in 1664, was confirmed in English possession.

Charles II committed England to the third Dutch War in March, 1672, according to the terms of his

alliance with Louis XIV of France. This war was even more disliked than the first: and pressure by the country interests in parliament brought about its conclusion in Feb., 1674.

**Dutch West Indies.** These former colonial possessions of the Netherlands are described under the headings Curaçao; Surinam.

**Dutra, ENRICO GASPAR** (b. 1886). Brazilian soldier and politician. After a distinguished career in the army, he became minister for war in 1937 under President Vargas. He was responsible for modernising the army and organized the expeditionary force which fought with the Allies in Italy in the Second Great War. In Dec., 1945, Gen. Dutra stood as Social Democratic candidate for the presidency and was elected by a majority of over 1,000,000 votes, the first president chosen by popular vote since 1926. His term was inaugurated Jan. 31, 1946. While a new Brazilian constitution was being drawn up, he governed by presidential decree.

**Dutt, MICHAEL** (1824-73). Bengali poet and dramatist, properly Madhu Sudan Datta. Born Jan. 25, 1824, at Sagandari village, Jessore district, Bengal, he was sent to the Hindu College, Calcutta, at the age of 13. Six years later, objecting to a marriage that was being arranged for him, he ran away, forsook his caste, and became a Christian. He then completed his education with four years at the Bishop's College. His first book, *The Captive Ladie* (1849), in English verse, though containing much that was remarkable in one writing in a foreign tongue, was less notable than his subsequent poetry written in Bengali. His *Sermista* (1858) and *Ratnavali* (1859) are the first examples of classical and regular drama in Bengali. Of both of these he made English translations.

His other poems include two great epics in blank verse, *Tillotama* (1860) and *Meghanad badh Kavya* (1861), the latter being described by a compatriot critic (R. C. Dutt) as the greatest literary production of its century. His name has become a household word among the people of Bengal, and he is by common consent regarded as the chief master in modern Bengali literature. He died June 29, 1873. *Consult*: *The Literature of Bengal*, R. C. Dutt, 2nd ed. 1895.

**Dutt, ROMESH CHUNDER** (1848-1909). An Indian statesman and author. Born in Calcutta, Aug.

13, 1848, and educated at the Presidency College, Calcutta, and University College, London, he was called to the bar at the Middle Temple, 1871. A member of the Indian civil service, 1871-97, he was the first native divisional commissioner. Of Baroda he became revenue minister, 1904-07, and prime minister, 1909. Made a C.I.E. in 1892 for his administrative and literary work, he was author of a *History of Civilization in Ancient India*, 1889-90; condensations in English verse of the *Mahabharata* (1899) and *Ramayana* (1900); books on the economic history of India; and a number of historical and social novels in Bengali. He died Nov. 30, 1909. *Consult* *Life and Work*, J. N. Gupta, 1911.

**Duval, CLAUDE** (1643-70). Franco-British highwayman. He was born at Domfront, Normandy, came to England at the Restoration in the train of the duke of Richmond, took to the road, and became notorious for his daring robberies and for his gallantry. He was captured while drunk in a London tavern and executed at Tyburn, Jan. 21, 1670. He was buried in Covent Garden church. Duval is the subject of a well-known picture by W. P. Frith.

**Duveen, JOSEPH DUVEEN, BARON** (1869-1939). British art patron. The son of Sir Joseph Duveen (v.i.), he was born Oct. 14, 1869. He became president of Duveen Brothers and a trustee of the National Gallery, the Wallace collection, and the Imperial Gallery of Art. He founded the British Artists' Exhibitions organization for the encouragement of less known British painters; the establishment of the Courtauld institute of art in 1930 was in part due to his generosity; he endowed a chair in the history of art at London university; and additions were made at his expense at the National Gallery and National Portrait Gallery. He was knighted 1919, made a baronet in 1926, and a baron in 1933. He died May 25, 1939, leaving no heir.

**Duveen, SIR JOSEPH JOEL** (1843-1908). An Anglo-Dutch art dealer. Born in Holland of Dutch parentage, he started as an antique dealer in Hull in 1865. In 1877, with his brother Henry, he founded in New York the art-dealing firm bearing their name. Opening in London in 1879, the firm quickly became noted for its discrimination and ability, among its famous purchases being the Kahn collection of old masters for nearly

£2,000,000. Duveen presented the Turner wing to the Tate Gallery (opened 1910), and many works of art to the national collections, and was knighted in 1908. He died at Hyères, Nov. 9 that year.

**Duveyrier, HENRI** (1840-92). French explorer and geographer. Born in Paris, Feb. 28, 1840, he travelled in the desert hinterland of Algeria and Tunis, reaching as far S. as El Golea and Ghadames (1859-61). This exploration work secured his appointment, in 1867, as secretary of the Société de Géographie. In 1874 he resumed his exploration of French N. Africa. His published works include *Exploration du Sahara: Les Touareg du Nord*, 1864; *La Tunisie*, 1881; *Le Transsaharien*, 1889-90; *Sahara Algérien et Tunisien*, 1905. He died April 25, 1892.

**Dux** (Lat., leader). Word sometimes used, especially in Scotland, for the head boy of a school.

**Dvina, NORTHERN.** River of Russia, in the northern region of R.S.F.S.R. It is formed by the union of the Sukhona and Yug. Flowing N.W. by Archangel, chiefly through level, marshy districts, it discharges itself into the White Sea by five mouths. It is navigable in summer throughout its entire length of about 460 m., but the shoals at the mouth are a nuisance to traffic. Fish abound, especially a kind of cod (*navaga*).

**Dvina, WESTERN, OR DUNA.** River of Russia. It rises in the lakes and marshes of the Valdai plateau in Kalinin region of R.S.F.S.R., flows S.W. and then N.W., across White Russia S.S.R., traverses Latvia S.S.R., and falls into the Gulf of Riga, 9 m. below Riga. It is about 640 m. long. As it forms a connexion with the Baltic and Black Seas through the Beresina canal it is used for timber transport, partly floated and partly by boat.

**Dvina, BATTLES OF THE.** Fought between Russians and Germans, 1915-16. The first battle took place Aug.-Sept., 1915. The German armies arrayed against the Western Dvina belonged to the army group commanded in person by Hindenburg. Mitau (Jelgava) had been taken on Aug. 1, and on Aug. 5 the Germans were only 10 m. from Riga, and preparations for evacuating the city were being made. A naval attack on the port was definitely repulsed by Aug. 21, and all attempts on the land side failed, but the Germans, after heavy fighting, moved forward towards Jacobstadt and Daugavpils (Dvinsk). They were

driven back, but were advancing again on the 24th. About Aug. 28 Below (*q.v.*) began a great assault on the line of the Dvina, with Friedrichstadt as his chief objective.

On Sept. 2 German cavalry stormed the bridgehead near Lennewaden, N.W. of Friedrichstadt, and next day the Russians were found to have withdrawn from the Friedrichstadt bridgehead. S. of that town the Germans advanced towards Jacobstadt, stubborn actions being fought. By about Sept. 13 the battle had died down, the Russians withdrawing to Podbrodzie, the purpose of the Germans being to participate in the operations against Vilna.

The second battle was fought during Jan.-Aug., 1916. At the beginning of the year the Russian line was virtually that established at the end of Sept., 1915, after the Russian retreat from Warsaw. On May 11 Hindenburg launched an ambitious but abortive offensive against the Russian positions at Selburg on the Mitau-Jacobstadt rly. Another attack was launched at the beginning of June against the sector to the S. of the station of Neu Zelburg, N.W. of Jacobstadt. Henceforth Galicia became the critical area of the Eastern front, and with the repulse of a Russian attack in the Dvina sector at the end of Aug. the second battle died down.

Germany attacked Russia on June 22, 1941, one offensive having Leningrad as its objective. Advancing through the Baltic States the invaders stood on the Dvina between Daugavpils and Riga on July 1. A fierce battle ensued for the river crossings, which were forced on July 3-4. The Russians held the line of the river in the Polotsk sector until July 11, when they withdrew to avoid encirclement, Vitebsk being captured by German units next day.

In the Russian summer offensive of 1944, five German divisions were encircled and annihilated at Vitebsk, the town being stormed by Russian troops on June 26. The principal bridges over the Dvina were captured intact; and Polotsk was seized on July 4, after bitter fighting. The German positions on the Dvina were turned, and two Russian armies drove towards the Baltic and East Prussia. Daugavpils fell on July 27, but there was heavy fighting on the N. bank of the Dvina during the Russian drive for Riga, captured Oct. 13;.

**Dvinsk.** This town of Latvia S.S.R. is described in this work under the name Daugavpils.

**Dvorak, Antonin** (1841-1904). Czech composer. The son of an innkeeper, he was born at Nelahozeves, near Prague, Sept. 8, 1841. He received his musical training at the organschool in Prague, and in 1862 joined the orchestra of the national theatre, but resigned after

Antonin Dvorak, Bohemian composer

the success of his Hymnus in 1873. Inspired by the example of Smetana, Dvorak turned to the rich sources of Bohemian folk music, and through the influence of Brahms, always an admirer, was invited to write a set of Slavonic dances, which established his fame abroad. From 1883 his music became popular in England, and he made five visits to this country, 1883-1891, conducting performances of his Stabat Mater, Requiem, and the symphonies in D minor and G major.

In 1892 he accepted the directorship of the conservatory of music in New York, staying three years. The symphony in E minor (From the New World), first performed at New York Dec. 16, 1893: the string quartet in F major, the quintet in E flat, and the concerto for cello and orchestra, 1895, belong to this mature period. But Dvorak had an extreme simplicity of nature and was never happy for long away from his Bohemian woods. A national strain runs through nearly all his work. On his return he wrote Humoresques, of which No. 7 proved remarkably popular. His programme music contains the famous cycle of three overtures, Amid Nature, Carnival, and Othello, and several tone poems; but he reached his finest expression in symphonies (of which he wrote nine and published five), the cello concerto, and chamber music. Director of the Prague Conservatoire from 1901, he died May 1, 1904.

**Bibliography.** Studies in Modern Music, W. H. Hadow, series ii, 1895; Antonin Dvorak: His Achievement, ed. V. Fischl, 1943; Dvorak, A. Robertson, 1945.

**Dwarf.** An abnormally short human being, or small animal or plant. Among human beings, the Asiatic negrito and African negrilla races, with a maximum stature of 4 ft. 11 ins., are usually called pygmies. The conventional maximum of spectacular dwarfism in the white and yellow races is 4 ft.

Notable court dwarfs were Queen Mary I's John Jervis, 24 ins., and Queen Henrietta Maria's Jeffery Hudson, 18 ins. at 30, and 45 ins. at death. Examples exhibited in London during the 19th century included the Polish court Boruwlaski, 39 ins.; the American, Charles Stratton (General Tom Thumb), 31 ins., who married Lavinia Warren, 32 ins.; the Fairy Queen, 16 ins.; the Mexican Midget, Lucia Zarate, and the French Princesses Topaze, each 20 ins. in height.

Dwarf races are primitive peoples whose average adult male stature is below 4 ft. 11 ins. There are two main groups: Asiatic negritos, comprising Aeta, Andamanese, Semang, Tapiro, and others; African negrillos, including Akka, Batwa, Bambute, and allied tribes.

The physiological basis of dwarfism is to be sought in the complicated inter-relationships of those endocrine organs which exercise a control over the processes of growth. Most important here are the pituitary and the thyroid. Hereditary or other peculiarities of these glands lead to marked disturbances of the normal development of the embryo. For instance the achondroplastic dwarf, popular as the court jester for so long, is simply a victim of a thyroid deficiency. Dwarf races are races in which an abnormal relationship between the endocrine glands and the rest of the body has become fixed. In different cases the oddness may be in the glands or in the rest of the body. In some animals—e.g. certain barnacles, insects, fishes—the males are relatively very small. The manner of evolution of these dwarf males has provided matter for discussion among zoologists.

Dwarf. Samson, a South American dwarf, standing on the table talking to his manager

The most satisfactory theory of pygmy origins regards these peoples as representing the early divergence from the main human stock of a tropical hunting type which has conserved its physical characters and primitive culture in racial isolation. This explains the absence of dwarf races from tropical America as well as from cold latitudes. The arctic Eskimo, the E. Siberians, and the European Lapps, together with the austral Yahgans of Tierra del Fuego, the Cape Bushmen, and the Ceylon Veddas, are short rather than dwarfish, being well above the pygmy stature, and alien to the pygmy culture. See Giant; Man; Negrito; Pygmy.

**Dwarka.** Municipality of India. It stands on the N.W. promontory of the Kathiawar peninsula. It contains the temple of Dwarkanath (Krishna), and is one of the holy places of India, the resort of Hindu pilgrims. Pop. 9,700, nearly all Hindus.

**Dwelling.** Habitation of mankind for repose, shelter, and domestic life. Dwellings may be natural or artificial, temporary or habitual, portable or fixed. That primeval man dwelt in tropical forest trees is a conjecture supported by anthropoid usage. Arboreal structures still characterise some primitive peoples, as among the Khas, Mois, and in the Solomon islands. When he migrated to the limestone lands of temperate Eurasia palaeolithic man utilised the rock-shelter and the cave-dwelling. This type of habitation also survives.

The rudest effort of art upon the ground level is the wind-screen, sometimes primarily to protect the fire. Hence emerged the hut, formed by binding the tips of saplings, and often skin-covered in cold weather. Devised in the palaeolithic age, it still exists in primitive forms among the African pygmies, Bhils, Botocudos, Fuegians, and Veddas. The natural hollow, and its simulation by an artificial pit, gave rise to the beehive roof and the lean-to or pent-roof, resting on the ground. Their conical or gabled surfaces were covered with thatch, turf, earth, or skins; rudimentary forms are still known—Ainu, Chukchis, and the Eskimo snow-house (igloo).

Thus arose the two simplest of structural types, the round and the oblong. The former prevailed in neolithic and early-metallic Europe. The Swiss lake-dwellers plastered their timbered huts with clay; this wattle-and-daub construction—sometimes as a secondary derivative from the plain thatch—still

endures. The dome-shaped or conical hut, developed in local forms in aboriginal America, prevails over wide regions in negro Africa. It may have a bamboo palisade, a loose-stone wall, or a defensive stockade. When used by nomad peoples it became the round Kirghiz yurt or the American tipi.

The introduction of metal tools and carpentry replaced pit-digging by the erection of posts, walled with unhewn or hewn timber, matting, stone, or clay. Sun-dried bricks, developed early along the Nile and the Euphrates, still survive in Mexico and the Sudan. The pent became the elevated roof, whose construction displays much diverse ingenuity, from the Bantu thatch, which may be double, as in Uganda, to the interlaced palm-leaves of Polynesia and the elegant timber carving of Japan. The neolithic lake-dwellers introduced pile-foundations in shallow waters, a practice still extant in Borneo and New Guinea. This cultural advance found its full development in the hewn masonry of Egypt, whose influence, passing into the Aegean, affected the architectural achievements of the Graeco-Roman and the Indo-Aryan world, spreading thence across the Pacific to the ancient American civilizations.

The early-Aryan rectangular house led to the formation of streets, and in the eastern branch to the quadrangular enclosure, at first a cattle-pen, afterwards the courtyard characteristic of the civilized Orient. The roof-angle is determined by the problem of rain and snow, as in the steep Scandinavian gable. The flat roof characterises Semitic life in sunny lands. Many-storeyed dwellings are developed in every continent. House-partition for sex-segregation is traceable to a remote antiquity. With many primitive peoples the social organization involves separate dwellings for unmarried girls and unmarried men. Communal houses for family or tribal groups are exemplified by the long-houses of the Iroquois and the Melanesian peoples. See Bee Hive Structure; Cave, Cliff, and Lake Dwellings; Igloo; Kraal; Wigwam.

**Bibliography.** History of Mankind, F. Ratzel, Eng. trans. A. J. Butler, 1896-8; The Races of Man, J. Deniker, 1900; Handbook to the Ethnographical Collections in the British Museum, T. A. Joyce and O. M. Dalton, 1910.

**Dwight, JOHN** (fl. 1671-98). English potter. He is believed to have been born in Oxfordshire, and to have been a member of Christ Church, Oxford. In 1671 and 1684 patents were granted him by

Charles II for the manufacture of porcelain, the secret of which he claimed to have re-discovered; but he can only be credited with the invention of an improved process of stoneware. He employed Italian workmen at the Fulham pottery works which he founded; and, in addition to utilitarian stoneware, he produced many fine statuettes and busts, including those of James II and Prince Rupert.

**Dwight, TIMOTHY** (1752-1817). American Congregationalist and poet. Born at Northampton, Massachusetts,

May 14, 1752, and a grandson of Jonathan Edwards, he was educated at Yale College. An army chaplain during the Civil War after being a minister at Greenfield, Connecticut, 1782-1795, he was president of Yale from 1795 until his death at New Haven, Jan. 11, 1817. His *Theology Explained and Defended*, 1818, a course of 173 sermons, has passed through more than 100 editions. He wrote the patriotic song, *Columbia*, and an epic, *The Conquest of Canaan*, and was author of an *Essay on Light*.

First of the great American college presidents, the number of students at Yale almost trebling during his presidency, Timothy Dwight was an advocate of co-education and of the higher education of women.

His grandson, another Timothy (1828-1916), was professor of New Testament Greek and exegesis, Yale divinity school, 1858-86; president of Yale, which during his term of office assumed the status of a university, 1886-99; and a member of the American committee for the revision of the English Bible, 1872-85. He contributed to the *New Englander* a series of articles on *The True Ideal of an American University*, 1870-71; and was the author of *Memories of Yale Life and Men*, 1903.

**Dwyka Series.** Shales and conglomerates beneath the Ecca formation in the S. African Karroo system. They extend for 800 m. from the Transvaal through the Orange Free State prov. and Natal into the Cape prov., with a maximum thickness of 2,300 ft. The lower Dwyka shales, of Permo-carboniferous date, were overlaid by deposits in and around the vast Karroo lake, into which icebergs broken from the faces of glaciers

dropped huge striated boulders of granite, jasper, and other rocks. The resultant conglomerate resembles English boulder-clay, but so greatly hardened as to be quarried at Umgeni for road-metal. This conglomerate was overlaid by the fine-grained upper Dwyka shales, whose fossil reptiles and plants correlate them with the Indian Gondwana system. This series is named after the Dwyka river.

**Dyak** OR **DAYAK**. Popular name for the Indonesian non-Malay peoples in Borneo. The land Dyak embrace some settled agricultural tribes in the Klemantan group. They use 8 ft. blowguns, sumpitan, with envenomed darts, and

Dyak. Woman in native costume. Upper, man in gala dress

practise cremation. The round-headed proto-Malayans Dyak, preferably called Iban, are the most tattooed Bornean tribe and were the most inveterate head-hunters. See Borneo.

**Dyas** (Gr., the number two). Alternative name for the uppermost system of palaeozoic rocks, called by R. Murchison the Permian. It was introduced by J. Harcou, on the analogy of the Trias which lies above it, because it is represented in Germany by two well-marked stages, the red sandstone (Rothliegende) and the minestone (Zechstein). See Permian.

**Dyce, ALEXANDER** (1798-1869). British literary and dramatic editor. Born at Edinburgh, June 30, 1798, he was educated at its high school and Exeter College, Oxford, subsequently taking orders. From 1825 he devoted himself to editing the old dramatists. He brought out Peele, 1828; Web-

ster, 1830; Greene, 1831. In 1833 he completed Gifford's edition of Shirley, and edited Middleton in 1840, and Skelton in 1843. He brought out the Works of Beaumont and Fletcher in 11 vols., 1843-46; issued an edition of Marlowe in 1850; and in 1857 appeared his valuable edition of Shakespeare, which he was engaged in revising when he died, May 15, 1869.

**Dyce, WILLIAM** (1806-64). Scottish painter. He was born at Aberdeen, Sept. 19, 1806, and educated at Marischal College. In 1830 he settled at Edinburgh as a portrait-painter. In 1835 he was elected Associate of the Scottish Academy. Successful in the Westminster Hall competition, he produced a fresco, The Baptism of S. Ethelbert, the first to be completed in the houses of parliament, 1845; and in 1848 became R.A. He died at Streatham, Feb. 14, 1864. See Augustine illus.

William Dyce, Scottish painter

**Dyer, SIR EDWARD** (c. 1540-1607). English courtier and poet. Born at Sharpam Park, Somerset, he went to Oxford and after Continental travel was introduced at court in 1566. A close friend of the Sidneys, and a member of the literary coterie known as the Areopagus, he enjoyed a high reputation as a man of character and a poet. He was sent by Elizabeth on a diplomatic mission to the Low Countries in 1584, acted as one of the pall bearers at Sir Philip Sidney's funeral in 1586, went on a diplomatic mission to Denmark in 1589, and acted as commissioner for the attachment of forfeited lands. Knighted and made chancellor of the order of the Garter in 1596, he retired after the accession of James I. He died in 1607, and was buried in S. Saviour's, Southwark. He is remembered as author of the poem, My Mind to Me a Kingdom is, published (without author's name) in William Byrd's Medius: Psalms, Sonnets, and Songs of Sadness and Piety, 1588. His complete works were edited by A. B. Grosart, 1872.

**Dyer, JOHN** (1700-57). British poet. A Welshman by birth, after studying art for a short time he became a clergyman. His chief merit is in the appreciation of nature shown in his poems Grongar Hill and The Country Walk, both

Dyers' Greenweed. Flowers and foliage of this dwarf shrub

published in Savage's Miscellany, 1726. The Ruins of Rome appeared in 1740. He died Dec. 15, 1757. His poems were edited by Edward Thomas, 1903.

**Dyer, REGINALD EDWARD HARRY** (1864-1927). British soldier. Born at Simla, Oct. 9, 1864, he was educated at Middleton College, co. Cork, and was commissioned in the Royal West Surrey Regiment in 1885. He transferred to the Indian army and became brigadier in 1916. In 1919 he was in command of the 45th infantry brigade sent to cope with disorders at Amritsar. On April 13 an unarmed mob of 5,000, demonstrating at the Jallianwallah Bagh, adopted such a threatening attitude that Dyer ordered his troops to fire, when 379 natives were killed and 1,200 injured. A committee of investigation severely censured Dyer, who was relieved of his command. The Army Council confirmed the committee's finding, and Dyer resigned from the army. One body of opinion, however, considered his action had prevented a serious rising. He died July 23, 1927. Consult The Story of General Dyer, I. Colvin, 1929.

**Dyers' Company**, THE London city livery company. Incorporated 1471, it was originally one of the 12 chief companies. With the

Vintners it has the right of keeping swans on the Thames, and it administers a number of charities. The hall in Dowgate Hill, E.C., erected 1840, is one of four, the first of

Dyers' Company arms

which, on the site of Dyers' Hall Wharf, was burnt in 1666

**Dyers' Greenweed** OR WOAD-WAXEN (*Genista tinctoria*). Dwarf shrub of the family Leguminosae. A native of Europe, it extends into N. and W. Asia. The bright yellow flowers are small, and are succeeded by smooth, flat pods, an inch long, containing about five seeds. It yields a yellow dye, which was largely used by dyers in connexion with natural indigo and was known as Kendal green.

**Dyers' Oak** (*Quercus velutina*). Large tree of the family Fagaceae. A native of N. America, it is

known as quercitron and yellow-barked oak, the rough, brown bark being orange-coloured internally. It has variously divided large leaves and small hemispherical acorns. The bark is extensively

Dyers' Oak leaf and acorn

used in tanning and dyeing.

runs into thousands. Many older ones have been discarded. The earliest examples were easy to make, involving only a few processes, but current examples, though using the same basic materials—benzene, toluene, naphthalene, and anthracene (all products of coal-tar distillation)—tend to involve a long chain of processes which can be appreciated only by the trained organic chemist. The intermediate substances made as steps in the chain of processes between starting-point and dyestuff include picric acid and trinitrotoluene (well-known explosives); salicylic acid (from which aspirin and synthetic wintergreen oil are made); benzaldehyde (artificial almond flavouring); and toluene sulphonic acid (from which saccharin is made). Chemicals required to produce these intermediate substances include the poison gases chlorine and phosgene. This illustrates how the dyestuffs industry is inextricably bound up with the drugs, explosives, and similar industries, and becomes in time of war a matter of prime national importance.

#### Choosing the Correct Dyestuff

The popular idea—that to dye anything (say) blue, all that is wanted is some blue dye—is an over-simplification. No one dye will dye all textile fibres, and a dyestuff must be chosen which will dye the material to hand (cotton, wool, silk, acetate rayon, etc.). The dyer then has to consider what the textile is to be used for, and what conditions it will have to stand. The range of dyes available to give bright shades on a silk evening dress is entirely different from those suitable for curtains. Special requirements occur; dyes for bathing suits must be as little affected as possible by salt water and bright sunlight. Dyes are divided into ten main classes.

*Acid dyes* dye wool and silk from a dye bath containing acid; do not dye cotton or viscose rayon. Usually bright shades, not very fast to washing and only of medium fastness to light. There are several sub-classes.

*Basic dyes* dye wool and silk from a dye bath containing acid, but dye cotton only if it is mordanted with antimony salts and tannic acid. The basic dyes include the brightest shades known; they are of reasonable fastness to washing, but the poorest of all dyes in fastness to light. They tend to rub off easily.

## DYES AND DYESTUFFS

F. V. DAVIES, authority on Textiles

*This article classifies the various kinds of dyes and describes the materials of which they are made. See the articles on the various dyes mentioned and on materials that are dyed, e.g. Cotton*

Dyes are substances used to impart colour to textile fibres, leather, paper, etc., and to colour oils, varnishes, polishes, foodstuffs, and beverages. Not all coloured substances are dyes; fabric immersed in some highly coloured solutions is only slightly stained, and this stain may be washed out completely by water. Dyes are, however, absorbed by the fabric and strongly retained; thus, on immersing white wool in a dye bath containing a red "acid" dyestuff, the wool becomes red, and at the end of the process the liquor is almost or quite colourless. This property of substantivity, or affinity with the textile, distinguishes dyes from simple coloured substances.

Dyeing is an art of great antiquity, the aesthetic appeal of garments of many colours having been realized early in history; but until about 1860 the only materials available were natural dyes such as the juice of various berries and extracts from plants and woods. Perkin's discovery of synthetic mauve dye led to the formation of the synthetic or coal-tar dyestuffs industry. The initial important discoveries in this field were made by English chemists; but the disinclination of English industrialists to support them led to their adoption by Germany, and gave rise to the illusion that German chemists were far superior to the English. Before 1914, almost all synthetic dyes were German-made; but withdrawal of supplies during the First Great War forced the development of a British industry, and it came to be realized that a strong dyestuffs industry is closely bound up with strong general

chemical, drug, and explosives industries. Since 1914, the contributions of British chemists have been of prime importance; in particular the first green dye of the "guaranteed fadeless" type—Caledon Jade green—and the first dyestuffs which would dye acetate rayon were discoveries of British chemists.

Natural dyes are variable in quality and in shade produced, whereas synthetic dyes are sold standardised exactly for quality and shade. The desire to match a given shade exactly, at some later time, and the liking for subtle differences in shade, would remain unfulfilled in the absence of synthetic dyes. Most natural dyes as such have little affinity with textile fibres, which must be given a pre-treatment termed mordanting (Lat. *mordere*, to bite) before the colour can be "fixed" in them; whereas synthetic dyes, which require no mordanting, are available for all fibres. Among the few remaining natural dyes in use are cochineal on a tin mordant, used for army scarlet tunics; logwood extract to give the best and most lustrous blacks on silk; and natural indigo. In a class apart are the mineral dyes, which are really pigments actually formed on and in the fibres; commonest of these is "mineral khaki," consisting of iron and chrome oxides, used for khaki drill warehouse coats, shirts, shorts, etc.

#### Basic Materials

Apart from these few exceptions, the word "dyes" now signifies the synthetic, aniline, or coal-tar dyestuffs; and dyeing is the application of these to the fabric, etc. The number of these dyes

*Direct cotton dyes* dye cotton and viscose rayon without mordanting; most dye wool and silk also. For cotton the dye bath contains salt, and often a little soda ash; for silk and wool it contains acetic acid. These dyes are particularly useful in union fabrics and other materials containing more than one fibre, and are used for silk stockings with cotton feet and tops. They are of good fastness to washing; as regards light, they fall into two sub-classes, one of moderate and the other of high fastness.

*Chrome dyes.* These are really a special class of acid dyes, which dye wool, but require treatment of the textile with potassium dichromate before, during, or after dyeing, to bring out their superior properties in relation to light and washing. In some dyes the chrome is actually part of the dyestuff. The shades available are admirably suited for ladies' dress materials and men's suits. Their use is normally confined to wool.

*Sulphur dyes* dye cotton and viscose rayon from a dye bath containing sodium sulphide. Risk of damage by the sodium sulphide usually precludes their use on wool and silk. The shades are dull; and some colours (e.g. good reds) are lacking in the series. Fastness to light and washing is good or very good.

*Vat dyes* dye cotton, viscose rayon, wool, and silk, though great care is required in their use for wool and silk. Indigo is a natural vat dye, and both indigo and the synthetic vat dyes are peculiar in method of use. The dyes themselves are insoluble, but on treatment with sodium hydrosulphite are reduced to bodies soluble in caustic soda solution, which constitutes the dye bath. On subsequent exposure to air the insoluble vat dye is re-formed, firmly fixed in and on the fibres. The colour of the soluble leuco-compound is usually different from that of the parent vat dye. Vat dyes contain the fastest colours known; some tend to deepen in shade rather than fade in strong light, and they withstand long boiling in soap solution.

*Azotic colours.* These are mainly used on cotton, and are actually formed on the fabric by impregnating it with two intermediates in succession which combine to give the dye on and in the fibres. Generally they are of high washing and high light fastness, but tend to rub off easily.

*Acetate dyes.* Special dyes have been developed for cellulose acetate. They are usually fine dispersions of water-insoluble dyes, applied from soap solution. Some newer examples, however, are water-soluble. They have high light-fastness, and usually adequate fastness to washing.

*Solubilised vat dyes.* These are vat dyes chemically modified to be water-soluble. They are applied like acid dyes, and then given an after-treatment which re-forms the insoluble vat dye. They are thus more easily applied than vat dyes, and can be freely used on silk and wool; but they are expensive.

*Oxidised colours.* Aniline black, used for umbrella cloths, and fur dyes are typical examples of these. They are mixtures of salts of aniline and its related compounds, which are applied to the fabric and then treated with oxidising agents such as chromic acid. An insoluble dye is then formed on the fabric.

These dyes are commonly utilised as follows:

*Wool.* Acid dyes are usually used; where blends of different wools are involved, a sub-class of levelling colours is chosen. Where the highest fastness is wanted, as in suitings and overcoatings, chrome dyes are used. Best quality navy blues are vat-dyed: few so-called "indigo-dyed" goods are all indigo dye, the indigo being reinforced by synthetic vat blues or blacks, plus a final topping with an acid or basic colour.

*Cotton.* For most purposes, the direct cotton colours are chosen. Where good light-fastness in dull shades is required, the sulphur colours are used. For curtains and upholstery fabrics of the "guaranteed fadeless" type, vat dyes are used.

*Viscose rayon* is dyed like cotton.

*Silk.* Either acid or direct dyes give good results for normal purposes; for very bright shades on evening dress materials and lingerie fabrics, basic dyes are used. Vat dyes can be used for highest light-fastness (e.g. embroidery silks, Macclesfield silks).

*Acetate rayon* is treated with the special dyes developed for it.

*Nylon.* Some acid and direct colours are satisfactory, but the best results so far are obtained with acetate dyes.

*Linens* are dyed with direct, sulphur, or vat dyes, like cotton.

*Furs* are dyed with fur bases of the oxidised colours group.

*Paper* is dyed with direct dyes, unless made coloured by adding pigment to the pulp in the beater.

*Oils, varnishes, etc.* These are coloured with special dyes, soluble in methylated spirit or oil.

*Leather* is dyed with acid of basic colours.

*Foods and beverages* are coloured with selected dyes of special purity, which are free from any harmful effect. The colours to be used are regulated by law.

The methods of dyeing textiles fall into two main groups: in the yarn and in the piece, i.e., before and after weaving. The former is more expensive and is used only where yarn is sold as such (e.g. knitting wools) or where it is to be woven into a patterned fabric. Hanks of yarn are hung over poles, and are turned as they dip into vats of dye liquor; or hanks are packed into a machine which circulates dye liquor through them. A more recent method is to wind yarn into large bobbins or cakes with a central perforated core, and then to force dye liquor through them under pressure.

#### Dyeing in the Piece

Dyeing in the piece is done on the winch or in the jig. In winch-dyeing the cloth is stitched end-to-end to form an endless belt, most of it immersed in the dye bath, but part emerging and passing over a rotating frame, which keeps the fabric moving in and out of the bath constantly. This is normally done in rope-form (i.e. fabric bunched together sideways), but for delicate fabrics is done open width. In jig-dyeing, the cloth is made to take a long path through a comparatively small dye bath, by passing it over a number of rollers, in open width. Jig-dyeing is the basis of dyeing processes where fabric is fed in continuously at one end, and emerges dyed at the other end of the machine. Another method is padding; a small trough of dye is combined with squeezing rollers, rather like a domestic mangle, which pad the dye on to the fabric. Hosiery is placed in bundles in cotton bags, which are put in a perforated drum and this rotates in an outer drum containing the dye liquor.

Any form of dyeing is a highly skilled art; there is not only correct choice of dyes to consider, but also correct preparation of the textile by scouring and removing sizing; choice of machine; composition and temperature of dye bath; avoidance of patchiness and crease marks; and matching.

The inherent difficulties of the work of dyers and cleaners are added to by the "raw material" being usually a garment already dyed. A complication is that parts of worn garments most exposed to light and weather (e.g. coat lapels) absorb dye more rapidly than protected parts. Lastly, whereas the yarn or piece dyer knows what material he is handling, the garment dyer must find out, and may meet unusual combinations of fibres.

**Bibliography.** The Colour Index, ed. A. M. Rowe, 1924, with supplement, 1928; The Synthetic Dyestuffs and Intermediate Products, J. C. Cain and J. F. Thorpe, 1933; Dyeing with Coal-Tar Dyestuffs, C. M. Whittaker, 1939.

**Dyke** or **DIKE**. Defensive earthwork or its adjacent ditch, especially in early Britain. Dykes may be promontory forts, or protective works as used in Holland, and in Great Britain as fenland causeways. Some were made or re-used for national or tribal boundaries. Red Earl's Ditch, along the Malvern Hills, was feudal. The greatest, Wansdyke, 80 m. long, from the Severn to Inkpen Beacon, Berks, was pre-Roman. Black Dyke, from Richmond, Yorks, across the Roman Wall to Peel Fell, Northumberland, continues as the Catrail for 48 m. to Galashiels, Selkirkshire. Roman Dyke, Rushmore, Wilts, was Romano-British. There are 25 in Dorset, and perhaps 50 elsewhere, some being of Commonweal date. (See Devil's Dyke; Grim's Dyke.)

In geology, dykes are wall-like masses of rock formed in vertical or highly inclined fissures in older formations. The name arose from their resemblance, when the softer enveloping rocks have been weathered away, to the structures made by man: in W. Scotland they are actually utilised as enclosures. Where the material forming the dyke is more easily eroded than the rock which has

been intruded, a narrow trench-like feature may be formed. In steep cliffs this would show as a chimney or a gully.

The rocks forming dykes show a wide range in chemical composition, but dolerites and basalts are the most common. Groups of dykes of similar age and forming a regular pattern are spoken of as a dyke-swarm. This may be radial around some volcanic centre, or parallel, the dykes all trending in one direction. Thus in W. Scotland, dykes of Devonian age at Glencoe trend N.E.-S.W., but those of Tertiary age associated with the volcanic centre of Mull run S.E.-N.W. Dykes vary in thickness from less than an inch to hundreds of feet. The Great Dyke of Rhodesia is some 300 m. long and 2-7½ m. wide. In Iceland a series of volcanic eruptions with extrusion of lava occurred in 1783 along the line of a new dyke—the Laki Fissure—about 20 m. long.

Ring-dykes, having a roughly circular plan at the earth's surface, are caused by the sinking of a

Dyke. Diagram showing association of ring-dykes (rd) and cone-sheets (cs) in a volcanic complex. The lavas (a) of the caldera lie on a sunken block of older rock (or) which has been let down into the magma reservoir

cylindrical mass of rock in the earth's crust and the injection of molten rock up the fracture so formed. They are probably formed at the same time as calderas (*q.v.*).

Sedimentary or Neptunian dykes have been formed in all geological ages, such as the pre-Cambrian sandstone dykes at Ben Slioch, Ross-shire, and those of limestone near San Francisco. These are sometimes the result of the filling-up of fissures by submarine earthquakes.

**Dykes, JAMES OSWALD** (1835-1912). British theologian. Born at Port Glasgow, Aug. 14, 1835, and educated at Dumfries academy, Edinburgh university, Heidelberg, and Erlangen, he was ordained at East Kilbride, 1859. Colleague of Dr. Candlish (*q.v.*), at Free S. George's, Edinburgh, 1861-64, he resigned through ill-health.

After spending three years in Melbourne, Australia, he was minister of Regent Square Presbyterian Church, London, 1869-88; and principal, 1888-1907, of the English Presbyterian College, Queen Square, London, afterwards removed to Cambridge, and known as Westminster College. His works include *The Beatitudes of the Kingdom*, 1872; *The Gospel According to S. Paul: studies in the first 8 chapters of his Epistle to the Romans*, 1888; and *The Divine Worker in Creation and Providence*, 1909. Dykes died Jan. 1, 1912.

**Dykes, JOHN BACCHUS** (1823-76). British musician and churchman. Born at Hull, March 10, 1823, he studied music at Cambridge and became a clergyman. In 1849 he was appointed pre-

center of Durham cathedral and vicar of S. Oswald's, Durham. He was one of the editors of *Hymns Ancient and Modern*, and composed a large amount of church music, including many hymn tunes. His tunes for *Nearer my God to Thee*, and *Jesu, Lover of my Soul*, attained immense popu-

larity. He died Jan. 22, 1876.

**Dykh-Tau.** Peak of the Caucasus, about 17,000 ft., Kabardin autonomous province, U.S.S.R.

**Dyle.** River of Belgium. Mainly in Brabant province, it rises near Nivelles and flows generally N. to Louvain, N.W. to Malines, and joins with other tributaries that fall into the Schelde. The Dyle line was a position occupied by the B.E.F. in Belgium in 1940. On May 10 the B.E.F. crossed the Belgian frontier and advanced to positions on the Dyle extending from Wavre to beyond Louvain. The Germans advancing from Maastricht were held on this line until May 16, when the B.E.F. withdrew to conform with the movements of the French 1st army on their right flank.

**Dymchurch.** Seaside village of Kent, England, 7½ m. S.W. of

James Oswald Dykes, British theologian Moffat

Dyke. "Watcher" dyke, outermost in the system of three dykes, watcher, dreamer, and sleeper, which guard the reclaimed soil of Holland from the sea

Folkestone. Situated on the borders of Romney Marsh, it is connected with Hythe and New Romney by a 15-in. gauge rly. Noted for its fine stretches of sand, diminutive church, and ancient inn, the village is described in Kipling's *Puck of Pook's Hill*, and in the works of H. G. Wells, who laid an early scene of *The War in the Air* on Dymchurch beach.

**Dymoke.** English family in which the ancient office of king's champion is hereditary. The origin of the Dymokes is variously traced to the village of Dymoke, in Gloucestershire, and to a place of that name on the Welsh border. Sir John Dymoke (d. 1381) was champion at the coronation of Richard II, the earliest recorded performance of the ceremony, and based his right on his ownership by grand serjeanty of the manor of Scrivelsby, in Lincolnshire. Henry Dymoke (d. 1865) was champion at George IV's coronation, after which the ceremony was discontinued, though the office remained. In the reigns of George V and George VI, the champion was Frank Scaman Dymoke (1862-1946). See *Champion*.

**Dynamical Equivalent of Heat.** Whenever work is converted into heat, or vice versa, there is an unchanging relation between the work done and the heat produced or lost. The quantity of work exerted to produce the unit quantity of heat energy is called the dynamical equivalent of heat. The first to determine this equivalent was Joule, whose first method consisted in measuring the heat developed when a known amount of work was done in stirring water. It has been found that the energy converted into sufficient heat to raise the temperature of one gramme of water one degree Centigrade (from 14.5° to 15.5°) is 4.185 times 10<sup>7</sup> ergs, where the erg is the c.g.s. unit of work. See *Heat*; *Thermodynamics*.

**Dynamics** (Gr. *dynamis*, power). Branch of the science of mechanics which investigates the action of force. It therefore includes the investigation of the conditions of bodies which are in a state of equilibrium owing to the forces acting upon them, although this special branch of the science is often referred to as "statics." The investigations depend ultimately on the Newtonian Laws of Motion. The various departments embrace the dynamics and statics of a particle which is acted upon by forces in one plane or in more than one plane; the plane

Dymchurch, Kent. The church in this seaside resort on the borders of Romney Marsh

dynamics of a rigid body; the three dimensional statics or dynamics of a rigid body, with which is associated the theory of screws; and by extension of the meaning of the term dynamics, those problems of analytical dynamics which investigate the action of forces on systems of particles, or the "problem of three bodies," which refers to the mutual attractions of three bodies in space, e.g. the Earth, Sun, and Jupiter, a problem which can be solved only in special cases. See *Motion*.

**Dynamite.** Name applied to a variety of high explosives of which the essential feature is a high content of nitroglycerine, absorbed in an active or inert porous base. Dynamite was invented by Nobel in 1866, when, owing to very many disastrous explosions, nitroglycerine was prohibited in various countries. He found that it could be rendered comparatively safe by absorption in kieselguhr (*q.v.*), which can retain up to three times its weight of nitroglycerine. This mixture, known as No. 1 or kieselguhr dynamite, is still the best known dynamite with an inert base. About 1 p.c. of magnesium carbonate or chalk is usually added to neutralise the acid evolved by nitroglycerine on storage.

The calcined kieselguhr is weighed out into a rubber bag, after it has been thoroughly mixed with the carbonate and sieved, the nitroglycerine being added in small portions, while the mass is kneaded by hand to form a paste, the operation lasting about 30 minutes. The dynamite is formed into cartridges by pressing it into parchment paper tubes by a wooden plunger working through a funnel. All these operations are dangerous and only small quantities of explosive are dealt with in light buildings protected by mounds.

In modern blasting explosives kieselguhr has been largely displaced as the absorbent by "active" and explosive bases, generally consisting of a mixture

of wood meal, flour, or similar carbohydrate and sodium or potassium nitrate. Nitro-cellulose is widely used as an explosive base, and many dynamites in British mining contain high percentages of ammonium nitrate.

Dynamite is a powerful high explosive of considerable brisance, while its plasticity is a great advantage in filling boreholes and applying it to solid objects for demolition purposes. It is safe to handle and transport, but is too sensitive to shock for employment in shell, and since it is detonated by the impact of a rifle bullet it is not a safe military store. If ignited in small quantities it burns fiercely but does not explode. Black powder will cause it to explode, but complete detonation can be effected only by initiation with a detonator.

Dynamite has two marked disadvantages: exposure to moisture displaces the nitroglycerine, causing exudation and dangerous sensitivity; it freezes about 10° C., when, whilst it is more insensitive to detonation, causing misfires, it is more sensitive to shock and friction. Frozen dynamite must be carefully thawed in a special oven. Exudation is guarded against by the use of special wrappers, and freezing can be prevented by using nitroglycerine containing substances which lower its freezing point and storing the dynamite in heated magazines. Dynamite is chiefly used for blasting operations where a powerful shattering effect is required. See *Blasting Gelatine*; *Explosives*; *Gelignite*.

**Dynamo.** Machine for converting mechanical energy into electrical energy, frequently (but incorrectly) known as a generator of electricity. The principles underlying the induction of electromotive force in a conductor cutting a magnetic field, and the elements of commutation to produce a unidirectional or direct current, are discussed under *Electro-magnetic Machine*. The evolution of the present-day machine of 1,500 kW or more has necessitated many changes from the single rotating coil and two-part commutator.

**ARMATURE DEVELOPMENTS.** The first step in evolution was to increase the number of coils and commutator segments to give a more sustained effect than the single coil, and an early method is shown in Fig. 1, which indicates the Gramme ring method of winding the armature, as the rotating

system of a dynamo is called. In this system, a number of coils are wound round an iron ring, as shown, the connexions between adjacent coils being attached to the commutator segments. This type had several advantages. As one side of each coil was inside the iron ring, it was shielded from the

magnetic field and consequently was inactive. This resulted in a waste of copper and space; also it was difficult to arrange an efficient mechanical connexion between the shaft and the ring, for driving purposes.

The ring armature has now been superseded by the drum type, in which the coils are laid in longitudinal slots on the surface of an iron drum, both coil-sides contributing to the output of the machine. If the drum were of solid iron it would act as a conductor cutting flux, and eddy currents would flow in it, causing it to get very hot and increasing the magnetic drag, thus reducing the efficiency of the machine. It is therefore laminated, or built up from a number of thin stampings of soft iron or alloy steel, insulated from each other by a coat of varnish. A typical stamping is shown in Fig. 2, with the slots arranged round the circumference. The hole in the centre has a keyway for the driving shaft; the other

Dynamo. Fig. 2. Armature stamping showing longitudinal slots in which the conductors of an armature are embedded

holes are ventilating ducts for cooling. Large machines have a hollow drum, built up from stampings, secured to a hub with solid spokes, known as a spider, to economise in the stamping alloy.

The coils are wound so that each slot contains one side of each of two coils. In small machines, a mush winding is frequently used; the conductor is wound directly into the slots, usually by hand, without any particular attempt at symmetrical arrangement of the coil-ends. Larger machines are former-wound, i.e. the coils are

wound to shape on specially designed formers, taped up solid, and shaped so that when dropped into the slots the end connexions are smoothly and symmetrically arranged. Whichever system is used the slots are lined with thick insulating paper or board, to prevent chafing of the coil insulation, and the coils are secured in the slots and prevented from flying out by fibre wedges and by bands of steel piano wire wound round the circumference of the armature, the ends being securely soldered.

The commutator of a modern machine is built up of a number of

Dynamo. Fig. 3. Drum armature and commutator

shaped copper segments, insulated from each other by mica, and secured by clamping between mica covered rings. Fig. 3 shows a typical armature with commutator.

The actual method of connexion between the coils and the commutator depends on the size and output of the machine. For small high voltage machines, the wave winding is used, so called because if successive coils are traced out they follow a wave-like or zig-zag path around the armature. Larger machines are usually lap-wound; the coils form a series of closed loops, each overlapping the next one.

**FIELD MAGNET.** It was found that a much more powerful field could be produced by an electro-magnet than by the permanent magnets

Dynamo. Fig. 4. Early overtype dynamo with 2-pole horse-shoe shaped field magnet

Dynamo. Fig. 5. Field system of dynamo, showing 4 poles and interpoles

used in the earliest machines. The horse-shoe shape of the magnet, with two poles, persisted for many years; an early type of dynamo is shown in Fig. 4. This type has now been completely superseded by the circular pattern, on account of its reduced magnetic leakage, as well as the way in which it permits a neater and more compact type of machine. In this type, two, four, or more poles are arranged, alternately north and south, within a circular

Dynamo. Fig. 6. Open type dynamo of 1,000 kW capacity

yoke, as seen in Fig. 5, which shows a four-pole machine, with two interpoles, or commutating poles, whose function is to assist commutation, and prevent sparking at the brushes.

The original method of excitation of the electro-magnet was from a battery, but it was later found possible to make the machine supply its own field. Sufficient residual magnetism usually remains in the iron of the magnet to produce a weak voltage when the machine is rotated, giving a small current in the field circuit which strengthens the generated voltage, this action continuing until the

machine has built up to its normal running conditions. Early machines were often slow and unreliable in building up, and it was common practice to employ a separate exciter machine to supply the field of a larger machine or group. Separate exciters are still used for alternators which, generating alternating current, are unable to supply their own field systems; but modern dynamos (Fig. 6), unless intended for special duties, are usually self-exciting.

In a series winding (Fig. 7) the field coil consists of a few turns of thick wire, carrying the whole of the current given by the machine. This system is seldom used for dynamos, which are more often shunt-wound; several turns of fine wire being connected directly across the brushes and a small current shunted off from the main circuit (Fig. 8).

Dynamo. Fig. 7.  
Series winding

Fig. 8.  
Shunt winding

Fig. 9.  
Compound winding

When load is taken from a dynamo its voltage will drop by an amount depending upon the design of the machine. To compensate for this, compound winding is often used (Fig. 9). In this a shunt-wound machine has a few series turns added to the coils. As the machine is loaded, the current in the series turns assists the shunt coils, thus keeping the machine voltage more constant. By over-compounding, i.e. putting a larger number of series turns on, the machine voltage can actually be made to rise as the load comes on, thus compensating for the voltage drop along feeder cables and maintaining a constant voltage at a distant point. The interpoles previously referred to are excited by series turns, but play no part in the regulation of the machine voltage, their function being solely to improve commutation.

**BRUSHES.** The bundle of copper wires or gauze, originally used for collecting current from the commutator, exists now only in name. Modern brushes are nearly always of carbon, and are pressed against the commutator by springs, and held in brush holders or boxes, which are themselves secured to a

brush rocker attached to the machine frame. This device was so called because, before the advent of interpoles, it was necessary to rock the brushes backwards or forwards with every change in load, to prevent sparking.

E. B. Watton

**Dynamo-Metamorphism** (Gr. *dynamis*, power; *meta*, implying change; *morphe*, form). Term for alteration of rock-structure by lateral pressures due to movements in the earth's crust; introduced by A. Harker to denote the effects of high pressure and low temperature, thermo-metamorphism being used to denote the effects of low pressure and high temperature.

The changes produced are physical and mineralogical, and usually render rocks more highly crystalline. Homogeneous rocks under pressure develop cleavage-planes, foliation, and schistose structure.

Thus clays, shales, or fine-grained volcanic dust may become roofing-slates, coarse-grained rocks may become gneisses. Heterogeneous rocks, if brittle and

yielding strata are intermingled, develop folding and faulting. Mineralogical changes include recrystallisation and the formation of chlorite and mica. See *Geology*; *Metamorphism*.

**Dynamometer** (Gr. *dynamis*, power; *metron*, a measure). Device for measuring force or power. Though the term dynamometer has been extensively used for many different kinds of measuring instruments, it is more commonly applied to instruments used for measuring the h.p. of engines. They may be divided into three classes: (1) those for measuring the pull of anything; (2) those for measuring the push or thrust; and (3) those for measuring twisting power or torsion.

The first type measures such forces as those exerted by railway locomotives, traction engines, etc., and consists essentially of a powerful spring balance through which the power is applied. The second type measures such forces as the thrust of an aeroplane propeller or steamship screw, and the third the force exerted by a revolving shaft. Both types may consist of recording springs or brake attachments.

When a brake is used it absorbs power and the dynamometer is called an absorption dynamometer. Transmission dynamometers measure the horse-power of machines without any absorption of power, save that due to friction, and the majority consist of recording spring devices.

The illustration shows a common type of brake dynamometer. To one end of a rope, encircling the flywheel of the engine, is attached a weight, and the other end is fastened to a spring. The motion of the wheel tends to lift the weight, and this tendency is measured on the spring and from it, and the known revolutions per minute of the flywheel, the horse-power being exerted can readily be calculated.

In the Froude hydraulic dynamometer the rotating element exerts a turning moment on the fixed element through a liquid medium, usually water, which flows through the apparatus and carries away the heat generated by the absorption of energy. This type of brake can therefore be used to measure larger outputs than the type shown in the illustration. Electrical dynamometers depend on the absorption of energy by eddy currents.

**Dynamotor.** Device, frequently known as a rotary transformer, which combines in one machine the functions of a motor and a dynamo, and enables direct current to be transformed from one voltage to another. It has one field magnet system and two armatures, or more usually one armature with two separate windings and commutators. Small sizes are widely used in radio work, to provide a high tension supply for portable transmitters, etc., where H.T. batteries would be inconvenient or impracticable.

The term is also (not strictly correctly) applied to automobile work where one machine functions as both charging dynamo and starting motor. In this device, the armature has one winding, and

Dynamometer. Common type of brake dynamometer

the field magnet system two; a shunt winding for normal running as a dynamo, and a series winding for engine starting.

**Dynasts**, THE. Epic-drama by Thomas Hardy. This masterpiece, described as the greatest single achievement of Hardy's career, consists of three parts, 19 acts, 130 scenes. Hardy's original intention was to write a chronicle play to celebrate Great Britain's part in the Napoleonic wars from 1805 (Trafalgar) to 1815 (Waterloo). But its huge canvas, monumental structure, hundreds of characters, and above all the superhuman comments of "phantom intelligences"—like the Spirits of the Years, of the Pities, etc., who form a kind of Greek chorus—enlarge the drama into a vision of the destiny of man. Blank verse, rhyme, and prose are all employed. The three parts were published separately in 1903, 1906, and 1908. An adaptation by H. Granville-Barker was staged at the Kingsway Theatre, London, in 1914, and at Oxford in 1920.

**Dyne** (Gr. *dynamis*, power). Unit of force, defined as the force necessary to be applied to a mass of one gramme to produce an acceleration of one centimetre per second every second. This force is very nearly equal to the force with which the earth attracts a weight of one milligramme. See *Erg*.

**Dynobel**, POLAR. British permitted explosive used for cutting hard coal and for moderate ripping, and as a general purpose explosive in the pit. Typical compositions of the dynobels are 14–16 p.c. nitroglycerine and 0.5–1.5 p.c. nitrotoluenes, gelatinised with 0.25–0.75 p.c. nitro-cotton, 51–54 p.c. ammonium nitrate, 24–26 p.c. sodium chloride, 4–6 p.c. wood meal, and 0–2 p.c. moisture.

**Dysart**. This locality in Fife, Scotland, forms part of the burgh of Kirkcaldy (*q.v.*).

**Dysentery** (Gr. *dys*, implying badness; *entera*, intestines). Term popularly applied to any condition of the bowel associated with diarrhoea and abdominal pain. Bacillary dysentery, the more severe form of the disease, is an acute colitis characterised by fever with frequent painful stools containing blood, pus, and mucus. No country is exempt but cases in the tropics are always more serious than those which occur in temperate climates. The bacillus of Shiga, the Flexner group, the bacillus of Sonne, are the main organisms among those which cause the condition. They are

ingested with food or drink which has been contaminated by faecal matter conveyed by flies or unclean hands. The incubation period is about a week and the onset is sudden with fever, headache, vomiting, and severe diarrhoea.

The bacilli of dysentery do not penetrate deeply into the mucous membrane of the bowel, and perforation and stricture are not of the syndrome. Treatment should be initiated by washing the germs away with small concentrated two-hourly doses of Epsom salt followed by one of the sulphate drugs. Dysenteric serum is of value early in the disease. The management of the case implies rest, warmth, a low residue diet, and the combating of shock, with the replacement of lost fluid. Death may occur from toxæmia or dehydration. The disease often becomes chronic, flaring up from time to time. Summer diarrhoea in children is often really bacillary dysentery.

Amoebic dysentery results from infection of the colon by *Entamoeba histolytica*, and is characterised by large stools containing mucus and dark red blood. Fever is seldom present. It is much less serious than bacillary dysentery, occurring mainly in the tropics. The cystic form, the amoeba, is swallowed with contaminated food or drink, and after passing through the stomach the cyst wall is dissolved by the pancreatic juice, and the freed organism nests in the glands of the large intestine. As a result of its activities small abscesses form, resulting in superficial ulcers which are the source of the blood and mucus passed. Adhesions and perforation with resultant peritonitis may be caused by these ulcers, and the amoeba travelling afield may set up abscesses in lung or liver. The incubation period varies from 3 weeks to 3 months and the onset of the characteristic diarrhoea is insidious. Most cases run a chronic course, tending to improve even as they tend to relapse. Emetine is the essential cure, with carbarsone, one of the arsenical group, and yatrien as adjuvant substances. Perforation of the bowel demands immediate surgical intervention to save life, and lung or liver abscesses more leisurely surgical consideration.

As both forms of dysentery are caused by the soiling of food and drink by organisms present in faeces and conveyed by flies and hands, the prevention of the disease lies in cleanliness and in the exclusion of flies from food

substances. As many patients become carriers, it is now general in hospitals and hotels to examine medically and with the aid of the laboratory the chef and kitchen staff, to make sure that the disease is not latent in them.

Hilary Ledgerwood, M.B.

**Dysidrosis** (Gr. *dys*, implying badness; *hidrōs*, sweat), POMPHOLYX (Gr. bubble, vesicle), or CHEIRO-POMPHOLYX. Acute eruption of vesicles produced by an inflammatory exudate on the skin of the hands and feet, associated often with excessive sweating. It sometimes follows local irritation, as in doctors and nurses after the use of antiseptic solutions, or in war workers handling exploded aeroplane bombs. Burning and extreme itching are the most marked symptoms. The condition is worse in spring and summer and often tends to recur at the same period of the year. Scratching may lead to secondary infection.

**Dyson**, SIR FRANK WATSON (1863–1939). British astronomer. Son of a Baptist minister, he was

Sir Frank Dyson,  
British astronomer  
Russell

born at Ashby, Jan. 8, 1868, and went to Bradford grammar school and Trinity College, Cambridge. He entered the Royal Observatory, Greenwich, as chief assistant in 1904. In 1906 he was made astronomer royal for Scotland and in 1910 transferred to the corresponding position in England. He became F.R.S. in 1901, was knighted 1915, retired 1933, and died on a voyage from Australia, May 25, 1939. Dyson started extensive programmes for measuring the positions, distances, motions, brightnesses, and colours of stars in the Greenwich astrographic zone. He greatly improved the time service from Greenwich; and the expeditions he sent out to observe total solar eclipses in 1919 helped to verify Einstein's theory of relativity. He wrote *Eclipses of the Sun and Moon* (with R. Woolley), 1937.

**Dyson**, SIR GEORGE (b. 1883). British composer. Born at Halifax, May 28, 1883, he was educated at the Royal College of Music, and after travelling in Italy and Germany was music master at Osborne, 1908; Marlborough, 1911; Wellington, 1921;

Sir George Dyson,  
British musician

Winchester, 1924-37. He was then appointed director of the Royal College of Music. In musical education he exercised a strong influence, and published *The New Music*, 1924, an examination of modern technique in composition. His compositions included songs, piano pieces, and church music, e.g. *In Honour of the City*, 1928; *The Canterbury Pilgrims*, 1931; *The Blacksmiths*, 1934; *Quo Vadis*, 1939. A symphony was published in 1937, and a violin concerto in 1942. Dyson also wrote a *Manual of Grenade Fighting* during the First Great War which was officially adopted by the War office. Northcliffe lecturer in English literature at London university, 1940, he was knighted 1941.

**Dyson, WILLIAM HENRY** (1883-1938). British cartoonist. Born at Ballarat and educated at Melbourne, Will Dyson first attracted attention with his cartoons for the *Daily Herald*. A pictorial satirist of unusual imaginative and dramatic power, he championed not only the rights of labour but also the largest issues of political freedom. The most famous of his cartoons appeared in the *First Great War*. Interested in the social credit theory of C. H. Douglas (*q.v.*), he wrote *An Artist Among the Bankers*. He died Jan. 21, 1938.

Will Dyson,  
British cartoonist

**Dyspepsia** (Gr. *dys*, implying badness; *pesssein*, *pepsein*, to cook, digest) or INDIGESTION. Acute dyspepsia is most often due to errors in diet, such as eating too much or unsuitable types of food. Alcoholic excess is a cause, and acute dyspepsia is sometimes an early symptom of many infectious fevers. The condition is characterised by pain in the stomach, nausea, vomiting, and belching of wind. The tongue is probably furred and diarrhoea or constipation reflects in the lower bowel the distress of the upper portion. Treatment is to withhold food for 24 hours and subsequently give light diet, while some form

of bismuth soothes the irritated mucous membrane. In adults, if the diagnosis is clear, a dose of calomel, followed next morning by a saline purge, is good treatment, but because of the treacherous nature and varying manifestations of appendicitis in children, a purge should never be given to them to relieve indigestion.

Chronic dyspepsia may follow the long continued intake of unsuitable or badly masticated food or excess of alcohol. It may be a symptom of Bright's disease, tuberculosis, or anaemia; it may be the first sign of cancer of the stomach. It may be caused by too great a secretion of gastric juice, or by a deficient secretion. This imbalance of secretion is often the protest of an outraged liver. The symptoms of chronic dyspepsia resemble those of the acute form. The underlying cause must be treated, and rest and regularly spaced meals are advisable. Alkalines and drugs of the belladonna family modify and inhibit over-free secretion, and the digestive ferments, such as pepsin and diastase, may be taken where secretion is deficient.

**Dysphagia** (Gr. *dys*, implying badness; *phagein*, to eat). Difficulty in swallowing; early sign of disease of the oesophagus, that part of the intestine connecting mouth and stomach. The discomfort is generally accurately localised by the patient. If the difficulty is at the upper extremity of the tube, the act of swallowing cannot be easily initiated; the underlying cause may be a severe anaemia common in women, hysteria, paralysis after diphtheria, or a more serious neuro-muscular non-coordination associated with the paralysis of organic lesion.

Distress in swallowing in the middle of the tube is almost always caused by malignant disease, though here also occur strictures resulting from injury or the cicatrization of old ulcerated surfaces.

Difficulty at the lower end of the oesophagus is most frequently associated with the condition miscalled cardiospasm, which is now recognized to be not so much a spasm of the contractile muscle of the part as a failure to relax by the sphincter opening into the stomach. This type is associated with degenerative changes induced by toxins or absence of vitamins in the mucous membrane of the tissues. Ulcers or malignant tumours are more serious reasons for cardiospasm, the diagnosis being decided by X-ray examination.

The type resulting from anaemia responds well to massive doses of iron; tumours may be susceptible to surgical or ray treatment; and contracting scars, or the so-called cardiospasm, will probably yield before the periodical passing of a weighted bougie. The non-malignant types cause loss of weight through vomiting or the inability to ingest sufficient food, but though the patient is thin a balance is eventually struck between intake of food and output of energy, and life is not directly endangered.

**Dysprosium**. Chemical element, a rare earth of the erbium family or sub-group of the yttrium elements, which are readily soluble in a saturated solution of potassium sulphate. Dysprosium, which has a close-packed hexagonal structure, was first isolated from the mother liquids after the separation of cerium by the alkali sulphate process by L. de Boisbaudran. The atomic weight is uncertain, but the international table for 1921 gives 162.5. The atomic number is 66. Dysprosium forms an oxide,  $Dy_2O_3$ , dysprosia, which is white and dissolves in acids giving green or yellow salts. Other compounds which have been prepared are the chloride, oxychloride, bromide, sulphate, carbonate, nitrate, and phosphate.

**Dystrophy** (Gr. *dys*, implying badness; *trophē*, nourishment) or MYOPATHY. Condition of groups of voluntary muscles in which the muscle undergoes primary degeneration resulting in loss of power, the rest of the body being healthy. The condition is of the muscle itself, no nerve lesion being found. The essential cause is unknown. There are various types of dystrophy named according to the age of onset and the groups of muscles affected. The disease is hereditary and is transmitted through the female. At some stage of life difficulty in walking, sitting up, or undertaking some common activity hitherto perfectly performed, calls attention to the presence of the condition. Treatment by massage and exercises is unsuccessful. Drugs are useless.

**Dytiscus** (Gr. *dytēs*, diver). Generic name for the larger carnivorous water beetles common in ponds throughout Great Britain. They swim with considerable speed, but have to come to the surface to obtain a fresh supply of air, which is stored under the wing-cases for breathing when under water. They prey on tadpoles and on other insects. See Beetle.

THE ancestor of the letter E in the earliest Egyptian hieroglyphic writing (5000-4000 B.C.) was , representing an aspirate rather than a vowel. The later hieratic form was , a sign adopted in the Semitic alphabet, in which the letter was known as *he* (pronounced *ha*), meaning window, but it was somewhat modified in shape, being turned on end and given a tail, thus . The Greeks, whose writing ran from left to right, i.e. in the opposite direction to that of Phoenician and Hebrew writing, found it con-

venient to reverse the letter, which by about 500 B.C. had become the classic Greek **Ε**, or *epsilon*, with the minuscule forms **ε** and **ϵ**. The Greeks were the first to use it as a vowel, its original long sound being "ey" which is how the name of the letter is usually pronounced in other languages than English which employ the Roman alphabet. The Latin form added the usual refinement of serifs, and from the Latin minuscule **e**, written with a single penstroke, was derived the formal lower-case e of the printer.

**E** Fifth and most frequently used letter, and the second vowel of the English and Latin alphabets. Its chief sounds are those heard in *me*, the Italian *i*, and in *men*, really the short sound corresponding to *a* in *mane*. In words like *there*, *here*, *her*, the pronunciation is influenced by *r*. In *clerk*, *Derby*, *e* has the sound of *a*. As a rule, *e* final is itself mute, but its usual effect is to lengthen the preceding vowel; e.g. *mat*, *mate*, but *give*, *live*. *E* following *c* and *g* usually softens these consonants, e.g. *fence*, *certain*, *gender*.

The combination of *e* with other vowels represents various sounds: *ea* usually *ee*, as in *meat*, but at times as in *bread*, *head*, *great*, *pear*, *heart*; *eau* in French words is a long *o*, as in *portmanteau*, but in *beauty* as *iu* (*yu*). *Ei* is a long *a* or *ee*, as in *weight*, *deceit*, but has a short *i*-sound in *foreign*, *sovereign*, sometimes long as in *height*, *neither* (also *neether*). *Eo* is a long *ee*, as in *people*, but *yeoman* is an exception; in words like *gudgeon*, *surgeon*, the *e* is introduced to soften the preceding *g* and does not affect the following vowel.

The continuations *eu*, *ew* have the sound of *iu* (*yu*), as in *deuce*, *new*, but of *o* in *sew*. In *ey* when accented, the sound is that of a long *a*, as in *purvey*, but when unaccented, as in *valley*, the sound approaches that of short *i*. *Key*, like its homonym *quav*, is pronounced *kee*. See Alphabet; Phonetics.

**E.** In music, the third note of the natural scale of C. **E** is two whole tones higher than C. See Key Signature; Pitch; and entries under the other letters.

**Ea.** God of Babylonian mythology. He is said to have arisen out of the Persian Gulf, bringing with him the elements of culture. He was the god of wisdom and of life, the trees of which grew under his protection in the Babylonian Paradise, which was watered by the rivers Euphrates and Tigris created by him at the beginning of time. He was also known as the potter who moulded gods and men.

**Eadmer** or **EDMER** (d. c. 1124). English historian. Brought up a monk at Canterbury, he became the intimate companion of Archbishop Anselm. Elected to the archbishopric of St. Andrews, Scotland, 1120, he refused to be consecrated except by the archbishop of Canterbury, and on the Scottish king's denying the jurisdiction of Canterbury, Eadmer remained in England, and eventually renounced his claims to the see. He wrote a life of S. Anselm and *Historia Novorum*—the latter

an English history from 1066 to 1122. Both works were edited by M. Rule, for the Rolls Series, 1884.

**Eagle** (Fr. *aigle*, Lat. *aquila*). Group of large birds of prey, including some fourteen genera and a large number of species. True eagles belong to the hawk family Falconidae, of which they are the largest members. All have strong curved beaks with sharp cutting edges, and the head has usually a flattened and rather snakelike look. The plumage is generally dark, and the wings are long and powerful.

**Eagle.** Examples of this large bird of prey. 1. Golden eagle, with prey, not uncommon in Scotland and Ireland. 2. Spotted eagle, occasionally found in the British Isles in winter. 3. White-tailed sea eagle, found in the Hebrides

All are exclusively carnivorous, and most of them eat carrion. They are found throughout Europe, Africa, Asia, and North America.

The most familiar member of the genus *Aquila* is the golden eagle (*A. chrysaetus*), which is not uncommon in Scotland and in the wilder parts of Ireland. The golden eagles seen in England have always turned out to be white-tailed species. The bird is about a yard in length, with dark brown plumage showing a tawny tinge at the neck. It lives mainly on hares, rabbits, and game birds, and will occasionally attack a lamb or young fawn. Its nest, made of sticks and often of a huge size, is usually built on a ledge of an inaccessible cliff. The white-tailed sea eagle (*Haliaetus albicilla*) is found in the Hebrides. The spotted eagle (*A. clanga*) is a rare winter visitant. See Beak illus.

**Eagle.** Symbol in heraldry. It was employed by several nations before the beginning of heraldic science, notably by the Hittites, Persians, and Egyptians. In heraldry it is almost universally displayed full front, with expanded wings, but is shown in a great variety of positions, as close (wing closed), rising (wings elevated or displayed), volant or flying, trussing or preying (devouring quarry), and double-headed, in which form it was adopted by the Russian and Austrian empires.

From a Roman standard-symbol it became the emblem of the rulers of the Eastern Empire, from whom Charlemagne adopted it after his coronation at Rome in A.D. 800, thus making it the badge of the medieval empire. From this early form was evolved the later German imperial eagle, which, originally one-headed, is represented on the coins of the emperor Louis the Bavarian as double-headed, to typify the union of the royal and imperial dignities. This continued

Eagle. The bird as displayed on military standards. 1. Of the armies of Ancient Rome 2. Of those of Napoleon I and Napoleon III

to be the basis of the arms of the Holy Roman Empire till its close in 1806. The Austrian Empire preserved the double-headed eagle. The Russian tsars assumed the double-headed form in 1472 under Ivan III. to signify their succession from the Greek emperors. The modern German Empire adopted the single-headed eagle on its formation in 1871

The origin of the assumption of the eagle as a national emblem by the United States of America is obscure, but there is good reason to believe that it was adopted from Indian usage. Its images, carved in wood, or its stuffed skin, surmounted the council lodges of the Creek Indians, its feathers composed their war flag; and it was worshipped by the Natchez, Alanzas, and other tribes. The American eagle carries in its talons a bundle of arrows and an olive branch, bears on the breast a shield crossed by six red vertical bars, and from its beak issues a band with the motto *E pluribus unum*. The eagle was adopted by the Mexican Republic because of an Aztec legend that when the site of Mexico City

was discovered an eagle with a serpent in its talons was seen perching on a cactus plant. The alerion is an heraldic form of the eagle, without beak or legs.

**Eagle.** Name given to a military standard in Rome, Persia, France under Napoleon I and III, and Germany under Hitler. In Rome the eagle was traditionally believed to have brought the symbols of earthly power to King Tarquinius Priscus, and was first adopted as a military emblem in the second consulship of Marius (104 B.C.), when the older tribal standards were laid aside and the eagle, as the bird of Jupiter, was alone retained. It was at first made of wood, but later was cast in silver and bronze, with expanded wings, the model being small.

In the time of Cyrus, the Persian military ensign was a silver eagle with wings outstretched. In 1148 the Teutonic Knights adopted the eagle as their standard.

The Napoleonic eagle, which was served out to regiments and vessels of war, was represented as gilded and crowned and perched on a thunderbolt. It was first issued on Dec. 3, 1804, the day after Napoleon's coronation, and the officers who received it took oath to "sacrifice their lives in defence" of the standard. Twelve Napoleonic eagles are preserved at the Chelsea Hospital, London, but the only naval eagle known is in the museum at Madrid. On the restoration of the Bourbons, the eagles in use were destroyed, but when Napoleon returned from Elba new eagles were issued. After Waterloo another destruction of eagles was ordered, and only one of those which had not been captured by the British—that of the Old Guard—was saved, remaining in possession of the officer who secreted it. The older Napoleonic eagles bore only the number of the regiment,

Eagle. Representations of this bird on the flags and standards of various nations. 1. Taken from an Egyptian coin of the time of the Ptolemies. 2. Ancient Rome. 3. Holy Roman Empire. 4. Austria 5. German Empire. 6. Russian Empire. 7. U.S.A. 8. Mexico

but those made in 1815 bore the legend L'Empereur des Français, and the names of the four principal engagements in which the regiment had taken part. The practice of carrying eagles in French regiments was restored by Napoleon III in 1832, but once more abolished by the republic in 1870.

In 1934 Hitler introduced the eagle as the standard for German regiments; the emblem surmounting the staff on which the colours were carried.

**Eagle.** Gold coin worth ten dollars, formerly current in the U.S.A. It bears a representation of the U.S. crest, an eagle. First coined in 1795, it became the standard gold coin. Later double, half, and quarter eagles were authorized, and \$3 and \$1 pieces. In 1934 further coinage of gold and the use of gold coins was forbidden by the Gold Reserve Act.

**Eagle Owl (*Bubo*).** One of the largest members of the owl family.

Eagle Owl, a nocturnal bird of prey

Occasionally found in Great Britain, it is over 2 ft. long, with handsomely mottled brown plumage and conspicuous ear-tufts. It is nocturnal in habit, bold and savage, and preys upon game birds, rabbits, and young fawns.

**Eagle Squadron.** Unit of the Royal Air Force, formed on Oct. 8, 1940, from U.S. volunteers, many of whom had already served in the French air force during the battle of France. By Dec., 1941, there were three Eagle squadrons operating with Fighter Command; their honorary commanding officer was Gp. Capt. Charles Sweeney, a veteran of the First World War. When the U.S.A. came into the war the men serving in these squadrons transferred to the U.S.A.A.F., but retained the right to wear the R.A.F. brevet on their tunics.

**Eaker, Ira Clarence** (b. 1896). American soldier and airman. Born at Field Creek, Texas, he studied at Southern California and Columbia universities, and was commissioned as lieutenant in 1917. He served in the Philippines, 1919-22, where he transferred to the Army Air Corps, making many notable flights. In 1942, as brig-

Ealing, Middlesex. The Town Hall situated on the Uxbridge Road, a main road running west out of London

gen., he commanded first the U.S. bomber command in the U.K.; then the 8th bomber command of the U.S.A. 8th A.F. in the European theatre of operations (leading on Aug. 17, 1942, the first all American raid in W. Europe, a day attack by 12 Flying Fortresses on Rouen railway marshalling yards); and from Nov. the U.S.A. 8th A.F. Promoted lieutenant-gen. Dec., 1943, Eaker commanded the Allied air forces in the Mediterranean from Jan., 1944, until the spring of 1945. He retired in July of that year. He was the author of several books on aviation.

**Ealing.** Parl. and mun. bor. of Middlesex, England. It is 5½ m. W. of Paddington by main rly., and has five stations on London underground rlys. Until

a borough. Since 1926 it has included Hanwell and Greenford; since 1928 Northolt. The chief

Ealing arms

buildings include the Victoria Hall, the town hall, and Christ Church, Uxbridge Road. The parish church is S. Mary's. Perivale, formerly a rural part of Ealing, has a tiny church 800 years old. Open spaces include Ealing Common and Walpole Park. At Ealing is the first British film studio to be built, 1931, for sound; productions included *Next of Kin*, 1941; *The Captive Heart*, 1946; *Passport to Pimlico*, 1949. Pop. est. 163,650.

## THE EAR: ITS ORGANISM AND FUNCTIONS

J. Cecil Hogg, F.R.C.S., Surgeon to the Ear, Nose and Throat Dept., St. Bartholomew's Hospital

*This article, describing the complicated physical characteristics of the organ of hearing in man and certain other creatures, explains also the functions of the ear apart from its auditory power. See also Deafness.*

The ear is the organ of hearing; more strictly it contains the specialised structures forming the end organ of the eighth cranial nerve. It has two separate functions: it collects and concentrates the vibrations known as sound waves, and transmits them to the nerves, in order that they may be perceived and interpreted in the brain; and it harbours the chief organ of balance or equilibration.

The ear is divided into three parts:

(1) The outer ear, composed of (a) the auricle or pinna, the concave structure applied to the side of the head, which leads into (b) the external auditory meatus, a narrow tube passing inwards to the tympanic membrane or drum of the ear. The outer ear is com-

posed chiefly of a framework of cartilage covered by skin. In many animals the pinna is large, has a considerable degree of mobility, and its meatus can be narrowed or widened at will. The skin lining the deeper external auditory meatus is closely adherent to the subjacent cartilage and bone. The skin glands in the outer third of the meatus are modified into ceruminous glands, which secrete a semi-solid substance of a waxy nature—the ear wax. In some cases excessive formation of wax will lead to sudden deafness by totally occluding the outer ear:

(2) The middle ear is a narrow cleft-like air space in the temporal bone of the skull, separated from the outer ear by the ear drum. Situated within this cavity is a

chain of three minute bones, the malleus (hammer), the incus (anvil), and the stapes (stirrup). The malleus is attached to the outer surface of the ear drum, and the stapes to the membrane of the oval window, a small membranous gap in the outer wall of the inner ear. The incus occupies an intermediate position, being hinged and attached to both the malleus and the stapes. Sound waves reaching the drum are in this way conveyed to the membranous oval window of the inner ear.

#### The Work of the Middle Ear

The middle ear in addition transmits in its wall the nerve of expression, the facial, and its branch the chorda tympanica, an important nerve of taste. In front the eustachian tube forms a direct communication between the middle ear and the throat. In health this allows air to pass into the middle ear during the act of swallowing, in order that the pressure of air inside the drum may equal that of the atmosphere. Since the middle ear also communicates above and behind with the air cells of the mastoid bone, behind the auricle, inflammatory processes starting in the nose or throat may extend via the middle ear to the mastoid process, giving rise in severe cases to a mastoid abscess.

These structures are in very close relationship to the brain and its covering membranes, and all middle ear inflammations are therefore dangerous. It is noteworthy that the introduction of sulphonamide and penicillin treatment has materially reduced the incidence of mastoiditis by cutting short the inflammatory process in its early stage, and has also provided a potent means of treatment of its complications. These remedies, however, are not in all cases adequate, and surgical treatment may be necessary to prevent chronic ear disease and deafness.

(3) The inner ear is a bony cavity embedded in the base of the skull deep in the middle ear, with which it communicates by two membranous openings, the oval and round windows. It is filled with fluid called perilymph, suspended in which are the hollow fragile membranous structures of the cochlea and the semicircular canals. These membranous tubes

also contain a liquid called endolymph. The cochlea is a spiral tube, consisting in man of about two and a half turns, and has been compared to a snail's shell. The nerve of hearing terminates in it, in a multitude of minute hair cells which float in the endolymph. Sound waves are carried through the outer and middle ear, and put the membrane closing the oval window in action, which in turn is communicated to the perilymph fluid filling the bony inner ear. The movement of this fluid is transmitted through the membranous cochlea to the endolymph, and thus to the hair cells which form the termination of the nerve of hearing. The stimulus thus given to the nerve is perceived in the brain as sound.

In a certain form of deafness, known as otosclerosis, there is a deposit of vascular spongy bone, chiefly around the oval window.

Ear. Diagram showing path of sound waves to the brain

This in time leads to a fixation of the footplate of the stirrup bone or stapes, with consequent interference in the transmission of sound waves to the inner ear. The operation by surgical means of a new artificial membranous window into the inner ear, the fenestration operation for otosclerosis, has been increasingly carried out in late years, both in Europe and America. There is often a marked temporary improvement in the hearing, but as yet permanent relief of the deafness is exceptional.

The semicircular canals of the inner ear are three bony semicircular tubes joined together at right angles to one another, and opening at both ends into a small cavity known as the vestibule, which unites them to the cochlea. Like the cochlea they are filled with perilymph fluid, in which is found the membranous organ containing the hair cells, floating in endolymph. Any movement of this fluid stimulates the nerve. The

fluid is set in motion by any change in position of the body. The stimulus thus produced is carried to the brain, and enables it to judge of the position in space, and automatically to adjust the muscles accordingly. It is believed that the semicircular canals are concerned with reactions to movement, whereas reactions to position are the concern of the hair cells in the vestibule.

**FUNCTIONS OF THE EAR.** The cochlea is the only part of the inner ear concerned in hearing. It is absent in fishes, first appears in amphibia and reptiles, increases in birds, and attains its maximum perfection in the mammals. Destruction of the cochlea produces total deafness.

Sensations of sound are distinguished by three characters—loudness, pitch, and quality or timbre. Loudness depends on the amplitude of the sound waves, and the distance from the ear of the observer. The pitch depends on the number of vibrations occurring in a given time. Man can detect sounds with a pitch ranging between 16 and approximately 22,000 vibrations per second. There is reason to believe that many animals can appreciate sounds of higher pitch, whereas the sensory cells of the fish which correspond

with the mammalian cochlea are capable of perceiving only vibrations of very low frequency—6 per second. The quality or timbre of a sound depends on the manner in which the vibrations succeed one another. If these are irregular a noise is produced, if regular and orderly a musical note.

#### Tests for Location of Deafness

In the investigation of deafness standardised tests are used by the physician to determine the type of the lesion and its degree. By tests with tuning forks, ranging in frequency between C16 and C4096 double vibrations, it is possible to determine whether the lesion is in the inner ear, in which case the deafness is mainly for the high tones, or in the middle ear, when there is loss of appreciation of the lower frequencies. An estimate of the degree of deafness can be formed by measuring the hearing distance for the voice, or some simple mechanical instrument such as a watch or a clock. An

electrical instrument, the audiometer, makes it possible to test hearing for pure tones with accuracy between approximately 60 and 12,000 vibrations. By plotting the results of the audiometer test graphically, both the type and the degree of deafness can be readily assessed.

Equilibration is a second function of the ear. In balancing himself a man normally depends on his sense of sight, his muscles, and the stimulus to his brain from the fluid in his semicircular canals, with their vestibule. It is doubtful if the canals themselves convey any sense of position. This may be realized in flying, where in a banking aeroplane the first sensation may be that the horizon, and not the machine, is tilting. Experienced aviators flying through cloud can sometimes estimate the angle of the machine by the direction of the pull of the straps which hold them. Sudden movement or acceleration of the head in any direction produces movement of the endolymph in the canal, with stimulation of the hair cells which float therein. As the three canals are arranged in planes at right angles to one another, like three adjacent sides of a cube, the fluid in them moves in a different way with each change of position in space. Unusual or violent agitation of the endolymph, such as is produced in flying or sailing, gives rise to disagreeable sensations, well known as air sickness or sea sickness. A simple method of preventing the motion of the ship from affecting the canals is to place sterile gauze into both ears, packing it against the drum until there is a definite sense of pressure in the ear.

The semicircular canals and the eyes are closely connected via the central nervous system. Stimulation of the former produces quick jerking movements in the latter, known as nystagmus. Nystagmus may also occur in certain nervous diseases, and is not uncommon among coal miners, when the person affected is asked to look far over to one or other side. Similarly if a passenger in a moving train looks out of the window for a time, the effort he makes to "fix" a moving object—that is, to preserve a constant field of vision—produces the to and fro movement of the eyes which is called nystagmus. In miners it is probably caused by efforts to "fix" objects in a poor light.

When a physician wishes to investigate the condition of the

semicircular canals, he does so by inducing nystagmus: the patient is rotated in a revolving chair, about 10 turns in 20 seconds, which strongly stimulates the nerves in the canals, with production of nystagmus lasting upwards of half a minute in a normal subject. Another even more valuable test is the caloric test, in which the ear is syringed with water at temperatures below or above blood heat. This sets up convection currents by cooling or warming the endolymph fluid, with consequent production of nystagmus and giddiness. Absence, or delay in onset, of nystagmus is clear evidence of a disorder of the semicircular canals.

**Earhart, AMELIA** (1898–1937). Maiden name of Mrs. G. P. Putnam, American airwoman. Born

Amelia Earhart, American airwoman

at Atchison, Kansas, July 24, 1898, she entered Columbia university and later took up social work among children in Boston. On June 17, 1928, she became the first woman to fly the Atlantic, and on May 20–21, 1932, made the first solo crossing of that ocean by a woman, her time of 13½ hrs. being a record. She flew the Pacific from Honolulu to Oakland, Calif., in 18½ hrs., on Jan. 12, 1935. In March, 1937, with two companions she began a round-the-world flight, but crashed at Honolulu after four days; and early in July she was lost in the Pacific after setting out from New Guinea. She married G. P. Putnam, the publisher, in 1931.

**Earl.** Title in the British peerage, ranking third after duke and marquess. The French equivalent is comte, and the German is Graf. The wife of an earl is called a countess, a reminder of the days when earl and count were synonymous. His eldest son bears his father's second title; the other sons are known as the Hon., the daughters prefix Lady to their first names. Including Scottish and Irish titles, there are over 200 earls in the peerage.

Earl is the oldest title of nobility. Under the former earl it first appeared in England in Anglo-Saxon times, being used for those of noble blood as distinguished from the ceorls. In the 11th century, Canute set rulers over parts of the country. He named them jarls, a Danish

word, but this became earl in England. This idea remained, and after the Conquest most of the counties had an earl as the head of their administration, he being entitled to the third part of its revenues. These earls were sometimes called after their residence, but gradually it became general to call them after their county. The office was not at first an hereditary one, but some earls managed to make it so. They corresponded to the counts, rulers of counties in France and other parts of Europe.

Gradually the title became a mark of rank rather than a mark of office. Earls who had no connexion with the rule of a county began to be created in the time of Edward III, and following the first creations of the higher ranks of duke and marquess, they took their present place in the peerage, the title carrying with it the right to a seat in parliament. The premier earl of England is the earl of Arundel, a title held by the duke of Norfolk. Of those who have no higher title, the earls of Shrewsbury (1442), Derby (1485), and Huntingdon (1529) are the senior. In Scotland the earl of Crawford is the senior earl, dating from 1089. See Peerage.

**Earle, JOHN** (c. 1601–65). English divine. Born at York, educated at Merton College, Oxford, and successively dean of Westminster, bishop of Worcester, bishop of Salisbury. He wrote *Microcosmography* (1628), a valuable reflection of contemporary life. He was buried in the chapel of Merton College.

**Earl Marshal.** In England the eighth great office of state.

The holder of the office is head of the Heralds' College and has various ceremonial duties. Since 1672 the office has been hereditary in the family of Howard, dukes of Norfolk. On the death of the 15th duke, 1917, his brother, Lord Edmund Talbot, was appointed deputy earl marshal, the

Earl's coronet

Earl Marshal of England. The 16th duke of Norfolk, hereditary holder of this office

16th duke being a minor until 1929. Until 1386 the title was marshal. With the lord high constable he was judge of the court of chivalry. The office of earl marischal (formerly great marischal) of Scotland was hereditary in the Keith family until the attainer of George, the 10th earl marischal, in 1716, when it was abolished.

**Earl's Court.** District of Kensington, London, with an underground rly. junction. Earl's Court has been synonymous with exhibitions since the original building was opened in 1884; in the grounds was the Great Wheel, removed in 1906. During the First Great War the grounds accommodated 100,000 war refugees. The building then fell into disuse until reconstructed and reopened in 1937; thereafter Earl's Court housed the Motor show, part of the B.I.F., and other trade shows, and the main hall was used as a boxing stadium seating 18,500. Here is also the Empress Hall, with an ice rink. Pop. 18,500.

**Earlston.** Parish and small town of Berwickshire, Scotland, formerly Erscildoune. It stands on Leader Water, 32 m. by railway S.E. of Edinburgh, and is a noted angling resort. There are traces of the old tower of Thomas the Rhymer (d. 1299) Pop. 1,800.

**Early, JUBAL ANDERSON** (1816-94). American soldier. Born at Franklin, Virginia, Nov. 3, 1816, and educated at West Point, he practised as a lawyer, 1838-52. Though a supporter of the maintenance of the union he threw in his lot with the Confederates on the outbreak of the Civil War. At the first battle of Bull Run he commanded a brigade, and at Fredericksburg and Gettysburg a division. A succession of defeats by Sheridan and Custer, in 1864, led to his being relieved of his command in 1865, yet competent authorities regard him as the best Confederate general after Lee and Jackson. He was the author of *A Memoir of the Last Year of the War for Independence, 1867*, and other military and historical writings. He died at Lynchburg, Virginia, March 2, 1894.

**Early, STEPHEN TYRES** (b. 1889). U.S. journalist. Born at Crozet, Virginia, Aug. 27, 1889, he went to elementary and high schools, and became a journalist soon after completing his education. A member of the Washington Staff United Press Association in 1908, and publicity director of the U.S. Chamber of Commerce in 1920, he was assistant secretary to

President F. D. Roosevelt, 1933-37, and thereafter secretary until Roosevelt's death in 1945.

**Early Closing.** Movement among shopkeepers and others which secured shorter working hours on week days. In 1886 the Shop Hours Regulation Act limited the working time of young persons under 18 employed in shops to 74 hours a week, the Shop Hours (Amendment) Act of 1893 contained provisions for the appointment of inspectors. In 1904 another Shop Hours Act introduced the principle of closing by local option by a two-thirds majority. The shop-assistants' charter, however, was the Shops Act of 1912, which consolidated previous legislation and gave a compulsory half-holiday on one day of the week.

Under the Shops Act, 1934, shops with certain exceptions must be closed by 8 p.m. every day in the week except one, usually Sat., when they must be closed by 9 p.m. Local authorities may also make orders requiring shops to close at some hour fixed by them not earlier than 7 p.m. They must be satisfied that at least two-thirds of the shopkeepers approve. During the Second Great War closing hours as early as 4 p.m. were imposed under Defence Regulations. Ordinarily no one under 16 may be employed about the business of a shop more than 44 hours a week, no one between 16 and 18 more than 48 hours a week. In not more than six weeks in a year during periods of seasonal or exceptional pressure, persons between 16 and 18 may work overtime for a maximum period of 12 hours in any week or 50 hours in any year.

**Early English.** Style of architecture originating c. 1170 in the reign of Henry II, and prevalent throughout the 13th century. The term is also used for a period of literature covering about the same years as the architectural one (see *English Literature*).

Architecturally it has been called the "lancet" style or period, from the resemblance of the slender pointed arch, its leading characteristic, to a surgeon's lancet. Norman work had retained the round arch of Romanesque pattern, and Early English inaugurated the new era of Gothic architecture by substituting the pointed for the round. In essence, Early English indicates a revolt against the slightly uncouth forms of the Romanesque style in England, and a striving after more elegant forms of con-

struction and ornament. Vaulted roofs in stone take the place of the old flat timber roofs. Windows are lengthened and crowned by the lancet arch; piers are formed of clustered columns, each having its own cap, but united under one capital from which spring the trefoiled pointed arches of the vault; mouldings are deeply undercut, often with dog-tooth ornament; the entire design becomes more elegant and flexible.

The choir of Lincoln Cathedral (12th-13th century) is one of the earliest and most beautiful extant examples of Early English architecture. The choir and Lady Chapel of Southwark Cathedral, still preserved, were built in 1207; the stone-webbed vault of this fine Early English church is an example of the style at its best. In other English cathedrals portions of Early English work are still preserved, notably at York Minster, Westminster Abbey, Salisbury, Durham, and Ely. The plan of churches built in this period shows the absence of the semicircular apse which was characteristic of Norman and Romanesque structures, and the substitution of a square east end; and the transepts generally divide the length into two almost equal parts. It is noticeable that the Early English style was coincident with a movement within the Church towards simplicity and reticence. The Reformed Orders, especially the Cistercians, were largely responsible for an architectural development which, beginning with a lightness and beauty unknown to the Norman period, was to attain, in the Decorated and Perpendicular styles which followed it, an ever-increasing magnificence. See *Architecture*; *Gothic Architecture*: also *Arch illus.*

**Earmark.** Term used in English law to signify a sum set apart for a particular purpose. For example, when executors have to pay a legacy to a person, say at 21, and they set aside and invest for that purpose some particular fund apart from the general investment of the estate, it is said to be earmarked for the legacy. The term originated in the practice of marking beasts by cuts in the ear, for identification purposes.

**Earn.** Loch of Perthshire, Scotland, about 11 m. W. of Crieff. Lying 317 ft. above sea level, it is  $6\frac{1}{2}$  m. long and  $\frac{3}{4}$  m. wide, with a maximum depth of 287 ft. Trout are plentiful. The lake occupies a rock basin scooped out by the ice sheet which crossed Perthshire

**Earn.** View of the loch looking eastward from Lochearnhead

during the Ice Age. Scott's Legend of Montrose introduces Ardvorlich House, on its shore, as Darnlin-varach.

**Earn.** River of Perthshire, Scotland. It issues from Loch Earn and flows E. for 46 m. across Strathmore to the Tay, which it enters 2 m. N.E. of Abernethy. Salmon, trout, and other fish abound. It is subject to floods, but small vessels, not exceeding 50 tons, can approach Bridge of Earn.

**Earnest.** Name given to a sum of money paid on account in order to show the good faith of the buyer. Such payments are recognized in English law, and also in other codes, the fact that such has been made being taken as proof that a contract has been entered into. Strictly speaking, earnest is not part

payment, although it has some similarity with the arrha of Roman law which was such. See Contract.

**Earring.** Object attached to the ear, usually by passing it or a subsidiary ring or hook through the lobe. Its purpose may be amuletic, ceremonial, or ornamental. Untraceable in the prehistoric stone age, earrings appear early in the metal age in the form of plain bronze and gold bands or wires, sometimes twisted, sometimes with one end clubbed. In the Swiss lake-dwellings, which have yielded hundreds of specimens, occurs a double-coil design which survives among the Sumatra Battas. In ancient Egypt the simple hoop developed complex forms, with animal head terminals and gems, partly under foreign influence

**Earring.** 1. Ancient Egyptian, mounted with beads. 2. Gold with jacinth drops, on either side pierced earrings with emerald matrix drops, all three Roman. 3. Ancient Greek gold earring set with jewels and enamels, c. 400 B.C. (centre); small Roman earrings of gold. 4. Enamelled Byzantine, set with pearls. 5. 16th century Italian, pearl set in gold. 6. Left, turquoise, c. 1840; right, modern Italian set with seed pearls; above, turquoise, c. 1840. 7. 16th cent. Italian, shaped like a ship in full sail; on either side, 16th cent. Venetian pearl pendants for earrings. 8. Modern Indian, set with diamonds and emeralds. 9. Phoenician earring from Tharros. 10. Modern Italian, gold set with seed pearls

From *Chats on Old Jewellery*, by MacIver Percival; and *Jewellery*, by Cyril Deaconport  
By courtesy of T. Fisher Unwin and Methuen & Co.

Except in Babylonia and Assyria these ornaments were usually confined to women. Many O.T. references to such rings properly concern nose-ornaments; that mentioned in Isaiah 3 was an amulet. The development of design is observable in Mycenae, Troy, Etruria, and S. Russia, through the winged sirens of Greece and the pearls and other jingling jewels of imperial Rome to the massive pendants of the Byzantine age.

Dormant during the Middle Ages, the use of earrings revived after the Renaissance. Mediterranean mariners introduced the single plain gold hoop to the seafaring world, where it is still in favour. In modern India rings may have a

**Earth.** Diagram to show the relative sizes of the earth and its satellite, the moon. The white band below indicates the distance between them on a scale where the width of the band equals the earth's radius

hundred pendant pearls, with supporting chains over the top of the ear, or the ear may have 12-13 borings, each with a separate ornament. Garo women sometimes wear 50 brass rings in each ear. Silver is preferred by Syrian women; other materials are the iron wire of the Dinka, shell of the Hottentots, cuttlefish bone of Formosa, and tortoiseshell of the Solomon Islands. See Mutilation Customs.

**Earsdon.** Parish and urban dist. of Northumberland, England. It is 4 m. N.W. of North Shields, and the inhabitants are employed in the local collieries. Pop. 13,086.

**Earth.** Name of the planet on which we live. The word is also applied to the soil of the external crust. The earth comprises a gaseous atmosphere, which is studied in meteorology (*q.v.*), a solid crust or lithosphere, studied in geology (*q.v.*), surface waters

Earth. Three views of the earth showing the three mountain ridges which meet in the plateau of Antarctica. These ridges indicate the shape which is being assumed by the earth's crust as the earth itself cools and contracts

called the hydrosphere (*see* Ocean) and an interior of which the structure can only be deduced and not directly observed (*see* Geophysics; Seismology). The mapping and study of the surface features of the earth are the province of geography (*q.v.*).

Primitive ideas of the earth nearly always conceived it as a flat disk surrounded by water and supported on foundations which allowed the sun, moon, and stars to complete their passage below ready to rise again and circle the celestial dome above the earth. Pythagoras was the first to suggest a spherical form, and Aristotle lent the weight of his authority to the idea. The arguments for sphericity—the gradual disappearance of ships hull first; the shape of the earth's shadow during eclipses of the moon; variation in the constellations visible as the observer changes his latitude—were, however, not generally regarded as convincing till the globe was circumnavigated in 1519. It is now known that the earth is approximately a sphere flattened slightly at the poles, the polar diameter being 7,900 m. and the equatorial 7,926 m.

#### The Four Divisions

The atmosphere, which consists at the surface of 75 p.c. nitrogen, 23 p.c. oxygen, and 2 p.c. rare gases, with variable amounts of water and carbon dioxide, extends in an attenuated state to an altitude of some 500 m. (*see* Aurora). The solid surface is diversified by hills and valleys believed to be due to the shrinking of the crust on a cooling core; the highest peak rises to 29,000 ft. above sea level, the lowest depths of the sea slightly exceeding this figure. There is nearly three times as much surface covered by water as dry land, and the distribution is strikingly uneven (*see* fig.). The surface rocks may be igneous, i.e. formed from molten material, or sedimentary. The

former are largely composed of silica, free or in combination with the oxides of aluminium, potassium, sodium calcium, magnesium, and iron. The latter are formed by denudation and chemical action from the former, and consist of the sand, clay, and carbonates familiar, for example, in S.E. England. The oceans consist of water containing 3.5 p.c. of dissolved salts, mainly the chlorides of sodium and magnesium and the sulphates of magnesium, calcium, and potassium. Present evidence suggests that there exists a central core 4,500 m. in diameter of metals in a quasi-fluid state, surrounded by a mantle of silicates, basalt, and granite.

#### Temperature and Specific Gravity

At the surface the temperature is controlled by radiation from the sun and therefore varies with latitude, the annual mean being about 85° F. at the equator and 0° F. at the poles. The rate of increase with depth in the surface layers is about 50° F. per mile, but this is due largely to radioactivity in the outer crust and the temperature gradient is probably not maintained inwards: the central core is unlikely to be hotter than 5,500° F. Lava flow from volcanoes is an index only to the conditions in local pockets close to the surface.

The mean specific gravity of the earth as a whole is 5.52, but that of the surface rocks is only about 2.7. At the boundary of the metallic core (roughly halfway to the centre) the specific gravity is about 7, and it may reach 12 at the centre. This progression is due partly to increase of pressure as well as to change of constitution. The pressure must reach a million atmospheres at a depth of 1,300 m., 2 million at 2,200 m., and about 3½ million atmospheres at the centre. These pressures cannot be reproduced in the laboratory, and presumed physical properties

of matter under such conditions are largely based on extrapolation.

The earth is one of the smaller of the ten major planets which together with the asteroids and comets comprise the sun's family. It is third in order from the sun, its mean distance being 93 million miles as compared with 36 million for Mercury, the innermost planet, and 3,680 million for Pluto, the outermost. Its mass of 5,900 million million tons exceeds that of the lightest planet Mercury, by a factor of the order of 30, but is exceeded by that of the heaviest, Jupiter, by a factor of 318. It is remarkable in having a satellite, the moon, that is very much bigger in relation to the earth than is any other satellite in relation to its primary. Possibly the moon once formed part of the earth, but its great size (its diameter is more than  $\frac{1}{4}$  that of the earth) suggests that it may be an independently formed planet captured by the earth in past ages.

#### Rotation on its Axis

The earth rotates on an axis along its shortest diameter (N.-S. axis) from W. to E. in a period of 24 sidereal hours or 23 h. 56 m. of mean time. A point on the equator moves at over 1,000 m.p.h. as a result. The rotation produces the alternation of day and night and the apparent diurnal rotation of the heavens from E. to W. Until the time of Copernicus (d. 1543) this was supposed to be due to a real rotation of the heavens, and experimental proof to the contrary was not adduced till Foucault in 1851 showed, by hanging a free pendulum 200 ft. long from the dome of the Pantheon in Paris, that its plane, which is invariably in space, did not continue to coincide with the initial direction of swing inside the building. This was visible proof that the floor was in fact turning with the earth under the pendulum bob. The rotation of

the earth is utilised to provide the directive force of the gyro-compass.

The great circulations of air-masses in the atmosphere and of water in the ocean currents are controlled by the earth's rotation. In the N. hemisphere the wind spirals counterclockwise into a depression, while in the S. hemisphere the motion is clockwise. In both, the spiral character of the motion is due to deviations produced by the rotation in winds which start directed towards the centre of the depression. A similar deviation has to be allowed for in calculating the path of projectiles in gunnery.

The earth revolves annually at an orbital speed of about  $18\frac{1}{2}$  m. per second in an ellipse with the sun at one focus, the plane of the orbit being inclined at  $23\frac{1}{2}^\circ$  to the plane of the equator. This inclination causes the N. polar regions on June 21 and the S. polar regions six months later to be tilted towards the sun. At the first date the N. hemisphere ex-

tract one another with a force directly proportional to the product of their masses and inversely as the square of their distance apart. The earth attracts all objects close above its surface towards its centre with a force which increases their speed of free fall by 32 ft. per second every second. An acceleration similar though smaller (because of the greater distance) keeps the moon from flying away from the earth at a tangent to its orbit. The force of gravity is more at the poles than at the equator by about 1 part in 189, partly owing to the earth's oblateness but mostly to the centrifugal force associated with its rotation. The gravitational attraction of big mountain ranges such as the Himalayas causes the plumb-line to be deflected in their vicinity. Such masses, however, usually have strata of lower density than normal below them; and deep ocean basins, relatively light, are underlain by much denser rocks

The early history of the earth is largely a matter of conjecture, but its composition is consistent with the view that it once formed part of the sun and was torn off, together with the other planets, by some catastrophe, such as the close passage of another star, which created enormous tidal waves in the sun. The gaseous matter ejected first liquefied, the heavy elements sinking to the centre, and then a solid crust formed on which, as it cooled, life appeared and evolved. The time of solidification can be fixed by geological means, such as measuring the proportion of various products of radio-activity in rocks. Many lines of evidence suggest that it occurred about 2,000 million years ago. Present astronomical evidence makes it seem likely that the ultimate fate of life on the earth is extinction by heat as the sun's temperature rises in the course of time.

**Bibliography.** The Earth, H. Jeffreys, 1929; Earthquakes and Mountains, H. Jeffreys, 1935; Internal Constitution of the Earth, ed. B. Gutenberg, 1939; About This Earth, F. K. Ward, 1946.

**Earth.** In the electrical sense, this term refers to the use of the earth as a very large conductor and consequently as possessing a very large capacity. Its potential is regarded as invariable by virtue of the fact that any other conductor that may be connected to it will have a negligible capacity by comparison. On connecting a charged conductor to the earth, the transference of electrical charge involved will therefore make an inappreciable change in the total charge residing in the earth, and hence the potential of the latter has come to be regarded as the general standard of reference. (See Circuit).

When it is desired to shield an electrical apparatus from the inductive influence of external electrical charges, it is usual to enclose the apparatus in a metallic container which is electrically connected to earth. This is called electrostatic screening. In some electrical train systems only one insulated conductor rail is employed, the earth being utilised as the return conductor.

**Earth Colours.** Pigments universally employed before the introduction of oils. The cave men used red, yellow, black, and white for their crude but spirited drawings of animals, and the ancient Egyptians and Greeks resorted to similar though somewhat more numerous

**LAND HEMISPHERE**  
Earth. The world in hemispheres. The land hemisphere has its centre approximately at London. The Arctic basin is antipodal to the Antarctic continent; Africa is antipodal to the great basin of the Pacific. The water hemisphere includes Argentina, Australasia, the East Indies, and the south-east corner of Asia

periences summer, the rays of the sun falling more nearly vertically than six months later, when the S. hemisphere has its summer. At points a quarter of a revolution away (see Equinox) neither pole is tilted to the sun, and all places on the earth have 12 hours' day and 12 hours' night. Owing to the earth's elliptic orbit, the sun is 3 p.c. nearer to the earth in Dec. than in June; thus the N. winter tends to be warmer than the S., and the N. summer cooler than the S. At any given latitude, however, the climate is largely controlled by the neighbouring land or ocean masses, and the isotherms (q.v.) by no means follow parallels of latitude.

The universal force of gravitation causes all material objects to

below. This condition of gravitational compensation is called isostasy.

The earth acts as a giant magnet with its axis inclined to the axis of rotation by about  $17^\circ$ , the poles being not quite at the ends of a diameter. The N. magnetic pole was reached by Ross in 1831 and found to be at long.  $96^\circ 43'$  W., lat.  $73^\circ 31'$  N. Shackleton in 1909 found the S. magnetic pole at long.  $155^\circ 16'$  E., lat.  $72^\circ 25'$  S. The magnitude and direction of the magnetic field at any point are constantly changing, but roughly speaking the field is similar to that which would be produced by a short magnet at the earth's centre lying along the magnetic axis. The cause of the magnetic field is unknown.

pigments. Honey or one of the gums was probably the binding medium. The earth colours include the ochres, umbers, sienna brown, and terre verte.

**Earth Density.** This has been determined experimentally by several physicists, beginning with Cavendish. The mean density as calculated most recently by C. V. Boys is 5.5268; or rather more than five and a half times that of water. See Cavendish Experiment.

**Earthenware.** Name given to all pottery that is not translucent. It includes Faience, Delft, Stoneware, Granite-ware, Silicon, and Semi-porcelain. It may be glazed or unglazed, the terracotta of the Greeks, flooring tiles and building blocks, Majolica and enamelled wares all coming under the general term. Its origin is lost in antiquity, dating back to a primitive culture when plaited baskets were encased in clay for cooking food. See Pottery.

**Earth-House.** Primitive underground structure of the early metallic age, especially in Scotland. Normally it is a round or rectangular chamber of unhewn masonry, with a beehive roof, beneath an artificial mound. Frequently one or more chambers are approached by stone-lined, stone-paved corridors, often planned with a sharp bend, as at Tealing, Angus, where it is 80 ft. long, 5 ft. 8 ins. high, with cup-markings. On the moor of Clova, Aberdeenshire, about 50 of these so-called Picts' Houses lie within two sq. m. At Skerrebæra, Orkney, several groups of chambers—one 21 ft. by 11 ft.—were reached from a common corridor. At Cairn Conan, Arbroath, the underground chamber lay near surface foundations, pointing to its probable use for refuge and storage in connexion with surface dwellings. The cultural range of the associated remains—querns, spindle-whorls, horn and bronze implements, Samian ware—resembles that of the Broch. Similar structures occur in Ireland and Cornwall. See Archaeology; Underground Dwellings.

**Earthly Paradise.** THE. Poem or cycle of narrative poems by William Morris, published in four parts, 1868-70. The stories, chosen from classical and medieval sources, are supposed to be told by a miscellaneous group of 14th century story-tellers, banded together in search of that earthly paradise which gives its name to the whole. The first poem in the series, *The Life and Death of Jason*, was published as a separate volume, 1867.

**Earth Movement.** The crust of the earth is much less stable than might be expected. Throughout geological time it has been subjected to great forces, and in consequence deformed, elevated, and depressed. Mountain ranges have been raised, and large areas have been elevated, tilted, or lowered beneath the sea. The temple of Serapis, near Naples, has been lowered beneath sea-level and now stands once more above it. Precise levelling shows that England is being slowly tilted to the S.E.; the foundations of Roman buildings on the S.E. coast are now below sea-level, and ancient British settlements in the same area have been found buried beneath recent deposits.

In Scotland the presence of raised sea beaches at 100 ft., 50 ft., and 25 ft. indicates periodical rising of the land relative to the sea. Movements which result in the slow elevation or lowering of large areas of the land are referred to as epeirogenetic.

Earth movements caused by compressional forces acting on the earth's crust give rise to the formation of mountain ranges—*orogenic* movements. These begin by the development of a long zone of subsidence or down-warping of the crust. The slow sinking of this trough—*geosyncline*—is accompanied by deposition of sediments which may accumulate to great thicknesses (over 30,000 ft. in the Appalachians). When the crust beneath the geosyncline is unable further to withstand the stresses it buckles downwards, and the sediments in the trough are crushed together and thrust beyond its borders. The folded and contorted rocks are thus raised above sea-level, and a mountain range is heaved up along the line of the earlier zone of subsidence.

Tensional forces acting on the crust produce fractures known as faults; the great rift valley of E. Africa, Red Sea, Dead Sea, and the Jordan is the result of the breaking of the crust and the dropping of elongated tracts between parallel faults. Some ocean deeps probably have been similarly formed. Faulting accompanied by tilting has produced in many regions fault-block mountains. These have a steep face which is the plane of the fault, and a gently dipping reverse slope which is the result of tilting of the block.

The greatest hypothetical earth movement, that of continental drift, is a matter of controversy. Some geologists believe that the

Americas were once attached to the Europe-Africa mass, and have drifted W., slipping on a viscous substratum below the crust. Australia, Antarctica, and New Zealand are thought to have moved S. and E. from Africa. The theory simplifies many geological problems, but raises others.

**Earth-Nut Cake.** Artificial feeding stuff. It is prepared from the underground fruit of the leguminous plant variously known as earth-nut, ground-nut, monkey-nut, or pea-nut (*Arachis hypogaea*), after the oil has been extracted. In the decorticated form, which is better known than the undecorticated, the husk has been removed, and it is then a good substitute for decorticated cotton-cake. Percentage composition: water, 10.43; oil, 8.17; albuminoids, 48.32; digestible carbohydrates, 22.99; fibre, 4.67; ash, 4.42.

**Earth Pillar.** Pillar of clay capped by stones. In an area consisting of clay or soft rock contain-

Earth Pillar. An example at Euseigne, Switzerland

ing large stones the softer materials will be readily washed away by the rains, but the stones, acting like umbrellas, will protect the clay or soft rock immediately beneath them. In this way pedestals capped by stones are formed.

**Earth Plate.** Metal plate, buried in the ground, to which a conductor is electrically connected if it is desired to maintain the conductor at the potential of the earth; the latter being assumed to have a zero value. See Circuit.

**Earthquake.** Vibration of the earth's surface resulting from some sudden movement in or below the crust. The study of earthquakes is known as seismology (*q.v.*), from Greek *seismos*, an earthquake. Most earthquakes are related to faults (*q.v.*) or earth-fractures lying near or within the margins of the more recently formed mountain chains of the world.

Seventy-nine p.c. of recorded earthquakes have occurred in one or other of two such great belts—the Circum-Pacific, i.e. the W. coast of the two Americas and W. Indies,

1. Vertical displacement of the surface, Mino-Owari, 1891. 2. Horizontal displacement of the surface shown by off-setting of fence, California, 1906. 3. Road in Napier, New Zealand, fissured by earthquake in 1931.

4. Ruined street in Gifu, Hondo, Japan. 5. Dak bungalow, Quetta, ruined, 1935. 6. Earthquake-proof bungalow, 1935, nearly opposite bungalow in No 5. 7 and 8. Desolation caused at Erzincan, Turkey, 1940

# **EARTHQUAKE: EXAMPLES OF EARTH MOVEMENT AND DAMAGE BY MODERN EARTHQUAKES**

1. From Great Earthquakes, C. Davison, Thomas Murby & Co., 2 and 3 From Earthquakes, J. Milne and A. W. Lee, Kegan Paul, Trench, Trubner & Co., 1939. 5 and 6 From Quetta Earthquake, Records of the Geological Survey of India, 1936, photographs by W. D. West

Aleutian Isles, E. China and Japan, E. Indies and New Zealand; the Mediterranean-Himalayan belt, which extends from the Cape Verde Is., through Spain and Portugal, Italy and the Alps, the Balkans, Asia Minor, the various Himalayan ranges to Burma and China, where it joins the Circum-Pacific belt. Subsidiary zones are the Rift Valleys of E. Africa, and the Mid-Atlantic Swell, which runs from Iceland to approximately Ascension Is. Few earthquakes have been recorded from those roughly level stable regions that are built of ancient rocks. Earthquakes associated with earth movements are referred to as tectonic earthquakes; they are of much greater intensity than are volcanic earthquakes, which occur near active volcanoes.

#### Cause and Degree of Earthquakes

The earth's crust is being continually deformed by slow internal movements, many of which occur in recognized fault zones. As long as the movement is slow and continuous, it is felt only by delicate instruments; but if some resistance restrains this slow movement, stresses in the earth's crust pile up until they become stronger than the resistance. A sudden slip follows, and the vibrations set up cause an earthquake. The San Francisco earthquake in 1906 was caused by a sudden slip on the San Andreas fault. The horizontal shift in this case was in places over 20 ft. Fences, roads, and water courses were displaced laterally. At Yakutat Bay, Alaska, in 1899, sudden movement on a fault resulted in a local uplift of the seacoast of nearly 50 ft.

The slip does not take place over the whole length of the fault, which may measure hundreds of miles; it is distinctly localised. The point or zone of origin of an earthquake is called the focus. In normal earthquakes it lies at less than 30 m. below the surface, in intermediate earthquakes at between 30 and 150 m., and in deep-focus earthquakes down to about 450 m. The epicentre, where the maximum effect of the earthquake is felt on the ground surface, lies vertically above the focus. The intensity of the shock at different points on the ground can be estimated by the nature of the damage done to buildings, etc. This damage has been classified and standardised in two scales, the Rossi-Forel scale and the Mercalli scale. By plotting the damage according to its degree by one of these scales, zones of equal inten-

sity are mapped around the epicentre. Their boundaries are called isoseismal (*iso*, Gr. equal). They are roughly concentric around the epicentre.

The 12 degrees of Mercalli's Scale, modified by A. Holmes (1944), are: (1) instrumental: detected only by seismographs; (2) very feeble: noticed only by sensitive people; (3) slight: felt by people at rest; (4) moderate: felt by people in motion; (5) rather strong: people are awakened, bells ring; (6) strong: slight damage; (7) very strong: walls crack, alarm is general; (8) destructive: chimneys fall; (9) ruinous: some houses fall; (10) disastrous: many buildings destroyed; (11) very disastrous: few structures left standing, ground fissured; (12) catastrophic: total destruction, objects thrown into the air, ground badly twisted.

The instrument for recording vibrations from earthquakes is known as a seismograph. It is mounted on a heavy masonry pillar let into the ground at a point free from local vibrations from traffic, etc. A delicately suspended lever carrying a heavy weight, the inertia of which keeps the lever stationary when the instrument and its foundation respond to the vibrations, is connected with and keeps steady a rotating drum on which a pen or other device forming part of the instrument records any motion to which the ground has been subjected.

#### Determining the Epicentre

Different types of vibrations emanate from an earthquake: the fastest are longitudinal vibrations or P-waves, which vibrate in the direction in which they are travelling. Next are transverse, shake- or S-waves, which vibrate at right angles to the path along which they move. Thirdly there are long- or L-waves, which travel in the earth's crust only and are the slowest. The L-waves are the most damaging. The accurate timing of the arrival of the different types of waves at an observing station, together with the known speeds of these types, affords from the measured time intervals (e.g. "S" time minus "P" time) the means to calculate the distance of the station from the focus. When the distances from three suitably placed stations are known, the position of the epicentre can be determined. If there are three seismographs at one station, recording vertical earth movements as well as movements in each of the N.-S. and E.-W. directions, it

is possible to deduce the epicentre, independently, from a complete record of these three components. As a rule, however, only large earthquakes provide sufficient information to make it possible to locate the epicentre in this way, without reference to the records from other stations.

Earthquake waves are reflected and refracted at discontinuities, or surfaces of different types of rock-matter, inside the earth. From a study of the so-called travel-times of the waves, it is possible to draw important conclusions regarding the inaccessible internal layers and core of the earth. Geophysical prospectors (exploring e.g. for possible oilfields) deduce facts about local geological structure from the behaviour of the waves of artificial earthquakes generated by explosive charges.

#### Submarine Earthquakes

Near the epicentre of a disastrous earthquake, the ground heaves in moving waves comparable to sea-waves in appearance. They are naturally more obvious in alluvium, artificially filled ground, or recent unconsolidated sediments than in solid rock. They cause the ground to crack open, and sand-laden springs to gush out. Under-surface pipe-lines are broken, and extensive damage by fire due to burst gas-mains and broken electrical wires is added to that caused directly by the earthquake waves. In mountainous areas landslides occur, which may dam rivers or divert them. Submarine landslides of unconsolidated sediment off the coast are common. Submarine earthquakes often produce enormous sea-waves or *Tsunamis* (Jap). These are very destructive, as at Lisbon in 1755, and more recently in the Sanriku earthquake (Japan) in 1933. Here the waves reached a maximum height of 93 ft.

The design of buildings to withstand earthquake shocks has improved in the 20th century. Steel frame or reinforced concrete buildings are efficient, if kept below 100 ft. in height, with light roofs and upper structures. Buildings on deep foundations and massive concrete-raft foundations have also stood shocks well. See Earth Movement; Fault; Geology; Seismology. Consult also Earthquakes and Mountains, H. Jeffreys, 1935; Great Earthquakes, C. Davidson, 1936; Earthquakes, J. Milne and A. W. Lee, 1939; Principles of Geology, A. Holmes, 1944.

A. J. Drummond, F.R.Met.S

**Earth-shine.** Illumination of the moon by reflected light from the earth. It can be observed with greater or less distinctness, according to locality and atmospheric conditions, when the portion of the moon illuminated by the sun appears only as a slender crescent. On account of irradiation (*q.v.*) the crescent appears slightly larger than the darker part of the disk, and the phenomenon is often described as "the old moon in the new moon's arms." In favourable conditions all lunar seas are conspicuously visible, as are also the other prominent features. Aristarchus and Copernicus appear as bright specks. Humboldt endorses an observation that this reflected light changes in colour according to the region of the earth from which it is reflected. *See Moon.*

**Earth-star** (*Geaster*). Genus of fungi, of the family Lycoperdaceae. They are distin-

Earth-star. Specimen of the fungus showing its pointed segments

guished from the puff-balls (*Lycoperdon*) by the two outermost layers splitting from the apex into several pointed segments which expand and give the plant its stellate form. The numerous species grow upon the ground.

**Earthwork.** Ancient stronghold defended by earthen mounds. There are several thousands in England and Wales. Promontory forts, utilising natural defences, are either coastal or inland. They developed into cliff castles. Hill-forts are characteristic of neolithic Britain. Plateau forts are on flatter ground. When round or oval they are pre-Roman, but often were used successively by neolithic, Celtic, Roman, Saxon, and Norman occupants. There is a good earthen hill-fort on Midhill Head, Midlothian, but Scottish strongholds are mostly of stone. *See Caesar's Camp; Dyke; Rath.*

**Earthwork.** In engineering, the excavation and disposal of materials which can be loosened with-

out blasting. Railway engineers, when running their surveys, endeavour to fix formation levels which will balance excavation and embankment, preventing useless

Earthwork. Diagram illustrating angle of repose

dumping and too much borrowing from outside areas.

The cubic contents of a cutting or embankment relatively to its average depth is governed by the angle of repose of the material under the conditions to which it will be exposed when the work is completed. If dry sand is poured on to a horizontal surface A B (*see diagram*), it forms a conical pile, the slopes of which make an angle of about  $35^\circ$  with A B. As long as the heap remains dry, the angle is unchanged, and the heap is stable. Therefore angle C A B (= angle C B A) is the natural angle of repose. Addition of water reduces the friction between the particles, and the heap spreads out until a condition of equilibrium is re-established, the angle of repose being reduced to  $22^\circ$ - $26^\circ$ .

The angles of repose of other substances are approximately: damp clay,  $45^\circ$ ; wet clay,  $16^\circ$ ; earth deposited in layers and rammed,  $60^\circ$ - $70^\circ$ ; damp earth piled in bulk,  $45^\circ$ ; dry earth,  $30^\circ$ ; wet earth,  $16^\circ$ - $18^\circ$ ; gravel,  $45^\circ$ - $50^\circ$ . Assuming that proper provision is made for drainage, a slope in which A D : C D ::  $1\frac{1}{2}$  : 1 is safe for average earthwork in both cutting and embankment. To allow for the effect of heavy rain, it may be prudent to make the slope more gentle than this, as extra work done in the first instance is less expensive. The shoulders and toes of embankments should be rounded off, and the slopes covered with grass, which protects the earth against the loosening influence of rain.

#### Ditches and Drainage

If there be any likelihood of water flowing down into a cut from higher ground, a ditch is dug near the edge to intercept the water and carry it to a point where it can pass away without doing damage. In clay it is often necessary to cut Y-shaped ditches in the direction of the slope and fill them in with lump chalk, clinkers, etc. The arms of a Y catch the water, which flows down the leg into permanent drains along the foot.

For general excavation of earthwork on a large scale, caterpillar tractor-drawn scrapers are employed, with capacities up to 13 cu. yds. They are used for removing the material and depositing it on sites, and a haul of about  $\frac{1}{4}$  mile is the most economical distance. This machine has the great advantage in forming embankments that it deposits the material in thin layers of about 6 ins., and the constant traffic of the caterpillar tractors and the pneumatic tires effects a high degree of consolidation. For larger hauls the wheel tractor scraper is best employed; for really long hauls the shovel, with bucket capacities up to 35 cu. yds., loading into dumpers, gives the greatest advantage. The dumper can transport material over rough unmade ground, and has largely superseded light rlys. and tipping wagons. It is extremely mobile and can take a load measuring up to 9 cu. yds.

In trenches, earth and other soft material is generally excavated by machines consisting of an endless chain, carried on a boom, and fitted with specially shaped buckets. The angle of the boom is adjustable and regulates the depth of the cut. The buckets discharge on to a belt conveyor which carries the material away from the trench ready for back filling.

Railway embankments are generally formed by tipping over the end, and allowing the debris to find its own angle. Settlement of the material by consolidation must be allowed for to the extent of  $\frac{1}{4}$  to  $\frac{1}{2}$  of the height of the pile. If the earth be spread in layers, subsequent shrinkage is small. To open the road quickly it may prove economical to run a temporary trestle across a fill and dump earth from it to both sides. The stringers are removed as the earth reaches them, the uprights and cross-bracings are left in position and help to give solidity.

If the maximum density be required, as for the embankments of reservoirs and behind retaining walls, earth is spread in layers a few inches thick, and well rammed. *See Embankment; Engineering.*

**Earthworm.** Segmented worm living in the soil. Their rounded shape and the short bristles with which the segments are provided enable the worms to push their way through the soil and to form burrows. They eat their way also, and derive their food largely from the vegetable matter contained in the soil swallowed. When this has

been extracted, the soil, after being reduced to fine particles in the intestine, is discharged at the mouth of the burrow in the familiar worm-castings.

In his Formation of Vegetable Mould through the Action of Worms, 1881, Darwin estimates that in an acre of average garden land there are about 53,000 earthworms, and that every year about ten tons of soil pass through their bodies, with the result that they spread fresh soil on the surface at an average rate of an inch in five years. In this way they are continually turning over the soil, and their burrows give access to light and moisture.

Earthworm, a valuable agent in maintaining the fertility of the soil

The destruction of earthworms is therefore an economic mistake.

Although without eyes, earthworms dislike light and emerge from their burrows only after dark, unless flooded out by storms. Even when they have emerged, they usually keep the tail in the hole ready for instant withdrawal if alarmed. They are in the habit of plugging the mouth of the burrow with leaves or small stones; and vegetable matter is drawn in for future consumption. They can certainly smell and taste, and it is probable that they can appreciate the vibrations caused by sound. Earthworms are hermaphrodite, and impregnation is mutual in the union of the sexes. The eggs are deposited in a kind of horny cocoon, which is formed by a secretion round the swollen ring which may be noticed on the body of an adult and is often mistaken for the scar of an old injury.

**Earwig.** Name given to members of the order Dermaptera (Gr. *derma*, skin; *pteron*, wing). Their fore wings are reduced to leathery flaps covering the large, complexly folded hind wings. The body ends in callipers, curved in the male and straight in the female. The female shows parental care for her eggs and young offspring. The common earwig (*Forficula auricularia*) eats both animal and vegetable food and is often injurious to tender

plants. It can be trapped in tightly rolled corrugated paper placed upright near its haunts.

**Easby Abbey.** Ruin in the North Riding of Yorkshire, England, 1 m. S.E. of Richmond, beside the river Swale. It was founded in 1152 by Premonstratensian canons and dedicated to S. Agatha. Later it passed into the possession of the Scrope family, and its decay dates from the dissolution of the monasteries under Henry VIII. The church is set in the centre, with domestic buildings N. and S.; the refectory, chapterhouse, gatehouse, and infirmary are among the most interesting remaining portions.

**Easel Picture.** Term applied in art criticism to a picture painted without reference to its eventual position or surroundings, dealing with any subject the artist prefers, for exhibition anywhere or for possible sale, in a frame, to any patron willing to buy. The term is thus used in contradistinction to a painting intended as a decorative adjunct to a particular architectural setting or fitting, e.g. a mural painting, or a painting for an altarpiece. The Dutch School (*q.v.*) of the 17th century was the first to devote itself almost exclusively to the painting of easel pictures.

**Easement.** Term used in English law for what is called servitude in Scots law and in other legal systems. There must be two pieces of land (tenements), and the owner of the one, called the dominant tene-

Easby Abbey, Yorks. Guest House, part of the remains of this 12th century religious foundation

ment, has a right over the other, servient tenement. Thus, the owners of Whiteacre (dominant) have a right to use a footpath which runs across Blackacre (servient); this is called a right of way. Other common easements are right of light, or the right to prevent obstruction to windows; drainage; support for buildings—e.g. where one house leans on another.

If the dominant and servient tenements come into the same ownership, the easement vanishes, and if the ownership is again divided a fresh grant of easement is required. Easements are acquired by grant from the servient owner to the dominant owner; but a grant will be implied where a grant

Earwig. Stages of life history. 1. Female earwig rearranging her eggs in the soil. 2. Assisting the hatching-out process. 3. The young earwigs, silvery at first, emerge after 15 days. 4. The family now increased to 48. 5. As they grow, the young earwigs moult to silvery white again. 6. Starting life at a month old. 7. Earwig, natural size. Figs. 1 to 6 are enlarged two diameters

of land would be useless without an easement—e.g. if A grants to B a field in the middle of A's land, and there is no public road to the field, there is an implied grant of a right of way over A's land. Easements are also acquired by long usage. See Prescription.

**East.** One of the cardinal points of the compass, and the quarter of the horizon where the sun rises when in the equinoctial. When the observer faces north the east is on the right hand. From ancient times the east has had religious significance, and devotees of most pagan religions built their altars in the eastern part of the temples, so that they could offer sacrifice towards the rising sun (see Eastward Position). The custom of praying towards the east was adopted by the Christian church in the 2nd century, as was the practice of burying the dead with their feet to the east; this was because of the tradition that Christ was placed in the tomb with His feet towards the east, and that at the day of judgement He would come from the eastward in the heavens.

As a noun, East is used for Asia and the eastern part of the world generally, and the terms Near East, Middle East, and Far East are employed as somewhat vague political and geographical subdivisions. The Near East may be said to include Egypt, Palestine, Turkey, Syria; the Middle East, India, Afghanistan, Arabia, Persia, Iraq; and the Far East, China, Siberia, Japan, Manchuria, Siam, Indo-China, and Indonesia.

**East, SIR ALFRED (1849-1913).** British painter and etcher. Born at Kettering, Dec. 15, 1849, he became a landscape painter of pronounced individuality, though with a strong sympathy with Corot. A.R.A. 1899, and R.A. 1913, he was knighted 1910, and died Sept. 28, 1913. Well represented in municipal galleries, he left to Kettering a collection of his works, opened 1913. His etchings are well remembered.

**East Africa, BRITISH.** The possessions included under this heading are described under their individual names: Kenya; Somaliland, British; Tanganyika; Uganda; Zanzibar.

**East Africa, GERMAN.** Former German colony now known as Tanganyika Territory (*q.v.*). The scene of much fighting in the First Great War, it was surrendered to Allied forces in 1918, and administered by Great Britain under League of Nations mandate 1920-46, then under U.N. trusteeship.

German East Africa. Map to illustrate the campaign in the First Great War, which ended in the conquest of the German colony in East Africa

At the outbreak of war on Aug. 4, 1914, German East Africa was garrisoned by a small but well trained and equipped native army with a leavening of 250 white troops. The German commander, Lt.-Col. von Lettow-Vorbeck, was an able soldier who enjoyed the unswerving loyalty of his troops, but his initial advantages were hampered by the timidity of the civil governor of the colony, von Schnee. British troops in East Africa were inadequate for large-scale operations, although on Aug. 13 a British cruiser bombarded Dar-es-Salaam and rendered the port temporarily untenable.

On land there were attacks by both sides on frontier posts and several places were captured and recaptured. The British eventually managed to isolate the colony, but as the Germans had ample supplies and were able to avoid being drawn into any decisive battle, the campaign in East Africa served only to tie down numbers of British troops. Thus matters stood in Feb., 1916, when Gen. Smuts (*q.v.*) arrived at Mombasa to take command in East Africa. Reinforcements had also been sent out, and soon he had some 30,000 men. The Belgians were also preparing to take part in the campaign.

Early in March the British opened a general offensive against Tanganyika by advancing through the Kilima-Njaro pass, but the main body of the enemy was able to retreat intact. The following month the British offensive was

The Germans put up a succession of rearguard fights and always managed to extricate their main army, but their territory was gradually shrinking and by the end of 1916 they were compelled to concentrate their force between the Rufiji river and Portuguese territory. The British reached Kibambawe on Jan. 5 1917, and after some months of hard marching and jungle fighting crossed the Rufiji on June 5. The Germans, in two main bodies, put up a bitter and prolonged resistance. On Nov. 28 one of their main bodies surrendered, and shortly afterwards the forces under von Lettow-Vorbeck crossed into Portuguese territory, finally surrendering on Nov. 14, 1918. The campaign cost nearly 20,000 British casualties. Consult *Three Years of War in East Africa*, A. Buchanan, 1919; *My Reminiscences of East Africa*, P. von Lettow-Vorbeck, 1920.

**East Africa, ITALIAN.** Former Italian colonies of Eritrea, Somaliland, and Abyssinia. Eritrea (*q.v.*) was formed in 1890 from a number of Italian possessions on the Red Sea. The inland boundaries of Italian Somaliland (*q.v.*) were settled by treaty with Abyssinia in 1908, and in 1925 Italy acquired from Great Britain the territories on the S. and W. bank of the Juba river. Abyssinia (*q.v.*) was annexed after conquest in 1936. Eritrea and Somaliland were occupied by the British in 1941 and Abyssinia was liberated the same year. See East Africa Campaign.

renewed with three divisions based on Moshi, while Belgian forces entered the colony from the W. In rapid succession Kondoa Irangi, Wilhelmstal, and Handeni were captured. The seizure of the rly. to Tanga made the British hold on the N.W. part of the colony secure. Tanga itself was captured on July 7, Mwanza on July 12, Dodoma on July 30. The British were then in control of a large section of the rly. from Dar-es-Salaam to Ujiji. Dar-es-Salaam fell on Sept. 4.

## EAST AFRICA CAMPAIGN: 1940-41

Irene Clephane, Associate Editor, Second Great War

*From this account of the conquest of Italy's East African Empire by British forces, it will be seen that the vital part of the campaign lasted only four months—from the end of Jan. to the beginning of June, 1941. For the relationship of this campaign to the war as a whole, see Second Great War*

When Italy declared war on France and Great Britain on June 10, 1940, she had in E. Africa a well trained and well equipped army estimated at over 200,000 men as well as another 200,000 in Libya; British forces in Egypt, the Sudan, Kenya, Palestine, and Aden totalled 85,000.

The British immediately began to make lightning raids over the frontier of Abyssinia from British Somaliland, Kenya, and the Anglo-Egyptian Sudan. At first they met with little resistance. By the end of June, however, the Italians were showing more fight: on July 4 they captured Kassala, on the 6th Gallabat, on the 7th Kurmuk, all in the Sudan; on July 15 the British garrison was forced to withdraw from Moyale (Kenya). At the beginning of August, the Italians invaded British Somaliland from Abyssinia in three columns, occupying Hargeisa and Zeila on the 5th, Oadweina on the 6th. Though greatly outnumbered, the British at first successfully resisted an enemy attack on the Tug Argan gap, between Hargeisa and Berbera, the capital. But the Italians made rapid progress towards Berbera along the coast from Zeila; and, deprived by the terms of the Italo-French armistice of the assistance of the French forces assembled in French Somaliland, the British had not strength to stem the enemy advance when the Italians brought up reinforcements. On Aug. 19 they evacuated the country, which was occupied by the enemy. The British force reached Aden safely with the bulk of its equipment and material.

### Patriot Forces Organized

British and South African air forces based in the Sudan, in Kenya, and, at first, in British Somaliland, carried out a number of bombing attacks on the E. African towns in which the Italians were most strongly established—Agordat, Asmara, and Massawa in Eritrea, Dire Dawa, Dessie, Addis Ababa, and Harar in Abyssinia, Kismayu and Mogadishu in Italian Somaliland. Skirmishes on the Abyssinian-Sudan and Abyssinian-Kenya frontiers continued, with varying

success on either side, and successful attacks were made on Italian convoys by Abyssinian guerrilla bands in the district of Gojjam, which the Italians had never entirely subdued. Resistance in this storm centre was gradually organized under conditions of great secrecy by a British mission (consisting of Col. D. A. Sandford, two other officers, and three n.c.o.s, all acquainted with the country, its customs, and its languages) which reached the area in Aug., 1940, though its presence was not admitted until Jan., 1941, following the announcement that patriot Abyssinian forces, assisted by the Royal Air Force, had compelled the Italians to evacuate Qubba.

### Abyssinian Guerrillas Armed

The mission was accompanied by a representative of the emperor, Haile Selassie, who himself arrived in the Sudan from England towards the end of July, 1940, where he immediately became the rallying point for all Abyssinians in exile and for many who crossed the frontier from Abyssinia itself. Some 1,000 rifles were presented to the patriot leaders, and other convoys of arms, carried on camels and mules and escorted by Abyssinian troops from the Sudan, followed. In Nov., Maj. O. C. Wingate was appointed to take charge of operations. The Italians failed to locate the mission, which lived in caves and under cover of the woods. The emperor himself, the crown prince, and the duke of Harar, entered Abyssinia on Jan. 20, 1941. This was the signal for revolt in Gojjam, and within a few days, without any definite action, a large part of the country between the Blue Nile and the river Seti was, except for isolated Italian garrisons, in Abyssinian hands.

Farther north, Gallabat was recaptured in Nov., 1940, Kassala on Jan. 19, 1941, by British forces, under the command of Lieut.-Gen. Sir William Platt. The Italians evacuated not only Kassala but strongly defended positions about it, withdrawing into Eritrea closely followed by the British, who occupied Sabdaret and Tessenei on the 20th, Aicota

on the 21st, forced the Keru Gorge on the 23rd, and reached Biskia on the 26th. The important railway junction of Agordat fell on Feb. 1, with the capture of hundreds of prisoners, many guns, and much mechanical transport. Barentu was captured on Feb. 2. On the coastal road, another force advancing from Suakin took Karora on Feb. 9, Mersa Taklai on the 10th, Kub-Kub on the 24th. Keren, after a difficult assault and strong defence, was stormed on March 27. The loss of Keren, a natural stronghold of great strength, broke the morale of the Italians in Eritrea, and British armoured forces followed the retreating enemy as fast as wheels could take them to Asmara, the capital, which was occupied on April 1. With the capitulation of Massawa on the Red Sea on April 8, Italian resistance in E. Africa outside Abyssinia ended.

The situation in Abyssinia had by that time changed considerably. With the cooperation of British and Imperial forces, particularly in the air, the patriot Abyssinians rapidly extended their sphere of control in Gojjam. On Feb. 16 the Italians abandoned Dangila, a large town which they had made into a garrison and air base, and other important posts. Enjabara, 18 miles away, and Piccolo Abbai, both evacuated by the Italians, were occupied, and the revolt swept on across the uplands of Gojjam, driving nearer and nearer to the main Italian base at Addis Ababa, which was constantly raided from the air. So also was Gondar, the base on which the Italian forces in the north had begun to retire, pursued by patriot and British troops.

### Italian Retreat in Abyssinia

By March 5 the patriot forces had occupied Burye and were pressing on towards Debra Markos. By the end of the month all effective resistance between Lake Tana and Lake Rudolf had been broken, and the Italians, both soldiers and settlers, driven much less by fear of the British than of the Abyssinians, were retreating on Dessie, Jiran (Jimma), and Addis Ababa. The Abyssinian flag was raised in Debra Markos on April 3, the emperor entering the citadel on the 6th. In six weeks some 1,600 Sudanese and Abyssinian troops, led by British officers, and with four 3-inch mortars, had cleared Gojjam of 10 colonial battalions, two Banda groups, four Blackshirt divisions.

In the meantime, British and Imperial forces had reoccupied Kurmuk (Feb. 12), captured Afodu, 45 miles inside Abyssinia from Kurmuk, and Asosa, near the Sudan border, and were also advancing from both Italian and British Somaliland.

There had been a gap of some 100 miles between the British and Italian forces along the Kenya-Italian Somaliland frontier from July to Dec. 1940, when the British, under Lieut.-Gen. Sir Alan Cunningham, opened an offensive. Composed of troops from S., W., and E. Africa, General Cunningham's force delivered its first attack on Dec. 16, against El Wak, a frontier post in the bush. After its capture the invasion of Italian Somaliland was prepared and organized from points far to the south. First a number of frontier posts on the Kenya border were

subdued, and then the Imperial forces swept on 100 miles from the frontier, to Afmadu, from which the Italians withdrew on Feb. 10, 1941, rather than wait for the British attack, delivered next day. Kismayu at the mouth of the Juba river was taken Feb. 12, the enemy having withdrawn.

The Royal Navy harassed the Italians moving along the road between Kismayu and Mogadishu, the capital, and on Feb. 25 Mogadishu itself was entered. The Italians surrendered in thousands, and only a small remnant endeavoured to escape along the road to Harar and Addis Ababa, pursued by the British who, crossing the Abyssinian frontier on March 6, advanced at an average rate of 65 m. a day. All the way to Harar there is a good metalled road, and the Italians offered no resistance—in fact, all

contact with the enemy was lost except through air reconnaissance. Jijiga was occupied on March 17, Harar on the 25th. Dire Dawa, evacuated by the Italians, was occupied on the 29th by S. African troops, who, arriving to find armed deserters from the Italian colonial infantry murdering Italian civilians, restored order.

Renewed operations in British Somaliland began when, on March 15, a little fleet of British warships and troop-carriers steamed towards the coast. Two landings were made, and naval guns bombarded Berbera, which was captured on March 16. A small column of Nigerians occupied Tug Wajale on the border on March 20, and two armoured cars, motoring through Hargeisa, established contact with the forces at Berbera. By March 24 British Somaliland was once more completely under British control.

By the end of March half Abyssinia had been conquered, and only three considerable towns remained in Italian hands. But the campaign was by no means at an end. Following heavy air raids on Addis Ababa aerodrome on April 4-5, Addis Ababa was entered on the 6th, and a comparative handful of Imperial troops, mostly S. Africans, disarmed 5,000 prisoners, of whom 4,000 were Italians. (On May 5—five years exactly since Italian troops entered the city—the emperor returned to his capital.) Fighting hard all the time, the Italians retreated on Dessie, which was captured on April 26 in the fiercest battle of the campaign: over 8,000 prisoners were taken. The Italian viceroy, the duke of Aosta, who had moved to Dessie on the fall of Addis Ababa, flew on to Amba Alagi, which at once became the target of growing attacks from the air.

The mountain of Amba Alagi rises to over 10,000 ft. Its caves, in which Haile Selassie had taken shelter five years earlier, became the last refuge of the Italian viceroy and his army. There were three ways of attacking the position, a naturally strong one reinforced by gun-emplacements cut out of the rock and other fortifications: by the Falaga Pass to the east, by the direct road, and along the ridge to the west. The last, the least apparently suitable and therefore least strongly defended, approach was chosen for the real attack, and while Indian troops advanced by the first two lines, the S. Africans,

East Africa Campaign, 1940-41. Showing the direction of British and Imperial attacks, which led to the conquest of Italy's E. African Empire

pressing on from the south, attacked on the west. The country through which the British forces were advancing was wildly mountainous, with deep gorges and towering peaks, where the enemy fought desperate delaying actions, destroying and obstructing the roads as they retired. But Indian sappers and miners did notable work in clearing them. By May 15 Amba Alagi was surrounded, and on the 16th it surrendered. The prisoners taken numbered 18,000, and included the duke of Aosta, with five generals and a number of other senior staff officers.

The Italian c.-in.-c. had surrendered, but fighting continued. One place after another fell into Allied hands, until Debra Tabor, cut off in mid-June, surrendered on July 3, 2,400 Italians and 2,000 Africans being taken prisoner. The Italian forces—some 40,000—still operating in Galla Sidamo surrendered next day. All Italian resistance in Abyssinia had collapsed, except at Gondar, on a plateau about 6,800 ft. high, where a force under General Nasi, estimated at between 10,000 and 15,000, still lay. Gondar was completely cut off from the rest of the country, not only by the British investment but also by the destruction of the three main roads by which the district could be reached. The area, however, produces a fair amount of food-stuffs, which reduced the possibility of starving out the garrison, and General Nasi held on through the summer and autumn.

Heavy rains made movement difficult, and operations were restricted to pressure by patrols of British, Imperial, and Abyssinian troops and to bombing from the air until weather conditions improved towards the end of Sept., and the British offensive was resumed. Wolcheft, a mountain pass of strategic importance north of Gondar, besieged since April 15, surrendered on Sept. 28. Patriot forces under British officers fought a number of successful minor actions in the Lake Tana area, and in the north established themselves between Wolcheft and Gondar. Low-level bombing attacks were made on Ambazzo 10 miles north of Gondar, on Oct. 21, and a day or two later British forces made contact with the Italians there, encountering strong opposition. Fighting took place on the Gondar-Asmara and Dessie-Gondar roads on Oct. 26.

Gradually the chieftains came in to the emperor, until at the

beginning of November only three in the Kamant area were still supporting the Italians. Kulkaber, an isolated enemy fort east of Lake Tana, surrendered on Nov. 21 and left the way open for an attack on the main defences of Gondar, 10 miles to the south. Civilian refugees from Gondar began to come into the British lines in a steady stream, and deserters, whose numbers increased daily, reported that outside Gondar there had been a mutiny of colonial troops, which had been suppressed only after severe fighting.

Allied and Abyssinian troops were now advancing on Gondar from six directions, and on Nov. 27 the garrison surrendered unconditionally to a combined infantry attack by African troops drawn mainly from E. Africa, with a proportion from W. Africa and the Sudan. The 1st battalion the Argyll and Sutherland Highlanders were the only non-Africans engaged. Prisoners taken numbered 11,500 Italians and 12,000 native troops. British aircraft dropped leaflets on the remaining Italian outposts telling of General Nasi's surrender, and all outlying garrisons surrendered on Dec. 2, 1941. Italian rule in E. Africa was at an end.

**East Anglia.** One of the kingdoms into which England was divided from the 6th to the 9th century. It embraced the present counties of Norfolk and Suffolk, and the name suggests that its founders were Angles. The first East Anglian king about whom anything definite is known is Raedwald, who died about 620. His successors were in turn the vassals of Northumbria, Mercia, and Wessex, until the Danes invaded their land and killed their king Edmund in 870. In the 10th century also

there were East Anglian kings, but they were only underlings of the English kings, as were the later earls. Today East Anglia is used loosely to describe the district between the Wash and the Nore.

**East Bengal.** Province of Pakistan. See Bengal.

**Eastbourne.** Co. bor., parl. div. and seaside resort, Sussex, England. It stands on the English Channel, bounded by Beachy Head, 3 m. S.W., and is 65 m. S.S.E. of London by electric rly. Formerly a village 1 m inland with scattered

Eastbourne arms

hamlets along the coast, the modern town was developed during the 1870s and is a fine example of street planning, the residential districts of Meads and Upperton containing wide tree-lined avenues. Much of the ground belongs to the duke of Devonshire. There are almost 3 m. of promenades, triple-terraced in parts, with Grand Parade forming the central portion. There are a pier and pavilion, three theatres, three golf courses, bathing, boating, and fishing facilities, and ample provision for tennis, croquet, etc. County cricket is played at The Saffrons in Aug. Other open spaces are Devonshire Park with its theatre, winter garden, pavilion, and baths; Gildridge, Hampden, and Prince's parks. During the season Eastbourne receives about 100,000 visitors and there are many hotels, the largest of which is the Grand.

The most famous residence is Compton Place, an 18th century mansion belonging to the duke of Devonshire which has been occupied by George V and Queen

Eastbourne. Sea front of this favourite holiday resort on the Sussex coast which also has a large residential population

Mary, George VI, Queen Elizabeth, and their daughters. The chief church is S. Mary's, the old parish church of the village of East Bourne (now known as Old Town). The other churches are modern, the largest being S. Saviour's. The principal school is Eastbourne College. The Lamb Inn was a medieval house of refuge. The Manor House has an art gallery and gardens. Carpet-gardens are famous. To the E. of the town stretches a shingly waste known as The Crumbles, from which point the coastline is diversified by martello towers. During the Second Great War Eastbourne suffered severely from German tip-and-run air attacks. In nearly 100 attacks, 800 H.E. bombs and 4,000 incendiaries were dropped; among buildings demolished was the technical institute. Pop. est. 42,210.

**Eastcheap.** London street extending from Gracechurch Street and Fish Street Hill to Great Tower Street, E.C. Owing its name to a butchers' market held here as early as the time of King John, and later removed to Leadenhall, the thoroughfare has varied in both length and name, but was known as Eastcheap from about the time of Henry III to the 16th century. About 1831 the W. end disappeared as did the church of S. Michael's, Crooked Lane, in the London Bridge improvements, and the E. end became known as Eastcheap and Little Tower Street. When the street was widened in 1884 the old name was restored for the whole of it. The site of the Boar's Head Tavern, Eastcheap, mentioned by Shakespeare, was approximately at the junction of King William Street and Gracechurch Street.

**East Chicago.** City of Indiana U.S.A., in Lake co., on the S.W. shore of Lake Michigan and Indiana Harbour, 20 m. S.E. of Chicago. One of the major Great Lakes ports, its facilities have been enhanced by the Indiana Harbour Canal, which extends S. to the Grand Calumet river and E. to Lake George. It ships petrol and finished steel, and receives cargoes of iron ore, coal, limestone, and other raw materials. It specialises in heavy industry, its plants including foundries, oil and metal refineries, rly. shops, and cement works. Settled in 1885, it was incorporated 1893. Pop. 54,637.

**Eastchurch.** Village of Kent. On the Isle of Sheppey, it is 5 m. E.S.E. of Queenborough and is served by railway. At an aerodrome here, in 1913, some of the earliest experiments in the drop-

ping of bombs from aircraft were carried out. During the battle of Britain the airfield was one of the stations of II Fighter Group and later became a training centre for R.A.F. and Fleet Air Arm personnel. It was one of the control points of A.A. defence in the flying bomb attacks in 1944. Pop. 1,500.

**Easter.** English name for the eccles. festival commemorative of the Resurrection of Jesus Christ. The feast, the most important in the Christian year, known as *Ostern* in Germany, in other countries is called by modifications of the Greek and Latin *Pascha*, which derives from the Aramaic *Pischa* and Hebrew *Pesach*=Passover, the name of the Jewish festival which coincided with the Crucifixion. Thus we have in Welsh *Pasg*, Italian *Pasqua*, Spanish *Pascus*, and French *Pâques*. The sacrifice of Christ, typified by the paschal lamb slain at the Passover, was celebrated as well as His Resurrection; there was a Pasch of the Cross as well as a Pasch of the Resurrection.

Celebrated generally in Christendom since the 2nd century, though for varying periods, Easter is a movable feast, and its occurrence governs the dates of the preceding Lent and the festivals following it. It was long observed as a special time for baptism, for the reconciliation of penitents and the release of prisoners, for the distribution of alms and for offerings to the clergy. Both the Roman Catholic and Anglican churches expect their members to receive holy communion at Easter, and have special services for Sunday, Monday, and Tuesday. Many special ceremonies also pertain to the celebration of Easter in the Roman Catholic Church. British Nonconformists, who in the 17th century formally repudiated the keeping of this festival, now commonly observe it. A number of pagan customs associated with the vernal equinox survived at Easter until the Middle Ages, and others were adopted by the Christian Church. In regard to the giving of Easter or pasch eggs, the idea that the egg symbolises resurrection is of a comparatively modern origin. Eggs, having been forbidden as food during Lent, were restored at Easter.

The secular importance of Easter is that it governs law, university, and school terms and business arrangements generally. Since the 8th century in Western Christendom, Easter Day has been celebrated on the first Sunday after

the first full moon, or after the 14th day of the moon, following March 21. Thus it cannot fall before March 22 nor after April 25. Neither of the extreme dates will occur again in the 20th century.

In 1928 an Act was passed in Great Britain providing that Easter Day should be the Sunday after the second Sat. in April to come into force on a date to be fixed by Order in Council. Twenty years later no date had been fixed.

Both the origin of the word Easter and the time of its observance have been subjects of controversy. Following the Venerable Bede, the derivation of Easter from *Eastre* or *Eostre*, the name of a Teutonic goddess of spring, has been commonly accepted. The dispute in the early Church as to the date of Easter was between the Christians of Asia Minor, who were called Quartodecimans because they kept the Resurrection on the third day after the 14th of the Jewish month Nisan, on whatever day of the week it fell; and the Western Church, which kept Easter on the Lord's Day following the 14th. The latter prevailed at the Council of Nicaea, 325. As the reform of the calendar in 1582 was not accepted in the East, the Eastern Churches still keep Easter on a different date from the Western. See Calendar; Metonic Cycle; Passover.

**Easter Island OR RAPANUI.** Lonely volcanic islet of the S. Pacific. It is 2,300 m. W. of Chile, to whom it belongs. Area about 50 sq. m.; alt. 1,970 ft.; lat. 27° 7' S.; long. 109° 20' W. It was discovered on Easter Day, 1722, by the Dutch admiral, Roggeveen, although its discovery is claimed for Davis, the buccaneer, in 1686. The few inhabitants are of Polynesian descent; Cook, visiting it in 1774, reported them as having the lobes of their ears extended almost to their shoulders. But its chief interest lies in some 500 ancient statues or torsos, stone huts and sculptural rocks, with pictographs (undeciphered) and Megalithic remains. Most of the carved faces are very high, one measuring 37 ft. Examples of these sculptures are to be seen at the British Museum. Attempts at deciphering some incised wooden tablets, called hyloglyphs, have not been altogether successful. The island is now a Chilean convict station. During the First Great War it came into notice in connexion with the commerce-destroying raids of the German auxiliary cruiser Prinz Eitel

Friedrich, which towed some of her captures to the island and there sank them. The crews of certain ships taken by the cruiser were left on the island., Dec 1914-Jan., 1915 *Consult Te Pito Te Henua or Easter Island*, W. J. Thomson, 1891; *The Mystery of Easter Island*, K. Routledge 1919

### Eastern Bengal and Assam.

Former province of India. On Oct. 16, 1905, it was constituted from the territories formerly administered by the chief commissioner of Assam, together with the Bengal divisions of Dacca and Chittagong, and the districts of Jalpaiguri, Dinajpur, Rangpur, Malda, Bogra, Rajshahi, and Pabna. The capital was Dacca. This partition was revoked in 1911, when George V announced at the Delhi durbar the reconstruction of Bengal with the presidency of Bengal, the lieutenant-governorship of Bihar and Orissa, and the chief commissionership of Assam. The new division of territory came into force April 1, 1912.

**Eastern Question.** Series of political problems arising in the 19th and early 20th centuries from the disintegration of the Ottoman empire. Russia, always desiring an untrammelled outlet to warm waters, aimed at securing the Dardanelles, while Britain (fearful for the Suez Canal and her imperial routes) and France (covetous of N. Africa and the Levant) supported the "sick man of Europe" against her. Turkey's Balkan provinces fought for independence; Austria tried to extend her borders to S. and E.; Italy wished to gain strategic buffers in Istria and Albania against Austria. Events arising from this maelstrom of con-

flicting policies were, in their chronological order, the war of Greek independence, the autonomy of Serbia and Egypt, the Crimean War, the formation of the Rumanian and, by the congress of Berlin, the Bulgarian kingdom, Austria's annexation of Bosnia-Herzegovina, and the Balkan wars of 1912-13 which, with the Serajevo murders of 1914, led directly into the First Great War, Germany seizing the opportunity to throw the Old World into chaos. The defeat of Turkey, Russia, and Austria in this conflict, and the rise of Kemal Atatürk's new Turkey after it, removed the prime factors in the Eastern Question. *Consult The Eastern Question*, J. A. R. Marriott, 1917.

### Eastern Siberian Region.

Territorial division of R.S.F.S.R. It is bounded by Krasnoyarsk to N.W., Yakutsk A.S.S.R. to N.E., Outer Mongolia to S., and surrounds the Buriat-Mongol republic. Irkutsk is the capital. Area 1,227,248 sq. m. Pop. 2,568,400. *See Siberia.*

**East Grinstead.** Urb. dist., parl. div., and market tn. of Sussex, England, lying 30 m. by rly. S.

East Grinstead. Picturesque buildings in the High Street of this small Sussex market town

of London. Its high street has Tudor timbered houses; Sackville College is a Jacobean almshouse dating from 1608. Bricks and tiles are made locally. Here is a hospital famous for plastic surgery operations. A German bomb fell in the centre of the town on July 9, 1943. Market day, Thurs. Pop. 7,902.

**East Ham.** Co. and parl. bor. of Essex, England. A populous district 6 m. E. of London, it has stations on two railway lines, and is served by London Transport vehicles. Residents work mainly at the docks and in factories, industries include engineering and the making of chemicals and soap, and the borough contains part of the Beckton gasworks, largest in the world. S. Mary Magdalene is the old parish church. East Ham was made a municipality in 1904 and a co. bor. in 1914. Two members are returned to parliament. Heavy air attacks in the Second Great War killed over 500 people and demolished 2,000 houses. Pop. est. 100,100.

**East India Company.** Name of a trading corporation, authorised by government to trade in the E. Indies. The Dutch company, 1602-1798, the French company, 1664-1794, and the Danish company, 1729-1801, followed the setting up of the English company, which survived them all. On Dec. 31, 1600, a charter was granted by Queen Elizabeth to "The company of Merchants of London trading to the East Indies." The establishment of three factories or trading-stations was sanctioned: at Surat, on the W. Coast, by the Mogul Jehangir in 1612; at Fort St. George, afterwards Madras, on the S.E. coast, by another native prince in 1639; at Hooghli, on the Ganges delta, 50 years later moved a little lower down the river to Calcutta, by Shah Jehan in 1640.

In 1661 the Portuguese gave Bombay to Charles II as part of the dowry of his bride; he conveyed it to the company, and it took the place of Surat as the western emporium. The three factories at Bombay, Madras, and Calcutta became the nuclei of the three presidencies.

The company was exclusively a trading concern. It had much difficulty in suppressing the embarrassing rivalry of independent traders called "Interlopers," who ignored its exclusive charter. In the reign of William III a rival company was actually sanctioned and started, but in 1701 the two were amalgamated as the Honourable East India Company. In 1746 Duplex.

the governor of the rival French company, attempted to oust the British and establish a French political ascendancy with the native princes. He was frustrated by Clive, with the general result that in 1765 the trading company had become the official administrators of the great province of Bengal, while sundry of the great princes were virtually their dependents.

The home government now became alive to a responsibility for the dominions acquired by the company; the unsuccessful experiment of Lord North's Regulating Act was followed by Pitt's India Act in 1784, which instituted the dual control shared between the company itself and a board of control appointed by a committee responsible to parliament. After the Mutiny of 1857 the government of India was transferred to the crown, and the East India Company was abolished by the India Act of 1858. *See* India.

**East Indies.** Popular name loosely applied to India, Indo-China, the Malay Peninsula, and more especially the islands of the Malay Archipelago, Sumatra, Java, Borneo, New Guinea, the Philippines, etc. All are described under their individual names. *See also* Indonesia.

**East Indonesia.** State of the United States of Indonesia, formed 1947 and comprising Celebes, Bali, Moluccas, Timor, Flores, Sumba and Lesser Sunda is., Lombok, and some smaller is. *See* Indonesia.

**East Kent Regiment, ROYAL.** Regiment of the British army. It originated in the City of London train-bands and was sent by Queen Elizabeth to help the Dutch, when it transferred to the Netherlands service and was known as the British Holland Regiment. In

East Kent  
Regiment badge

1665 it returned to the British service as the 3rd Foot, but from the colour of its tunic facings was known as The Buffs. The Buffs fought in Flanders under Marlborough, and were at Dettingen, 1743. They served throughout the Peninsular, Crimean, and South African Wars. The official title of the 3rd Foot was changed to the East Kent Regiment in 1881

Sixteen battalions were raised for service in the First Great War, and the regiment gained the battle honours: Aisne, 1914; Ypres, 1915, '17; Loos, Somme, 1916, '18; Arras, 1917; Amiens; Hindenburg Line; Struma; Jerusalem; Bagdad. In 1935 the East Kent Regiment was given the prefix Royal, and in accordance with the usual custom should have changed its facings to blue, but on account of its tradition was by special concession permitted to retain buff facings. At the outbreak of the Second Great War, a battalion was serving in Palestine, and a number of Palestinian companies were raised from among Jews and Arabs. This battalion served with the 8th army throughout the North African and Italian campaigns, another fought in the battle of France in 1940, and formations took part in the Normandy landings, June, 1944, and in the subsequent campaign in N.W. Europe, 1944-45.

**Eastlake, SIR CHARLES LOCK** (1793-1865). British painter and writer on art. Born in Plymouth, Nov. 17, 1793, he was taught drawing by Sam Prout and history painting by Haydon, later attending the schools of the Royal Academy. In 1827 he was elected A.R.A., in 1829 R.A., in 1842 librarian, and in 1850 president, of the Academy. That year he was knighted. He was the keeper of the National Gallery, 1843-47, and appointed its first director in 1855. The Escape of Francesco Carrara, 1834; Christ Weeping over Jerusalem (his masterpiece), 1841; and Sisters, 1842, are in the Tate Gallery. Eastlake's Materials for the History of Oil Painting, 1847, once enjoyed considerable vogue. He died at Pisa, Dec. 24, 1865.

**East Lancashire Regiment.** Formerly the 30th and 59th Foot British regiments, raised in 1702 for service as marines on board ship. They took part in the capture of Gibraltar in 1704 and in the subsequent naval action off Malaga. In 1727-28 they helped to defend Gibraltar, and in 1806 were in Baird's force which seized the Cape of Good Hope. In the Peninsular War the East Lancashires fought at Corunna, Badajoz, Salamanca, and Vittoria; they were at Waterloo and took part in the Mahratta War (1817-19). In 1826 the regiment distinguished itself at the capture of Bharatpur, as it did in 1854 at Inkerman: it shared in the storming of Canton (1857), the second Afghan War, and the Chitral expedition. It

did notable service in the South African War.

The East Lancashire Regiment raised 17 battalions in the First

East Lancashire  
Regiment badge

Great War and emerged with the following battle honours: Mons; Marne, 1914; Aisne, 1914, '18; Neuve Chapelle; Ypres, 1915, '17, '18; Somme, 1916, '18; Arras, 1917, '18; Dorian, 1917, '18; Helles; Kut-el-Amara, 1917.

During the retreat to Dunkirk in 1940, a company of East Lancashires held 1,000 yds. of the Canal de Bergues defences, and Major Irvine Andrews in command won the first V.C. of the Second Great War. The 2nd battalion was in Madagascar and then went to India, where it joined the 14th army and served throughout the Burma campaign. The regiment landed in Normandy in 1944, and was in heavy fighting at Caen, the 4th battalion suffering such heavy casualties that it was disbanded. The 1st battalion served on the Continent as infantry; the 8th, which had been transformed into a light A.A. regiment in 1941, was in 1945 transferred to the Royal Tank Regiment. The regimental depot is at Preston.

**Eastleigh.** Borough of Hampshire, England. In the valley of the river Itchen, it is  $5\frac{1}{2}$  m. N.E. of Southampton, on the railway. There are rly. workshops here for the manufacture of rolling stock. The land airport for Southampton, also known as Atlantic Park, which was a naval air station during the Second Great War, has aircraft factories. Regular services operate to the Channel Islands and elsewhere. Here also are cable and confectionery works. Pop. (including the dists. of Chandler's Ford and Bishopstoke) 30,000.

**East Liverpool.** City of Ohio, U.S.A., in Columbiana co. It stands on the Ohio river, 44 m. by rly. W.N.W. of Pittsburgh. The staple industry is porcelain manufacture, the city being the chief pottery centre of the country. The industry was founded in 1839 by James Bennett, who produced yellow and Rockingham ware. White ware was first made in 1872, and semi-vitreous china in 1890, porcelain being added later. Today most of the clay is brought

from Florida, Kentucky, North Carolina, and England. The city also makes foundry and machine shop products, electrical fixtures, bricks, barrels, and casks. Settled in 1798, East Liverpool was incorporated in 1834. Pop. 23,555.

**East London.** City and seaport of Cape Province, S. Africa. It stands at the mouth of the Buffalo

factures are not extensive. Haddington (co. town), Dunbar, and North Berwick are the principal towns. The co., formerly called Haddingtonshire, joins with Berwickshire to elect an M.P. Pop. est. 43,800.

**LITERARY ASSOCIATIONS.** Bishop Gilbert Burnet's first benefice was Saltoun. His pupil,

ander Peden, the Covenanter. There is much in the work of Sir Walter Scott concerning the county, notably in *The Bride of Lammermoor*.

**East Lynne.** Novel by Mrs. Henry Wood (*q.v.*) published in 1861. It achieved an enormous contemporary success, was translated into all European and some Oriental languages, and is still widely read, while several dramatic versions have enjoyed almost equal popularity. The chief interest of the book—an interest which is intensified in the plays founded upon it—lies in the situation which develops when the erring Lady Isabel returns to her home and children disguised as a nurse. East Lynne has little literary merit, but the plot is well constructed and the reader's interest continuously sustained.

**East Malling Research Station.** Horticultural and plantation crop research and experimental farm and laboratory at East Malling, near Maidstone, Kent, England. It is one of the eight stations administered by the executive council of the Imperial Agricultural Committee (*q.v.*). Besides conducting experiments in improved methods of horticulture, it acts as a clearing house of information about its activities.

**Eastman, GEORGE (1854-1932).** American inventor. He was born at Waterville, N.Y., July 12, 1854, and educated at Rochester, N.Y. He experimented in the making of dry plates, and in 1880 began to manufacture them; four years later he produced the first efficient roll-film, and in 1888 perfected his first Kodak camera. Two years later he patented the first machine for making rolls of transparent film. As head of the various Kodak companies he amassed great wealth. He endowed the Rochester Mechanics'

Institute and the laboratories of the university of Rochester, and in 1912 gave £100,000 towards the endowment of that university. His other gifts included £30,000 to the Royal Free Hospital, London, in 1930. He died March 14, 1932.

**Easton.** City of Pennsylvania, U.S.A., the co. seat of Northampton co. It stands at the union of

**East London.** Air view, taken from the east, of this South African port and watering-place, which lies at the mouth of Buffalo river

river, mainly on the E. side 887 m. by rly. E. of Cape Town. It has a spacious harbour, and by dredging operations the great obstacle to its development, the bar at the river mouth, has been in large part overcome. There are ample wharves and other shipping accommodation. Apart from shipping the chief industries are connected with the trade of a large district. There is also some fishing. The chief buildings are the city hall and the public offices. The city is lit by electricity and has a service of electric tramways. It is a watering-place, with good facilities for sea bathing, and there is ample accommodation for visitors, including a space prepared for tents. Pop. 78,530 (39,646 Europeans).

**East Lothian.** S.E. maritime co. of Scotland. With about 40 m. of coast on the Firth of Forth and North Sea, its area is 267 sq. m. Along the S. border are the Lammermuir Hills (Lammer Law, 1,733 ft.), whence the surface has a gradual slope to the coast; in a few places isolated eminences occur—Garleton Hill (590 ft.), Traprain Law (700 ft.), and North Berwick Law (612 ft.). The Tyne, the chief stream, flows N.E. to the sea.

Agriculture and the pasturage of sheep, fishing and fish-curing, occupy a number of the inhabitants. The Dunbar red lands are an area of exceptional fertility. Large quantities of coal and limestone are obtained, but manu-

Andrew Fletcher, is generally known as Fletcher of Saltoun, and is widely remembered for his saying that so long as he might make the ballads for a people he cared not who made its laws. John Knox is believed to have been born in the Gifford Gate of Haddington, and was educated in the grammar school of this town. At Haddington, too, Jane Carlyle was born and is buried. John Home, author of *Douglas*, lived at Kilduff, and a statue to him stands in Haddington. At Gifford was born John Witherpoon, 1712-94, principal of Princetown College. At Ormiston is a granite obelisk to the missionary Robert Moffat, who was born there. The Bass Rock (*q.v.*) was at one time the prison of Alex-

**East Lothian.** Map of the Scottish maritime county formerly known as Haddingtonshire

the Lehigh and Delaware rivers. 76 m. by rly. W. of New York. Near the coalfield, it is a busy rly. and industrial centre, making cement and machinery, and has an airport. The seat of Lafayette College, founded 1832, it has a number of schools and a public library. Several treaties with the Indians were concluded here between 1756 and 1761. Founded 1750, it was incorporated in 1789, and became a city in 1887. Pop. 33,589.

**Easton's Syrup.** Syrup of iron phosphate with quinine and strychnine. Each fluid dram contains  $\frac{1}{2}$  of a grain of strychnine. It is used as a tonic in convalescence in doses of  $\frac{1}{2}$  to 1 fluid dram. It is also prepared in the form of sugar-coated tablets.

**East Orange.** City of New Jersey, U.S.A., in Essex co. Adjoining Newark and 12 m. W. of New York, across the Hudson, East Orange forms a unit of the pleasant, tree-shaded group of suburban residential communities known as The Oranges. It makes motor car and aeronautical equipment, dynamos, hydrants, and waterworks' supplies and tools. It is the seat of Upsala College, a Lutheran institution. Part of Orange until 1863, when it was incorporated as a town, it was chartered as a city in 1899. Pop. 68,945.

**East Prussia.** Until 1945 the easternmost province of Germany, separated from the rest of the country in 1919 by the Polish Corridor (*q.v.*) created under the Versailles treaty. Its area—excluding the Memel territory, likewise cut off from East Prussia, and including a district of former West Prussia—was 14,700 sq. m., and pop. 2,356,938, 84 p.c. Protestants. The area is a land of plains with a long ridge of hills up to 1,000 ft. stretching across the S., where also are lakes of different size, mostly surrounded by huge beech forests. The largest of these Masurian Lakes, the Mauersee and the Spirdingsee, each covers 40 sq. m. The capital was Königsberg, old coronation city of the Prussian kings, with 316,072 inhabitants; other large towns were Elbing (72,409) and Tilsit (57,286). But East Prussia was mainly an agricultural province; with Pomerania and Silesia, the main area for Germany's surplus grain, meat, and other food production; and the stronghold of the Prussian nobility and large estate owners, the Junkers. Sixty p.c. of the gainfully employed worked in agriculture, forestry, and food production.

Industrially, East Prussia had shipbuilding and wood-working yards, saw-mills, pulp and paper mills; sugar, textile, and cigar factories, breweries and distilleries; and a local industry in the exploitation of Baltic amber.

The province arose from the duchy of Prussia, seat of the Teutonic Knights left to them by the treaty of Torun (Thorn) in 1466. Secularised in 1525, it was acquired in 1618 by the Brandenburg dynasty of Hohenzollern; depopulated by a plague 1709–10, it was resettled by Frederick William I with colonists from the Palatinate, Switzerland, and Salzburg. It was occupied by the Russians, 1758–1762; rose, as part of Prussia, against Napoleon; and although in later history its name became a byword for reactionary politics, it was the birthplace of Liberalism in the 1820s, and of constitutional democracy in 1848. During the First Great War large parts fell twice into Russian hands, were liberated by Hindenburg, and rapidly reconstructed. In the Second Great War East Prussia suffered severely, and in Aug., 1945, was partitioned by treaty between the U.S.S.R. and Poland. See Masuria; Poland; also Russo-German Campaigns.

**East Riding.** Smallest of the three administrative divisions (O.E. *thriding*, third part) of Yorkshire, England, and for many purposes a co. of itself; area, 1,172 sq. m.; pop. 482,936. Its character is chiefly agricultural, though it contains Hull, the third seaport of England. Beverley is the ecclesiastical capital; Bridlington and Filey are seaside resorts. Much of the district is chalk; the wolds which continue into the North Riding rise to 808 ft. E. of Bugthorpe. The East Riding includes Flamborough Head and Spurn Head. It is bounded on the N.W. almost throughout by the Derwent, and on the S.W. by the Ouse from York to the beginning of the Humber. See Yorkshire.

**East River.** Salt water estuary or tidal strait connecting Long Island Sound and Upper New York Bay and separating Manhattan from Long Island, New York. It is 16 m. long and varies in width from 1,000 yds. to 3 m., receiving the waters of the Harlem, which is connected with the Hudson on the W. of Manhattan. Most of its islands are the sites of municipal hospitals and other institutions. Hell Gate is a treacherous rapid once a menace to navigation. The river is crossed by Brooklyn Bridge and six other

bridges. Under it run tunnels for underground rlys. and vehicular traffic. Franklin D. Roosevelt Drive has transformed the formerly squalid waterfront into one of the smartest residential areas in New York. A site on the Manhattan side of the river was selected in 1946 as the home of the United Nations.

**East St. Louis.** City of Illinois, U.S.A., in St. Clair co., on the left bank of the Mississippi, opposite St. Louis, Missouri, with which several bridges connect it. An important rly., industrial, and agricultural centre, it is the largest producing centre for alfalfa stock feed in the U.S.A., and has the world's largest horse and mule market. Manufactures include locomotives, rly. equipment, pneumatic tools, rolling mill products, white lead, paint, glass, and flour. The Keokuk dam plant provides hydroelectric power. East St. Louis was incorporated as a town in 1861 and chartered as a city in 1865. Pop. 75,609.

**East Surrey Regiment.** Raised in 1702, this British regiment served until 1713 as marines at Gibraltar and elsewhere. It then became the 31st Foot, and fought at Dettingen, where George II gave the men their nickname of the "Young

East Surrey Regiment badge

Bufs." In 1756 a second battalion was raised; this was numbered the 70th, and the two were united as the East Surreys in 1881. The regiment fought in America in 1776–77 and in the W. Indies in 1793–96. It rendered excellent service in the Peninsular War, especially at Talavera and Albuera. In 1842 it marched to Kabul and spent nearly two years fighting in Afghanistan; in 1845–46 it served against the Sikhs, and later in the Crimean War, the China War (1860), the New Zealand War (1863), and the Egyptian War (1884–85). Under Buller in the S. African War the regiment fought hard to relieve Ladysmith.

During the First Great War, the East Surreys expanded to 18 battalions and earned the battle honours: Mons, Marne, 1914; La Bassée, 1914; Ypres, 1915, '17, '18; Loos; Somme, 1916, '18; Albert, 1916, '18; Cambrai, 1917, '18; Selle; and Dorian, 1918. In the Second Great War they served in France in 1940 and in Africa,

Sicily, and Italy. A battalion with the 6th Indian infantry brigade took part in the campaign in Malaya from beginning to end, suffering such heavy casualties that it was formed into a composite unit with the remnants of a battalion of the Leicesters.

**Eastward Position.** Term applied to several observances of the Christian Church, especially to the position taken up by the officiating priest at the celebration of the Holy Eucharist and the practice of turning to the E. at the recitation of the creeds. The position of the priest has been the subject of much controversy in the Anglican Church consequent on the conflict between the rubric of 1552 and the replacing of the altar in 1660.

In the primitive Church converts at baptism turned to the W. when renouncing the devil and to the E. when confessing their faith in Christ. Thus Augustine says, "When we rise for prayer we turn towards the East." Chancels of churches are usually in the E., so that worshippers, when turning towards the altar, face the E. Similarly arose the custom of burying Christians with the feet towards the E. and the face upward, so that at the Resurrection they might be ready to meet Christ and be in a posture of prayer as soon as raised. Pagans commonly worshipped with their faces towards the rising sun, and the Christian adoption of the custom gave rise to the charge that they were sun-worshippers (Tertullian). The Jews in exile turned towards Jerusalem when they prayed (Dan. 6) and Mahomedans face Mecca. See Oxford Movement.

**Eastwood.** An urban dist. of Nottinghamshire, England. It is 9 m. by railway N.W. of Nottingham. The collieries provide the chief employment. Here took place the meeting of colliery owners which marked the first step in rly. construction from which the Midland rly. was developed. D. H. Lawrence was born here. Market day, Fri. Pop. 8,860.

**East Yorkshire Regiment.** Formerly the 15th Foot, this British regiment was raised in 1685 at

East Yorkshire Regiment badge

the time of Monmouth's rebellion. After serving in Flanders (1694-97), it was engaged in Marlborough's campaigns, and was one of the regiments that

**Eatonswill.** Election-day rowdiness in this famous fictitious borough, as depicted by "Phiz" in one of the original illustrations to *The Pickwick Papers*

led the attack at Blenheim. In 1758-59 it served under Wolfe in the capture of Louisbourg and Quebec. The East Yorkshires did good work in seizing the West Indian Islands from the French both before and after they served against the American Colonists. They fought in the Afghan War of 1879-80, and one battalion was in the 8th division during the South African War.

Twenty-one battalions of the East Yorkshire Regiment served in the First Great War and gained the honours: Aisne, 1914, '18; Armentières, 1914; Ypres, 1915, '17, '18; Loos; Somme, 1916, '18; Cambrai, 1917, '18; Selle; Dorian; and Gallipoli, 1915. During the Second Great War regular and territorial battalions served in France and particularly distinguished themselves in the fighting round the Escaut position. The regiment fought throughout the North African and Sicily campaigns, and landed in Normandy on D-Day. Thereafter they fought in France and the Netherlands.

**Eatonswill.** A fictitious E. Anglian town depicted in Dickens's *Pickwick Papers* as the scene of a parliamentary election of 1830, i.e. some 40 years before the introduction of the ballot box.

Incidents in the town and at the hustings are burlesqued with memorable gusto, free fights and unlimited bribery and corruption being the order of the day. Thus the name is perpetuated as a symbol for the rowdier aspects of electioneering. Propaganda in the U.S.S.R. is said to have cited this extravaganza, written in 1836, as a serious argument against western methods of democratic government.

**Eaton Hall.** Seat of the duke of Westminster, Cheshire, England. It stands on the river Dee, 4½ m. S. of Chester. A Gothic structure, built 1869-82, from designs by A. Waterhouse, the third on the same site, it stands in a well timbered demesne of 400 acres. The interior is richly decorated, and besides examples of Rubens, West, and Millais, the pictures include a fine collection of portraits of famous racehorses owned by the family. A bronze by G. F. Watts stands before the hall. An officers' hospital in the First Great War, the mansion housed naval cadets from Dartmouth in the Second, and became the O.C.T.U. centre for Western Command in 1946.

**Eaton Socon.** Village of Bedfordshire, on the border of Huntingdonshire, England. It is on the

Great North Road, 7 m. N.E. of Bedford. A remarkable restoration of the Norman church followed its destruction in 1930. The remains of Bushmead priory are 12th century. Bunyan was arrested after preaching in the village in 1658. Dickens mentions the inn in *Nicholas Nickleby*.

**Eaton Square.** Largest square in Belgravia (*q.v.*), London, S.W. Covering about 5 acres, it has six gardens, is named from the duke of Westminster's Cheshire seat, Eaton Hall (*q.v.*), and was built 1827-53. At the E. end is the church of S. Peter, 1824-26, restored 1872, where many fashionable marriages have taken place. No. 71 was, for a time, the official residence of the speaker of the house of commons. Sir Henry Wilson was assassinated in Eaton Place in 1922.

**Eau Claire.** City of Wisconsin, U.S.A., the co. seat of Eau Claire co. At the confluence of the Eau Claire and Chippewa rivers, 88 m. E. of St. Paul, it is served by several rlys. Its buildings include a Carnegie library and state teachers' college. The commercial centre of N.W. Wisconsin, outlet for the Chippewa lumber district, Eau Claire makes machinery, refrigerators, aluminium products, tires, and harness. Settled in 1846, it was granted a city charter in 1872. Pop. 30,745.

**Eau-de-Cologne.** A perfume said to have been invented by an Italian chemist, Johann Maria Farina, who settled in Cologne in 1709. It is believed that the original recipe was lost and never recovered, though many chemists in Cologne, using the name Farina, claim to be the sole owners of it. The perfume is prepared from alcoholic vegetable extracts, essential oils, and rectified spirits. The usual recipe prescribes twelve drops of each of the essential oils, bergamot, citron, neroli, orange, and rosemary, with one dram of Malabar cardamoms and a gallon of rectified spirits, which are distilled together. Eau-de-Cologne is largely made in Great Britain, where the oils are mixed with a highly purified spirit, and distillation is unnecessary.

**Eau-de-Javel.** Bleaching liquid first made in 1789 at the Javel chemical works, Paris. It was the first practical means of utilising the bleaching properties of chlorine. Eau-de-Javel, prepared by passing chlorine gas into a solution of potash, was also employed as a disinfectant. Shortly afterwards Charles Tennant, of

Glasgow, prepared bleaching powder by passing chlorine gas over quicklime, and Labarraque, a French chemist, made a better bleaching liquid, eau-de-Labarraque, which is a solution of sodium hypochlorite made from sodium carbonate and calcium hypochlorite.

**Eau-de-vie** (Fr., water of life). Old French name for brandy. The product of a distilled wine was so called in the 13th and 14th centuries, and the name is still used. The eaux-de-vie de marc are distilled from wine lees or from the residue in the stills after the best brandy has been made. See Brandy; Fire-Water.

**Eaux-Bonnes.** Watering-place of France. In the dept. of Basses-Pyrénées, it is 28 m. S. of Pau. It stands 2,460 ft. high, just where two streams, coming down from the Pyrenees—the Sourde and the Valentin—meet, and is named on account of its waters. These have been known since the 14th century, and are good for lung and other troubles. Winter sports are held.

**Eaux-Chaudes.** A watering-place of France. In the dept. of Basses-Pyrénées, it is 5 m. S.W. of Eaux-Bonnes, standing where a stream, the Gave d'Ossau, comes down from the Pyrenees, its valley being one of the most beautiful in the neighbourhood. The town has hot springs—hence its name—which, being sulphurous, are good for rheumatism, affections of the respiratory organs, etc.

**Ebb.** Reflux or return of the tide-water towards the sea. Ebb tide occurs when tidal water returns to the lowest point it can reach on any particular day.

**Ebbsfleet.** Coast hamlet of Kent, England. It stands on Pegwell Bay,  $3\frac{1}{4}$  m. S.W. of Ramsgate, and is the traditional landing point of Hengist and Horsa in 449-450, and also the place at which S. Augustine and his forty monks disembarked in 597.

**Ebbw Vale.** An urban district of Monmouthshire, England. It stands on the Ebbw-fawr, a head-stream of the Ebbw, 21 m. N.W. of Newport, and is served by two railways. In a busv colliery district, it has large tinplate works, iron and steel being also manufactured on a large scale and the coal exported. Christ Church is a modern building in the Early English style. A parl. div. is named from the town. Market day, Sat. Pop. 27,653. *Pron.* Ebboo.

**Ebenaceae.** Family of trees and shrubs: the ebony family. They have alternate, undivided

leaves, and regular flowers, succeeded by berries. They are chiefly natives of tropical countries. The timber is hard and dark-coloured. See Ebony.

**Eben-Emael.** A fortress of Liège, Belgium. When the Germans invaded Belgium on May 10, 1940, the fortress system of Liège was one of the main bastions of the defence. Eben-Emael, the most modern of the fortifications, covered 200 acres. Tremendous attacks were developed by German heavy artillery, bombing planes, and waves of infantry. Parachutists landed on the top of the fort in darkness, and put the defensive armament out of action by thrusting bombs and explosives through the casemates. The remaining forts held out for some days, but the Germans claimed the capture of all the inner works by May 21. In the course of the liberation of Belgium, Eben-Emael was captured by the Allies Sept. 12, 1944. See illus. p. 1061.

**Ebenezer** (Hebr., stone of help). Name of an unidentified spot where the Hebrews were defeated by the Philistines (1 Sam. 7); also that of a stone set up by Samuel near Mizpah in memory of an Israelitish victory over the Philistines (1 Sam. 4). It is used as a Christian name.

**Eberhard** (1445-96). Duke of Württemberg. Born Dec. 11, 1445, a member of the ruling family of Württemberg, he became count of one part of it in 1457. In 1482 he secured the rest of the country, and in 1495 was raised to the rank of a duke. By uniting Württemberg and by obtaining support for certain changes, both from the emperor without and from his own nobles within, he is regarded as the founder of the country. One who shared in the intellectual awakening of his time, he founded the university of Tübingen and encouraged scholars. Eberhard, who was known as the Bearded (im Bart), died Feb. 25, 1496, at Tübingen.

**Ebers, GEORG MORITZ** (1837-98). German Egyptologist and novelist. Born March 1, 1837, at Berlin, he studied at Göttingen and Berlin, and early specialised in Egyptology. To popularise his favourite study through the medium of fiction, he wrote *An Egyptian Princess*, 1864, Eng. trans. 1870-71. In 1865 he became lecturer and later professor in Egyptology at Jena, and held a similar post at Leipzig 1870-89.

After his first travels in Egypt, Ebers wrote *Egypt and the Book of Moses* 1868. He revisited

Egypt in 1872-73, and discovered at Thebes one of the finest examples of ancient papyrus—Papyrus Ebers, now in the Leipzig Museum. This is a medical treatise from Sais of the 16th century B.C. Ebers also wrote historical novels descriptive of South Germany and the Netherlands in the 16th century. He died at Tutzing, Aug. 7, 1898. His Autobiography was translated into Eng. by M. J. Safford, 1893.

**Ebert, Friedrich** (1871-1925). German statesman. Born at Heidelberg, Feb. 4, 1871, and educated at an elementary school, he was apprenticed to a saddler of that town. In 1892 he became editor of the Socialist organ, Bremer Bürgerzeitung, and in 1894 married Louise Kamp, who, he said, proved his best counsellor throughout his career. Leader of the Socialists by 1916, in the revolution of 1918 he succeeded Prince Max of Baden as chancellor on Nov. 9, and then became provisional president of Germany. The first Socialist president maintained his position through the stormy days of Jan., 1919, and at the opening of the new national assembly at Weimar on Feb. 6, made a long protest against the armistice terms, and urged the union of German Austria with Germany. On Feb. 11 Ebert was confirmed in the presidency of the republic which he held until his death on Feb. 28, 1925. His rule was tactful and statesmanlike and he was held in respect by the German states. He published several books, including a study of German Social Democracy, 1924.

**Eberth, Karl Joseph** (1835-1926). German bacteriologist. Born in Würzburg, Sept. 21, 1835, he studied under Kolliker and Virchow. He was professor at Zurich, 1874, and at Halle, 1881-1911. He made important contributions to bacteriology, and in 1880 discovered the typhus bacillus which bears his name. He died Dec. 2, 1926.

**Ebionites** (Hebr. *ebyon*, poor). Name given to certain Judaizing sects in the Christian Church in the 2nd century. Denying the divinity of Christ, they regarded Christianity as merely a reformed type of the Jewish religion, and Christ as only a natural man of exceptional spiritual attainments acquired by a strict observance of the law of Moses. References in the writings of Irenaeus and other Fathers state that the Ebionites observed all the details of the Mosaic Law, recognized only the

Gospel of S. Matthew, and rejected S. Paul as an apostate. At a later period many of the Ebionites held the Gnostic heresy of the dualistic origin of the universe.

**Eblis** or **IBLIS**. A Mahomedan name for Satan or the prince of darkness. In the Koran it is stated that God, having made Adam, called upon the angels to bow down and worship him; all did so except Eblis, who refused, and became the declared enemy of the newly created race of men. Eblis is also described as chief of the genii.

**E-Boat**. Popular but incorrect name given to the *Schnellboot* (Ger. swift boat), or motor torpedo-boat used by the Germans in the Second Great War. The name was incorrectly applied under the impression that the German term was *Eilboot* (speedboat); whereas the official title was *Schnellboot* and the letter S was prefixed to a vessel's number. The largest type displaced 86 tons on a length of 105 ft. and was driven by Diesel engines developing 2,400 h.p. to give a speed of 33 knots.

There were two 19-7-in. torpedo-tubes mounted on either beam and firing forward. With a crew of 19, the vessel had a range of 600 m.

*Schnellboote* were the most active of the German surface craft during the war, frequently attacking Allied convoys in the English Channel and the Mediterranean. Lying low in the water, they were inconspicuous and could launch their torpedoes before their targets detected their presence. They made extensive use of smoke both before and after attack. Their activities were eventually checked by sweeps organized by the R.A.F. and by motor torpedo boats. See Coastal Craft.

**E-Boat.** German motor torpedo-boat of the Second Great War, here seen at high speed

**Ebonite** or **VULCANITE**. Hard vulcanised rubber made by mixing pure rubber with about one-third of its weight of sulphur, and heating for a number of hours in temperature rising to 300° F. Ebonite is often used as a substitute for bone, ivory, and horn, for making small ornamental articles like combs, knife handles, buttons, etc. It can be moulded, cut, carved, and polished to a high degree of perfection. It has good electrical insulation properties, though for high frequency work plastics have been found more satisfactory. See Rubber.

**Ebony** (*Diospyros*). Trees of the family Ebenaceae, whose heart-wood is the ebony of commerce. Several species furnish the timber, the difference being denoted by the place of origin. Mauritius ebony is the produce of *D. ebenum*; this, with that produced by *D. reticulata*, is the finest known. Coromandel ebony comes from *D. melanoxylon*. Calamander wood, a variegated ebony, is the timber of *D. guaiacita* from India and Ceylon. Some species have edible fruits. See Date-plum; Persimmon.

**Ebor**. Abbreviation of Eboracum or Eburacum, the Latin name for York. It is still used as a signature by the archbishop of York, e.g. Cyril Ebor. See York.

**Éboue, Adolphe Félix Sylvestre** (1884-1944). French administrator. Éboué, the son of an African negro, was born in Cayenne, French Guiana, and educated at Cayenne College and the Sorbonne, Paris. He entered the French colonial service and in 1936 became governor of Guadeloupe, the first man of colour to rise to that position. Governor of Lake Chad Territory from

1938, he refused to capitulate at the order of Vichy and declared for de Gaulle, Aug., 1940, thereby securing for the Allies the whole of Central Africa from W. to E. He became governor-general of French Equatorial Africa in Nov., 1940, and died in Cairo, May 17, 1944, while on his way to the Lebanon.

**Ebony.** Fruit and leaf of Persimmon, an ebony tree

**Ebro** (anc. *Ibērus*). River of N.E. Spain. Rising in the Cantabrian Mts., in the prov. of Santander, it flows S.E. to the Mediterranean. Its length is about 460 m., and it drains some 35,000 sq. m. Its chief affluents are the Jalon, Huerva, Guadaloque, Aragon, Gallego, and Segre. Running through narrow valleys, its channel is obstructed by shoals and rapids. Ships can proceed only as far as Tortosa (16 m.).

During the Spanish Civil War, 1936-39, there was heavy fighting along the line of the Ebro when government forces launched an offensive across the river in July, 1938, to relieve pressure on the Sagunto sector. Gen. Franco's troops were taken by surprise, and the Ebro was crossed on July 25. Gandesa was almost enveloped, despite frequent and costly counter-attacks. On Aug. 7 Franco began a counter-offensive and made some progress; but during the ensuing three weeks neither side gained any real advantage. Some 300,000 men were engaged in a sixth attack on Oct. 2, but, despite great superiority in the air, Franco's troops achieved only local gains, and by the end of the month the government forces were still inside his territory. On Nov. 7 the Nationalists seized the bridgehead of Mora de Ebro; by the middle of that month the government forces had been cleared from the left bank of the river, which was recrossed on the 16th. The Ebro battles laid the foundations for Franco's conquest of Catalonia; the losses incurred by the government army, estimated at 40,000, could not be replaced and undermined morale. The Nationalists employed massed artillery and extensive bombing in this campaign, while the government relied on intricate field fortifications.

**Ebullioscope**. Apparatus for determining the boiling-point of a liquid, e.g. in working out molecular weights. It is sometimes employed for ascertaining the alcoholic strength of solutions from the temperatures at which they boil.

**Eburacum** OR EBORACUM. Roman town on the site of which the city of York, England, now stands. Erected by the Ninth legion on an earlier Caer Eborac about A.D. 75, the fort of 52 acres—still traceable in the lower courses of the multi-angular tower—was garrisoned by the Sixth legion. A municipal colonia flourished on the opposite bank of the Ouse. Here in 120

Hadrian held court, here also died Severus in 211, and Constantius Chlorus in 306. *Pron.* Eburācum. *See* York.

**Eça de Queiroz, JOSÉ MARIA** (1845-1900). Portuguese author. Born at Povoá do Varzim, near

J. M. Eça de Queiroz, Portuguese author

Oporto, Nov. 25, 1843, and educated at Coimbra university, he joined in 1871 the staff of the critical journal *As Farpas*. In 1874 he published a novel which attracted a good deal of attention, *O Crime do Padre Amaro*. He was Portuguese consul successively at Havana, Newcastle, Bristol, and Paris. His later stories included *O Primo Bazilio*, 1877 (Eng. trans. *Dragon's Teeth*, 1889) and *A Reliquia*, 1886. The posthumous collection of *Contos*, 1902, contained the famous stories *O Defunto* and *O Suave Milagre*, translated into English as *Our Lady of the Pillar* and *The Sweet Miracle*. He died Aug. 16, 1900.

**Écarté** (Fr., discarded). A card game for two players which had a great vogue in France at the beginning of the 19th century. The six down to the two inclusive of each suit having been removed from the pack, the players cut for deal, and the pack is shuffled by the dealer, and cut by his opponent. The dealer then gives five cards to the other player and to himself: either three and two or two and three alternately. The eleventh card is turned up for trumps, the remainder of the pack forming the stock. Should the eleventh card be a king the dealer scores one point; otherwise the turn-up has no scoring value.

The players then look at their hands, and should the non-dealer (the leader) be satisfied with his cards, he may at once proceed to play them. But if he considers it would be advantageous to change any or all of them, he says, "I propose" or "Cards." The dealer then has the option of changing his cards also, and on deciding to do so says, "I accept" or "How many?" Should he be satisfied with his cards, he may refuse, and exclaim "I refuse" or "Play." If either player refuse to change cards, then both must play their original hands. Otherwise, the discarding of cards for others in the stock may proceed so long as both are agreeable. The players

being satisfied with their hands, the play begins. If either holds the king of trumps he must declare it before playing his first card, and is entitled to mark one point.

The object of the game is to make tricks; the highest card of a suit wins, though a trump naturally scores over any card of another suit. A player must always take a trick if able to do so. The cards rank in this order: King, queen, knave, ace, ten, down to seven. The winner of a trick always leads to the next. The score is made as follows: Turning up or holding the king of trumps counts 1; winning three tricks out of five is called the *point* and also counts 1; winning all five tricks is termed the *vole* and counts 2. If either player fail to make three tricks after having declined cards, his adversary scores 2. A game consists of 5 points.

**Ecbatana**. Ancient capital of Media, now in N.W. Persia. The Hebrew form Achmetha (Ezra 6) survives in the modern Hamadan. Situate 5,930 ft. above sea-level, near Mt. Elwend, it was the summer residence of the old Persian and Parthian kings. Its identification with the seven-storeyed fortress described by Herodotus as built by Deioeces (700 B.C.) is in doubt. The so-called Syrian Ecbatana was at Hamath.

**Ecce Homo** (Lat., Behold the Man). Short title of a survey of the life and work of Jesus Christ by Sir J. R. Seeley. It was published anonymously in 1866, and caused a storm of criticism. It attempted to present Christ as an exclusively human personality, the founder of a new system of society.

**Eccentric** (Gr. *ekkentros*, out of the centre). In engineering, a metal disk, mounted eccentrically on a shaft, to give reciprocating movement to a valve or pump or lever. The edge of the eccentric is grooved and encircled by an eccentric strap, one half of which is secured rigidly to the front end of a connecting-rod. In effect an eccentric is a cam: or it may be regarded as a crank having a pin larger than the shaft. *See* Link Motion; Steam Engine.

Eccentric. Metal disk on a shaft fixed out of centre. A and B show two positions of this moving shaft

**Ecclefechan.** Village of Dumfriesshire, Scotland. It is 6 m. S.E. of Lockerbie by railway, and it has been identified as the original of Entepfuhl in Thomas Carlyle's *Sartor Resartus*. It was Carlyle's birthplace and burial place. Near by are the Roman camps of Birrens and Birrenswark. Pop. 988. See Carlyle *illus.*

**Eccles.** Mun. bor. of Lancashire, England. It stands on the Irwell, 4 m. W. of Manchester, of which it is an industrial suburb, and is served by the railway. Famous for Eccles cakes (made of pastry with currants), the town has cotton and other textile industries. It has an old church, presumably the origin of its name. Pop. 40,694. See Manchester.

**Ecclesfield.** Parish of the West Riding of Yorkshire, England. It is 5 m. W.N.W. of Sheffield, and is served by two rlys. The Perpendicular church of S. Mary, formerly designated the Minster of the Moors, contains some fine oak carving. There are cutlery and tool works, paper mills, iron works, and collieries. Pop. 16,019.

**Ecclesia** (Gr. *ekkalein*, to call forth). In ancient Athens, the assembly of the whole body of free citizens. The meetings were held in the Pnyx and latterly in the theatre; on special occasions they were held in the agora. In theory the ecclesia was the supreme power in the state, and any citizen had the right to speak; but in practice its power was virtually confined to the business which had been prepared for it by the *boulê*, or council of 500. Voting was by show of hands, and on special occasions by ballot. In addition to some 40 regular meetings a year, the ecclesia could also be convoked for special business by a chief magistrate. The Greek name *ecclesia* (Fr. *église*) came to be applied in Christian times both to the assembly of Christians and to the place of assembly. See Cathedral; Church.

**Ecclesiastes.** Title adopted, through the Vulgate, from the Septuagint, for the O.T. book which in Hebrew bears the title *Kôheleth*. The meaning of the Hebrew term is disputed, but may be "one who speaks in an assembly" (hence Jerome's rendering *concionator* and the English translation "the Preacher"). In chap. 1, vv. 1, 12, the writer seems to be identified with King Solomon, to whom tradition ascribed the authorship. But the language of the book, which contains Persian and possibly

Greek words, and represents a transitional stage in the development of Mishnic Hebrew, is that of an age much later than Solomon's. The book cannot, however, be later than Ecclesiasticus (c. 200 B.C.), which pre-supposes its existence. It presents a strange mingling of despair and pessimism ("Vanity of vanities, all is vanity") with an irresistible sense of the goodness of God. Thus the writer's utterances often seem contradictory.

The true explanation seems to be that the book is a series of reflections representing two or more moods, or in other words is the record of the negative and positive phases in a soul's struggle for light. Hence, probably under Greek influence, a philosophic materialism and epicureanism; under the influence of national subjection, a general despondency; and yet, under the influence of an innate religious trend, an unquenchable faith in a divine dispensation. The materialistic element will account for the hesitation with which the book was admitted into the Hebrew Canon. The writer in one mood sees little profit or progress in life; the same happenings recur perpetually (cf. Nietzsche's philosophy). The best course in life seems to be to eat and drink and enjoy things as much as possible. But in another mood the writer realizes that true happiness is dependent upon fear of God and obedience to His commandments.

**Ecclesiastical Commission.** Body constituted in 1836 to manage the extensive estates of the Church of England. Under its direction the large incomes of certain bishops and other dignitaries were gradually reduced to a more uniform scale.

In certain cases in 1836 the dean and chapter refused to hand over the cathedral estates to the commissioners, and several such incomes were reduced owing to agricultural depression. Those which took the other course received a fixed income whatever the rent-roll of the surrendered estates might be. The commission dealt with an annual income of nearly £2,000,000, and after paying the various stipends it usually set aside some £400,000 a year for increasing the endowment of poor livings and providing for the foundation of new ones.

In 1947 this body was merged in the new Church Commission (q.v.), its members becoming known as the Church Commissioners for England. Consult Num-

ber One Millbank: The Story of the Ecclesiastical Commission, J. R. Brown, 1944.

**Ecclesiastical Courts.** Courts of law that deal with offences against ecclesiastical law, i.e. cases affecting benefices and the like. Such are in their nature confined to the established church. The courts held by the Pope and by the various prelates of the R.C. Church are ecclesiastical courts.

In England clerics are now for practical purposes on the same footing before the law as laymen. Formerly this was not so, and the church courts dealt with all kinds of offences committed by clergymen as well as with all cases affecting marriage (divorce, etc.) and wills—two subjects which the church regarded as peculiarly its own. The process of reducing the powers of the ecclesiastical courts was a gradual one, but by about 1860, the date of the Ecclesiastical Courts Jurisdiction Act, they may be said to have been confined to their present duties, dealing only with cases affecting church discipline, and no longer with any that are offences against the state. In 1855 their jurisdiction in cases of defamation was taken away, and in 1857 they lost that affecting wills and matrimony.

The existing ecclesiastical courts in England are the courts of arches, presided over by the dean of arches, which is the chief court in the province of Canterbury, and the chancery court, which fulfils the same purpose for the province of York, and is presided over by the official principal.

The court of arches hears appeals from the consistory courts, and from it there is an appeal to the judicial committee of the privy council. Until 1833 these appeals were to the court of delegates of appeals, which dated from the time of the Reformation.

Each diocesan bishop has his court, called the consistory court, over which the chancellor of the diocese presides. The archdeacons have courts, which, however, have little to do. Each archbishop has an almost obsolete court of audience, and also the court of the vicar-general, which deals with the confirmation of the elect on of bishops, gives advice to convocation, and controls the issue of marriage licences. The law administered in the church courts was mainly canon law and English statute law so far as it concerned the Church. See Canon Law; Church of England; Curia, Ecclesiastical Law.

## ECCLESIASTICAL LAW IN ENGLAND

Rev A J Macdonald, D.D., F.S.A. Rural Dean of the City of London

*This article deals with Ecclesiastical Law, the main branch of which is that under which the Church of England lives and works.*

*Another aspect of the same subject is dealt with under Canon Law  
See also Church of England*

Ecclesiastical law is here used to mean the law affecting the Established Church of England. Other churches are subject to the general common law and statute law affecting corporate or non-incorporate bodies. In the Middle Ages, English ecclesiastical law was the canon law of the western European church, supplemented, and in some cases modified, by the statute law of the realm and by the common law derived from custom. Indeed, it has been argued that the canon law itself was regarded as an undefined part of the common law, probably because it also largely represented the codification of ecclesiastical custom.

The legislation of Henry VIII shifted the centre of gravity of English ecclesiastical law from the canon law to statute law, and the guiding legal principles and maxims of English ecclesiastical law since his time are to be found in his legislation, notably in the Act of Supremacy (1534), modified in the reign of Elizabeth (1559) and of later sovereigns. At the same time, the principles of English common law have been more and more applied to the church.

### Relation to Old Canon Law

The exact relation of modern English ecclesiastical law to the old canon law has never been precisely defined by statute, by the courts of the realm, or by any other competent authority. Many of the regulations of the medieval canon law were embodied in the Canons of 1604, which became binding upon the clergy, but not (except in so far as they repeat existing law or apply to church officers) upon the laity. In 1939 a commission was appointed to prepare the first revision of these canons for over three centuries. The recommendations of this commission were published in May, 1947.

The canons of 1604 did not, however, close the door of appeal to the rest of the medieval canon law. Many authorities regard that canon law as part of the English ecclesiastical law, save in so far as any of its provisions conflict with the statute law or custom of the realm. This lack of definite legal precision places English ecclesiastical law at a disadvantage when compared with the *Codex Juris Canonici* (1917) of the R.C. Church.

Another considerable modification of the medieval jurisdiction still surviving in the English ecclesiastical courts took place in 1857, when all cases concerning marriage (other than the grant of marriage licences), divorce, and wills were transferred from the church courts to new secular courts.

### The Enabling Act

The Church of England Assembly (Powers) Act (1919), commonly called the Enabling Act, set up a new legislative body for the church called the National Assembly of the Church of England, otherwise the Church Assembly. This consists of the house of bishops, the house of clergy (embodying the lower houses of convocation of the two provinces of Canterbury and York), and the house of laity (elected). When agreed upon, its measures go before the ecclesiastical committee of the two houses of parliament, also created by the Act of 1919. The measures can then be debated by both houses of parliament, but if no debate is demanded, and this is the usual course of procedure, then, after the consent of both houses of parliament has been obtained, the measures go forward for the royal assent, and so become part of the statute law of both church and state. Between 1920 and 1945 over 90 measures of new ecclesiastical legislation were added to English ecclesiastical law in this way, and the process continues.

The church assembly has no power to interfere with the canons or to encroach upon the duties and privileges of the convocation of the provinces of Canterbury and York. These are part of the ancient constitution of the realm, and grew up side by side with parliament—indeed, preceded it. Together with the lords and commons, they formed a kind of third estate, and at one time had the right to authorise separate taxation of the clergy, which differed in amount and incidence from that imposed by parliament upon the laity. The houses of convocation of the two provinces, which sit separately in London and York, may with the royal sanction promulgate legislation of a canonical and doctrinal character, but only so far as it does not infringe the

statute and common law of the land. In comparison with the legislation passed by the church assembly, that undertaken by the convocations in modern times has been small.

Ecclesiastical law relates to the affairs and discipline of archbishops, bishops, clergy, and lay officials of the church and to the laity generally in all matters where the faith, forms of worship, rites and ceremonies are concerned; to the fabric of the church, rectory and vicarage houses and other buildings which are church property. Revisions proposed in 1947, for example, dealt among other matters with procedure for baptism, qualifications of sponsors and of churchwardens, the hearing of confession, the anointing of the sick, the ordering of deaconesses, and the interchange of pulpits with nonconformists.

Ecclesiastical law is in the U.K. administered in both ecclesiastical and civil courts, with the usual course of appeal, in the case of diocesan courts to the provincial court and the privy council, and in the case of the high court to the court of appeal and the house of lords. The 1947 proposals included suggestions for the simplification of church courts. *Consult Law Relating to Church and Clergy* H. W. Cripps, 7th ed. 1921.

**Ecclesiastical Titles Act.** Act passed by the British parliament in 1851. It was a reply to the brief of the Pope Pius IX which restored the Roman Catholic hierarchy in England, making Westminster an archbishopric and selecting various towns, not occupied by Anglican bishops, as new seats for the episcopate. In response to Protestant political agitation Lord John Russell introduced the bill, which was passed into law. The Act was from the first a dead letter, and was repealed in 1871.

**Ecclesiasticus.** Name in the Vulgate of one of the most important of the O.T. Apocrypha, which in the Greek version is called the "Wisdom of Jesus, son of Sirach." The book was called Ecclesiasticus ("belonging to the Church") because, though not canonical, it was considered suitable for use in the public worship of the Western Church. By the decree of the Council of Trent it was declared a canonical book of the O.T. in the Roman Catholic Church.

It was originally written in Hebrew, between about 190 and 170 B.C., by Jesus the son of Sirach and was translated into Greek soon after 130 B.C. by a grandson of the

same name. The Hebrew text was lost until 1896, when Mrs. Agnes Lewis discovered a fragment in Palestine. Subsequently other fragments came to light, and now the greater part of the work can be read in Hebrew. The book belongs to a class of Hebrew literature known as Wisdom Literature. The author gathers up ethical proverbs, precepts, and wise sayings concerning various matters in the conduct of life. See Apocrypha.

**Ecclesiazusae.** Comedy of Aristophanes, produced 392 B.C. It represents the women of Athens as controllers of public affairs and founders of a socialistic state in which property and husbands were held in common, as in Plato's Republic. The title means Women in the Ecclesia (general assembly).

**Ecclesiology** (Gr. *ekklesia*, church, assembly; *logos*, discourse). Science treating of the organization and development of Christianity and of ecclesiastical architecture and decoration, especially in regard to their liturgical significance. See Christianity; Church.

**Ecdysis.** Zoological term for the shedding of a skin or shell, e.g. of an insect or crustacean. The cast skin is the exuviae and the intervals between successive ecdyses during the life of the animal are instars.

**Echegaray y Eizaguirre, José** (1832-1916). Spanish dramatist, poet, and politician. He was born, April 4, 1832, at Madrid, and educated at its university. Before entering politics, 1868, he was a teacher of mathematics. He held office in the Radical-Monarchist government of 1872-73, as minister of education, and in 1874 and 1905-06 was minister of finance. His versatility was extraordinary, and he was a director of commercial companies, as well as a philosopher and poet. In 1904 he won the Nobel prize for literature. His dramas, numbering over eighty, have been translated into most European languages, and he is regarded as the founder of the new school of Spanish dramatists. The plays include *Mariana*, 1893, adapted in English, 1897, at the Court, and revived, with Mrs. Patrick Campbell in the title rôle, at the Royalty, 1901; *El Gran Galeoto*, 1881, produced in London, 1889, under the title of Calumny. Echegaray died Sept. 16, 1916.

**Echelon** (Fr., rung of a ladder). Military term. Troops, warships or aircraft are said to be in echelon formation when the second unit is to the rear and to the

flank of the leader, the third similarly placed in relation to the second, and so on. In the case of aircraft in echelon, each machine is usually stepped in relation to that immediately in front. This is to provide additional defensive protection to the formation. The army uses the term B echelon for second-line transport, etc., and servicing units attached to R.A.F. bomber and fighter squadrons are also known as echelons.

**Echidna.** Spiny ant-eater of Australia and New Guinea, of which there are two species, the

Echidna. An egg-laying mammal of Australia

five-toed and the three-toed. They are egg-laying with a common opening of genital ducts, urethra, and rectum called a cloaca, and are thus Monotremata. The back of the head and body is covered with short spines, like porcupine quills, and the head is provided with a slender beak. In the breeding season the female lays a single egg, which is incubated in a pouch on the underside of the body.

**Echinodermata** (Gr. *echinos*, hedgehog; *derma*, skin). Phyla of invertebrate marine animals. They comprise the feather-stars (Crinoidea), star-fishes (Asteroidea), brittle-stars (Ophiuroidea), sea-urchins (Echinoidea), and sea-cucumbers (Holothuroidea); certain other orders are represented only by fossils. They are organized on a five-rayed symmetrical plan, though this is not at once evident in some of the sea-cucumbers. The skeleton consists of a soft integument in which is deposited carbonate of lime in the form of plates, bars, or spicules. Although there is no distinct head, there is a mouth on the underside, except in the sea-cucumbers, where it is placed at one of the two extremities.

The nervous system has its principal seat in a five-angled ring around the gullet, from which branches radiate in all directions. There is no heart; but there is a system by which the products of digestion are circulated. Of a complex system of coelomic spaces, one set accounts for the most remarkable feature of echinoderm organization: the series of water-vessels

known as the ambulacral system, from its function of supplying hydraulic power for locomotion.

The outer surface of the echinoderms varies in the several orders. In the sand-stars and brittle-stars it consists of overlapping plates which allow the rays to be thrown into horizontal curves; in the common star-fish and its near allies it is studded with hard bosses and short spines; and in the sea-urchins it is armed with long or short spines which move on ball-and-socket joints. There are also sense organs of varying character in the different groups. The star-fishes have rudimentary eyes at the tips of the rays.

The echinodermata are of the widest distribution, being found in all seas, at all depths. They are an ancient group, for their fossil remains are found in rocks as far back as the Ordovician period.

**Echinoidea** (Gr. *echinos*, hedgehog; *eidos*, form). Order of echinodermata containing the sea-urchins. They include regular urchins of which the somewhat spherical common sea-urchin (*Echinus esculentus*, of rocky British coasts is a familiar example; the oval heart-urchins (e.g. *Echinocardium*) of the sandy shores; and the depressed cake-urchins (*Clypeaster*), which are not represented in British waters.

The common sea-urchin has beneath its coat of about 4,000 bristling spines a thin stony box composed of nearly 600 five-sided plates, placed edge to edge. Through the minute perforations issue the delicate sucker tubes of the ambulacral system (see Echinodermata). Some of the plates bear polished bosses upon which the spines turn in any direction. Each tapering spine has a polished cup at its base to receive the boss, and the two are held together by muscular tissue. Among the spines will be found stalked and sessile organs resembling the bills of birds, which have the power of snapping; these are called pedicellariae. Around the Mediterranean the sea-urchin is esteemed as food; hence its name *esculentus*. The gonads are edible and a rich source of vitamin A.

The heart-urchins, which burrow in muddy sand, are clothed with silky bristles, all pointing backwards. The scoop-like mouth is at the broad end and without teeth.

**Echmiadzin.** A monastery in Armenia S.S.R. It stands 12 m. W. of Erivan and 40 m. N. of Mt. Ararat. Its foundation is attributed to S. Gregory the Illuminator in 302, and since 1441 it has

been the patriarchal seat of the Armenian Church. Many tombs, relics, and manuscripts are shown. The neighbouring town is Vagarsapat, but Echmiadzin has given its name to an administrative district.

**Echo.** A sound caused by reflection of sound from a suitable surface such as a wall or rock-face. It may be heard quite distinctly from the direct sound if the observer is suitably placed with respect to the source and the reflecting surface. The rolling of thunder is due to numerous successive reflections between surfaces of clouds.

**Echo.** In Greek mythology, a mountain nymph. At one time the companion of Hera, having displeased the goddess, she was punished by being rendered incapable of speaking except when spoken to. Subsequently Echo fell in love with the beautiful Narcissus, but, her love not being returned, she pined away and was changed into a stone which retained the echo or answering voice.

**Echo Sounding.** Electro-sonic method whereby ships take automatic soundings of the sea bed over which they are passing. First developed during the First Great War for detecting the presence of enemy submarines, the echo sounder was used instead of the lead with which mariners used to estimate depths of water.

By the opening and shutting of a control switch, an electrical current is passed from a charged condenser through the windings of a transmitter and causes a sound impulse to be emitted. This impulse is reflected, or echoed, back from the sea bed or any obstacle in its path and picked up by the receiving portion of the instrument. After being amplified, the sound impulse actuates a stylus which records, on a revolving strip of sensitised paper, marks proportional to the time taken for the echo to return from its source to the instrument. The number of echoes received ranges from 75 to 400 a minute, according to the instrument.

As the rate at which an echo travels through water is known, it is possible to calculate with fine accuracy the depth of the object returning the echo. The stylus moves to the right or left of a central line on the paper, and its successive marks form a continuous contour or graph. This graph shows the smallest variation of water depth, and gives an indication of the character of the sea

bed; the thicker the line on the paper, the harder the bottom. The echo sounder is equally responsive in deep or shallow water.

Most large liners are fitted with echo sounders, as are colliers bringing coal to the power stations and gasworks on the banks of the Thames. Many trawlers carry echo sounders to detect the presence of shoals of fish, or any obstacles that might destroy nets. Whaling factory ships use echo sounders that will respond to a whale two miles away. The instrument was used to survey the bottom of the English Channel preparatory to laying the oil pipe line (*see* Pluto) between England and France in 1944.

Detectors making use of the sonic principle have been applied to industry for detecting flaws in metal castings. The instrument transmits ultrasonic pulses into the metal under test and measures the time it takes the pulses to travel through the material, reflect from the opposite side or from a defect, and return to the point of origin. Ultrasonic waves travel best in solids and, as they weaken when in contact with air, register on a meter when they strike an air hollow or flaw in a metal casting.

**Echternach.** Town of Luxembourg. It stands on the Sure, near the frontier of Prussia, and is famous for its annual festival and its association with S. Willibrord. In the church, a Romanesque building of the 11th century, restored in the 19th, were the remains of the saint. There was a rich Benedictine abbey here until 1801. The festival, which dates from 1300 or earlier, is held every Whit Tuesday. It is attended by pilgrims and invalids, as well as high ecclesiastics, who are accompanied by a singing and dancing crowd as they go in procession to the church. Echternach had a town hall and some small industries.

Southernmost point at the base of German penetration in the Ardennes counter-offensive, Dec., 1944-Jan., 1945, Echternach changed hands more than once during hard fighting, but the stubborn American defence prevented the enemy from overrunning it and extending his advance southwards.

**Echuca** (formerly Hopwood's Ferry). Town of Victoria, Australia. It stands on the Murray river, 156 m. by rly. N. of Melbourne. It is the chief river port on the Murray at its junction

with the Campaspe. A bridge (rail and road) 1,905 ft. in length spans the river here, connecting with Moama in New South Wales. Echuca is the outlet for the wine, wool, and timber of this district. A rly. line 45 m. long to Deniliquin, on the Edward river, taps part of the N.S.W. Riverina trade; and Echuca is also connected with Bendigo. Pop. est. 4,480.

**Écija** (anc. *Astigi*). Town of Spain, in the prov. of Seville. It stands on the Genil, here crossed by an old bridge, 34 m. by rly. S.W. of Cordova. Écija, once a Roman colony (Julia Augusta Firma) and a Moorish town, retains many traces of ancient civilization. It now manufactures boots and shoes, soap, pottery, and textiles. The surrounding fertile plain produces corn, cotton, and olives; the vine is largely cultivated, and a fine wine is made. From its climate Écija is popularly called the Frying-pan of Andalusia. Pop. 30,560.

**Eck, JOHANN MAJER VON** (1486-1543). German theologian. He was born at Eck, in Swabia, Nov. 13, 1486, his father's name being Maier. Having studied at Heidelberg, Tübingen, and elsewhere, he was ordained priest in 1508. Two years later he became professor of theology at Ingolstadt university, with which he was associated for the rest of his life. The ablest opponent of the Reformation in Germany, in June-July, 1519, he debated publicly at Leipzig with Luther and Carlstadt, then wrote a treatise on the Primacy of Peter, and went to Rome. He returned with the papal bull excommunicating Luther (*q.v.*). Eck organized the Catholic Federation, and took a prominent part in successive conferences and diets at Ratisbon, 1524; Baden, 1526; Augsburg, 1530; and Worms, 1540. His German version of the Bible was published in 1537. He died Feb. 13, 1543.

**Eckener, Hugo** (b. 1868). German engineer and airman. Born at Flensburg, Aug. 10, 1868, he was at one time a mathematician, economist, and psychologist, and later assisted Count Zeppelin in building airships. In 1908 he became Zeppelin's deputy and in 1911 his successor. During the

Hugo Eckener, German engineer and airman

First Great War and after, Eckener continued to design and pilot Zeppelin airships. He designed the Graf Zeppelin (*q.v.*), piloting it round the world in 1929, and in 1931 flew over the North Pole. A staunch democrat, he was, after the defeat of Germany in 1945, invited by the French occupation authorities of the Lake Constance area to play a political rôle; and edited the most important daily paper of that area, *Süd Kurier*.

**Eckermann, JOHANN PETER** (1792-1854). German writer. He was born at Winsen, Hanover, Sept. 21, 1792. After early hardships he served in the war of 1813-14, and later studied at Göttingen. In 1822 he sent Goethe the MS. of his *Beiträge zur Poesie*, and this resulted in his going to Weimar, where he acted as secretary to Goethe, and assisted in the preparation of the final edition of his writings. Eckerman is best remembered by his *Gespräche mit Goethe* (1836-48), Eng. trans. John Oxenford, 1850. He died at Weimar, Dec. 3, 1854.

**Eckhart, JOHANNES** (c. 1260-1327). German mystic and theologian. Born at Hochheim, near Gotha, he became a Dominican friar, and in 1298 was prior of Erfurt and provincial of Thuringia. In 1300 he was lecturer in Paris, and in 1307 he was vicar-general of Bohemia and provincial of Saxony. He was subsequently lecturer at Paris, Strasbourg, and Frankfurt, and from 1320 until his death was professor at Cologne. Certain expressions used by Eckhart were condemned as heretical, and he was suspected of pantheism. But he made complete repudiation of error and submission to Rome.

Eckhart, who is known as the Master, was the founder of German mysticism. His writings do not present a definite system of philosophy, and his teaching is mainly concerned with the Divine essence in all things, the relation of the human soul to God, and the attainment of God by casting off all that hinders knowledge of God. No complete English trans. of his works exists. *Consult* *Deutsche Mystiker des 14 Jahrhunderts*, ed. F. Pfeiffer, 2nd ed. 1907.

**Eckington.** Parish and town of Derbyshire, England. It stands on the Rother,  $6\frac{1}{2}$  m. S.E. of Sheffield, with a rly. station. Agricultural implements are manufactured, and there are coal mines in the neighbourhood. Market day, Fri. Pop. 15,000. Another

Eckington, in Worcestershire, is close to the Avon and Bredon Hill.

**Eckmühl, BATTLE OF.** Victory of Napoleon over the Austrians, April 22, 1809. In an attempt to reopen his communications, which had been broken by the French, the archduke Charles emerged from Ratisbon to give battle. His troops were routed by Davout and Oudinot, and the whole Austrian army was demoralised and forced across the Danube. For his part in the day's success Davout was created prince of Eckmühl.

**Eclampsia.** Term applied to a condition in which convulsions occur before, during, or after childbirth. These convulsions are due to failure of the maternal kidneys to excrete the toxic load of the mother and foetus. The condition can be diagnosed at its onset by a rise in blood pressure and by presence of albumen in the urine. The careful obstetrician records the blood pressure of the pregnant woman and examines the urine for albumen as routine measures. Should the blood pressure rise, and should albumen make its appearance, the treatment is complete rest, a diet of water and vegetables, and hourly observation of the case. Termination of the pregnancy by induction of labour or by caesarian section may be necessary.

**Eclecticism** (Gr. *eklektikos*, picking out). In philosophy, a method which, while not excluding independent thought, selects and works up into a whole what is acceptable in other philosophical systems.

The most important Greek representative of this practice, which first made its appearance in the Stoic school, was Antiochus of Ascalon (1st century B.C.), the head of the so-called Fifth Academy, whose teaching led to the adoption of eclecticism by the Academy in place of scepticism as

its ruling principle. Among the Romans, Cicero, who attended his lectures at Athens, although by no means an original thinker, skilfully selected and combined Sceptic, Stoic, and Peripatetic doctrines. Among modern eclectics Leibniz and Victor Cousin may be specially mentioned.

**Eclipse** (Gr. *ekleipsis*, failing to appear). In astronomy, the temporary interruption of the light from a celestial body. Eclipses fall into two classes: (1) If the eclipsed object is self-luminous, an eclipse will occur if a dark body is interposed between it and the earth. The best example of this is an eclipse of the sun, when part of the earth's surface is covered by the moon's shadow. A similar phenomenon occurs when the orbit of a binary star (*q.v.*) lies edge-on to the earth. (2) If the eclipsed body shines by reflected light, an eclipse will occur if a dark body comes between it and the source of light. An eclipse of the moon is of this type, the moon passing into the shadow cast by the earth. Eclipses of planetary satellites (*e.g.* the moons of Jupiter) by their parent bodies also fall into this class.

If the earth, the sun, and the moon moved in the same plane, there would be an eclipse each time the three were in a straight line. Since, however, the moon moves in an orbit inclined at an angle of  $5^{\circ} 8'$  to the plane of the sun's path, the ecliptic (*q.v.*), there can be an eclipse only when the moon is crossing the plane of the ecliptic. The points where the moon crosses the ecliptic are called the nodes, and when new moon happens at one of these nodes there will be an eclipse of the sun. When full moon occurs at one of the nodes the earth is between the moon and the sun, and there will be an eclipse of the moon by the earth's shadow.

An eclipse of the moon will be visible to the whole side of the earth turned away from the sun. But in a solar eclipse the moon casts only a restricted shadow on the earth, and therefore the sun will appear in total eclipse only in the narrow path of this moving shadow.

Owing to the refraction of the

Eclipse. Diagram showing the phases of an eclipse of the moon by the shadow of the earth. Top, eclipse of the sun by the moon. When the moon is too near the sun there is an annular eclipse.

sun's rays by the earth's atmosphere into the geometrical shadow, the moon is hardly ever quite swallowed up in blackness. A total lunar eclipse may last about 1 hour 45 minutes. If the moon is not exactly at the node at its eclipse a partial eclipse will result, the lower or the upper limb of the moon being obscured by the umbra, or darker portion of the earth's shadow.

In a total eclipse of the sun by the moon the diameter of the moon's shadow cast on the earth averages only about 150 m. and sweeps across the earth from W. to E. with great rapidity. The eclipse can be visible only in places swept by the shadow, and the longest time the total eclipse of the sun by the moon can be visible at any place is a little more than seven minutes.

Partial eclipses occur when the new moon is not quite at the node; annular or disk-like eclipses are due to the fact that the moon is sometimes too far from the earth to hide the sun entirely from the view of an observer on the earth. The length of the cone of the moon's shadow varies with the moon's distance from the sun between 228,000 and 236,000 m. The moon is sometimes as near as 221,700 m. to the earth, and sometimes 252,400 m. away, so causing the variation both in the appearance and the length of time of solar eclipses.

The maximum possible number of eclipses of the sun and the moon in any one year is seven. This happened in 1935 and will not occur again for two centuries. The minimum is two (both solar). Although there is no actual connexion between one eclipse of the sun or moon and the one immediately following, there is a cycle, known as the Saros, of a little over 18 years of eclipses, and it was owing to a knowledge of this fact that the ancients were able to predict eclipses of the moon, though since eclipses of the sun are very rare at any given place on the earth's surface, the similar sun cycle was overlooked.

Eclipses of the sun have been fruitful in discovery, for only when the bright disk is covered can the sun's atmosphere be effectively studied. The eclipse of 1868 resulted in the discovery of helium in the sun, 27 years before it was found to be a constituent of one of the rare earths, cleveite. The eclipse of 1919 provided an opportunity to prove Einstein's generalised theory of relativity by show-

ing that light was attracted by the sun and deflected from a straight path.

As a total solar eclipse occurs only over a limited track on the earth's surface, astronomers make expeditions with portable equipment to study it. Total lunar eclipses can be seen over half the earth but are of little scientific interest. The last total solar eclipse visible in Great Britain was on June 29, 1927, when a Greenwich expedition studied it from Giggleswick, Yorks; the next will be on Aug. 11, 1999, visible in Cornwall. See Corona; Ecliptic; Moon; Occultation; Sun; Consult also Eclipses of the Sun and Moon, Sir F. Dyson and R. Woolley, 1937.

**Eclipse.** English racehorse, regarded as the greatest that has ever lived. Foaled April 1, 1764, he was named because on that day there was an eclipse of the sun. He ran in his first race May 3, 1769, and from then until Oct., 1770, ran in 18 races, never being beaten. He was bred by the duke of Cumberland, but at the time of his successes was the property of D. O'Kelly. After 1770 he was used for stud purposes. The horse's skeleton was placed in the Royal Veterinary College, Camden Town.

**Eclipse Stakes.** Race for horses of 3 years and upwards run at Sandown Park over a distance of  $1\frac{1}{4}$  m. It was inaugurated in 1884 and formed the first of the £10,000 races. Danny Maher rode the winner of this event on five occasions. One of the most popular wins was that of Orme, after recovering from his supposed poisoning, in 1892. See Horse Racing.

**Ecliptic** (Gr. *ekleiptikos*, relating to an eclipse). Track in the heavens along which the sun appears to move backwards amongst the stars in the course of a year; so called because the moon must be on this great circle if an eclipse is to occur. The sun's motion is only apparent; it is the motion of the earth about the sun which produces the appearance of the sun's itinerary. The plane of the ecliptic is the plane of the sun's apparent, and of the earth's real, motion. The obliquity of the ecliptic is the angle ( $23\frac{1}{2}^\circ$ ) the ecliptic makes with the celestial equator. Since the orbits of the moon and planets are nearly co-planar with the earth's, all these bodies in their wanderings stay close to the ecliptic. The celestial zone containing the ecliptic is the zodiac. See Sun; Zodiac.

**Eclogite** (Gr. *eklogos*, picked out). Crystalline metamorphic rock having the same general com-

position as gabbro or basalt, from which it may have been derived by heat and pressure. When freshly broken it presents a beautiful appearance due to red garnets in a green matrix of omphacite (pyroxene) and smaragdite (amphibole). It occurs in irregular masses in schists; some geologists think it forms an irregular layer in the earth below the crust.

**Eclogue** (Gr. *eklogē*, selection). Pastoral poem relating the lives and loves of shepherds. Properly almost identical with the idyll, the term is generally restricted to pastoral poems in dialogue form, such as the *Bucolics* of Virgil. Spenser set the fashion anew with his *Shepherds Calendar*, and the form was common in the artificial poetry of the 17th and 18th centuries. The name has sometimes been used for dialogue poems other than pastoral, as in Phineas Fletcher's *Piscatory Eclogues* (1633) and John Davidson's *Fleet Street Eclogues* (1893-96).

**Encomus.** Headland on the S. coast of Sicily, between Agrigento and Licata. Off here in 256 B.C. the Romans under Regulus utterly defeated the Carthaginian fleet.

**École des Femmes, L'** (The School for Wives). Five-act comedy by Molière, first produced at the Palais-Royal, Paris, Dec. 26, 1662. The scene is in Paris. A selfish, middle-aged bachelor, Arnolphe, brings up a young girl, Agnes, to make her his wife, keeping her ignorant of the world; but fails to prevent her from falling in love with Horace, a son of his old friend Oronte. Unaware of Arnolphe's relation to Agnes, Horace reveals to Arnolphe his love story. The lovers do not meet before the audience until the last act. Molière acted the part of Arnolphe.

**École des Maris, L'** (The School for Husbands). Three-act comedy by Molière, first produced at the Palais-Royal, Paris, June 24, 1661. The theme of two brothers, Ariste and Sganarelle, in charge of two wards, sisters, whom they desire to marry, was suggested by The *Adelphi* of Terence. Ariste is generous as Sganarelle is mean and masterful. Molière acted the part of the latter. The scene of the play is laid in the French capital.

**Ecology** (Gr. *oikos*, house, *logos*, discourse). The study of living things in their natural surroundings. It shows that particular organisms are normally to be found in certain habitats, and hence leads to the view that the conditions in the habitats are suitable for their life. The

conditions, or ecological factors, resolve themselves into a purely physical group such as temperature, humidity, light intensity, and kind of soil; and a biotic group, due to the activity of organisms, such as the effect of grazing, shading, availability of organic food. Organisms living under particular sets of conditions constitute communities of which various categories are recognized. The clan is formed of members of one species; the society and the association of more than one. In mixed communities one or more types dominate.

Organisms often modify the environment in which they live and so render it more favourable to less prosperous inhabitants or for the establishment of invaders. Either will then augment the competition within the community, and prosperous species may suffer, even to the point of suppression. Alternatively changes in communities may be caused by factors originating from without. Ultimately in any succession there is produced a community with innate equilibrium, consisting of organisms best suited to the environment with a limited number of dominant species so constituted that they prevent others attaining a higher degree of importance. Consult *The Ecology of Animals*, C. Elton, 1933. *Animal Ecology*, A. S. Pearse, 1939; *The British Islands and their Vegetation*, A. G. Tansley, 1939.

**Economic Man.** Term used to describe man as discussed in the works of Ricardo. John Stuart Mill, and other political economists. He is a person who is actuated solely by material interests, who judges every transaction by the loss or gain afforded to him. Later writers have emphasised the fact that man is not actuated solely by material considerations, and have disputed the existence of economic man.

In the mass and in the long run men tend to act along certain well-defined lines, e.g. they tend to stop production which does not pay. Hence it is useful to conceive an average man whose family is of average size, whose needs are satisfied in an average way, whose work yields an average return, and so on. Such an imaginary economic man provides a ready standard of comparison. Just as the mathematician needs the perfect circle which does not really exist, so the political economist postulates an economic man for the study of his science. See *Economics*.

## ECONOMICS: THE STUDY OF COMMERCE

F. C. C. Benham, Prof. of Commerce, University of London

*A description of the field of man's activities—namely, the satisfaction through commerce of his needs of food, clothing, housing, and occupation—with which economics deals, and of how it formulates explanations of the changing conditions within that field*

The main purpose of economic activity is to satisfy the wants of people for food, clothing, housing, and all the other commodities and services which they consume and which constitute their standard of living. The central economic problem for any community is how to make the best use of its labour and resources. All wants cannot be completely satisfied. The problem is to satisfy them as fully as possible from the means of production available. These means of production—labour, land, and capital (physical assets)—are limited in amount. Many of them are capable of alternative uses. Youths and girls can enter any one of a number of occupations, some workers can move from one industry to another; some land can grow any one of several crops or can be used for pasture, or for building sites; and many buildings and machines can serve any one of several purposes. The community must, therefore, choose what assortment of goods and services shall be produced out of the infinite number of assortments which it could produce. Hence Professor Robbins, in *The Nature and Significance of Economic Science*, has defined economics as "the science which studies human behaviour as a relationship between ends and scarce means which have alternative uses."

### Methods of Organization

One method of dealing with this problem is by complete central planning, as in Soviet Russia. A good deal has been written on the merits and defects of this form of social organization. But most countries retain the institutions of private property, freedom of enterprise, and freedom of choice by consumers, all subject to greater or less control by the state. Hence most economists writing in English assume the more common framework of social institutions.

Under these conditions, the problem is solved mainly through the price-system. A large part of economic analysis deals with the formation of prices, and the relations between prices: in other words, with the theory of value and its applications. Everything which can be exchanged for money has a price: for example, wage rates in different occupations and

rates of interest are prices, and form part of the price system. The price of a commodity or service tends to equate the demand for it (the amount which buyers are willing to take at that price) with the supply of it (the amount which sellers are willing to sell at that price). Demand reflects the preferences of consumers and the relative spending power of different consumers; supply reflects the relative scarcities of the various commodities and services. The demand for means, or factors, of production is derived from the demand for the commodities and services which they help to produce. In the absence of monopoly, the price of a factor tends to equal the value of the addition which an extra unit of that factor would make to output (known as its marginal product) and the price of a commodity tends to equal the extra money cost of producing a further unit (known as its marginal cost).

### How the Price System Works

In the absence of monopoly, therefore, the central economic problem would be met in the following way. An increase in the demand for a commodity would tend to raise its price; that industry would become a specially attractive field for investment; labour and other factors of production would be directed towards that industry, where they could now earn more; and so more of that commodity would be produced in response to the increased preference for it of consumers. An increase in the supply of a commodity, due perhaps to a big harvest or to an invention which reduces costs of production, or to the movement of labour and capital to an industry in excess of the limits of demand at a high price, tends to reduce its price and thereby to expand its sales. Conversely with decreases in demand or supply. Costs represent alternatives forgone, for they are sums of money paid to attract factors away from other industries, where they could contribute (nearly) the same value to output.

But the price system does not work perfectly. While 19th century industrialists considered it good policy to make a small profit on a

great many items, in the 20th century it was found to pay a monopolist deliberately to keep down output in his field in order to raise prices and increase profit on each item. Economics studies these phenomena of monopoly and imperfect competition, associated with trade marks and advertising. It is generally agreed that the state should supplement the price system by preventing or controlling monopoly and by paying for services such as defence and public health and education which private enterprise would not provide adequately.

Economic activity under free enterprise has large swings up (booms) and down (slumps); mass unemployment often occurs during the slumps. Hence economics studies the nature and causes of this "trade cycle" to discover whether general economic depressions, or slumps, can be avoided.

An important contribution to economic theory in general, and especially to this branch of it, was made by J. M. Keynes (Lord Keynes) who published in 1936 *The General Theory of Employment, Interest, and Money*. He showed that if people spent less, in order to save more, this tended to create unemployment unless it was offset by increased expenditure on "capital goods" such as buildings, ships, plant, and machinery. Much has been written, largely inspired by this book, on methods of preventing mass unemployment. Suggestions include public works, control of investment, and deliberate budget deficits when slumps threaten.

#### Fluctuating Value of Money

Industry and trade on the modern scale would not be possible without the use of money. Money is a generally acceptable purchasing power. A man will take it in exchange for his goods and services because he knows that others in turn will take it from him in payment for what he wants to buy. The purchasing power of the monetary unit may change from time to time. If it falls (in other words, if the general level of prices rises), this hits people on fixed incomes and creditors due to receive fixed sums of money, for the money buys less than it used to do. On the other hand, the prospects of a rising price level often stimulate borrowing and economic activity, although sometimes firms embark on enterprises which do not survive after prices cease to rise. The theory of money and banking deals with

these questions, and also how changes in the amount of money and in the desires of people to hold money rather than income yielding securities ("liquidity-preference") may affect the rate of interest.

The theory of international trade explains why a country specialises in the production of certain commodities which it exports in exchange for others, which it imports; and discusses "the terms of trade"—what forces determine the volume of imports a country gets in exchange for a unit of exports. A country also engages in other transactions with the rest of the world. It may receive payments as interest or profits on its foreign investments, or for shipping and other services which it renders, or from tourists. All the various payments which it makes and receives together form its balance of payments. Equality between its payments and receipts can be attained in various ways. These include changes in the rate of exchange between its currency and other currencies; restrictions on imports and subsidies on exports; and, under fixed exchange rates, inflation or deflation of the national money income. The money income of a person for a year is his total receipts, including the value of any items such as farm produce which he produces for his own consumption, less his business expenses. The national income for a year is the net sum total of all incomes of persons, firms, and institutions for that year. It must be measured net. For example, dividends paid by companies must not be counted in the incomes of the companies as well as in the incomes of the shareholders; income tax must not be counted in the incomes of both the taxpayers and the government.

#### How to Assess National Income

The national income of a country is the best single measure of its economic position, but for comparison with other years or with other countries allowance should usually be made for differences in population and in the purchasing power of money. The latter allowance can be made by taking some year as the "base" year and then altering the money figures for other years to make them represent money units of the same purchasing power as in the "base" year. The result gives a comparison of "real," as opposed to "money," income. For example, if in the year 2000 the

price level should be twice as high as in 1950 (taken as the base year) the actual national income of 2000 should be divided by two in order to compare it with that of 1950.

The main determinant of real income is the volume of production. This is influenced by many factors. These include the natural and acquired capacities of the people, and the natural resources and other assets (the size of the population relative to these resources, the amount of specialisation, and the state of technical knowledge) of a country. Part of the economic activity of a country is devoted to providing for the future by increasing productive equipment, and improving health and knowledge; this investment keeps down current consumption, but tends to increase future output.

#### Increase of Technical Knowledge

The great economic progress which has taken place in the western world over the last hundred years or more has been due to the continued growth of technical knowledge combined with increased investment and greater specialisation, including large-scale production. But technical progress may be offset by over population, by wars, or by natural catastrophes.

The study of economics is an aid to clear thinking and is useful to the citizen as well as to the statesman. Economists do not always agree among themselves on practical issues. This is usually for one or both of two reasons. In the first place, these issues may involve personal judgements about the extent to which one aim (for example, greater output) should be sacrificed to another aim (for example, greater equality or social security). In the second place, they usually involve forecasts about how people would respond to the proposed measures. But the citizen should know enough economics to form his own judgements on these issues of policy.

**Economics and Political Science**, LONDON SCHOOL OF. College of the university of London founded in 1895 for the study of the social sciences. Among the subjects for which teaching is provided for undergraduate and post-graduate students are economics, banking and currency, commerce, transport anthropology, colonial administration, history, law, geography, political science, statistics, social science, criminology, international relations, and sociology. This is one of the most important centres in the U.K. for research in the social sciences; its library is the biggest of its kind in Europe. The school is in Houghton Street, Aldwych, London, W.C.2.

**Economic Warfare**. Engendering paralysis of the enemy's war machinery by depriving it of materials. Great Britain's economic warfare against the Axis powers, 1939-45, was conducted by a ministry (*v.i.*) whose function was to starve the enemy of raw materials for munitions, oil, grain, fats, cotton, and every imported commodity that might be useful. A blockade was instituted and a number of contraband control stations established, at which neutral ships were searched for contraband cargo. Exports from Germany were also blockaded. A form of passport, called a *navicert* (*q.v.*), was issued at the port of shipment to cover legitimate cargoes.

A secondary arm of economic warfare was the purchasing of supplies in neutral countries to prevent their going to enemy countries. Some targets bombed by the R.A.F. were selected by the ministry, especially dams, transport centres, synthetic rubber plants, and oil refineries. Examination by experts of material captured on the battlefield revealed certain shortages in enemy countries and suggested where such air attacks might prove most effective.

Another method of tightening controls of enemy imports and exports was the use of black lists; lists of persons and firms, chiefly in neutral countries, known to be cooperating with the enemy. No *navicerts* or export licences were issued to anyone on these lists, or suspected of acting for black-listed firms. See *Black List*; *Blockade*.

**Economic Warfare, MINISTRY OF**. Department of the British government during the Second Great War. It was formed on Sept. 3, 1939, the first minister being R. H. Cross, and had tasks

analogous to those of the ministry of Blockade set up during the First Great War, namely, to disorganize the economic life of the enemy in order to reduce his capacity for waging war. The ministry was dissolved in May, 1945, its functions in the Far East being undertaken by the Foreign office.

**Economiser**. Extension of the feed water pipe-line of a steam boiler, comprising a nest of tubes placed in the flue gas exit to utilise waste heat by additional heating of already warmed feed water. The water should be preheated to 120° F. to prevent undue cooling of the flue gas, as condensation of moisture in a highly sulphurous atmosphere would cause severe external wastage of the tubes. The preheater may use exhaust or live steam, or heated feed water may be by-passed back to mingle with the incoming cold water. An economiser also provides a reserve of hot feed water against peak load demands, and helps to reduce scale formation in the boiler by receiving the bulk of the sludge precipitated from temporary hardness. The outsides of the tubes are cleaned by steam-jet soot blowers, or mechanically operated scrapers. Saving in fuel may amount to 10 p.c.

**Economist, THE**. A London weekly paper devoted to political economy. It was founded in 1843 by James Wilson, who edited it until 1859, Herbert Spencer being sub-editor, 1848-53. During 1859-77 the paper was edited by Walter Bagehot; 1907-16 by Francis W. Hirst; 1922-38 by Sir Walter Layton, who was succeeded by Geoffrey Crowther. It has always discussed financial questions from a social and economic standpoint, and in its early days was a staunch advocate of free trade and the repeal of the Corn Laws.

**E.C. Powder**. One of the oldest British smokeless powders for use in sporting guns. Invented in 1882 at the works of the Explosives Company, hence E.C., at Stowmarket, it consisted essentially of nitro-cellulose mixed with nitrates and moderants. The powder is prepared in granular form suitable for loading. It is a 33-grain powder, *i.e.* 33 grains of the smokeless powder is equivalent to the old standard charge of 82 grains of gunpowder.

**Écrins**, BARRE DES Mt. of S.E. France. It is the highest summit of the Pelvoux group of the Cottian Alps, which lie between the depts. of Hautes-Alpes and Isère. Alt. 13,460 ft.

**Ecstasy** (Gr. *ecstasis*, displacement, trance). A name given to various states of consciousness, in which, the mind being concentrated on a definite object, the senses are temporarily inactive, and external sensations inoperative. It has been experienced at various times by many Christian mystics, notably by S. Teresa, and valued as a supernatural phenomenon. According to their own testimony the mystics have received, in ecstatic condition, special manifestations of the will of God. The term is also sometimes applied to the abnormal mental conditions of catalepsy, the hypnotic trance, somnambulism, and to the trances of spirit mediums. The chief points distinguishing these states from ecstasy are the absence of consciousness and of all memory of what has taken place during the trance. See *Dreams*.

**Ectoderm** (Gr. *ectos*, outside; *derma*, skin). Term applied to the outer layer of the embryo, from which the skin and nervous system of a vertebrate animal originate. It is also used for the outer layer of cells in the Coelenterata. See *Embryology*.

**Ectopic Gestation or EXTRA-UTERINE PREGNANCY** (Gr. *ectopos*, out of place). Condition in which the fertilised ovum, or egg cell, instead of developing within the uterus, becomes implanted in the Fallopian tube which leads to the uterus, or escapes into the body cavity and there begins to develop. It is rare in young women, and is most often seen in women who have been married for a number of years without having had a child, or where a long time has elapsed since the last pregnancy. Any inflammation affecting the tubes is a predisposing cause, narrowing the lumen of the tube or interfering with the movements of the delicate ciliae (minute processes of the lining mucous membrane) which with a wave-like movement normally propel the fertilised ovum towards the uterus.

The symptoms are not very definite, but some signs of pregnancy may be present. When irregular bleeding or recurring colic-like pains occur, coupled with the possibility of pregnancy, a medical opinion should be sought. Often, however, the first indication is a sudden attack of acute pain with collapse, and signs of internal haemorrhage, due to rupture of the sac of the developing embryo. In most cases immediate operative treatment provides the best hope of saving life. See *Pregnancy*.

**Ectoplasm** (Gr. *ektos*, outside; *plasma*, something moulded). The outer layer of a non-cellular animal, such as amoeba, and apparently usually in the gel state, i.e. relatively stiff. It can undergo a reversible thixotropic change to the sol condition in which it flows. It acts as a semi-permeable membrane and permits the ingress and egress of molecules during the metabolism of the animal. Spiritualists use the term ectoplasm for an apparent vaporous materialisation occurring during the trance of the medium.

**Ectozoa** (Gr. *ektos*, outside; *zōon*, animal). Term applied to parasites which live on the exterior of their hosts, in contrast with the entozoa, which live in the internal organs. Lice and ticks are examples of the ectozoa, tape worms and flukes of the entozoa.

**Écu** (Fr., shield; Lat. *scutum*). Obsolete French silver coin. First struck by Louis IX, its value was three livres. Charles VI issued, in 1384, a piece known as *écu de la couronne*, the *écu* being called in England a crown. There was also minted a double silver *écu* of six livres, worth about 5s. See Crown.

**Ecuador.** Republic of South America, lying between Colombia on the N. and Peru on the S. It is

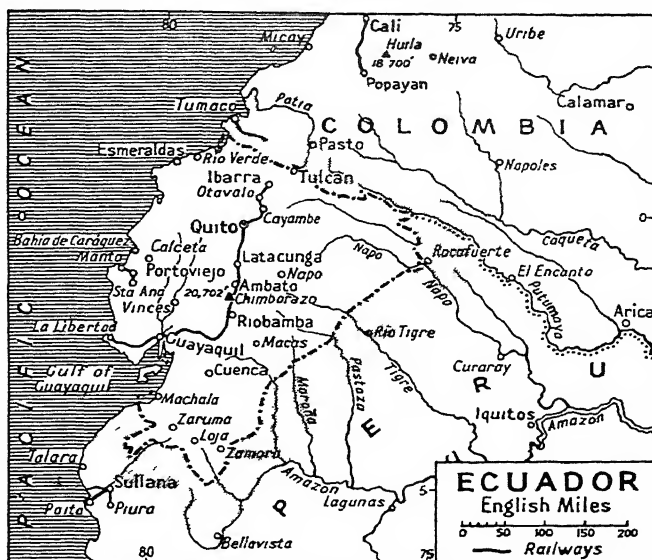

so named because the equatorial line runs through the country. Its western shores, 500 m. in extent, are washed by the Pacific Ocean. The Colombian boundary was

Ecuador arms

settled by treaty in 1917, and the Peruvian frontier was agreed upon in Jan., 1942. The republic embraces the provinces of Azuay, Bolívar, Cañar, Carchi, Chimborazo, Cotopaxi, Esmeraldas, Guayas, Imbabura, Loja, Manabí, Napo, Pastaza, El Oro, Pichincha, Los Rios, Santiago Zamora, Tungurahua, and the Galápagos archipelago. Its area is not known even approximately; there are estimates of 176,000 and 276,000 sq. m. A large area was lost by the boundary revision of 1942. The pop. is estimated at 3,100,000, over half being of mixed blood and 27 p.c. Indian.

The dominant geographical feature is the gigantic mountain system which traverses the land from N. to S. Two towering mountain ramparts, the Eastern and Western Cordilleras, run parallel to each other, enclosing a broad elevated valley, 20-50 m. wide, and

Ecuador. Map of the South American republic which lies between Colombia and Peru; the frontiers shown are those of the 1942 revision

8,000-10,000 ft. above sea level. This trough is walled on either side by the famous "avenue of volcanoes," above a score of peaks in a double line, most of them rising far above the snow line. No fewer than 20 of these summits can be counted from Quito, the capital, which stands on the central plateau at a height of 8,400 ft. The volcano of Pichincha (about 15,910 ft.) is notable for its perilous proximity to the capital; but more conspicuous is the perfectly symmetrical and dazzling cone of Cotopaxi (19,613 ft.). Higher yet soars the imposing snow-clad mass of Chimborazo (20,702 ft.). Above the snows, volcanic craters emit their clouds and ashes. Eruptions have been frequent since records began with the coming of the Spaniards, and the whole region is subject to earthquake shocks. The region presents an endless variety of altitude and climate: torrid, forest-clad plains bordering the lower spurs; temperate, pleasant, and productive valleys; cool regions of the lofty plateau; páramos, or icy, wind-swept plains and slopes, approaching the limit of perpetual snow.

Although the mountains predominate, the greater part of Ecuador lies in the forest-clad plains which stretch to E. and W. from the foot of the two Cordilleras. In fact, Ecuador has three distinct zones: the coastal plain, the Andine mountain system, and the *montaña*, the densely wooded region stretching into the

interior from the base of the Eastern Cordillera, and intersected by the multitudinous upper waters of Amazonian affluents.

The most valuable and productive part of the country is the broad coastal plain, richly tropical and humid in character. This plain, watered by innumerable streams and originally covered by dense forests, supports the extensive plantations of cacao, which supply the chief export, besides plantations of bananas and other tropical products. Numerous streams, particularly those connected with the port of Guayaquil, provide access to the cacao plantations. The forest is valuable for its thickets of bamboo, dyewoods, cinchona, balsa trees, and many kinds of palms, besides the palm-like plant whose fibre is woven into Panama hats.

Through the towering wall of the Western Cordillera, lofty passes lead to the Andine plateau. From this plateau steep and difficult mountain passes lead eastwards, up between the peaks of the Eastern Cordillera, and then down along twisted and precipitous river valleys to the *montaña*, where scanty tribes of savage Indians support life by hunting with the blow-pipe and with poisoned arrows. This most inaccessible region resembles the forests of Brazil; its woods and waters are haunted by a multitude of reptiles, saurians, fishes, birds, and insects. Trees, lianas, flowering shrubs, and gaudy orchids occur. The mammals

include jaguars, pumas, tapirs, sloths, bears, deer, armadillos.

The volcanic group of the Galápagos Islands lies on the Equator, 695 m. from the W. coast, and covers 2,868 sq. m. Named from the gigantic tortoise (galápagos) found on the islands, they are remarkable for the fact that about half the indigenous plants, all the reptiles, and nearly all the birds are peculiar to this archipelago. In the 17th and 18th centuries the islands, at that time uninhabited, were the resort of buccaneers.

**PEOPLE, LANGUAGE, ETC.** The population is descended partly from Spanish settlers, partly from indigenous Indians, and in a less degree from negro slaves. Most of the Indians and mixed types are simple and ignorant; they perform all the manual labour, and bear with customary apathetic submission the domination of the ruling class. These peasants and labourers are virtually devoid of any sense of nationality or citizenship and indifferent to forms or methods of government, although they have been swept into contending armies, in numerous civil wars, by *caudillos* on either side. More than 50 p.c. of the pop. is pure-blooded Indian, 25 p.c. mixed Spanish and Indian, 15 p.c. negro, and the remainder is of pure Spanish descent. The dominant class, which forms a society of typically S. American culture, is of mixed blood. The official language, and the tongue in general use, is Spanish. Quichua is spoken by several Indian tribes in the N.

**CONSTITUTION, ETC.** Under the constitution of March 6, 1945, the president is chosen by direct popular election for four years, and is eligible for re-election. José Velasco Ibarra came to office in 1944. A single chamber of deputies is chosen for two years by elections on a provincial basis, extra deputies being chosen by special groups. All literate adults, men and women, are eligible to vote. The Roman Catholic faith is generally professed, maintaining an archbishop and six bishops, but is not officially established; all religions are tolerated. Primary education is free and compulsory. There are universities at Quito, Guayaquil, and Cuenca. There is a small standing army, with compulsory military service. The unit of currency is the sucre.

**ECONOMIC CONDITIONS, INDUSTRY, ETC.** A large part of the world's supply of cacao comes from Ecuador. The weaving of Panama hats is an important industry;

nearly 3,000,000 are exported annually. The chief exports are cacao, coffee, rice, rubber, bananas, ivory nuts, balsa wood, hats, and a little kapok, mangrove bark, and alligator skins. Cotton is raised in Manabí and tobacco in Esmeraldas. Some gold is produced in the Andes. Deposits of petroleum occur in Guayas, some 300,000 tons, mostly crude, being exported annually; sulphur in Chimborazo and the archipelago.

Guayaquil, the chief port and the largest town in the republic, is linked with Quito by a mountain rly. 288 m. long, which traverses one pass of the Western Cordillera. There are eight other short lines. Main roads total 1,600 m., but over the greater part of the country bridle-paths and mules are the means of transport. Cuenca, Ambato, Riobamba, Loja, and Latacunga are other towns.

**HISTORY.** Before the European discovery of America, the mountain plateau was the seat of a monarchical native civilization, inferior to that of the Incas, but notable for its organization and skill in the arts of building, stone-carving, weaving, pottery, and the working of gold and silver. Towards the end of the 15th century the Inca monarch, Huayna Capac, defeated the king of Quito, and added his dominions to the Inca empire. By the daughter of the conquered chief, the Inca conqueror had a son, Atahualpa, who became the Inca ruler of Quito. He then claimed the throne of the Inca empire, and dethroned his brother, the legitimate heir. He himself lost his kingdom and his life at the hands of Pizarro, the Spanish invader, in 1533. The conquest of Peru by the Spaniard was naturally followed by the occupation of Quito. The kingdom of Quito, which included territory now belonging to Colombia, constituted thenceforth a presidency or government, subordinate to the Spanish viceroy of Peru. But in the 18th century the presidency of Quito was made subordinate to the newly established viceroyalty of Santa Fé de Bogotá.

In 1808 a revolutionary or republican movement broke out in Quito; but, after four years of confused tumult, Spanish authority was re-established, and subsisted until the decisive victory of the republican commander Sucre in the battle of Pichincha in 1822. Quito was now incorporated into the extensive republic or federation of Colombia under the authority of Bolívar. But in 1830 that rather artificial political system was

broken up into the three separate republics of Venezuela, New Granada (now Colombia), and Ecuador.

There followed a stormy period of personal rivalries, despotisms, factions, civil wars, frontier wars with Colombia, and boundary disputes with Peru. From 1859 to 1875 the country was ruled by García Moreno, an ultra-clerical conservative, who attempted to set up a kind of Catholic theocracy, to be guided by the authority of the pope. His dictatorship, more stable than previous governments, was by no means peaceful; and his assassination in 1875 opened a fresh era of disorder and conflict.

Ecuador began to benefit with the rest of South America by economic expansion in the 20th century, though its political temper remained erratic, few presidents completing their terms without the threat or practice of revolution. In foreign affairs the outstanding question was that of frontiers, especially with Peru, but the definitive settlement of 1942, after a period of open hostilities, seemed to promise a less strained atmosphere. Argentina, Brazil, and the U.S.A. assisted in the settlement. Ecuador broke off relations with Germany in the First Great War and was a signatory of the peace treaty. In the Second Great War she severed relations with the Axis powers, Jan. 31, 1942, allowed the U.S.A. to establish bases in the Galápagos Islands and the Santa Elena peninsula, and declared war on Germany and Japan Feb. 9, 1945.

**Bibliography.** Travels in the Wilds of E., A. Simson, 1887; Travels amongst the Great Andes, E. Whymper, 1892; Ecuador, C. R. Enock, 1914; E. the Unknown, V. W. von Hagen, 1939; E.: Portrait of a People, A. B. Franklin, 1943.

**Eczeema** (Gr. *ek*, out; *zein*, to boil). An inflammatory disease of the skin. The term includes cases due to chemical irritants of which the nature is unknown; those in which individuals are over-susceptible to mild irritations, e.g. by sun or wind; and those which become hypersensitive to an irritant so that fresh patches are produced. Predisposing causes are certain toxic states such as gout or rheumatism; deficient elimination as in Bright's Disease; chronic septic absorption as in pyorrhœa; while sensitiveness may be either inherited or acquired. Some disturbance of the nervous system may be present.

Eczeema varies widely in type, stage, and distribution over the

body with the age and condition of the patient, but its essential characteristics are redness of the skin, formation of small blisters or vesicles, watery discharge, formation of crusts and scales, and usually extreme itching. Various types are recognized: erythematous eczema, in which bright red patches appear on the skin; papular eczema, characterized by the formation of small red papules or pimples about the size of a pin's head; vesicular eczema, marked by the appearance of crops of vesicles and watery discharge; and pustular eczema, in which pustules containing matter are formed and on rupturing give rise to yellowish-brown scabs.

Attention must be paid to the general health, sepsis being eliminated, and the liver eased of its burden by the removal of fats, pork, and milk from the diet. Alcohol and tobacco, because of their toxic influence, must be avoided. Many cases of eczema result from specific irritants; the offending substance can sometimes be determined by the reaction produced when it is introduced into the skin, a weal or blister being a positive result. Desensitisation can then often be achieved by injecting under the skin minute and gradually increasing doses of the material. This type of eczema has much in common with asthma and urticaria and the conditions are found in certain family groups (see Allergy). Local medical treatment depends entirely on the manifestation of the disease at the time.

**Edam.** Town of the Netherlands, in the prov. of N. Holland. It stands on the Zuider Zee, 12 m. N.N.E. of Amsterdam. The name is derived from a dam built on the little stream Ye. Edam possesses some old brick houses, and a fine church, S. Nicholas, dating from the 14th century and restored, 1602-26. It is noted for its dairy produce, and in particular for round, red-rinded cheese (*v.i.*).

**Edam Cheese.** A Dutch cheese. It is pressed in globular moulds, red outside, a rich apricot inside. It is a cow's milk cheese, weighing about 5 lb. Texture is waxy, and flavour varies in quality. It is not usually considered a gourmet's cheese, but connoisseurs have been known to treat it like Stilton, even to the careful introduction of port wine. Gouda cheese is almost exactly similar, but is made in large flat rounds, and in two grades, one with 45 p.c. fat content, the other with 40 p.c.

**Edda.** Two collections of Icelandic literature, known respectively as the Elder, or poetical, of Saemund, and the Younger, or prose, of Snorri. The former were discovered by Brynjulf Sveinsson, an Icelandic bishop, in 1643. He attributed them to Saemund Sigfusson (1055-1132), but an earlier date is generally assigned by critics. The Prose Edda was compiled by Snorri Sturlason (1178-1241), and is generally ascribed to the 12th century.

**Eddington, Sir ARTHUR STANLEY** (1882-1944). A British astronomer and philosopher. Born

Sir A. S. Eddington, British astronomer

at Kendal, Dec. 28, 1882, he was educated at Manchester university and at Trinity College, Cambridge, where he was senior wrangler in 1904 and fellow in 1907. As chief assistant from 1906 at the Royal Observatory, Greenwich, he established his reputation as a brilliant worker in stellar mathematics. He became Plumian professor of astronomy at Cambridge in 1913, and the next year was appointed director of the university observatory and elected F.R.S. In 1928 he was awarded the Royal Medal of the Royal Society, and in 1930-32 was president of the Physical Society. He was knighted in 1930 and invested with the O.M. in 1938. He died Nov. 22, 1944.

Eddington's principal researches were concerned with stellar motions, in which field he first established that the stars describe orbits under the attraction of the whole galaxy without interfering with one another; with the theory of relativity, which he helped to confirm at the eclipse of the sun in 1919; and with the internal constitution of the stars, in which he first established the importance of radiation within a star and discovered that its brightness depends essentially on its mass. From 1925 he entered the field of philosophy, where his conclusion that much of physics is deducible by pure reason without recourse to experiment has not yet received general assent. He was known to the public through lucid and entertaining popular expositions of scientific topics: Report on the Relativity Theory of Gravitation, 1918; Space, Time and Gravitation, 1920; The Mathematical Theory of Relativity 1923; Stars and Atoms, 1927;

The Nature of the Physical World, 1928; Science and the Unseen World, 1929; New Pathways in Science, 1935; Fundamental Theory, 1947.

**Eddo.** Tuberous stem of several species of colocasia, caladium, etc., of the family Araceae. Though acrid in a raw state, these stems are used as food when cooked. *Colocasia antiquorum*, an E. Indian species, is cultivated for food, even in S. Europe, under the name of taro (*q.v.*).

**Eddy, MARY BAKER** (1821-1910). An American religious leader, the founder of Christian Science. She was born at Bow, New Hampshire, July 16, 1821. Deeply religious by nature, she was from childhood a Bible student. Asa Eddy (d. 1882), whom she married in 1877, was her third husband; she had been widowed, and obtained a divorce. She died at Newton, Mass., Dec. 3, 1910.

It was in 1866, while recovering from the effects of an accident—her recovery she attributed to the reading of Matt. 9, vv. 2-8—that she discovered in the Bible a scientific law underlying the healing works of Christ. She named her discovery Christian Science, and in 1875 issued its textbook, Science and Health with Key to the Scriptures. Other writings by Mrs. Eddy include: Unity of Good; No and Yes; Rudimentary Divine Science; Pulpit and Press; Retrospection and Introspection; Christian Healing; The People's Idea of God; Messages to the Mother Church; The First Church of Christ, Scientist, and Miscellany; Christ and Christmas; Christian Science versus Pantheism. Her biographers are E. F. Dakin, 1929; L. Powell, 1930; S. Wilbur, new ed., 1930. See Christian Science.

Mary Baker Eddy, Christian Scientist

**Eddystone.** Lighthouse on the Eddystone Rocks, a dangerous reef, 14 m. S.W. of Plymouth. There have been four lighthouses. The first, a wooden structure, 120 ft. high, by Winstanley, was destroyed by a hurricane in Nov., 1703, three years after its completion. The second, 92 ft. high, was erected by John Rudyerd in 1709, and was burned down in 1755. The third, a granite building by Smeaton, 95 ft. high, was completed in 1759. It was the first in which the stones were dove-

Eddystone Lighthouse, built 1882.  
Left, stump of the old lighthouse

tail jointed, and remained a model for other designs till 1877, when it was found necessary to dismantle it, as the rock foundation had become insecure; the upper sections being transferred to Plymouth Hoe. The present tower, completed in 1882, is located 40 yards from the previous one. Built of granite, with dovetailed stones, it is 168 ft. above low water and is built in circular sections. The lantern shows a group flashing light of two flashes every 30 secs., and has a range of nearly 18 m.

**Ede, JAMES CHUTER** (b. 1882). British politician. He was born at Epsom, Sept. 11, 1882, and

J. Chuter Ede,  
British politician

educated at Dorking high school and Christ's College, Cambridge. He taught in Surrey schools before entering civic life and was chairman of the Surrey county council, 1933-37. He entered parliament in 1923 as Labour member for Mitcham; and represented South Shields, 1929-31, and from 1935. Ede was parliamentary secretary to the ministry of Education in 1940, and Home secretary in C. R. Attlee's cabinet of 1945. He was made a privy councillor in 1944.

**Edelfelt, ALBERT GUSTAF ARISTIDE** (1854-1905). Finnish painter. Born at Helsinki, July 21, 1854, he was trained at Antwerp and at the École des Beaux Arts, Paris, under Gérôme. He painted landscapes, portraits, and compositions with equal skill. Invited by Tsar Alexander III to paint the portraits of his children, he produced, while in Russia, several works in landscape and genre. He died at Borga, Aug. 18, 1905. His finest and most characteristic works are

Divine Service in the Skaergaard, at the Luxembourg; Pasteur in his Laboratory, at the Sorbonne; Laundry; Jesus appearing to Mary Magdalen, and Women in the Churchyard, both at Helsinki.

**Edelinck, GÉRARD** (1640-1707). Flemish engraver. Born at Antwerp, Oct. 20, 1640, he was the pupil of Gaspard Huberti and Cornelis Galle. Visiting Paris in 1665, on the invitation of Colbert, he practised there for the rest of his life, and is more properly classed with the French school. He obtained ample patronage from Louis XIV, was received in the Academy in 1677, and died in Paris, April 2, 1707. He became one of the most brilliant line engravers of the 17th century. In portraiture—e.g. his Dryden and Philippe de Champaigne—Edelinck was equally accomplished.

**Edelweiss** (*Leontopodium alpinum*). Perennial herb of the family Compositae. A native of the mountains of S. Himalaya, it is thickly coated with long woolly hairs, which give it a white appearance, accentuated in the bracts which surround the cluster of terminal yellowish flowerheads. The leaves are lance-shaped, and the plant is about 6 ins. high. It occurs locally in the Alps, but the idea that it is exceedingly rare and can only be gathered in circumstances of great danger is erroneous. Edelweiss is German, meaning "noble white."

**Eden.** English river rising on the borders of Westmorland and Yorkshire, and flowing N.W. past Kirkby Stephen and Appleby into Cumberland, and then past Carlisle to the Solway Firth, which it enters at Rockliff. Its length is 65 m., and it contains salmon. A stream of the same name is a tributary of the Medway, in Kent.

**Eden.** River of Fife, Scotland. It is formed by the confluence of two small burns, the Beattie and the Carmore, at the Kinross-shire border, and flows E.N.E. through the Howe of Fife and past Cupar to the North Sea, which it enters at Guard Bridge by a muddy estuary 6 m. in length; total length 30 m. There is good salmon fishing.

**Eden, GARDEN OF.** In the earliest Biblical account (the Jahwis-

tic) of Creation (Gen. 2, vv. 8-25) Yahweh Elohim plants a garden eastward (from the Palestinian standpoint) in Eden for man to dwell in. In the Septuagint the word for garden, Heb. *gan*, is represented by *paradeisos*, a loan-word (Hebraised *pardēs*) from the Zend *pairi-daeza*, "enclosure"; hence arises the term Paradise as a description of Eden and of the Christian heaven. The garden of Eden seems to have been thought of as a park or pleasure-ground; in Gen. 3, v. 8, Yahweh Elohim is described as walking in the garden in the cool of the evening (cf. Isaiah 51; Ezek. 28 and 31). The name Eden is perhaps from Babylonian *ēdinu*, plain or steppe, more probably from Hebrew *eden*, delight.

The location of Eden is difficult to determine. Sayce identifies the garden with the sacred garden of the Babylonian deity Ea at Eridu, the river which watered it (Gen. 2, v. 10) being the Persian Gulf, and the four branches (vv. 11-14) being the

Edelweiss. Specimen of the plant on a mountain side

Pallakopas, the Choaspes, the Tigris, and the Euphrates. E. Naville (Archaeology of the O.T., 1913), comparing Gen. 13, v. 10, "like the garden of the Lord, like the land of Egypt as thou goest unto Zoar," and identifying Zoar with the Egyptian Zar (mod. Kantarah), thinks that the narrator located the garden in Egypt in the western part of the Delta between the Tanitic

and Pelusiac branches. Another traditional site is at Qurna at the junction of the Euphrates and the Tigris, and an old tree preserved here, claimed as the original Tree of Knowledge, was broken by British soldiers in 1920, and re-erected on a concrete base. It is not, however, of any great age. See Creation Legends; Fall.

**Eden, ROBERT ANTHONY** (b. 1897). British politician. The second son of Sir W. Eden, he was born June 12, 1897, and educated at Eton and Christ Church, Oxford. Entering parliament as Conservative member for Warwick and Leamington in 1923, he was private secretary to Sir A. Chamberlain during the latter's foreign secretaryship, 1926-29. Made under-secretary for Foreign Affairs in 1931, he was lord privy seal three years later,

and during this period still devoted much attention to foreign affairs, especially to the League of Nations. In the Baldwin cabinet

Anthony Eden,  
British politician

of 1935 he was minister without portfolio for League affairs, and his adroit handling of diplomatic situations led to his appointment as Foreign secretary in succession to Sir S. Hoare

on Dec. 23. He resigned in Feb., 1938, as a result of his disagreement with Neville Chamberlain's policy towards Mussolini and Hitler. On the outbreak of the Second Great War one of the changes by which Chamberlain broadened his Conservative administration was bringing Eden back to office as Dominions secretary. When Churchill became prime minister in May, 1940, he made Eden War secretary, a position he retained until, again on Dec. 23, he succeeded Lord Halifax as Foreign secretary. In 1943 he visited the U.S.A., where he conferred with President Roosevelt and other leaders. He visited Athens several times during the winter of 1944-45, alone and in company with Churchill, for discussions on Greek affairs. He was head of the British delegation to the San Francisco conference, 1945. He retained his post in Churchill's "caretaker" government, May-July, 1945, and held his seat at the election of 1945. A trustee of the National Gallery from 1935, he received the chancellorship of Birmingham university in 1945. In 1939 he published *Foreign Affairs*.

**Edenbridge.** Market town of Kent, England. It stands on the Eden, 25 m. S.S.E. of London by railway. There are some ancient houses and a church in several styles from Norman onwards with a Burne-Jones window. The town is a centre for neighbouring agriculture. Its annual firework display on Nov. 5 is well known. Pop. 3,500.

**Edenhall.** Parish and village of Cumberland, England. It stands on the Eden, 3 m. N.E. of Penrith. At Eden Hall, former seat of the Musgraves, was an ancient enamelled drinking goblet, known as the Luck of Eden Hall, which, according to tradition, was taken from the king of a fairy band feasting near S. Cuthbert's Well in

the grounds, who, when departing, exclaimed:

If e'er this cup shall break or fall,  
Farewell the luck of Eden Hall

This goblet was removed to the Bank of England. In Longfellow's translation of Uhland's ballad on the Luck of Eden Hall the glass is represented as having been destroyed.

**Edentata** (Lat. *edentatus*, toothless). Group of mammals without front teeth, and sometimes without cheek teeth also. They comprise the sloths, ant-eaters, and armadillos, all of which are S. American. The pangolins and the aard-vark are included in the order. Where cheek teeth are present in the edentates, they are of simple structure, have no enamel, are without roots, and continue to grow throughout life. All the genera are land animals, and while the sloths and some ant-eaters live in the trees, the armadillos are burrowing animals. They are insectivorous, except the sloths, which are vegetable feeders.

The living representatives of this order are insignificant in number and degenerate in structure compared with those found in a fossil state. Fossil skeletons are found in the Pampa formation of S. America. See Mammals.

**Eden Treaty.** Name sometimes given to the commercial treaty negotiated by Pitt and signed Sept., 1786, by William Eden (later Lord Auckland) for Great Britain and Count Vergennes for France. It removed several restrictions on trading between the two countries, but its effect was nullified by war in 1793 following the French Revolution.

**Eder Dam.** Dam on the river Eder, a tributary of the Weser, Germany. On May 17, 1943, Lancasters of the R.A.F., carrying special mines, attacked the Mohne,

Sorpe, and Eder dams. The Eder was breached in two places on its upstream face by mines dropped from aircraft at less than 100 ft. The dam, a curved, gravity concrete structure, 157 ft. high and 1,312 ft. long, was built in 1914, and the reservoir, the second largest in Germany, contained 200,000,000 tons of water. The dam compensated the Weser for water taken from it for the Mittelland canal, the link between all main navigable rivers W. of Berlin. Without the dam either the canal or the Weser would become unnavigable. After its destruction the water swamped vast areas and flooded factories, power stations, and towns, Kassel, 35 m. away, being inundated.

**Edessa.** An ancient city of Osroenē in the N.W. of Mesopotamia, on the river Scirtos (Daisan). Founded by Seleucus I and called Antiocheia Kallirhoe by Antiochus IV, after the downfall of the Seleucid empire it became the capital of an independent kingdom from 137 B.C. to A.D. 216, under rulers called by the title Abgar (*q.v.*). It then became a Roman military colony, under the name of Colonia Marcia Edessanorum. After the division of the Roman Empire into East and West, Edessa became an important centre of Christianity. During the reign of Justin I it was destroyed by an earthquake and rebuilt as Justinopolis in 525. It is the modern Urfa (*q.v.*), in Asiatic Turkey. The town of Edessa in Greece (pop. 13,115) is capital of the Macedonian dept. of Pella.

**Edfū** or **ATBO.** Town in Egypt on the left bank of the Nile, 485 m. S.S.E. of Cairo. It is celebrated for its beautiful and almost perfect temple dedicated to Horus, one of the finest Ptolemaic buildings in Egypt; now that the temple of Philae is submerged this is the best example still to be seen. Edfū is the Greek Apollinopolis Magna.

**Edgar** or **ÆADGAR** (944-75). King of the English. The younger son of King Edmund, he became king as the result of a rising against his brother Edwy. The brothers were not apparently hostile to each other, but one party wanted Edgar for king and the witan decided that he should rule the land north of the Thames. In 959 Edwy died and Edgar became king of the whole country. His coronation, which did not take place until May, 973, is important in the history of that ceremony, in that, for the first time, the two archbishops took part. After this the king sailed to Chester

Edenhall. Drinking goblet known as the Luck of Eden Hall, with its case  
From a drawing by C. G. Harper

and on the Dee was rowed by six or eight vassal kings. He assumed a certain vague overlordship, his authority extending to Ireland, and called himself emperor. He fought against the Welsh, but his reign rightly earned for him the title of the peaceful. He formed a fleet for service against the pirates, and showed zeal in putting down crime. With S. Dunstan he reorganized the monasteries. Edgar died July 8, 975, and was buried at Glastonbury. His son Edward, called the Martyr, succeeded to the throne.

**Edgar Atheling** (d. c. 1130). English prince. The son of Edward the Exile and grandson of Edmund Ironside, he was born in Hungary, but was brought to England in infancy. After Harold's death in 1066 he was proclaimed king by the northern earls, and in 1068 and 1069 was involved in unsuccessful rebellions in the N. of England. Reconciled to William the Conqueror in 1074, he lived at his court in Normandy for twelve years. In 1097 he deposed the Scottish usurper Donald Bane and seated his own nephew Edgar on the throne. He went on crusade in 1099 and in 1106 was taken prisoner at the battle of Tenchebrai while fighting for Robert of Normandy against Henry I. He was released, but the rest of his life was spent in obscurity.

**Edgbaston**. South-western suburb of Birmingham, England. Almost entirely residential, it includes the Oratory of S. Philip Neri (1847), the buildings of Birmingham university at Bournbrook, and the city cricket ground on which Warwickshire C.C. play matches. Neville Chamberlain was Conservative M.P. from 1929 until his death in 1940. *See* Birmingham.

**Edge, SELWYN FRANCIS** (1868-1940). British motoring pioneer and agriculturist. Born in Sydney, N.S.W., March 29, 1868, he was brought to England as a child and privately educated at Norwood. He became one of the best cyclists of his time, and rode from London to York in 12 hours 50 mins. An early motor manufacturer, in 1896 he founded the De Dion Bouton business in England. In 1899 he established the Motor Power Company and was later connected with the Napier Company. He won the Gordon Bennett International Paris-Vienna race in 1902, the Harmsworth motor boat trophy, and for 17 years held the record of 1,581 miles for continuous 24-hour driving. Retiring in 1912, he took up farming. In 1917 he was con-

troller of the agricultural machinery department of the ministry of Munitions. Edge established the largest pedigree pig-breeding business in Great Britain and introduced the farm tractor. In 1921 he returned to the motor industry as director of A.C. Cars Ltd. He died Feb. 12, 1940.

**Edgehill, BATTLE OF**. First battle of the Civil War, fought between Charles I and the parliamentarians, Oct. 23, 1642. The hill is a ridge in Warwickshire, on the borders of Oxfordshire. The king was marching from Shrewsbury to London, and the parliamentarians, under Essex, moved across to intercept him. On the morning of the 23rd Essex marched out of Kineton to find the royalists drawn up on Edgehill, about 3 m. away. His artillery had not yet arrived, so he left the initiative to his enemies, who opened the fight.

Each army was drawn up with the infantry in the centre and cavalry on the wings. On both wings the royalist horse, one body under Prince Rupert, the other under Wilmot, drove the parliamentarians before them and followed them for miles. In the centre, however, the parliamentarians stood firm and their horsemen charged the royalist centre. Only the return of Rupert's following and the oncoming night saved Charles from utter defeat. Charles had about 14,000 men; Essex about 10,000.

**Edgeworth, MARIA** (1767-1849). British novelist. Born at Black Bourton, Oxon, Jan. 1, 1767, she was one of many children of Richard Lovell Edgeworth, whom she accompanied to Ireland in 1773. She spent most of

*Maria Edgeworth*

her life on her father's estate at Edgeworthstown, obtaining her knowledge of the Irish peasantry from dealing with his tenants and her familiarity with fashionable life from association with his neighbours. She wrote *Practical Education*, 2 vols. (1798), in collaboration with her father, and it was largely on his account that she rejected a proposal of marriage made to her by Count Edelfrantz, a Swede, at Paris, in 1802.

Visits to London and the Continent between 1803 and 1844 brought her into touch with the

best literary and fashionable society of her time, and in 1823 she visited Scott at Abbotsford, a visit returned by him at Edgeworthstown two years later. Scott's admiration of her literary ability is recorded in *Waverley*, where he declared that her presentation of Irish life and character had induced him to attempt a like service to his people in *The Waverley Novels*. In addition to the three novels of Irish life on which her fame is based—*Castle Rackrent*, 1800; *The Absentee*, 1812; *Ormond*, 1817—she wrote *The Parent's Assistant*, 1796, enlarged ed. 1800; *Moral Tales for Young People*, 1801; and completed her father's *Memoirs*, 1820. The amiable and practical qualities displayed in her life distinguish Maria Edgeworth's books, which despite their didacticism still make a strong human appeal. She died May 22, 1849.

*Bibliography*. Life, H. Zimmermann, 1883; *Life and Letters*, ed. A. J. C. Hare, 1894; *The Edgeworths: a Study of Later 18th Century Education*, A. Paterson, 1896; *Life*, E. Lawless, 1904; *Chosen Letters*, ed. F. V. Barry, 1931.

**Edgeworth, RICHARD LOVELL** (1744-1817). British author. Born at Bath, May 31, 1744, he belonged to the English family that made their home at Edgeworthstown, co. Longford. Educated at Drogheda and Longford, he went to Trinity College, Dublin, and then to Oxford. Of independent means, Edgeworth was able to devote his time to study, friendship, travel, and experiment. He invented a system of telegraphy, was an early believer in the possibility of electricity, and helped to found the Royal Irish Academy. From 1772 until his death, June 13, 1817, most of his time was spent in Ireland, looking after his estates. For a short time he sat in the Irish parliament. His works include *Practical Education*, 1798, and *Memoirs*, parts of both being written by his daughter Maria (*v.s.*).

**Edging Plants**. Plants suitable for planting to make an edge to beds and borders. For sunny places the best of the perennial kinds are thrift (*armeria*), aubrietia, mauve catmint (*nepeta*), pink and silvery saxifrage. The old white, sweetly-scented pink named Mrs. Sinkins, and the Cheddar pink (*Dianthus caesioides*), are favourites for this purpose, but the newer Allwoodii pinks of various colours are often chosen. These plants need well drained soil; sand should be added to clay ground, and pinks and saxifrages

need a scattering of lime. All except thrift and saxifrage should be cut back when the flowers have faded. As edgings to shady borders, London Pride (*Saxifraga umbrosa*) and the bellflower named *Campanula muralis* are first-rate. Box is suitable as an edging to formal beds intersected by gravel paths; so, too, is lavender-cotton (*Santolina*) which forms small, grey-leaved bushes that should be pruned hard in spring.

Of annuals the most suitable are the dwarf white and lilac-coloured alyssum, candytuft, Virginian stock, leptosiphon, and dwarf nasturtium.

**Edgren, ANN CHARLOTTE LEFFLER**, DUCHESS OF CAJANELLO (1849-92). Swedish novelist and dramatist. The daughter of Prof. Leffler, a mathematician, she was born near Stockholm, Oct. 1, 1849, and married G. Edgren in 1872. Her earlier tales were issued under the pen-name of Carlot, but in 1882 she began a series of novels and plays under her own name, and many of these enjoyed considerable success. One of the plays, *Sanna Kvinnor*, 1883, was translated into English by H. L. Braekstad as *True Women*, 1890. In 1890 she married the Italian mathematician, the duke of Cajanello. She died at Naples, Oct. 21, 1892.

**Edgware**. Residential town of Middlesex, England. It is 8½ m. N.W. of Marble Arch, on the road to St. Albans, and is served by London Transport road and rail. Formerly called Eggesware and Edgworth, and once the first village of note on Watling Street after its emergence from London, its manor has been since 1443 the property of All Souls College, Oxford. The W. side is in the parish of Little Stanmore. The parish church of St. Margaret, rebuilt 1765 and 1845, is said to have been part of a monastery; near it was a house of refreshment for the monks of St. Albans as they travelled to and from London. Of the old inns, The Chandos Arms has a fireplace from the mansion of Canons (q.v.).

At Edgware was the forge of William Powell, whose work on the anvil is said to have suggested to Handel the melody of *The Harmonious Blacksmith*. Piper's Green preserves the tradition that a former lord of the manor provided a minstrel for the amusement of the tenants in his service. Brockley Hill, 1 m. farther N., is supposed to be the site of the Roman station *Suloniaca*.

**Edible Birds' Nests.** Nests of certain species of swift (*Collocalia*), found in Australia and the East Indies. They are composed chiefly of the saliva of the birds and are attached to the walls of caverns. The Chinese value them as a delicacy and convert them into a kind of glutinous, but almost tasteless, soup.

**Edict** (Lat. *edictum*). Promulgation, on his entry upon office, by a Roman magistrate, especially a

praetor, of the principles upon which he intended to administer the law during his term. The result of this practice was that side by side with the civil law there grew up a great body of magisterial law which ultimately became the most valuable part of Roman jurisprudence. The word was also used later, especially in France, for certain laws, e.g. the edict of Nantes. See Praetor; Roman Law.

## EDINBURGH: THE CITY AND ITS HISTORY

Sir William Young Darling and Sir Herbert Maxwell, Bart.

*One of Edinburgh's leading citizens, a former Lord Provost who later became M.P. for South Edinburgh, describes the Scottish capital as it is today; its romantic history is told by a distinguished Scottish historian and former chairman of the National Library of Scotland. See also Arthur's Seat; Canongate; Fettes College; Holyrood; Princes Street, etc.*

Edinburgh is the capital of Scotland and is the headquarters of the administration of Scottish affairs. At S. Andrew's House in the city (built in 1839 by Thomas S. Tait) there is housed the secretary of state for Scotland, who is responsible for education, agriculture, health (which includes housing), and what is called the Scottish home department. The other departments of the United Kingdom are administered in Scotland directly by the minister at Whitehall, but always in association with the secretary of state for Scotland, although in the house of commons responsibility is accepted by the specific minister, except for the foregoing four departments under the secretary of state.

The law courts—the court of session and the high court of justiciary—are located in Lawnmarket and Parliament Square, while at Register House, opposite the G.P.O., are to be found the various record and register offices, including the office of the Lord Lyon court. Thus, Edinburgh is not only an historic capital but an administrative capital.

The population of the city in 1931 (the most recent census) was 439,010, but there were many fluctuations during the Second Great War. Edinburgh is one of the largest cities in the United Kingdom in extent; it measures 11¼ m. by 8 m. and is one of the earliest of the planned cities of the world. It returns seven members to parliament.

The Royal Mile, in The Old Town, as it is called, is what re-

mains of the city's earlier days and in its historic houses, ranging between the castle (now the national war memorial) and the palace of Holyroodhouse, the nobility and gentry of the days gone by lived. At the beginning of the 19th century the town's boundaries extended, and what is still called The New Town came into being under the inspiration of the Adam brothers. Here, in Princes Street, George Street, Queen Street, Heriot Row, Northumberland Street, and a succession of parallel streets and squares, is to be found one of the best examples of planning in the kingdom, and these broad highways are a lasting memorial to a generation which had a wide conception of the best in city life.

The city of Edinburgh is grouped round the centre of Scottish government; but it has an industrial life independent and entirely its own. Its chamber of commerce was instituted by royal charter in 1786. For generations it has been a brewing centre. Unique wells rising from its unusual geological strata form the basis of this important and widespread industry. Its other activities include the making of textiles, particularly in the field of knitted wear, engineering in all its aspects—and, very notably, light engineering and electrical engineering—shipbuilding and ship repairing in what was the port of Leith and became in 1918 part of the city of Edinburgh, and the manufacture of rubber an industry which includes the largest employer of female labour in Scotland.

Edinburgh University (v.i.) is the pioneer educational institution of the city. Closely associated with it are the medical schools and hospitals and, in another field, such

Edinburgh city arms

colleges as the Heriot Watt college (specialising in technical education), and the Edinburgh college of art, which has a notable record in the field of architecture and town planning.

The schools of Edinburgh, too, are of marked importance. Under many public trusts, notably the company of merchants of the city of Edinburgh, several famous schools are maintained by the generous endowments of days gone by. The best known of these, perhaps, is George Watson's college, at which have been educated chancellors of the exchequer and other ministers of the crown; Daniel Stewart's college; Edinburgh Academy (*v.i.*), at which Lord Cunningham was educated; Fettes college, founded by an Edinburgh grocer and former lord provost of the city, a residential school which attracts pupils from all over the country and includes Lord Simon among its notable scholars; the Royal high school, associated with Sir Walter Scott; Heriot's hospital, whose founder was banker to James VI of Scotland (afterwards James I of England); the Mary Erskine schools for girls; and George Watson's ladies' college. These famous educational establishments charge for education. Excellent schools are also provided under the education committee of the local authority within the boundaries of the city of Edinburgh.

#### Centre of Book Production

Edinburgh is among the great printing centres of the world and the making of books in all its aspects is a major preoccupation of a city which rests upon a wide and diverse cultural basis. Ancillary to the book producing industry, and of considerable importance, are the manufacture of printing machinery and printing inks, bookbinding and book illustration.

The government of the city of Edinburgh is under its town council, which consists of seventy-one members with a lord provost, who is entitled to the designation right honourable, bailies, a city treasurer, a lord dean of guild, and councillors. Its administration covers all civic activities and it has its administration grouped round the several departments. The town clerk and the city chamberlain are, respectively, the principal officers in the legal and financial spheres, supported by the burgh engineer, the medical officer of health, the city architect, the chief education officer and others. After the Second Great War an important new activity was under-

taken in the organization of the annual Edinburgh Festival (*q.v.*), which attracted visitors from all over the world.

The city is known for economical management and for many years the rating burden has been maintained at under 10/- (8s. 2d. in the £ in 1946). The economy and efficiency of its administration has made Edinburgh a place which people, from home and abroad, tend to select as the place of their retirement, more especially if they have a family to educate.

The plan of the city of Edinburgh is unique and it owes, possibly, as much to nature as it does to art. It lies in a semi-circle of hills—from Corstorphine Hill (home of Edinburgh's far famed zoological park), the Pentland Hills, Arthur's Seat and the Salisbury Crags to the Calton Hill (with its observatory) and the fringes of the Forth. A beautiful and romantic city, it has evoked praise from writers of every nation and facing the spacious Princes Street are the celebrated Princes Street gardens, with a distinctive floral clock and many monuments.

#### Principal Public Buildings

The taste of its citizens is reflected in many buildings, public and private, of importance. The Usher Hall, presented by a generous Edinburgh citizen, the McEwan Hall, which owes its existence to a like generosity, the City Chambers, the National Gallery, the Antiquarian and the Royal Scottish Museums, the Bank of Scotland on the Mound and other head offices of great banks, St. George's parish church, the cathedral of St. Giles, and the much more recent episcopal cathedral of St. Mary in the west end of the city: these are only a few of the buildings well worth seeing for their individual quality. Combined, they make Edinburgh a city of character and distinction where the old blends with the new, and the whole produces a feeling of unity and satisfaction.

The city is diversified by many parks and gardens. The Links at Bruntsfield, Leith Links down by the water side, the golf courses on the Braid Hills, at Craigentiny, and at Carrick Knowe, the private golf courses at Barnton, Swanston, Duddingston, and Liberton diversify the streets and thoroughfares; the gardens in the squares lead on to the lovelier and more extensive Royal Botanical gardens at Inverleith; there are many bowling greens, tennis courts, playing fields and sports grounds of one

sort and another. Edinburgh has always had a strong appreciation of the importance of swimming and the many public baths include an open air pond at Portobello, completed in 1936.

Sir Walter Scott called Edinburgh "mine own romantic town"; Robert Louis Stevenson, dying in Samoa, sighed for "that long line of glittering gas lamps in Princes Street"; Robert Burns hailed the capital city as "Edina, Scotia's darling seat"; and there have been lesser writers no less devoted to the city. Edinburgh is a communicative city and its citizens have an outward look. Successive lord provosts have been notable for their wide contacts, all over the world, particularly to the many centres where Scotsmen live and remember their capital city.

#### Transport and Communications

The city of Edinburgh has a special bureau for communications with the outer world, and the headquarters of the Scottish Tourist Board is located there. Edinburgh's roads date back to the very dawn of communications in Britain. Through it passes the Great North Road, as have passed through it the invading armies of the past and the fighting Scotsmen of yesterday. Edinburgh has two principal railway stations, the Waverley and the Caledonian. City transport is by publicly owned electric tram and motor omnibus services, supplemented by the coach service which covers Scotland by road with Edinburgh as its centre. Turnhouse aerodrome is an important air station.

#### William Young Darling

**HISTORY.** In primitive times, when what is now Scotland was peopled by tribes chronically at war with each other, but combining on occasions against some powerful invader, isolated crags or mounts were highly esteemed for defensive purposes. Among numerous sites of that character in northern Britain, none stands out more conspicuous than the Castle Rock of Edinburgh, which would no doubt be seized by the early colonists of Lothian and fortified by the usual rampart of stone and palisade. Within the enclosure they planted their wattled huts, and subsisted by the chase; for according to Strabo (25 B.C.), and Dion Cassius (c. A.D. 150-235), the natives of northern Britain were ignorant or independent of agriculture when the Roman legions arrived there.

Of Edinburgh as a town, nothing

1. Princes Street ; in the centre are seen the tall pinnacles of the Scott monument, behind it, to the left, the colonnade of the National Gallery, and behind this again, Castle Hill. 2. The Castle. 3. Parliament House.

4. University buildings : the university was incorporated by a charter of James VI. 5. West front of S. Giles's Cathedral. 6. House of John Knox, in Canongate. 7. Holyrood Palace : in the background, Arthur's Seat.

**EDINBURGH OLD AND NEW: PLACES OF NOTE IN SCOTLAND'S CAPITAL**

Edinburgh. Map of the environs of the Scottish capital, including part of the Pentlands Hills

appears, even in tradition, until after the conquest of Lothian by Eadwine, Saxon king of Deira (Yorkshire) and Northumbria, in the 7th century. It appears from King David's foundation charter of Holyrood in 1128, and Simeon of Durham's chronicle written in the same century, that King Eadwine was thus early regarded as the eponymus, for in both of these writings the place is called Edwines-burgh. The Gaelic branch of the Celts called it Dunedin; among the Welsh population of Strathclyde it was known as Dineiddyn or Mynydd-agneid, the latter name appearing to signify the mount of the Painted People or Picts. According to the Pictish Chronicle the Saxons held Oppidum Eden till they surrendered it to Indulf, son of Constantine king of Scots (954-962); but all is misty and vague until Malcolm III was persuaded by Queen Margaret to remove his seat of government from Dunfermline to Edinburgh, about 1060.

In 1128 David I founded the abbey of Holyrood, and empowered the convent to form the burgh of Canongate, which retained its separate jurisdiction until 1856, when it was united to the corporation of Edinburgh. The date of the erection of Edinburgh into a royal burgh is unknown. Doubtless it had already received a charter before David I (1124-53) made it his principal residence, but many years had to run before it was recognized as the capital of Scotland. The strategic importance of Edinburgh having been

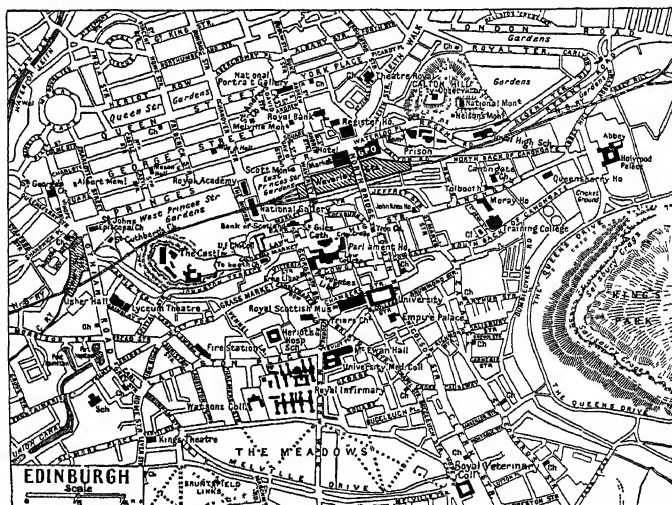

enhanced by the loss of Berwick in 1296 and Roxburgh in 1368, it became recognized as the most important town in Scotland, and increased steadily in population and commerce.

City and castle were taken by Edward III of England in 1335, but were recovered to the Scots by a clever stratagem in 1341. To the parliament summoned in 1357 for the special purpose of raising 100,000 marks for the ransom of David II, Edinburgh returned three burgesses, and appeared for the first time in precedence over all other burghs. It was sacked

and burnt by Richard II in 1385 and besieged by Henry IV in 1400, but the castle held out until Henry had to raise the siege in order to deal with Glendower's rebellion.

From this period onward Edinburgh, in common with the whole of Scotland, suffered from the arbitrary power of the great barons, who made full use for selfish ends of the opportunities afforded by the imprisonment in England of David II and James I, and by the frequency with which the succession to the throne devolved on an infant, the average age of seven successive sovereigns from 1406 to 1567 on their accession being but six years. Thus the 4th earl of Douglas, keeper of Edinburgh Castle, and a number of other nobles and officials, not only refused to pay the duties leviable upon wool and hides which they exported, but did not scruple to appropriate money which the customs officer had collected. In consequence, the gross customs of the city, which amounted to £2,047 in 1416, had fallen to £1,098 5s. 4d. in 1418, though the volume of trade was considerably greater. Bitter complaints of oppression were continually made to the government; Livingstone, guardian of the boy king James II, and Chancellor Crichton made these serve as excuse for ridding themselves of a dangerous rival, the 6th earl of Douglas, a lad of 17, whom, with his brother David, they lured to a banquet in Edinburgh Castle and had them both butchered in the king's presence.

In 1448 the town council, taking advantage of the respite of English invasion during the Wars of the

Edinburgh. Plan of the central part of the city. The valley spanned by the North Bridge separates the Old Town on the S. from the New Town on the N.

Roses, set to work to strengthen the defences of their city. The king's garden on the N. side, now occupied by the Waverley rly. station and lines, was inundated by a dam thrown across the E. end, thereby forming the North Loch, whence a wall was built round the E. and S. sides of the city to the Castle Rock near the West Bow.

During the reign of James IV (1488-1513) the revival of learning first made itself felt in Edinburgh. The guild of chirurgion barbers received a royal charter in 1505, to develop under a fresh charter in 1684 into the Royal College of Surgeons of Edinburgh. In 1507 the first printing press in Scotland was established in Edinburgh. But a new era of bloodshed was inaugurated on Flodden Field in 1513, where James IV was killed with the flower of Scottish nobility and gentry. In 1544 the earl of Hertford sacked and burnt Edinburgh, wrecked Holyrood Abbey, drove away the monks, and gutted the palace, but was repulsed in attacking the castle. He returned in 1547 under his new name of Protector Somerset, and completed the destruction of Holyrood.

#### The Scottish Reformation

In the 16th century Edinburgh became the vortex of the Scottish Reformation. Parliament enacted the establishment of the Protestant religion in 1560, proscribing the Mass under penalty of death. Queen Mary, returning as a young widow to the capital which she had left as a child of six years, found the churches stripped of all adornment, the altars wrecked, the clergy, secular and regular, of her own faith banished, while from the pulpits Knox, Bruce, and other zealots hurled vehement denunciation against the Scarlet Woman. Knox laid the foundation of that system of national education to which Edinburgh owes so much of her distinction as a seat of learning and letters; but, dying in 1572, he did not live to see the foundation of the university in 1583.

Queen Mary's personal reign covered no more than six stormy years, perhaps the darkest and bloodiest in the whole history of Edinburgh. Conspicuous among the crimes perpetrated were the slaughter in Mary's presence of her favourite, David Rizzio, in 1566, and the murder of Darnley in 1567.

The city, which is believed to have contained at the time some 30,000 inhabitants, suffered considerably in trade when James VI succeeded to the throne of England and removed his court to London. He promised to revisit Edinburgh every third year, but fourteen

years went by before he returned for the first and last time. Charles I was crowned in Holyrood in 1633, eight years after his accession—the only coronation ever performed in the Scottish capital, except that of James II in 1437. In 1637 the city was thrown into ferment when Charles sent Laud's liturgy to Edinburgh, with a command that it was to be used in all the churches. Edinburgh had been staunchly loyal hitherto; but this gave immediate birth to the National Covenant which was signed in Greyfriars Churchyard, Feb. 28, 1638. The obnoxious liturgy was withdrawn, Sept. 17, but things had gone too far; the Covenanters were under arms, and in 1639 Sir Alexander Leslie, one of Gustavus Adolphus's veterans, stormed and captured Edinburgh Castle. After the pacification of Berwick, it was handed back in 1640 to Sir Patrick Ruthven, who also had served long under Gustavus Adolphus, for the king; but when war broke out afresh in June, it was captured once more by the Covenanters under Leslie.

In 1642, when King Charles took the field against his parliament, the people of Edinburgh were fervid Covenanters; but the Scottish privy council declared for the king by eleven votes to nine. On Aug. 2, 1643, the general assembly promulgated the Solemn League and Covenant, which sought to impose Presbyterianism by compulsion on both England and Scotland. Charles I having been executed Jan. 30, 1649, the Scottish Estates caused his son to be proclaimed king at the Mercat Cross of Edinburgh on Feb. 5, but the Covenanters would have none of him.

#### Covenanters and Anti-Jacobites

The duke of Hamilton, the earl of Huntly, and the marquess of Montrose were executed in succession in Edinburgh. Cromwell invaded Scotland, July 22, 1650, utterly defeated Leslie's Covenanters at Dunbar on Sept. 3, took possession of Edinburgh and proclaimed the Commonwealth. Ten years later, at the Restoration, "the Maiden," an instrument similar to the guillotine, was set to work at the Mercat Cross.

In 1688 the Edinburgh populace was vehemently anti-Jacobite. King James VII and II had escaped to France, but the mob overpowered the guard in Holyrood Palace; wrecked the abbey church, which had been redecored as the Chapel Royal, and, bursting open the royal burial place, scattered the bones of Scottish kings and queens. The duke of Gordon still held the castle for the king, and

his historic parting with Dundee, when that intrepid soldier rode from the Nether Bow to his death at Killiecrankie, forms the subject of Scott's lyric *Bonnie Dundee*.

The city was riotously convulsed during the proceedings in the Scottish parliament over the legislative union with England in 1707. It was little affected by the Jacobite rising of 1715, but in 1745 Prince Charles Edward, after defeating Sir John Cope at Prestonpans, took possession of Edinburgh, proclaimed his father king James VIII at the Mercat Cross, and held a brilliant court at Holyrood for more than two months.

#### Intellectual Edinburgh

Notwithstanding the loss of custom and prestige caused by the departure of James I and his court in 1603, the misery and bloodshed entailed by the civil wars and religious persecution of the 17th century, and the further loss consequent on the union of parliaments in 1707, Edinburgh continued to advance both materially and intellectually. Allan Ramsay the Elder, 1686-1758, who began life as a wig-maker, must be honoured as chief pioneer in the revival of literature, for he founded the literary coterie called the Select Society, reconstructed in 1755 as the Society for Encouraging Art, Science, and Industry. The torch which he kindled was passed from hand to hand by such writers as James Hamilton of Bangour, Thomson of The Seasons, David Hume the historian, John Home the tragedian, Dalrymple Lord Hailes, Home Lord Kames, Burnett Lord Monboddo, "Jupiter" Carlyle, Adam Smith, political economist, and Henry Mackenzie, the "Man of Feeling," who introduced Burns to Edinburgh society in 1787. These created a literary atmosphere which lingers in the Scottish capital to this day, having received fresh vigour from Jeffrey, Brougham, Lockhart, "Christopher North," and, most illustrious of all, Walter Scott.

Of social gaiety in Edinburgh there was no lack in the 18th century. Scotland had entered at the Union of 1707 on a period of prosperous industry which had been impossible during the war with England and the civil wars of the 17th century. The revival of agriculture set country gentlemen at work reclaiming waste lands; their increasing revenues enabled them to bring their families to town for the season to lodge in "lands" (flats, as they would be called now), erected high over the malodorous, crowded "wynds" and courts opening out of the High

Street. The Old Town had become congested in a degree incompatible with decency and sanitation. The narrow limits of the ridge whereon the city was built made lateral expansion impossible, unless the North Loch were drained away and a New Town laid out on the far side thereof. Plans were prepared by the architect James Craig, and the foundations of the first house in the New Town were laid on Oct. 26, 1767. The result has been the creation of one of the most striking urban landscapes that can be found in any country. The picturesque features of the Old Town have, indeed, been greatly impaired by the removal of at least two-thirds of the ancient "lands," as the lofty houses piled high on the ridge were called, but enough remains to offer striking contrast to the spacious streets and commodious architecture of the New Town. The scene would have been even more impressive had the North Loch been purified and retained as an ornamental sheet of water, instead of being drained away and its bed occupied by the North British Railway (later part of the L.N.E.R.). But enough is left to justify the pride with which her citizens speak and think of Edinburgh as the Modern Athens, the Castle Rock being no mean counterpart to the Acropolis, while the Calton Hill reflects the contours and relative position of Lycabettus.

Herbert Maxwell

**Bibliography.** Romantic Edinburgh, John Geddie, 1900; Romance of Edinburgh Streets, M. W. Stewart, 1925; Perambulator in Edinburgh, James Bone, 1926; Haunting Edinburgh, Mary Grierson, 1929; Scottish National War Memorial, L. Weaver, 1929; An Edinburgh Miscellany, W. Forbes Gray, 1931; Auld Reekie: A Lowland Boyhood, A. A. MacGregor, 1943; Edinburgh, S. Sitwell and G. Bamford, 1943; The Future of Edinburgh: report of the Advisory Committee on City Development, 1944.

**Edinburgh, ALFRED ERNEST ALBERT, DUKE OF (1844-1900).** British prince. The second son of Queen Victoria, he was born at Windsor, Aug. 6, 1844. He was educated for the Navy, and in 1893 was made admiral of the fleet. In 1862 he was elected king of Greece, but for political reasons refused the crown. He was created duke of Edinburgh in 1865, and in 1893 became reigning duke of Saxe-Coburg and Gotha, surrendering his privileges as an English peer, but retaining

his rank of admiral. He was a collector and a patron of music. In 1874 he married Marie Alexandrovna, only daughter of Alexander II of Russia; she died Oct. 25, 1920. The duke died July 30, 1900, and was succeeded as duke of Saxe-Coburg by his nephew, Leopold Charles, duke of Albany.

**Edinburgh, DUKE OF (b. 1921).** British prince. See Philip, p. 6470.

**Edinburgh Academy.** Scottish public school. Incorporated by royal charter, it was opened by Sir Walter Scott, 1824. The headmaster is termed the rector. The academy is divided into an upper school and a preparatory school, the junior department of which is in Denham Green House, about a mile away. Primarily a day school, it has four houses for boarders situated beside New Field, the larger of the two playing fields; the other field, Raeburn Place, was the scene of the first rugby football international in 1871. The Edinburgh Academical F.C., composed of old boys and founded 1858, is the oldest football club in Scotland.

**Edinburgh Festival.** Annual international festival of music and drama, at Edinburgh, Scotland. First held in 1947, it lasts for three weeks in Aug.-Sept. and attracts visitors from all parts of the world. Continental and British orchestras are engaged, and new and classic plays performed by British and foreign companies; film showings, ballet performances, and an art exhibition are other features.

**Edinburgh Review.** First of the great critical quarterlies, but the second of the same name. Its predecessor was brought out in 1755, under Adam Smith, Alexander Wedderburn, and others, and ran to only two numbers. The famous blue-and-buff Whig organ was founded by Sydney Smith, Oct., 1802. Francis Jeffrey was editor 1803-29, Macvey Napier 1829-47, William Empson 1847-52, Sir George Cornewall Lewis 1852-55, Henry Reeve 1855-95, Arthur Elliott 1895-1912, Harold Cox 1913-29, when publication ceased. Jeffrey's literary criticism provoked Byron's English Bards and Scotch Reviewers; and Macaulay's Essays first appeared in the Edinburgh.

**Edinburgh University.** Founded in 1583, this obtained in 1621 the same privileges as the other three Scottish universities, which were confirmed at the time of the Union (1707). Alterations in its constitution were made in 1858 and 1889. Edinburgh has six faculties, arts, science, divinity,

law, medicine, and music, and its professorships usually attract distinguished scholars. Women are admitted to courses and degrees equally with men. Its medical school is specially efficient; Edinburgh also pays much attention to agricultural education, and has courses for the training of teachers and army officers. In 1944-45 it had 3,642 students.

The university is ruled by a university court, a university council, and the senate, while the city council has some share in its government. Its head is the chancellor, but the actual direction is in the hands of the principal. The lord rector, another honorary official, is elected by the students every three years. It unites with the other Scottish universities, St. Andrews, Glasgow, and Aberdeen, to send three members to parliament.

The present buildings, begun in 1789, occupy the site of Kirk o' Field. Prominent among them are the hall and the library, which contain a most valuable collection of books and MSS. In Teviot Row are the extensive buildings of the medical school. The university has numerous and well-equipped laboratories and museums, and offers many scholarships to intending students. In 1919 a site of 115 acres for science laboratories was acquired on the southern outskirts of the city, between Mayfield and Blackford Hill; here were erected buildings for chemistry, geology, zoology, animal genetics, and engineering.

**Edirne.** Turkish name of the city described in this work as Adrianople.

**Edison, THOMAS ALVA (1847-1931).** American inventor. Edison was born at Milan, Ohio, Feb. 11, 1847, of mixed Dutch and Scottish descent, and had almost no regular education. When twelve years old he became a news-

boy on a railway, and at 15 was printing his own newspaper, The Grand Trunk Herald, on a train in motion. He began his technical career as a telegraph operator on the Grand Trunk rly., and made his first invention, a vote-recording machine, when twenty-one. This was followed by the first really practical tape machine and a remarkable series of improvements on

the then crude methods of electrical transmission.

Edison next interested himself in telephony, enormously improving the system based on Bell's invention, and invented the phonograph, first machine for recording and reproducing sound. By discovering the carbon filament in 1879, he advanced electric lighting. In 1887 he invented the kinetoscope, the direct forerunner of the cinematograph, and other subjects on which he worked included magnetic ore separation, storage batteries, motor vehicles, railway signalling, and typewriters. Turning to chemistry, during the First Great War he designed benzol and carbonic acid producing plants. He was granted some 1,300 patents, and he was honoured by many scientific bodies. The range of Edison's inventions was such that he has left his mark on nearly every branch of science, though much of his work took the form of improving appliances invented by others. He died Oct. 18, 1931. Among many Lives are those by F. A. Jones, 1925; F. T. Miller, 1932; W. A. Simonds, 1935; consult also Edison as I Knew Him, Henry Ford, 1930.

**Edith Cavell.** Mt. of Canada. A peak of the Rocky Mts., it is situated in Alberta, close to the border of British Columbia, 14 m. S. of Jasper. It is 11,033 ft. high, and was named after Nurse Edith Cavell. See Cavell, Edith.

**Editor** (Lat. *edere*, to produce). One who controls the production and contents of a newspaper, book, or magazine. On daily newspapers his personality and political and business acumen and knowledge of men and affairs are more vital than literary facility, the necessity of his close attention to detail being obviated by subdivision of labour. In book and magazine production he needs special qualifications according to the nature of the work on which he is engaged. In all cases practical knowledge of the various processes connected with printing, illustration, etc., is essential. See Journalism; Newspaper.

**Edmonton.** A municipal borough of Middlesex, England, adjoining Tottenham, Enfield, and Southgate, and bounded on the E. by the river Lea, which also divides Middlesex and Essex. The New river passes through part of the W. of the bor. Edmonton, which is served by railway and London Transport, has a number of light industries, and there is

timber trade on the Lea. It is associated with Cowper (cf. John Gulpin) and Keats; and Charles and Mary Lamb lie buried in the parish churchyard. It suffered considerable damage from air raids during the Second Great War. One member is returned to parliament. Pop. approx. 100,000.

**Edmonton.** Capital and largest city of Alberta, Canada. It is on the N. bank of the North Saskatchewan river, 793 m. W. of Winnipeg and 771 m. E. of Vancouver, and is served by the C.P.R. and C.N.R. The provincial parliament buildings stand N. of the river, while to the S. is the university of Alberta, founded in 1906. The city owns electric light and power, water, telephone, and street railway.

Edmonton, Canada. Air view of the town showing (centre) the main river bridge; upper picture, the Parliament buildings of the province of Alberta, also to be seen, right centre, in the lower picture

systems. Edmonton is the gateway to the northern minefields, the centre of a rich agricultural country, and the home of many industries. An oil pipe line to Superior, Wis., was begun in 1949. There is a school for training teachers. Pop. 93,817. See Alberta.

**Edmund** or **EADMUND** (841-70). English saint, king of East Anglia. Late legends describe him as the son of Alkmund, king of the Saxons, and state that he was born at Nuremberg and adopted by Offa, whom he succeeded as king of East Anglia in 855. Captured by the Danes on their invasion in 870 and refusing to give up Christianity, he was beheaded at Hoxne, Suffolk. His body was removed

in the 9th century to Bury (now known as Bury St. Edmunds), where the famous shrine was erected. He was held in great veneration as a saint, many English churches are dedicated to him, and his festival is kept on Nov. 20. Consult The History of King Eadmund the Martyr, ed. Lord F. Hervey, 1929.

**Edmund** (c. 922-46). King of the English. The son of Edward the Elder and grandson of Alfred

the Great, he succeeded his half-brother Athelstan in 940. He fought against the Danes in the north, the result being a division of the kingdom. This did not last long, as Edmund crushed the Danes in Mercia, and was again ruler of the whole land. He subdued Cumbria in 945 and bestowed it on Malcolm, king of Scotland, on condition that he should be his "fellow-worker by sea and land." He was mortally stabbed by an outlaw at Pucklechurch, Gloucestershire, May 26, 946, and was buried at Glastonbury. Edmund's military victories and reforms in church and state gained him the names of the Deed-doer and Magnificent. His

sons, Edwy and Edgar, became kings after his brother Edred.

**Edmund** (c. 1175–1240). English saint and archbishop, known as Edmund Rich. Born at Abingdon, after studying and lecturing at Oxford and Paris he became in 1222 treasurer of Salisbury. He preached the Crusade in England, 1227, and on the nomination of Gregory IX was elected archbishop of Canterbury, 1233. Edmund vainly endeavoured to persuade Henry III to get rid of his foreign favourites, and was equally unsuccessful in establishing discipline amongst the monks at Canterbury, and in his protest against the provision of English benefices for Italian clergy. Finally in 1240 Edmund withdrew to France, where he died at Soissy. He is buried at Pontigny, and was canonised 1247. His festival is kept in the R.C. Church on Nov. 16, the day of his death. A college is dedicated to him at Ware. There are Lives by F. de Paravicini, 1898; B. Ward, 1903; M. R. Newbolt, 1928.

**Edmund Ironside** (c. 981–1016). King of the English. A younger son of Ethelred the Unready, he appeared in public about 1015. He was ruling Mercia, evidently as an under-king, when Canute invaded the land. Edmund raised an army, but was forced into Northumbria, and the war was raging when Ethelred died. Edmund was chosen king in London and Canute at Southampton, and the war between them was continued more fiercely than before. In Somerset the English king was victorious, and after a protracted battle at Sherston, Wilts, he was left master of Wessex. He then fought battles to relieve London from the attentions of Canute, but then followed the terrible defeat at Assandun. After this the two kings met and decided upon a division of the kingdom, but Edmund had not reaped the benefit of this when he died in London, Nov. 30, 1016. He was buried at Glastonbury. He won his nickname by personal bravery and his one year's fighting record.

**Edmundston.** Town of New Brunswick, Canada, at the junction of the Madawaska with River St. John, on the Canadian Pacific and National rlys. A bridge over the St. John connects with the state of Maine, U.S.A. It is the centre of a lumbering and farming district, and industries include pulp and paper mills and the C.N.R. shops. Pop. 7,096.

**Edom.** District situated to the S. of Palestine. It stretched from

the Dead Sea to the Gulf of Akabah, covering an area of about 100 m. by 20 m. The name Edom (red) is probably derived from the prevalent red sandstone of the district. Its first recorded inhabitants were a cave-dwelling race known as the Horites, who were conquered by Esau and his sons. During the Exodus, the inhabitants of Edom refused to allow the Israelites passage, and hence arose a feud which lasted till the end of the second century B.C. Both David and Solomon defeated them, but in the reign of Jehoram they threw off the yoke. Amaziah and Uzziah again subdued them, but after the fall of Judah they again became free till the days of the Maccabees, when they were finally crushed and forcibly proselytised by John Hyrcanus. The Edomites were polytheistic in religion, and marriages between their women and the Hebrews were a frequent source of trouble. The Herods were of Edomite origin. See Palestine.

**Edred** or **EADRED** (d. 955). King of the English. Youngest son of Edward the Elder, he succeeded his brother Edmund, May

26, 946, receiving the submission of Northumbria, the Scots, and the Welsh. In poor health, he left much of the administration to his mother and S. Dunstan, but led expeditions against his northern vassals and imprisoned Wulfstan, archbishop of York, for encouraging them. He also fought against his father's old enemy Anlaf. He died at Frome, Nov. 23, 955, and was buried at Winchester.

**Edremid.** Variant spelling of the port of Asiatic Turkey better known as Adramyti (*q.v.*).

**Edström, DAVID** (1873–1938). Swedish-American sculptor. Born at Hvetlanda, Sweden, March 27, 1873, he went at an early age to the U.S.A. with his family. At 13 he was a newsboy, later a factory hand, and at 21 decided to study art. He worked his passage to Sweden, where he became a student at the Royal Academy in Stockholm. Edström made portrait busts of members of the Swedish royal family. One of his most famous works was the Montreal war memorial. He published his autobiography, *The Testament of Caliban*, in 1938, and died at Los Angeles on Aug. 13 that year.

## EDUCATION: ITS THEORY AND PROBLEMS

Sir Fred Clarke, M.A. (Oxon.), Director, Institute of Education, 1936-45

*The general theory and the broadest aspects of education are considered in this article. The subject is treated in more particular detail under School; University, etc. See also under such headings as Co-education; Further Education; Technical Education; Grammar School; Modern School; Public School; County College*

Mankind, since it began to think at all about human concerns, has never ceased to give much anxious thought to the education of the young. Hence a rich store of wisdom on this great matter has accumulated, much of it still relevant to current needs.

In the course of history there occur periods when criticism of inherited ideas and practices gathers unusual strength. Men become conscious, often all too slowly, that times have changed, and that the methods and ideas of their fathers for the upbringing of children are not necessarily relevant to the changed conditions of their own time. Then the usual danger is reversed. Instead of accepting too uncritically whatever tradition dictates, men in their eagerness to reform run the risk of rejecting elements of tradition which still have real value.

The present is such a time. Criticism of traditional ideas and methods was certainly never more active. There is hardly a country where the critics are not heard, all saying much the same things.

The best thought is trying to state the answer for the present age to a question that has arisen in all ages of history, though men have not always been so acutely aware of it as they are today. It is a question of finding the right balance between what look like two distinct aims of education, aims which may seem to be in conflict with each other. These are: (1) The full development within the individual of all the powers and capacities with which nature has endowed him. (2) The production of a type fitted to live in a given society and to serve its needs.

These two aims can be summarised as: Fullness of Life and Fitness for Membership. If, as sometimes it seems, they are real contradictories, so opposed that the pursuit of one excludes the pursuit of the other, then the lot of man is melancholy indeed, for it would mean (as Rousseau sometimes thought) that he cannot be fit for social membership without sacrificing his individuality, nor of achieving full

individuality except (as some have maintained) by sacrificing social membership and living the life of a hermit.

Stated thus baldly, the alternatives seem grim; but much educational discussion seems to accept them, even if unconsciously, as absolute and final alternatives, and much practice seems to assume that one or the other must be chosen.

It is not possible to escape from the dilemma by formal appeals to the principles of democracy. For democracy is not ultimate. It is rather an expression of a choice of ideals already made, and experience and history show that democracy itself can be totalitarian, that it can place all the emphasis in education upon producing the type, and restrict very narrowly scope for individual development. Conversely, a non-democratic order can be so mild as to provide much scope for the free development of the individual. There are abundant examples in history of the emergence of most brilliant persons, highly individualised, from education under despotic regimes. Nevertheless, the choice between freedom and discipline, both in education and in the affairs of society at large, does seem to present itself acutely in a world where the problem of maintaining social order in peace and justice and free cooperation becomes increasingly difficult.

#### Revising Old Ideas

The solution of the difficulty must be found in a growing realization that the present is a new era in human experience and that thought about education, as about so much else, should not so much reject old ideas as revise them, bring them under critical review in the light of current experience. Thus it may be possible to achieve a restated doctrine of education that will meet the needs of a new age.

In the relatively small custom-ridden communities of a former age, this problem hardly presented itself. The pattern of life and belief was so firmly fixed, so universally accepted, and so little changing, that the plan of a child's education was clear. He learned to tread the way of his fathers simply by sharing, as he grew up, the traditional life of home and village and tribe.

It is important to realize that, until recently, this conception of the nature and purpose of education was general among

mankind. Only here and there and occasionally, as in the Greek city states and in Europe at the time of the Renaissance, did profound social change shake a few intelligent and critically disposed men out of the rut of tradition to think out the problem of education from first principles. Plato among the Greeks, and to a less extent Erasmus in the Renaissance, come to mind as examples.

#### Conditions Rapidly Changing

Now, in the mid-20th century, the kind of task which they attempted is, in effect, forced upon everyone. Also it will have henceforward to be repeated at not very long intervals, since, although the basic principles of education may remain the same, the conditions in which they are to be applied change rapidly. In a word, education, like everything else, has now to be planned and constantly replanned. An age of full critical self-consciousness has succeeded to the long age of traditional acquiescence.

When society is in a state of continuous change and movement, it is inevitable that individuals should become conscious, often painfully conscious, of themselves as such. They are then apt to conceive of society not as a necessary support and guarantee of their personal existence, but as something alien, and even hostile, pressing upon them from outside. This feeling of conflict, often now so acute, not only complicates the practical task of education; it also sets a problem for educational theory. In this way some understanding of the forces which have brought western culture to its present condition is necessary both for the intelligent guidance of educational practice and for the balanced statement of educational theory to explain and justify it.

The most important of these forces are all those powerful influences that can be grouped comprehensively under the term science, including both the organized mode of thought that is characteristic of the present world, and the systematic knowledge, with its many practical applications, that has resulted from the exercise of it. Science accounts for the vast increase in the pace of change. Major changes in men's way of life occurred, in the past, only at long intervals; the interval now may be shorter than a man's lifetime. Hence sociologists point significantly to what they term the "lag," the

much slower pace at which habits, ideas, and ways of thought change in response to the material changes wrought by science.

Science has also vastly increased the range from which influences come to affect the life of the ordinary man. His effective environment may now be the whole earth, and there are signs that a broad common culture, with varied local and regional forms, may include all mankind. A strong impulse to international organization, economic, social, cultural, and political, shows how the "lag" is being reduced.

Again, within the national society, the effect of science is to increase specialisation and division of labour. This sets up conflicts and tensions between the various group-interests and puts a growing strain upon social cohesion. When the strain is severe and the compensating forces making for unity are not strong, the conditions become favourable for a totalitarian order. Men may be driven to acquiesce, feeling that if social cohesion goes, everything goes. (There is no convincing evidence that the progress of science is necessarily favourable to democracy.)

#### The Right of the Strong

With the decay of a common basis of belief may go commonly accepted moral standards. Here, again, is a factor making for totalitarian order. If there is to be no right but that of the stronger, then the strong must impose their will upon all the rest, since apart from observance of common rules of conduct no society not based on the imposition of the will of the stronger can continue to exist. Other influences making in the same direction are the reaction against the over-exposure and the sense of loneliness that accompany excessive individualism, and the release that comes to some people when they swallow a creed whole and abandon the responsibilities of independent judgement by accepting the judgement of a leader.

It is not therefore surprising that the governing issue in all educational theory and practice becomes the choice between fullness of life and fitness for membership. The issue is essentially modern, arising from the same conditions that produced modern democracy. The first to state it clearly was Rousseau in his *Émile* (1762). He made no attempt to reconcile the clash: instead he rejected passionately the idea of

educating for some predetermined membership, and in what was really a kind of novel, told the story of the education of *Émile* by nature, that is, in effect, by a process of supervision and guidance under a tutor which had as its sole purpose the full and free development of all that was potential in him at birth.

#### Conforming to Pattern

The 20th century has experience of national communities where education is designed to ensure fitness for membership, a set pattern of beliefs, ideas, and habits to which all must conform. The same phenomenon in principle is found wherever education is inspired by the motive "catch 'em young": where conformity to a predetermined pattern is preferred to the more adventurous free development of individual potentialities. It can be detected even in family tradition, where a son is destined and trained from infancy to follow in the footsteps of his father.

By contrast, and particularly in England and the U.S.A., examples of the opposite conception can be found: "free" schools exercising very little discipline of the customary kind, but attempting to evoke and develop all the powers with which the child has been endowed by nature. Such schools are apt to underestimate the extent to which they also are subject to the shaping influences of the community, its beliefs and standards, its institutions and customs. Nevertheless, they do important service by their emphasis upon the alternative conception, and when, as is generally the case, they are conducted upon enlightened lines, they yield a valuable harvest of knowledge about child nature in its many diversities.

But the central question for educational theory remains: Is the clash of aims real and final? Is the choice necessarily between fullness of life and fitness for membership? Further, and of vital importance, is there a real choice at all? Since, as many urge, the more the claims of the individual are stressed, the less he seems to matter, the less his personal development seems to be generally possible, is not social solidarity the only effective governing value in practice?

It is necessary to draw a sharp distinction between appearance and principle; to avoid confusing the particular phenomena peculiar

to a given age or condition of society with the abiding principles of human education as such. In certain communities and at certain periods of history, the education that would have produced the approved standard type of citizen would have necessitated the distortion and misdirection of the natural development of the individual. Rousseau's *Émile* was, in fact, a protest against this very thing. The same kind of situation may occur in almost any society. Thus, as is well known, prevailing custom or fashion may even call for some physical deformation of the human body. In all cases where there is a conflict between social and individual purpose in education, the reason is to be found in some defect of society itself; and since no human society is perfect there will always be some measure of conflict in actual fact.

This, however, is a different thing from treating the distinction as a matter of principle, and so speaking as though every child has to be given two educations, one for himself as an individual and one for the human unit that is to become a citizen.

#### The Idea of a Common Humanity

One way of escaping the difficulty might be to deny that there is any such thing as a common human nature; to deny, that is, that man, simply as man, is a notion having any real concrete meaning at all. Then it would be necessary to say that man is merely whatever circumstances and the pressure of society make of the quite neutral material which is all that nature provides in the new-born infant. It is, however, only in movements of fanatical passion like that of Nazi Germany that the idea of a common humanity is denied. The idea has had a long history. Though it was for Christianity to enunciate it in a most thorough-going and unqualified form, it can be traced very plainly in the Hebrew prophets, and the Stoic philosophy of ancient times held it as a fundamental tenet. In modern times it has become a central theme of world-history, and perhaps within a measurable distance of time the idea of a common humanity, with its associated ideas of rights and claims, will be consciously held by all mankind and applied as a criterion to test the justice of measures of government and education alike. The underlying principle of such documents as the Atlantic Charter and the Charter

of the United Nations can hardly be interpreted in any other sense.

If, then, the seeming conflict between social and individual education is not to be evaded by denying the human claims of the individual, the conflict has still to be resolved.

There can be no doubt about the answer. It is impossible, in the last resort, to believe in a universe so constituted that, in order to become a social being, man is compelled to sacrifice or to distort some or all of his native impulses and attributes as an individual. As a distinguished American writer (W. E. Hocking) puts it: "Sociality is structural, not adhesive," *i.e.*, men and women do not just become social by an added training that may be doing violence to their individual "nature." To be social is itself part of human nature, and human beings cannot be fully individualised except as social beings.

Hocking puts the point in another formula in educational terms when he says: "Education must communicate the type [*i.e.* the type called for by the given social and cultural situation] and must provide for growth beyond the type." In other words, individual human values are still sovereign, and society stagnates and withers apart from the constant revitalising that issues from criticism by creative individuals. Society's supreme interest, therefore, is to remain open at the growing end, as it were. Its growing end consists of just these creative individuals, but they could not emerge at all except as social beings who have first assimilated the existing values of their society and then grown beyond them. These new or enriched values have the status of a real discovery, analogous to, say, a scientific discovery. They reveal further possibilities in the development of man. Take, for instance, the discoveries made regarding the value of free activities for young children and the factors that determine healthy physical growth.

#### A Valid Philosophy

Discoveries continue to be made. In so far as they are valid at all, they are valid for man as such, and it is for this reason that they become accepted. In spite of appearances the conclusion is, therefore, that there really is discoverable a philosophy of education that is valid for all mankind, and present tendencies towards intercommunication,

centres of international study of education, and nation learning from nation, show that belief in such a common philosophy is increasingly accepted. Its further development and acceptance can only be hampered by continued emphasis upon a false antithesis between individual development and effective social membership.

In educational practice, the line of advance for all peoples who are free to take it seems now to be fairly clear. On the public side the movement is towards more coherent and comprehensive rational planning, designed for the conscious use of education as a supreme instrument of social control. "Free" societies seek to achieve this by means which afford scope for the spontaneous action of "voluntary" groups and communities, while securing broad equality of opportunity in the interests of society and the individual alike. Great Britain's Education Act of 1944 is a striking example of such an attempt. On the side of the individual there is a complementary movement to diversify the forms of education provided and to relax the rigidities of school organization so as to find and apply that form of educational treatment that is best calculated to realize the possibilities, great or small, of each pupil. Belief in some degree of educability in even the weakest and most handicapped grows steadily stronger.

#### Research into Problems

Accompanying and supporting all this is a powerful movement to promote research into educational problems. It is realized that the achievement of such purposes calls for the establishment of a body of knowledge about education that, on the analogy of medical knowledge, might well be described as "clinical."

The driving motive behind these two complementary tendencies is more than the obvious democratic urge. There is also the awakened sense of the need to conserve, develop, and train all the human resources of the nation, wherever these may be found—another instance of the coincidence of the social with the individual purpose. In such a situation growing co-ordination of education with social policy may be effected. While there will be no diminution in the importance of the school (rather the contrary), there will be growing realization of the truth that all the agencies and activities of society are in some way or

other involved in producing the desired result: a human being who is at the same time a developed individual and an effective citizen. Finally, there are ultimate educational aims. There is general agreement that all alike must be enabled to achieve the highest possible level of knowledge and skill, that all are entitled to the highest level of attainable well-being.

#### Code of Traditional Conduct

In the moral field, a code of traditional conduct is still widely enough accepted to ensure the day-to-day continuance of the social routine; but at the deeper levels of basic beliefs there is probably less agreement than at any other time in human history. Yet it is at this level that the ultimate sanctions of conduct operate. Surface conventions can hold things together in normal times, but they may lose their hold in times of crisis; and in the absence of the deeper sanctions of common basic beliefs about man's life and destiny, social disintegration may result.

If, as many believe, the real danger to society lies here, then here also is found the ultimate problem of education. Perhaps it is at present all too little regarded, too much reliance being placed upon sheer organization, upon increase in knowledge, and upon practical efficiency in the educational process.

If, however, the perennial problem of man is that of rising superior to his own creations and inventions, if every fresh conquest of nature means a new demand upon his moral resources, then the continued enhancement and consolidation of those resources provide the supreme problem, social as well as educational. Failure to solve it where alone it can be solved effectively, in the moral control of the individual by himself, means at best the forcible imposition of control from outside, or at worst, sheer dissolution. Signs are accumulating that the issue cannot much longer be evaded. If this is so, then the ultimate problem of education is clear enough, and the philosophy of education must deepen its foundations accordingly.

**Bibliography.** The Evolution of Educational Theory, J. Adams, 1912; The Aims of Education, A. N. Whitehead, 1929; Human Nature and its Re-making, W. Hocking, 1929; Education and the Social Order, B. Russell, 1932; Freedom and Culture, J. Dewey, 1940; Education and Social Change,

F. Clarke, 1940; The Future in Education, R. Livingstone, 1941; The Social Psychology of Education, C. Fleming, 1944; Education: Its Data and First Principles, T. P. Nunn, 1945; Total Education, M. L. Jacks, 1946.

**Education, MINISTRY OF.** Government department established by the Education Act, 1944, as the legal successor of the board of Education, constituted in 1899. It is the duty of the minister "to promote the education of the people of England and Wales and the progressive development of institutions devoted to that purpose and to secure the effective execution by local authorities under his control and direction of the national policy for providing a varied and comprehensive educational service in every area." Whereas the president of the board of Education could claim to be consulted by local education authorities, could advise them, and could partially control them by withholding grants from central funds, the minister of Education has statutory power to direct local authorities to act in order that a national policy is carried out. A central advisory council for education for England, and another for Wales and Monmouthshire, appointed by the minister, advise him upon "such matters connected with educational theory and practice as they think fit and upon any questions referred to them by him." The minister has to report annually to parliament on the work of the ministry and of these advisory councils. R. A. Butler, who piloted the Act through the house of commons, and from whom it took its name, was the first minister of Education.

Education in Scotland is supervised by the Scottish Education department, under the general control of the secretary for Scotland. An Education (Scotland) Act was passed in 1946, applying to Scotland provisions similar to those of the Education Act, 1944. N. Ireland has its own ministry of Education, under the control of the N. Ireland parliament.

**Education Acts of GREAT BRITAIN.** Acts passed to improve at public expense the general state of education. Government intervention in education began in 1832 when parliament made a grant of £20,000 for school buildings to the British School Society and the National Society. The Elementary Education Act of 1870 (Forster Act) set up elected school boards, with power to raise money from local rates, in districts where school

accommodation was insufficient. An amending Act of 1876 made it the duty of the parent to see that every child received elementary instruction in "reading, writing, and arithmetic." An Act of 1880 required local authorities to enforce attendance. The Technical Instruction Act of 1889 empowered councils to levy a rate not exceeding a penny in the £ in aid of technical instruction; the Local Taxation Act of 1890 allowed the use for technical instruction of the imperial contributions paid to local authorities for the beer and spirit duties. This so-called "whisky-money" greatly helped the establishment of technical colleges throughout the country. An Act of 1899 set up the board of Education. The Education Act of 1902 (Balfour Act) abolished school boards, and made the county or county borough the authority for all forms of education, a special Act dealing with London being passed in the following year. The Education Act of 1918 (Fisher Act), re-enacted by the Education (Consolidation) Act of 1921, gave wide powers to local education authorities to provide adequately for the physical, as well as mental, welfare of children of all types from two years old. It raised the school-leaving age from 12 to 14, and gave the local authority power to raise the age to 15, a power never acted on.

#### The Butler Act of 1944

The Education Act of 1944 (Butler Act) revolutionised the English educational system. It established a ministry of Education (*q.v.*); it unified the control of all forms of education within each area; it provided for a unified statutory system of public education, organized in three progressive stages known as primary, secondary, and further; it sanctioned the raising of the school-leaving age to 15, and subsequently to 16; it provided for the establishment of county colleges, at which adolescent workers up to 18 years of age must attend for the equivalent of one day a week; it abolished fees for secondary education in publicly financed schools; and it contained schemes for a vast expansion of educational services of many kinds, including those for adults. An amending Act (1946) clarified a few points in the main Act, and also removed the ban on membership by teachers of certain public bodies.

**Edward.** Masculine Christian name. Of Teutonic origin, it means able to guard. It was popular

among the Anglo-Saxons, being borne by Edward the Elder, Edward the Confessor, and other kings, and has since been one of the most used of English names. The Anglo-Saxon Edward is sometimes spelled Eadward, a form which gives the best idea of the diphthong with which it began in that tongue. Eduard, Edouard, and Edoardo are respectively the German, French, and Italian forms.

**Edward, LAKE,** formerly Albert Edward Nyanza. Lake of East Central Africa, 150 m. W. of the Victoria Nyanza. Lying at an alt. of 3,000 ft. above sea level, it is connected on the N.E. by a tortuous channel with Lake George. The latter was discovered by H. M. Stanley in 1875, who believed it to form part of the Albert Nyanza; but, while tracing the source of the Semliki river in 1889, he discovered the lake he named Albert Edward Nyanza, and also the channel connecting it with Lake George. The length of Edward Lake is 44 m. and the breadth 33 m.

**Edward THE CONFESSOR** (c. 1005-66). King of the English. The son of Ethelred the Unready

Edward the Confessor. His great seal, the earliest known specimen

and Emma, daughter of Richard, duke of the Normans, he was born at Islip, Oxon. He was taken to Normandy by his parents when Sweyn became king in 1013. Invited to England in 1041 by his half-brother, Hardicanute, when the latter died in the following year Edward was chosen king, and placed on the throne largely by the help of Earl Godwin, whose daughter Edith he married in 1045.

Edward, who was probably an albino, had the unusual qualities for a Saxon king of abstemiousness, kindness, and humility, and was long remembered in affection; but he was scarcely an effectual ruler. His reign was peaceful, though marked by struggles for power between the English and the Normans, the latter being be-

friendred by the king. Edward's chief interest was religion, and he devoted a large part of his revenues to the erection of Westminster Abbey. It was consecrated Dec. 28, 1065, and Edward died Jan. 5, 1066. He was canonised in 1161, and his festival is kept on Oct. 13. *Consult* Lives of Edward the Confessor, ed. H. R. Luard, Rolls Series, 1858.

**Edward THE ELDER** (d. 924). King of the English. The son of Alfred the Great, he fought with him against the Danes. He was called king before his father's death, and in 901 the witan chose him as Alfred's successor. His succession was disputed by his cousin Ethelwald, who rebelled and was slain in battle in 905. By 918 Edward brought the Danes into subjection; in 919, on the death of his sister Ethelfleda, he absorbed Mercia; and in 921 he subdued the Welsh. He ruled as far north as the Humber, and his overlordship was acknowledged by all the other kings. The "unconquered king," as Florence of Worcester calls him, died at Farndon, Northants, and was buried at Winchester. His son Athelstan succeeded him.

**Edward THE MARTYR** (c. 963-978). King of the English. The son of Edgar, his right to the succession was disputed on Edgar's death in 975 by his stepmother Elfrida, who put forward her son Ethelred (the Unready). Edward was supported by Archbishop Dunstan, and was crowned. On March 18, 978, he was assassinated at Corfe Castle by Elfrida's orders, while being offered a drinking-cup, and was hastily buried at Wareham. In 980 his body was transferred to Shaftesbury, and his tomb became a place of pilgrimage. He was long revered as saint and martyr, his festival being kept on March 18.

**Edward I** (1239-1307). King of England. The eldest son of Henry III, he was born at Westminster, June 17, 1239. In the differences between the crown and the baronage, Edward sided with his father, and was taken prisoner after the battle of Lewes, May 14, 1264. He escaped, however, and directed the royalist victory over Simon de Montfort at Evesham, Aug. 4, 1265. He succeeded to the throne

Edward I, King of England, 1272-1307

in 1272. During his reign, Edward conquered Wales, and endeavoured to form a united kingdom embracing the whole island by asserting his sovereignty over Scotland, which regularly rebelled whenever the king was seriously engaged elsewhere. Edward was at the head of an invading army when he died, July 7, 1307, at Burgh-on-Sands.

Edward ranks as one of the greatest kings of England. He systematised the English laws, and gave the English parliamentary system its definite form by summoning to the Model parliament of 1295 not only the higher clergy and baronage, but knights and burghers. His tomb in Westminster Abbey bears the inscription, *Malleus Scotorum*, "the Hammer of the Scots," and his motto, *Pactum serva*, Keep troth. Edward's first wife was Eleanor, daughter of the king of Castile; his second was Margaret, daughter of Philip of France. *Consult* E. I, T. F. Tout, 1893; Welsh Wars of E. I, J. E. Morris, 1901.

**Edward II** (1284-1327). King of England. Son of Edward I, he was born at Carnarvon, April 25, 1284. In 1301 he was created prince of Wales at Lincoln and he acted as regent when his father

Edward II,  
King of England,  
1307-27

was away; however, he early revealed the indolence and levity that finally destroyed him. In 1306 he was given the province of Gascony, and in 1307 he became

king. He abandoned the war against Scotland, and was married to Isabella of France.

Edward was already under the influence of Piers Gaveston. The barons took up arms with Edward's cousin, earl Thomas of Lancaster, at their head, and they forced upon the king the banishment of Gaveston. A reconciliation, brief and insincere, followed. In 1314 the Scotch war was renewed and Edward suffered defeat at Bannockburn. This was Lancaster's opportunity, and for a time the king was a cipher, but he found fresh favourites in the Despençers, and a combination of circumstances brought about the defeat and death of earl Thomas in 1322. Edward and the Despençers were then supreme until 1326. Isabella, alienated from her husband, crossed from France with some followers. Caught in Wales, he was formally deposed, and on Sept. 21, 1327, he was murdered at Berkeley Castle

*Consult* Place of the Reign of Edward II in English History, T. F. Tout, 1914; *see* Carnarvon illus.

**Edward III** (1312-77). King of England. Born Nov. 13, 1312,

he was raised to the throne by the deposition of his father, Edward II (Jan., 1327). The government was in the hands of the queen-mother Isabella and Roger Mortimer till the young king, who married Philippa of Hainault, 1328, overthrew them by a *coup d'état* in 1330.

At first Edward warred against the Scots, but his ambitions were soon turned to France, and in 1338 began the Hundred Years' War. In the course of it he secured the English supremacy of the narrow seas by the naval victory of Sluys, June 24, 1340, established the prestige of the English soldiery and the military supremacy of the English archers by the startling victory of Crécy, Aug. 26, 1346; and in 1347 captured Calais. A victory was won by his son Edward the Black Prince at Poitiers, Sept. 19, 1356, and Edward was confirmed in the independent sovereignty of Aquitaine by the treaty of Brétigny in 1360. He died, prematurely senile, June 21, 1377. His family included the dukes of Clarence, York and Lancaster, whose descendants fought for the crown during the Wars of the Roses. He was the first king who conspicuously directed policy to commercial expansion, the security of the trade with Flanders being one of the objects of his French wars. *See* Lives, W. Longman, 1869; W. Warburton, 2nd ed. 1876; J. Mackinnon, 1900.

**Edward IV** (1442-83). King of England. The eldest son of Richard duke of York, and Cicely Neville, he was born at Rouen, April 28, 1442. In Dec., 1460, he became the leader of the Yorkists and their candidate for the crown. Acting with great energy, he crushed the Lancastrians at Mortimer's Cross, and in London was hailed as king. He then seated himself on the throne at Westminster on March 4, 1461.

Edward III,  
King of England,  
1327-77

After a victory at Towton Edward was able to hold his own, although not absolutely secure. In 1469, however, came a change. He had made many enemies by the favour he showed to his wife's kinsfolk, the Woodvilles, and when Warwick and Clarence, the king's brother, joined his foes, his position was precarious. He prepared to meet them in the field, but the desertion of 6,000 men was fatal to his cause, and in great haste he left Lynn for the Netherlands. Returning with an army, he won battles at Barnet and Tewkesbury. In 1475 he conducted a short war with France and he had some trouble with Scotland, but in general he kept the land at peace. He died April 9, 1483. *Consult* Life and Reign, C. L. Scofield, 1923.

**Edward V** (1470-83). King of England. He was born in the Sanctuary, Westminster, Nov. 3, 1470, a son of Edward IV and Elizabeth Woodville. When he succeeded to the throne, April 9, 1483, his uncle, the duke of Gloucester, was his guardian. *See* *Richard III*.

Gloucester, however, imprisoned the boy king and his brother in the Tower, and had himself crowned as Richard III, July 6, 1483. According to Sir Thomas More, endorsing contemporary belief, Edward and his brother were murdered very shortly after. *See* Richard III.

**Edward VI** (1537-53). King of England. He was born at Hampton Court, Oct. 12, 1537, the son

Edward

of Henry VIII and his third wife, Jane Seymour, and succeeded to the throne, Jan. 28, 1547. His uncle, the duke of Somerset, was protector and the real ruler for the first half of the reign, and on Somerset's fall and execution, to which the young king calmly assented, his rival, the earl of Warwick, later duke of Northumberland, held the chief power. The young king favoured Northumberland's plan for securing the succession of his daughter, Lady Jane Grey. Edward died at Greenwich, July 6, 1553. *See* King Edward VI: an appreciation, C. R. Markham, 1907.

Edward IV

**Edward VII** (1841–1910). King of Great Britain and Ireland and of the British dominions beyond the seas, and emperor of India. Albert Edward, second child and eldest son of Queen Victoria and Prince Albert, was born at Buckingham Palace, Nov. 9, 1841, and created prince of Wales the following month. His education, planned by his father on severe and rigid lines, made his boyhood a weariness and his adolescence a struggle for emancipation. Following private tutoring, he studied science at Edinburgh and became a student first at Christ College, Oxford, then at Trinity, Cambridge, but took no degrees. To the end of his life he preferred to learn from his inexhaustible interest in living men and women rather than from books. The most rewarding part of his education was afforded by travel. In 1859 he went to Italy and Spain, in 1860 he toured Canada and the U.S.A., and in 1862 he visited the Holy Land.

In 1863 he married Alexandra, daughter of Prince Christian of Glücksburg, heir to the throne of Denmark. Thenceforward until his accession in 1901 he resided at Marlborough House. The Sandringham estate, in Norfolk, was bought for him out of the money saved during his minority. During this period he performed such lesser representative functions as Victoria, with her preference for personal retirement in the years of her widowhood, felt herself unable to face. But until he was over fifty years old the Queen consistently declined to allow him to participate in affairs of state or even to afford him access to important dispatches. Thus his wide political knowledge, acquired externally by intercourse with politicians of all nations, lacked scope for action. The prince and his wife became the acknowledged leaders of London society, his duties also brought him into touch with people of every social grade, and his popularity was firmly established. He became a member of a royal commission on the housing of the poor, and took a particular interest in the cause of the London hospitals, an interest to some extent due to his own grave illness from typhoid in 1871. He was grand master of English freemasonry 1874–1901. In 1875 he visited India, laying a foundation for later relations between that empire and the British crown.

Despite his popularity, he was not exempt from criticism: first

for his love of the turf (he won the Derby in 1896 with Persimmon, 1900 with Diamond Jubilee, and 1909 with Minoru), but more generally for what seemed to some a tendency to select his friends from those who shunned the sterner walks of life. Criticism came nearest to a head in 1891, after the Tranby Croft baccarat case, a lawsuit following a game of cards at which the prince, who had been banker, appeared as a witness. But the incident was overlooked in the widespread sympathy expressed six months later on the death of his eldest son, the duke of Clarence, Jan., 1892.

*Edward VII*

Edward succeeded to the throne in his sixtieth year, and reigned only nine years, during which his health required increasing care. His coronation, fixed for June 26, 1902, was postponed at short notice by an operation for appendicitis, his second serious illness, though he recovered in time to go through a shortened ceremony on Aug. 9. Yet during his brief reign he evinced a more ready aptitude for kingship than had been generally expected. In 1903 he paid a series of European visits devoted to strengthening friendship with France, Italy, and Portugal, in the first case setting the seal of his personality on the establishment of the *entente cordiale*. Three visits to Ireland were made with a similar object, and later he went twice to Germany, whose emperor bore public testimony to his uncle's "unremitting endeavours" in the cause of peace. His diplomacy averted war between Sweden and Norway in 1905. All these activities earned him in his own lifetime the sobriquet of

Edward the Peacemaker. At home, while revealing a clear appreciation of the functions of a constitutional sovereign, he did much to consolidate the personal dignity of the monarch, restoring most of the brilliant pageantry associated with the court which had lapsed under Victoria.

He died at Buckingham Palace, May 6, 1910, following an attack of bronchitis, and was buried May 20 in St. George's Chapel, Windsor. Nine sovereigns attended his funeral: his son George V, the German emperor, and the kings of Spain, Portugal, Norway, Denmark, Belgium, Greece, and Bulgaria. Five of his children survived infancy: Albert Victor, duke of Clarence (1864–92), George V (*q.v.*), and the princesses Louise (1867–1931), Victoria (1868–1935), and Maud (1869–1938), queen of Norway. The statue of Edward in Waterloo Place, London, is one part of the national memorial, the other being Shadwell Park.

Edward's short reign has given the name "Edwardian" to a recognizable period, suggesting in retrospect the final golden effulgence of 19th-century prosperity, comfort, and security, projected into the first decade of the 20th century, and marked in social life as in the arts by a magnificent prodigality of display and decoration amounting at times to ornateness when judged by later standards: a period when the austerities of Victorian days were relaxed and the grimmer problems of later years had scarcely appeared above the horizon.

**Bibliography.** Official Life, Sir S. Lee, 2 vols., 1925–27; The Delightful Profession, a Study in Kingship, H. E. Wortham, 1931; Edward VII, E. F. Benson, 1934; Edward VII and his Times, A. Maurois (Eng. trans. H. Miles), 1936; Edward the Seventh, C. Gavin, 1941; Victoria's Heir, G. Dangerfield, 1942.

**Edward VIII** (b. 1894). The eldest son of King George V was born June 23, 1894, and succeeded his father Jan. 20, 1936. He abdicated Dec. 11 the same year, after the shortest reign in England (327 days) since that of Edward V, and was granted the title of duke of Windsor. See Windsor, Duke of.

**Edward** (1330–76) known as the Black Prince. Eldest son of Edward III of England, he was born at Woodstock, June 15, 1330; in 1333 was made earl of Chester, four years later duke of Cornwall, and in 1343 prince of Wales. He accompanied his father on the French campaign and distinguished

Edward,  
the Black Prince  
From an old engraving

himself at the battle of Crécy, Aug. 26, 1346. He was at the capture of Calais, and in 1350 in the sea fight off Winchelsea against the Spaniards. In 1355 Edward

was sent to Gascony, when he led the English armies in a series of raids over the French territory. A similar expedition culminated on Sept. 19, 1356, in the battle of Poitiers.

In 1357 he returned to England and in 1361 married his cousin Joan, known as the Fair Maid of Kent. In 1362 his father granted him Gascony and Aquitaine. He took part in a disastrous expedition for replacing Pedro of Castile on the throne, but soon many disaffected lords of his territories rose against him and towns surrendered to them. When, after a month's siege, he retook Limoges, he ordered a general massacre of its inhabitants. In 1371 Edward returned, in broken health, to England. He supported the bishops against the evil administration of his brother Lancaster. He died at Westminster, June 8, 1376, and was buried in Canterbury Cathedral. He was not called the Black Prince until long after his death, the name being probably given him because he wore black armour. While Edward was a superb warrior and has been looked upon as a model of chivalry, his work was wholly unconstructive and his personal character deteriorated after about 1360. Richard II was his son. A *Life* by R. P. Dunn Pattison appeared in 1910. Maurice Baring wrote a poetic drama, *The Black Prince*, 1902. An imaginative bronze statue by Thomas Brock is at Leeds.

**Edward** (b. 1884). Duke of Saxe-Coburg-Gotha. Prince Charles Edward was born at Claremont, Esher, Surrey, July 19, 1884, as the duke of Albany, posthumous son of Duke Leopold, 4th child of Queen Victoria. He succeeded his uncle Alfred in 1900 as duke of Saxe-Coburg-Gotha, where he ruled until Nov., 1918. He had been a Prussian general, and after his abdication joined the Nazi movement and backed Hitler with part of his great wealth. The latter frequently used him for displaying the completeness with which his party embraced all social strata,

and made him a general of the party army. He represented Germany at the funeral of George V in 1936.

**Edward, THOMAS** (1814-86). Scottish naturalist. He was born Dec. 25, 1814, at Gosport, taken by his parents to Banff at an early age, and remained there for the rest of his life. A poor shoemaker, he for many years spent the whole of his nights out of doors. He discovered between twenty and thirty species new to science, adding to the British fauna a vast number of species hitherto unknown in these islands. In 1866 he was elected an associate of the Linnean Society, and a civil list pension was awarded to him. He died April 27, 1886. *Consult* *Life of a Scotch Naturalist*, S. Smiles, 1876.

**Edwardes, GEORGE** (1852-1915). British theatrical manager. He was born Oct. 8, 1852, of Irish parents, and started his career as business manager at the Gaiety Theatre, Dublin. In 1875 he became business manager for D'Oyly Carte at the Opéra Comique, London, and went with him to the Savoy. He joined John Hollingshead as joint manager at The Gaiety, London, 1885, and in 1886 became the manager of that theatre, which he directed for nearly 30 years, producing a long series of successful musical plays. He died Oct. 4, 1915.

**Edwardes, SIR HERBERT BENJAMIN** (1819-68). British soldier and Indian administrator. He was born at Frodesley, Shropshire, Nov. 12, 1819, and became a cadet in the East India Company in 1840. In 1845-46 he was aide-de-camp to Sir Hugh Gough in the Punjab campaign. As first assistant to Sir Henry Lawrence, the resident at Lahore, he administered Bannu, and his courage and resourcefulness were conspicuously seen in his defeat of the diwan of Multan, 1848. Edwardes rendered signal service during the Mutiny by securing the neutrality of Afghanistan. Knighted in 1860, he died Dec. 23, 1868.

**Edward Medal.** Medal instituted in 1907 by Edward VII to reward heroic acts by miners,

Edward Medal, instituted as a reward for heroic deeds in civil life (reduced)

quarrymen, etc., who have endangered their lives in rescuing others so employed. It consists of two classes, the Edward medal, and the Edward medal in silver. Bars are awarded for further acts. The medal bears a portrait of King Edward. The ribbon is dark blue with narrow yellow edge.

**Edwards, ALFRED GEORGE** (1848-1937). British prelate, the first Anglican archbishop of Wales. Born at Llanymawddwy, Merionethshire, Nov. 2, 1848, he was educated at Jesus College, Oxford, and, having been ordained, became in 1875 headmaster of Llandovery College. In 1885 he was made vicar and rural dean of Carmarthen, and in 1889 bishop of St. Asaph. In 1920 Dr. Edwards was elected first archbishop of the new province of Wales, although he had opposed Welsh Church disestablishment. He was in retirement from 1934, dying July 22, 1937. His *Memories* appeared in 1927.

**Edwards, AMELIA BLANDFORD** (1831-92). British novelist and Egyptologist. She was born in London, June 7, 1831, and for many years wrote stories for *Household Words* and *All the Year Round*, besides contributing articles to the *Saturday Review* and the *Morning Post*. A novel, *Barbara's History*, 1864, was translated into German, Italian, and French; Lord Brackenbury, 1880, ran into 15 editions. In 1882 she founded the Egypt Exploration Fund. She endowed the first chair of Egyptology at London. She died April 15, 1892.

**Edwards, JOHN PASSMORE** (1823-1911). British journalist and philanthropist. Born at Blackwater, Cornwall, March 24, 1823, son of a carpenter, he trained himself to be a journalist, coming to London in 1846. He was proprietor and director of the London

J. Passmore Edwards,  
British philanthropist  
Elliott & Fry

evening journal, the *Echo*, 1876-96, and sat as Liberal M.P. for Salisbury, 1880-85. Edwards is chiefly remembered for his benefactions to hospitals, libraries, art galleries, and other public institutions, of which he founded more than 70. The settlement in Tavistock Place, London, W.C.1, is now the Mary Ward Settlement. He died April 22, 1911.

**Edwards, JONATHAN** (1703-58). American divine and theologian. He was born Oct. 5, 1703, at East

Jonathan Edwards,  
American divine

Windsor, Conn., and in 1727 became minister at Northampton, Mass. His extreme and logical Calvinism was expounded with unusual power, but his insistence on church discipline brought dismissal from the pulpit. From 1750 he resided at Stockbridge as a missionary to the River Indians, and before his death, March 22, 1758, was appointed president of Princeton College. Edwards's most important book was *A Careful and Strict Enquiry into . . . Freedom of Will*, 1754. His works were edited by S. E. Dwight, 10 vols., 1830. See Calvinism.

**Edwin** OR **EADWINE** (c. 585-633). King of Northumbria. The son of Ella, king of Deira, he was driven from Deira after his father's death by the king of Bernicia, and took refuge with Raedwald, king of E. Anglia, who defeated and slew the Bernician king in 617. Edwin then annexed Bernicia and became king of Northumbria. In 625 he married Ethelberg, sister of the king of Kent. In 627 he was baptized by Paulinus and his kingdom became Christian. Edwin's overlordship extended over all Anglo-Saxon Britain except Kent, and his rule was notable for its justice and peace. On Oct. 12, 633, Edwin was defeated and slain at Heathfield, near Doncaster, in a battle against a coalition of heathens under Penda of Mercia and Cadwallon of North Wales. Edinburgh is named after him, and he was long venerated as a saint, his day being Oct. 4.

**Edwin and Angelina.** Simple ballad, sometimes called *The Hermit*, by Oliver Goldsmith. It was privately printed for the countess of Northumberland in 1765 and first published in *The Vicar of Wakefield* (1766), where it is introduced by way of contrast with the false taste and meretricious exuberance of language in the poetry of the time. It tells of the coming together of separated lovers. From this ballad the names have come to be applied to any loving young couple.

**Edwin Drood.** The full title of Charles Dickens's unfinished novel is *The Mystery of Edwin Drood* (q.v.). See also *Drood Controversy*.

**Edwy** OR **EADWIG** (c. 940-959). King of the English. Known as the Fair, he was the son of Edmund who was murdered in 946, and succeeded his uncle Edred who died Nov. 23, 955. He appears to have been a quarrelsome youth, offending his counsellor Dunstan, who was exiled, and driving the northern nobles to rebellion. He died Oct. 1, 959, was buried at Winchester, and was succeeded by his brother Edgar.

**Beckhout**, GERBRAND VAN DEN (1621-74). Dutch painter. Born at Amsterdam, Aug. 19, 1621, he was the favourite pupil and later the friend of Rembrandt. He painted genre pictures, portraits, and scriptural subjects, but his cabinet pictures are superior to those on a larger scale. Among his works which were in German galleries may be mentioned *The Raising of Jairus's Daughter*, *Tobit and the Angel*, *The Presentation of Jesus in the Temple*, *Jesus Among the Doctors*; and the portraits of Oliver Dapper, the geographer, and Rembrandt. He also executed etchings. Beckhout died at Amsterdam, Sept. 29, 1674.

**Eecloo.** Town of Belgium, in the prov. of E. Flanders. It stands on the Liève, 11½ m. N.W. of Ghent. A rly. junction, it is connected also with neighbouring towns by tramways. It carries on a large trade in grain, and its manufactures include lace, woollen, and linen goods. Pop. 14,672.

**Eel** (*Anguillidae*). Group of fishes with elongated snake-like bodies and no visible scales. They are

Eel. The common eel found in both sea and fresh water

found in both sea and fresh waters in most parts of the tropical and temperate regions of the world. The common European eel (*A. anguilla*) is a familiar example.

The life history of the eel, long a complete mystery, was worked out by the Danish zoologist Johannes Schmidt. It is now known that the silver and yellow eels are not two varieties, but different stages in the life history. In autumn the mature silver eels migrate down the rivers to the sea, and those in ponds will often go overland for considerable distances at night to reach the rivers. Eels spawn in

the Sargasso Sea during winter, in deep water. The eggs hatch out as little fish known as *Leptocephali* or glass fishes, or elvers, so entirely unlike their parents that they were formerly thought to be a distinct species. They are flat, ribbon-like creatures about 3 ins. long, curiously deep in body, scaleless and transparent, with small heads. These *Leptocephali* do not appear to feed in the sea, and they gradually shrink both in length and depth, and become round in body, when they are known as glass eels. In this state they make their way up the rivers in countless millions. In ponds eels often live for several years before descending to the sea to spawn. They die after depositing their eggs. The grown male is smaller than the female.

Eels are used as food by most European nations. Most of those eaten in Great Britain come from Holland and Denmark. Before the First Great War the Germans had established a large elver-catching depot on the Severn.

With certain exceptions it is illegal to fish for eels with rod and line between March 14 and June 16. For the protection of salmon it is made illegal, with minor exceptions, to use an eel basket, net, or trap between Dec. 31 and June 25 in waters frequented by salmon or migratory trout. The ministry of Agriculture and Fisheries may make orders regulating eel and elver fisheries. See also *Conger*.

**Eel**, **ELECTRIC** (*Gymnotus electricus*). Large eel-like fish found in the rivers of Brazil and Guiana. Though resembling an eel in general appearance, it is widely removed from it in internal structure. It attains a length of 6 ft., and is notable for the powerful electric shock that it can give. The electricity is generated by four organs lying in pairs under the skin, but their precise mode of action is not fully understood. The animal uses this power for killing or stunning the fish on which it feeds, as well as in self-defence. The force of the shock varies greatly, but is sometimes so strong that it would overpower a horse. See *Electric Fish*.

Electric Eel. A large fish which can impart an electric shock

**Eel-grass** (*Vallisneria spiralis*). Perennial aquatic herb, member of the family Hydrocharitaceae.

It is a native of warm and temperate regions, including S. Europe. The short stem is immersed in the mud of rivers and lakes, and from it arises a tuft of thin grass-like leaves a yard long, but only  $\frac{1}{2}$  in. wide. The female flower has a very long spiral stalk which enables it to lie upon the surface of the water. The male flowers (produced by separate plants) have very short stalks which break away from their attachment, so that they float to the surface, where they pollinate the females. This accomplished, the female, by the spiral contraction of its stalk, is withdrawn to the bottom, where it develops into a cylindrical berry.

Eel-grass. Plants of the aquatic herb

**Eel Pie Island.** Islet in the Thames opposite York House, Twickenham. Also called Twickenham Eyot, it has long been noted as a favourite resort of anglers and boating parties. The inn on the islet occupies the place of Eel Pie House, pulled down in 1830.

**Eel Pout** (*Lota lota*). Popular name for the burbot. It is a freshwater fish, common in European and American rivers, and in Great Britain found chiefly in the Cam and the Ouse. It is about a yard long, and somewhat eel-like in shape.

**Effendi.** Turkish title of respect. It is applied in the East to government officials, men of learning, and others. It is a corruption of the Greek *authentēs* (mod. pron. *aithendēs*), a lord.

**Effervescence** (Lat. *effervesce*, to boil up). Name applied to the phenomenon of the rapid escape of gas from a liquid. It is usually the result of chemical action. A familiar example is seen in the mixing of a seidlitz powder with water. When soda water is withdrawn from a syphon the evolution of carbon dioxide is due to physical causes.

**Efficiency** (Lat. *efficientia*, a carrying out). Term meaning in general the quality of producing some desired result. Apart from its use in engineering, it is increasingly used in industrialism and economics, considerable attention being paid by doctors and others to the efficiency of the worker.

In engineering, efficiency is the ratio of the amount of energy given out from a conducting, converting, or transmitting device to

the energy received by it. In all cases the efficiency is less than unity, as some of the energy is dissipated or used up unprofitably. The efficiency of a joint is the ratio of the strength of the joint to a similar section of unjointed material. In aeronautics, where the main spars are spliced, the efficiency of the splice is its strength relative to that of the unspliced wood of similar section.

The heat-absorbing efficiency of a boiler is represented by the percentage of the heat units of the burnt fuel which is found in the water and steam. The efficiency in very good boilers may be as high as 80 p.c. The heat-converting efficiency of a steam engine is its capacity for converting units of heat energy into units of mechanical work on the basis of one thermal unit being equivalent to 778 foot-pounds of work. So much heat is wasted by conduction, condensation, etc., that the efficiency, even in the best engines, does not exceed 15 p.c. to 18 p.c. The brake or effective h.p. of an engine is less than the indicated h.p., owing to loss in overcoming friction. Similarly, the converting efficiency of a dynamo or electric motor respectively is its capacity for transforming mechanical into electrical, or electrical into mechanical energy. The difference between energy units received and delivered decides the transmitting efficiency of lines of shafting, belt drives, etc.

A good example of the cumulative effect of losses due to efficiencies being less than unity is afforded by the propelling apparatus of a ship. Assuming a boiler efficiency of 75 p.c., an engine heat-efficiency of 15 p.c., a transmitting efficiency of 90 p.c., and a propeller efficiency of 60 p.c.—all well above the average—out of 100 units of heat-energy developed by the burning of boiler fuel only  $(100 \times \frac{75}{100} \times \frac{15}{100} \times \frac{90}{100} \times \frac{60}{100}) = 6.075$  p.c. are converted into useful work. See Boiler; Steam Engine.

**Effigy** (Lat. *effigies*, image, likeness). Monumental effigies on tomb-lids in Christian churches from the 13th century onwards abound in England and W. Europe. Originally carvings in low relief, which gave rise to monumental brasses, they developed into figures in the round, usually recumbent. Ancestral effigies, kept in great houses in ancient Egypt and Rome, suggested to medieval Europe the funeral effigies placed upon the biers of royal and other personages.

In primitive culture effigies are important adjuncts of sympathetic magic. There are palaeolithic cave-portraits of food-animals, speared symbolically to ensure success in hunting. The piercing or melting of waxen images to induce sickness or death, practised in early Egypt, Babylonia, Vedic India, Greece, and Rome, prevailed in 13th-17th century Christendom. See Numismatics; Waxworks.

Effigy. Two examples in wax. Left: Effigy of Queen Elizabeth in Westminster Abbey. Right (by courtesy of Messrs. Tussaud): Effigy of Queen Marie Antoinette, originally shown at Versailles

**Effingham**, EARL OF. British title borne by the family of Howard from 1731 to 1816, and again since 1837. The family is descended from Lord William Howard, a son of the 2nd duke of Norfolk. He served Henry VIII and his three children and was in 1553 made Baron Howard of Effingham, in Surrey. His son Charles commanded the English fleet against the Spanish Armada and was made earl of Nottingham in 1596. The earls of Nottingham held the barony of Howard of Effingham until their extinction in 1681, when it passed to Francis, whose son Francis, 7th baron, was created earl of Effingham in 1731. In 1816 the earldom became extinct, and the barony devolved upon a kinsman, Kenneth A. Howard, created earl of Effingham in 1837. Mowbray, 6th earl, was born Nov. 29, 1905, and succeeded his father 1946. An eldest son is still known as Lord Howard of Effingham.

**Efflorescence** (Lat. *efflorescere*, to bloom). Term applied in chemistry to the changes which some crystals undergo when exposed to air. The surface of the crystals becomes covered with a fine powder, fancifully known as flowers. The change is due to the giving up of water owing to the higher vapour pressure of the crystal compared with that of the surrounding atmosphere. A familiar example is seen in washing soda, which, at first transparent, after exposure becomes opaque on the surface. The change is due to a reduction in the quantity of water of crystallisation normally present in the crystals. The word is also used in botany for the process of flowering. See Chemistry; Crystallisation.

**Effusion** (Lat. *effundere*, to pour out). Escape of a gas under pressure from the vessel in which it is enclosed, through a small opening. This escape will follow precise laws expressed by Graham as follows: "The velocity with which a gas effuses varies directly as the square root of the difference of pressure on the two sides of the opening (in the vessel and outside it) and inversely as the square root of the density of the gas."

**Efik**. Negro tribe in the Calabar coastland, S. Nigeria. They predominate between the Cross and Ikpan rivers, and, having long acted as middlemen between the white traders and the interior peoples, they are largely Christianised and Europeanised. Their speech is semi-Bantu.

**Eft**. Properly the newt (*q.v.*). The word is often loosely applied

to various lizards, which are reptiles and not amphibians as is the newt.

**Egan**, PIERCE (1772-1849). British sporting author. He spent his life reporting races, prize-fights,

Pierce Egan,  
British author  
After Sharpley

cock-fights, cricket matches, trials, and executions. He achieved great popularity as the author of a series of sketches describing London amusements in Regency times and entitled *Life in London: or the Day and Night Scenes of Jerry Hawthorn, Esq., and his elegant friend, Corinthian Tom*, accompanied by Bob Logie, the Oxonian, in their *Rambles and Splees* through the Metropolis. These were issued in monthly parts from 1821 and illustrated by I. R. and G. Cruikshank. Of his numerous other writings Pierce Egan's *Book of Sports and Mirror of Life*, 1832, was the best. He died Aug. 3, 1849.

**Egba** OR **EGBALAND**. District of Western Nigeria. It is situated N. of Lagos, and is surrounded by Ibadan, Ikorodu, Badagry, and Meko. Its area is about 1,869 sq. m. The native population consists of four local tribes known as the Egba-Alake, Egba-Oke-Ona, Egba-Agura, and the Owus. The S. is largely forest, especially from Oba to Igaun, but is well watered and productive. The N.W. is hilly and not well watered. Cotton is grown. The principal means of communication, in addition to the roads, are the Ogun river and the Lagos-Ilorin railway. The capital is Abeokuta. Pop. 639,500.

In 1857 the British government established friendly relations with the Egbas, and in 1892 a treaty of protection was arranged. The country remained an independent native kingdom within Nigeria, with a British resident, until 1914, when it was placed under the direct government of the protectorate of Nigeria.

**Egbert** (d. 839). King of Wessex. The son of Ealhmund, a king of Kent, he was driven into exile to the court of Charlemagne and

returned to England as king of the West Saxons in 802. He then subdued West Wales or Cornwall, defeated the king of Mercia at Ellandune, annexed Kent, and in 829 became overlord of all the English kings. He was defeated by Scandinavian pirates in 836, but in 838 routed a formidable army of Northmen and West Welsh at Hingston Down, Cornwall. The first king of England, he was succeeded by his son Ethelwulf.

**Egede**, HANS (1686-1758). Scandinavian missionary in Greenland. Born in Norway, and educated at Copenhagen university, he was a Lutheran minister at Vaagen, 1706-17. Four years later he went with his wife and family to Greenland, where he worked among the Eskimos for fifteen years and converted many to Christianity. In 1736 he returned to Copenhagen, but continued to superintend the missions in Greenland until his death, Nov. 5, 1758. He wrote accounts of his work, and *A Description of Greenland* (1729-41), Eng. trans. 1745. Consult *The Story of Hans Egede*, Jans Olaf, Eng. ed. 1864.

**Egedes Land**. That portion of E. Greenland lying N.W. of Denmark Strait and N.E. of King Christian IX Land. It is named after Hans Egede.

**Eger**. River of Czecho-Slovakia. It rises in the Erzgebirge in Saxony, but most of its course is in Bohemia. It flows generally E. until it falls into the Elbe near Leitmeritz (Litomerice). It drains the S. side of the Erzgebirge. Cheb and Karlovy Vary (Karlsbad) are on it; its length is about 140 m.

**Eger**. German name for the town whose Czech name, used in this work, is Cheb.

**Eger** OR **ERLAU**. City of Hungary. It stands on the Eger, a trib. of the Tisza, in a beautiful and mountainous region, 70 m. N.E. of Budapest, and is the capital of

Eger, Hungary. The cathedral of this ancient city, built in the Italian style in the nineteenth century

# EGGS OF FIFTY BIRDS THAT FREQUENT THE BRITISH ISLES

1 Grading eggs at the National Laying Test at Milford, Godalming, Surrey, farmers from all parts of the country enter their best laying or breeding hens, and at the end of a two-year period, certificates and prizes are

awarded 2 Testing eggs with electric light at Cheltenham egg grading station. 3 Egg grading machine at work in a West Country grading centre; the machine deals with 300 dozen eggs per hour. 4. Packing eggs.

#### EGG - ASPECTS OF A HIGHLY ORGANIZED BRITISH INDUSTRY

the county of Heves. Its chief industry is the making of red wine, the grapes for which are grown on the hills around. The cathedral, in the Italian style, was erected in the 19th century; the church of the Brothers of Mercy and the minaret of an old mosque are also noteworthy. Other buildings include the palace of the archbishop, the town hall, and the observatory. The town grew up around the bishopric founded about 1010. It was taken by the Turks in 1596, and they kept it until 1687. In the Second Great War the approaches to Eger, the gateway to S. Slovakia, were heavily fortified by the Germans in the summer of 1944; the Russians captured the town Nov. 30. Pop. 30,328.

**Egerdir.** Lake of Asiatic Turkey. Lying between the Sultan Dag and the Taurus Mts., it is 27 m. long and from 3 m. to 10 m. wide. On it stands the town Egerdir.

**Egeria.** In classical legend, a nymph beloved of Numa Pompilius, king of Rome, who set great store by her advice and prophecies. On the death of Numa her grief was so great that she dissolved in tears, and was turned into a fountain by Diana. The name is given in modern times to a lady who stimulates and inspires a man's intellectual activity.

**Egerton, Sir Alfred Charles Glynn** (b. 1886). British chemist. He was educated at Eton and University College, London, became a lecturer and technical consultant at the R.M.A., Woolwich, and was reader in thermodynamics at Oxford from 1921 to 1936, when he was appointed professor of chemical technology at the Imperial College of Science. During the Second Great War he was on the scientific advisory committee to the war cabinet. Made F.R.S. in 1926, he became secretary of the society in 1938. He was knighted in 1943.

**Egerton, Sir Charles Comyn** (1848-1921). British soldier. He was born Nov. 10, 1848. Entering the army in 1867, he took part in Roberts's march to Kandahar, 1880, led the Indian contingent at Suakin, 1896, and commanded the Somaliland operations, being promoted full general in 1906 and field-marshal in 1917. He was a member of the council of India, 1907-17. He died Feb. 20, 1921.

**Egerton Prize.** Award given annually by the Admiralty to the naval officer who, when qualifying for gunnery lieutenant, passes best in the examination in practical

gunnery. The prize was founded in 1901 in memory of Commander F. G. Egerton, R.N., killed in Lady-smith, Nov. 2, 1899.

**Egg.** Reproductive cell formed in the body of the female animal, which, when fertilised by union with the spermatozoon of the male, produces a new individual. Except in the lowest forms of life, when propagation takes place by fission or budding, every animal begins its life history as an egg. In the viviparous animals, as in nearly all mammals, the development of the egg takes place in the body of the mother; in the oviparous it is extruded and development proceeds apart from union with the mother. (See Embryology.)

Only such eggs as are "laid" by the female and hatched externally to her body are here considered. This phenomenon occurs in all the phyla or sub-kingdoms of the animal world except certain of the lowest and most primitive. In the mollusca, which include the snails and the shell-fish, eggs vary considerably in form and size. In the largest of the British snails (*Helix pomatia*) the egg is enclosed in a chalky shell, and is as large as a moderate-sized pea; while one of the snails of Barbados (*Strophocheilus oblongus*) lays a white egg as large as that of a pigeon.

Some insects, like moths and butterflies, lay an enormous number of eggs; but the most prolific creatures of all are the fishes. The ling produces more than 500,000 eggs to each pound of her weight.

Nearly all reptiles lay eggs. Those of the crocodiles and tortoises have hard, limy shells, but most are enclosed in membranous capsules. Those of the amphibians like the frogs and newts, are deposited in gelatinous masses. Speaking generally, eggs laid in the water or in wet places are without hard external coverings.

All birds deposit eggs, varying immensely in size and colour. In size they range from that of the ostrich, which equals about twelve hens' eggs, to the tiny productions of the humming-birds. The colouring of birds' eggs is sometimes of a protective nature, and adapted to the surroundings. The eggs of razor-bills and guillemots, which lay on exposed edges of rocks, are of tapering shape, so that when disturbed by wind or by a passing bird they simply turn round. Among the mammals, eggs are laid only by ornithorhynchus and echidna. (See Biology; Birds, Protection of; Cell.)

\* Paul G. Espinas

**EGG INDUSTRY.** This deals particularly with hens' eggs produced for consumption, either in the original form or processed. In processed form, eggs are used extensively in food manufacture. In their original form, eggs are classified as fresh or store. Fresh eggs pass straight to consumer from poultry farms via the retailer. Store eggs pass from poultry farm via wholesaler to refrigerated store, and thence to retailer; they are imported from the British Dominions, and, in normal times, from Europe and China, and held in cold storage before distribution to retailers.

The increase in the production and consumption of eggs is due principally to refrigeration. With the building of cold stores there came a new incentive to the farmer to produce supplies in excess of immediate demand. Poultry farms became a paying proposition because of the possibility of conserving egg supplies from the surplus productive season (i.e., March to June). Processed eggs are those taken out of shell and processed in quantity. Eggs can be dried by evaporating the water content until flakes or powder be formed. Eggs can also be frozen in quantity out of shells. Dried egg and frozen egg are used in biscuit factories and in cake-making.

#### The Development of the Egg

An egg is of complex structure, a knowledge of which is necessary to ensure the proper handling and conserving of huge quantities. The egg-producing organ of the hen is called the oviduct. The yolk develops first in the ovary; it is enclosed in a sac, develops by the addition of concentric layers of yellow yolk, and, according to an American authority, requires fourteen days for full development. When the yolk is fully developed, the oviduct envelops the yolk sac. The latter splits or opens, and the yolk begins its escape through the oviduct. The male sperms are at the opening of the oviduct, and enter the yolk at the germinal disk, a light-coloured spot on the surface of the yolk. The white or albumen of the egg is laid on the yolk during its passage down the oviduct. Ligaments which suspend the yolk are twisted by the revolving motion of the yolk during its passage. Next are added the shell membranes, the shell pigment, and the outer gelatinous coating, and the egg is ready for expulsion. It takes about three hours for the formation of the first

layers of albumen, three hours for the formation of the shell membranes, and 12-20 hours for the formation of the shell, the function of the uterus and vagina, and the laying. Formation of the yolk is continuous in the sac, and there are always hundreds of minute yolks developing independently, ready for fertilisation.

The yolk varies in colour according to the food or breed of hen. When an egg is opened, the yolk should assume a rounded form and not break easily. It is lighter in weight than the white of the egg, and has a high fat content. Usually the yolk contains the following percentages: 48 water, 30 fat, and 15-20 protein. The albumen, which is a viscous fluid, should be colourless. The shell membranes consist of a network of organic fibres, and are almost transparent. The shell is a calcareous deposit about  $\frac{1}{16}$ -in. thick. It is porous, permitting the easy absorption and evaporation of water and odours. The air cell is the space between the contents of the egg and the shell, caused by evaporation. The egg contracts after it has left the body of the hen, and the space caused by contraction between the two shell membranes fills with air.

#### Causes of Defective Eggs

Eggs are often defective, the physical condition and breed of the hen affecting quality. The size of yolk, percentage of moisture, firmness and percentage of albumen, and strength of shell can often be controlled if the hen receives careful treatment. Summer eggs have weaker albumen than those produced earlier; eggs with weak albumen do not stand cold storage. Dark yolks are due to excessive consumption of green foods by the hen. Grass eggs have dark yolks and greenish whites.

Two-yolk eggs are caused by ovarian conditions; abnormal yolks by the passage of the yolk sac into the oviduct before full development; blood clots by the rupture of blood vessels in the ovary of the hen; meat spots are floating particles in the albumen, either portions of loosened glands torn from the walls of the oviduct, or abnormal growths of tissue.

Shells differ in formation and construction through lack of lime or enforced production in which the shell does not get the requisite time for formation. There are soft shell and thin shell eggs, and shells with excessive porosity.

Shells with slight ridges do not keep well, and should be put aside.

Light float eggs contain an enlarged air cell and a darkened yolk; they deteriorate rapidly. A heavy float egg is a more advanced stage of the conditions of the light float. Blood rings around the germinal disk prove that the egg is unfit for human consumption. An opaque solidified appearance shows that the egg has been subjected to high temperatures; loose frothy appearance, together with a cracked shell, signifies freezing with subsequent thawing. Moisture or sweating of eggs caused by changes of temperature destroys the structure of the albumen. Excessive evaporation is caused by dry air passing rapidly over eggs.

Buying and collecting eggs from poultry farms, arranging for transport and storage, withdrawing from store, and selling to retailers, are in the hands of brokers and merchants working independently or on behalf of provision groups and firms. Early in April the first eggs are shipped to cold stores where they remain for several months. All eggs are usually withdrawn by the end of Jan. Selected eggs are packed in crates with cardboard divisions—fillers and flats—or with "excelsior" packing. Crates are usually 6 ft. long by 2 ft. wide and 6 in. high, each crate containing 130 dozen. The crates, when stowed in the cold chambers, should be stacked flat, with separating dunnage between the crates and floor and walls. The air circulation should be gentle, and a temperature of 32° F. and 80 p.c. humidity are also necessary. Withdrawal from store begins in October, when the supply of fresh eggs diminishes and prices increase. **A.E. Miller**

**Egg, AUGUSTUS LEOPOLD** (1816-63). British artist. Born in London May 2, 1816, he studied under Henry Sass and at the R.A. school, exhibited for the first time in 1838, became an A.R.A. in 1848, and R.A. in 1860. A subject painter, his best works include *Queen Elizabeth Discovers She is No Longer Young*, 1848; *Peter the Great Sees Catherine for the First Time*, 1850; and *The Night Before Naseby*, 1859. He died at Algiers, March 26, 1863. See Dickens illus.

**Egga.** Town of central Nigeria (Northern province). It stands on the right bank of the Niger, a few miles above Baro, the terminus of the Baro-Kano rly. It is the commercial outlet of the Gando country. Pop. about 10,000.

**Eggar Moth** (family *Lasiocampidae*). Name given to certain moths of moderate to large size

Eggar Moth. Example of small eggar moth, *Eriogaster lanestris*

whose caterpillars spin rather egg-like cocoons. Four species are British.

**Eggishorn.** Mountain of the Bernese Oberland, Switzerland, in the canton of Valais. It is the loftiest peak of the ridge separating the Aletsch Glacier from the Rhône Valley. Alt. 9,625 ft. On its S.E. slope is the Jungfrau-Eggishorn Hotel, at an alt. of 7,195 ft.

**Egg Plant** (*Solanum melongena*). Herb of the family Solanaceae. The leaves are oval, lobed, and woolly beneath; the flowers are similar to those of the tomato, white, yellow, or purple. The fruit,

a berry as large as a goose's egg, is white or purple. The fruit is edible, and the herb is largely grown for food. It is also called aubergine, brinjal, Jews' apple, rind apple.

**Egham.** Urban dist. and parish of Surrey, England. It stands on the Thames, 21 m. by railway W.S.W. of London. Near

by are the Royal Holloway College, at Englefield Green, which provides advanced education for 250 women, and Holloway Sanatorium, a large asylum for the mentally deficient, opened in 1885. Pop. 22,650. Between here and Windsor lies Runnymede (*q.v.*).

**Egin** or **EKIM.** Town of Asiatic Turkey, in the vilayet of Erzincan. It stands at an alt. of 3,300 ft. on the right bank of the Kara Su or Western Euphrates, 140 m. S.W. of Trabzon. Founded in the 11th

Egg Plant. Specimen of the herb, showing leaves, flower, and berries

Egmont. The snow-capped cone of an extinct volcano of North Island, New Zealand

century by Armenian settlers from Van, it was the scene of massacres of Armenians in 1895. The houses are built as terraces and the streets are ladders cut into the rock. Fruit, wine, and cotton are produced. Pop. 23,000.

**Eglantine.** Name applied by the earlier poets, notably Chaucer, Spenser, and Shakespeare, to the sweet briar (*Rosa rubiginosa*). In Milton it probably refers to the honeysuckle (*Lonicera periclymenum*), still called eglantine in parts of Yorkshire. See Sweet Briar.

**Eglington.** Village of Ayrshire, Scotland, in the parish of Kilwinning. It is chiefly notable for its castle, a seat of the earl of Eglington and Winton. This is a building dating from 1798 but modelled on the baronial castles with towers and a keep. The village is on a coalfield, and near are large ironworks and coal mines.

**Eglington.** Village of co. Londonderry, N. Ireland. Situated 10 m. E.N.E. of Londonderry, it is on the main Belfast road and has a railway station. During the Second Great War a large aerodrome was built from which air cover was provided for the Atlantic convoys. This was later taken over by the U.S.A.A.F. Pop. of village, 850.

**Eglington Tournament.** Revival of the medieval tournament by the 13th earl of Eglington, Ayrshire, held at Eglington Castle. Aug. 28, 1839. The week's pageant was entirely spoiled by rain. Arrayed in complete suits of armour and representing characters in chivalry, some 15 knights tilted in ancient fashion, breaking their spears in the jousts and finally paying their devoirs to the queen of beauty, Lady Seymour, afterwards duchess of Somerset.

**Egmont.** Cone of an extinct volcano, North Island, New

Zealand. It rises from the Taranaki plain to a height of 8,260 ft. It is perpetually covered with snow, and is a well-known land-mark for sailors.

**Egmont, LAMORAL, COUNT OF** (1522-68). Flemish soldier and politician. Younger son of John IV, Count of Egmont, he was born at Hainault, Nov. 18,

1522. He served in the Algerian expedition of Charles V, and married a sister of the elector palatine. He acted as emissary between Philip of Spain and Mary of England, attending their wedding ceremony. His charge against the French at St. Quentin, 1557, and a brilliant victory at Gravelines, 1558, made him the hero of Flanders, and he was appointed governor of that province by Philip. Egmont protested against the Spanish administration, but refused to join the conspiracy of Flemish nobles in 1566; nevertheless, he incurred the enmity of Alva, regent of the Netherlands, was imprisoned at Ghent, condemned by the notorious Council of Blood, and beheaded, together with Count Horn, in Brussels, June 5, 1568.

The execution of these leaders is usually taken to mark the beginning of the revolt of the Netherlands. In 1865 a monument to Egmont was erected on the site of his death. His closing years are the subject of Goethe's great and popular tragedy (1788). To this work Beethoven wrote incidental music (op. 84) in 1810; the overture continues to be played at orchestral concerts.

**Ego** (Lat. *I*). Term employed generally in psychology to mean either the self or that side of the self which is governed by the instinct of self-preservation. By Freud it is used for that portion of the mind which receives knowledge of the external world through the senses, is capable of reasoning, can be directly modified by experience, and initiates direct voluntary responses to stimuli. The ego is distinguished from the id and the super-ego and in a satisfactorily adjusted person controls the activities of both by means of reason.

**Egoism** (Lat. *ego*, *I*). In philosophy, the theory that only "I" exists, and that everything else is

only an idea of this "I." This is now more commonly called solipsism (*solus*, alone; *ipse*, self). Egoism is more generally understood as the theory of self-interest, which leads a person to act with a view to securing pleasure and advantage for himself without any consideration for others. Egotism, as distinct from egoism, is thinking or telling too much about oneself.

**Egoist, THE.** Novel by George Meredith (*q.v.*), published in 1879. If not great as a story it is yet one of Meredith's greatest prose works. In the central character, Sir Willoughby Patterne, is presented a remorseless delineation of egoism fostered by circumstance.

**Egremont.** Urban dist. and market town of Cumberland, England. It stands on the Ehen, 5 m. S.E. of Whitehaven and close to the Irish Sea. An ancient town, Egremont was a parl. bor. in the reign of Edward I, and has ruins of a 12th century castle. Iron ore is mined and limestone quarried. Market day, Sat. Pop. 6,015. Another Egremont, in Cheshire, is a N.W. suburb of Birkenhead.

**Egremont, EARL OF.** British title borne by the family of Wyndham from 1750 to 1845. It was

first a subsidiary title of the 7th duke of Somerset, Algernon Seymour, for whom it was created in 1749. From him it passed, in 1750, by special arrangement, to his nephew, Sir

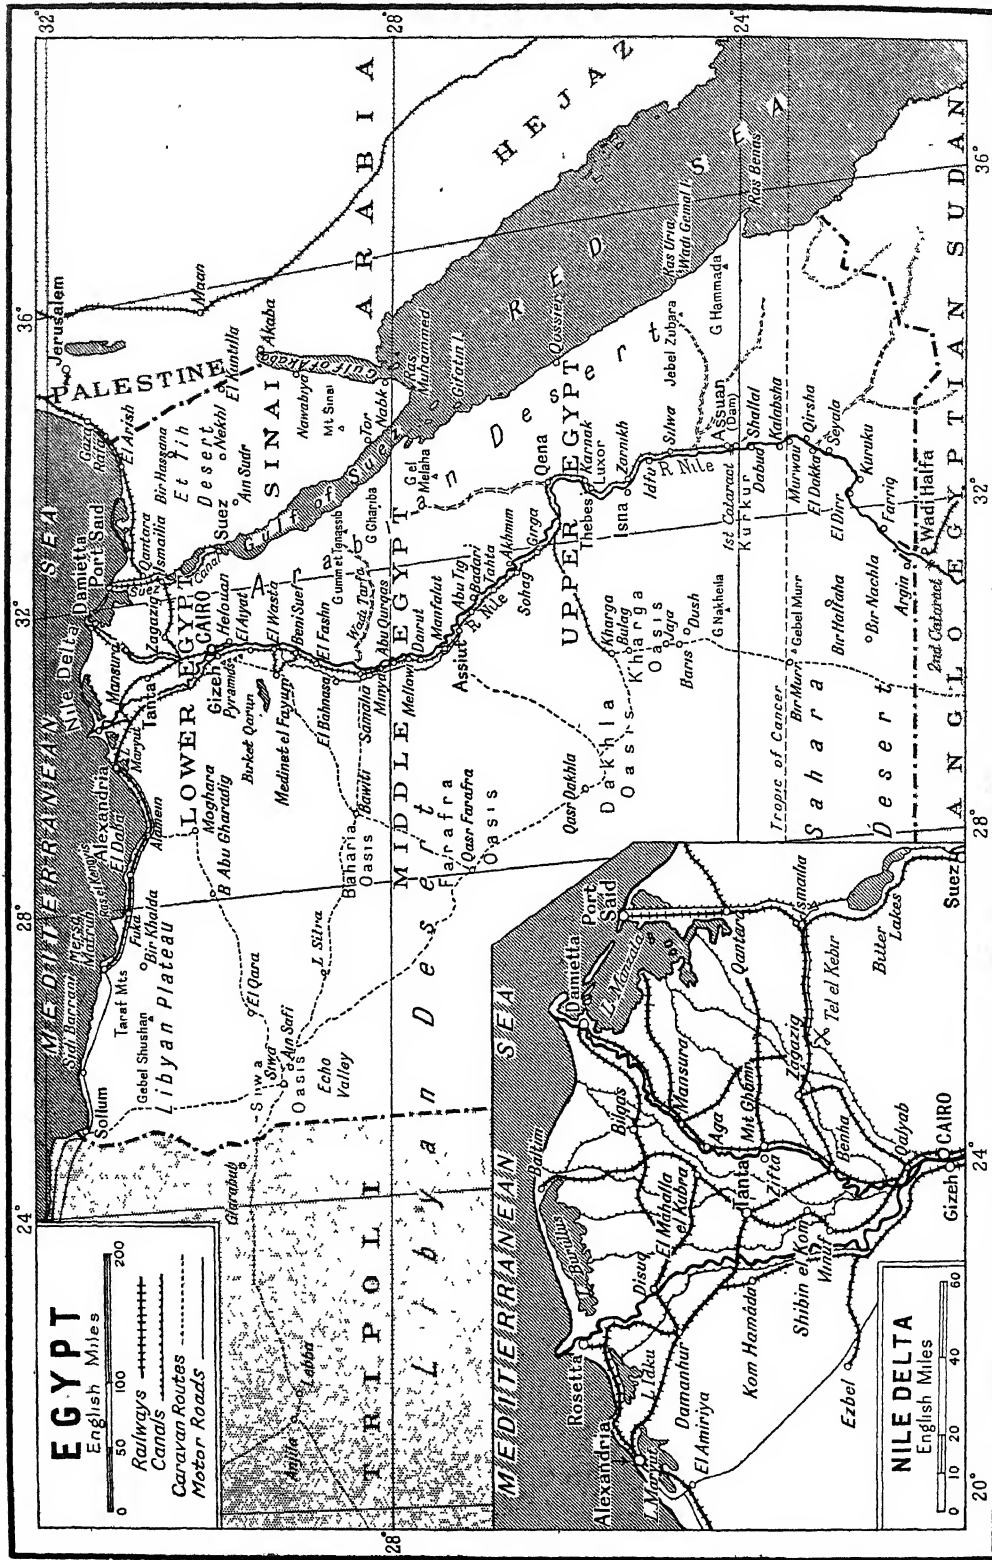

After T. Phillips, R.A.

Charles Wyndham (1710-63), who was secretary of state, 1761-63. The 3rd earl, George O'Brien Wyndham (1751-1837), made Petworth, his Sussex residence, noted for hospitality. When he died he left his estates to his natural son, George Wyndham, who was made Baron Leconfield in 1859. The title earl of Egremont passed to a nephew, and became extinct on his death in 1845.

**Egret.** Name applied to several species of small white herons, of which the little egret is one of the best known. It occurs rarely in Great Britain, but is common in S. Europe and many parts of Asia and Africa. See *Aigrette*.

**Egri Palanka.** Town of Yugoslavia. It is on the high road from Uskub (Skopje) to the Bulgarian frontier, and on the Pcinja. It is both a trade and strategic centre.

# EGYPT: IN ANCIENT AND MODERN TIMES

SIR W. M. FLINDERS PETRIE, F.R.S., MARGARET MURRAY, D.Litt., and KENNETH WILLIAMS

*This article is divided into two main sections. The first describes the wonderful civilization which grew up in Egypt in the earliest days of recorded history, as revealed through archaeology. The second gives a concise account of modern Egypt, especially since the granting of independence in 1920. For later information see Novissima Verba at the end of the Encyclopedia. See also Pyramids; Dendera, Karnak, etc., and articles on the various rulers of Egypt; Alexandria; Cairo; Suez Canal, etc.*

Egypt, owing to its unique climate, the amount of sunshine being more than tropical, is one of the most important lands in the history of man. Its productive power is unrivalled, while the usual N. wind makes it cooler than any other country of that latitude, except ocean coasts. These conditions fitted it for the growth of an early civilization. The advantage of having excellent building stones along the whole valley, with easy water transport, and the necessary lack of agricultural work during the inundation for a third of the year, were the most favourable conditions for a great architecture. The extreme dryness of the country has further led to the wonderful preservation of even the frailest materials. It is thus possible to take a longer continuous view of human changes here than in any other land. The only hindrance is that, the Nile bed and water level of the country having risen about 5 ins. in every century, the early dwellings of man in the plain are now 20 ft. under water.

## Earliest Human Work in Egypt

The Nile Valley began its history as a fault in the Eocene limestone which covers the surface for 400 m. from the sea. This was much raised on the E. side, up towards the Red Sea mts., while on the W. side the surface dips down in the Fayum, and also in the oases, below sea level to more than 100 ft. The fault in the strata naturally received the drainage of the plateau, and so gouged out the Nile Valley. The continuous changes in the history of the country that can be observed begin with the first interglacial period, when there is evidence of a fall of sea level about 300 ft. below the present, compared with 200 ft. in Europe. In the second glacial period a rise of the sea to 650 ft. above the present level compares with 900 ft. in Europe.

The earliest human work here is of the second interglacial age, that of the grand Chellean flint work of Europe, fully equalled in Egypt. This would be placed by some authorities at 250,000 years ago. The sea had retreated in Europe to 600 ft. below the present level, making land continuous from Africa to far W. of Ireland. The

climate was warm and dry, and mankind took a step forward in artistic perception, shown by the imperishable flint remains.

## A Rainless Land

To this succeeded the third glacial period, long ages of cold and high sea level, cutting Europe into scattered islands. The misery of this age is seen by the decay of the only art we can trace—flint working. In Egypt the sea level rose to 800 ft. over the present, compared with 700 ft. in Europe. The Nile Valley and its tributaries were silted up with rolled gravel and sand, and rolled beds of gravel are found at the top of high cliffs. When the sea retreated and the Sahara dried up, there was no more moist wind to form rain, and Egypt became the rainless land we know. Of the later stages of the Stone age in Europe, known by the artistic products of cave man, there are the equivalents in Egypt on the surface. Flints of Mousterian, Aurignacian, and Solutrian types are found in sites on the desert; and the Magdalenian types are those of the prehistoric civilization which can be traced into historic times.

The colouring materials and the patterns are exactly like those of the highland Algerian pottery today; and, as the skulls of the prehistoric Egyptians are almost exactly the same size as those of the prehistoric Algerians, it seems that these early civilized Egyptians were one with the North African people. Stone vases, usually of basalt, were also made, entirely by handwork, without turning. Slate palettes became usual for grinding the malachite which was painted round the eyes as a preservative. The palettes were made in the forms of the elephant, stag, turtle, bird, fish, etc. Ivory combs to fasten the hair were usual, with figures of animals standing upon them. Flint working was highly developed, equal to the best European. The whole civilization seems to have been much on the level of the Maori, or the best Pacific island stage.

**PREHISTORY.** This is divided into five periods, each called after the modern village near which the remains were first

found: (1) Tasian, (2) Badarian, (3) Amratan, (4) Gerzean, (5) Semainian. Of the Tasian little is known, but the Badarian has been well worked out.

The method by which the prehistoric age was reduced to its order of growth can be briefly stated. If there is a full record of all varieties of pottery and other objects found in a thousand or more groups or graves, it will be seen that some forms are obviously derived by degradation from others. A rough classing by such means can be extended by percentage of forms like those already classed; as with the percentage of recent shells in various Tertiary strata. By other modes of sorting and comparison, the groups can be put in their most probable order, keeping all resemblances as close together as possible in the series. Such a series was first worked out only on the Amratan and Gerzean periods, which were divided into numbered stages from 30 to 78, at which point the first dynasty begins the written history. The order of prehistoric time is therefore stated not by years but by sequence dates. Though this method was worked out in the study and not in the field, its accuracy was abundantly proved by excavation.

## Sequence Dates

The sequence dates of the Badarian period run from 20 to 30. This culture merges without a break into the Amratan. The Badarians were already acquainted with the use of metal, for crucibles have been found among their remains. Though Badarian and Amratan pots are alike in being covered with a wash of haematite and then polished, the shapes and decoration are different. The Badarians used open bowls, and their characteristic mode of decoration was by combing the surface of the vessel with an instrument of many prongs. Trade with other countries was already well established; ivory, lapis lazuli, copper, and foreign pottery are found on Badarian sites. Glazing of stone is first known in this period.

The Amratan culture, which began at S.D. 30, introduced entirely different types of pottery, the decoration being by patterns.

By S.D. 36 considerable changes begin; new types of pottery rapidly appear, and others die out between 38 and 43. The older stone forms cease at S.D. 40, the newer begin at 39. New materials come in, silver at 38, diorite at 39 haematite at 40. In pottery the characteristic is a class of light brown hard ware, decorated with painting in red lines, and evidently copied from stone forms, in place of basket patterns. By S.D. 40 the culture had suffered a change so complete as to suggest an armed conquest with the annihilation or enslavement of the Amratian population. No such change is found again in the cultural history of Egypt until the Roman conquest. The Gerzean culture was the direct ancestor of the great civilization of the Nile Valley, greatest civilization of the Bronze Age. The links of various kinds are with the E. rather than the W.; the capital may have been Heliopolis, a prehistoric centre of worship.

The climax of this civilization was about S.D. 55. More metal was used; flint flaking reached a perfection not known anywhere before or since; the hardest stones were perfectly cut for vases; gold, amethyst, turquoise, obsidian, and porphyry came into use. Large ships on the pottery indicate the spread of commerce.

In the Semian period the physical type of the people approximates toward the historic type. Probably for centuries a fresh race had been permeating the country. At last a body about a tenth of the number of the male population entered Egypt as conquerors. They seem to have started in Upper Egypt, and it is probable that they came across the desert road from the Red Sea to Koptos. They were of a higher civilization than the natives, bringing with them the elements of writing, and a great artistic skill, as well as more organization. They held Upper Egypt at first, centring at Hierakonpolis (40 m. S. of Thebes), and later at Abydos (40 m. N. of Thebes). Thence they conquered down to near the Fayum, where they centred about S.D. 77-78. Memphis became the capital in S.D. 79 under Menes and his successors of the 1st dynasty.

At this point we touch the continuous written history of the country. About the close of the Vth dynasty the Egyptians set up an engraved chronicle, known as the Palermo stone, stating the main event of every year, and the height of the Nile, from the beginning of the 1st dynasty. Later

there were papyri containing complete lists of the kings, with the reign of each stated in years and days, with summaries of events. Parts of such a papyrus of the XVth dynasty remain, known as the Turin papyrus. There are monumental lists of kings at Abydos, set up in the XIXth dynasty, but only of the best known periods. Lastly, there are the transcripts of a Greek version of the history compiled by Manetho, which, with many minor corruptions, gives a consecutive record of the whole of the dynasties. All these records agree in their general account, they agree with the total reckoning quoted by Herodotus, they agree with the various external checks—astronomical and others—that can be discovered. This account is therefore accepted here; but many writers prefer to abandon the authorities, and construct fanciful systems of shorter length, bringing down the 1st dynasty from 5500 B.C. of the Egyptian record to about 3000 B.C.; all dates before 1587 B.C. are also reduced.

The 1st dynasty (about 5600-5300 B.C.) was the highest point of the Third civilization. Much of the old arts continued; the hard stone vases, the rich burials, the style of pottery, all show continuity. Yet there was an immense change: writing became usual; a large official class had arisen to administer the country, each office, with its seal, down to the gatherer of lotus seed; jewelry shows skilful work; building both in wood and in brick was much increased; ivory carving was excellent for its natural character and freedom of expression; the use of copper was much extended; and glazing became a decorative art for building. The IIrd dynasty was only a gradual decay, but the IIIrd shows a fresh influence which led up to the greatest age of all.

#### Glories of the IVth Dynasty

The IVth dynasty (about 4800 to 4500 B.C.) established the Fourth civilization. The Egyptians here reached the highest mastery of art, of grandeur, and of conception. Never has the immensity or the accuracy of the great pyramid of Khufu (Cheops) been equalled in later ages; never has there been a greater expression of character and dignity than in the portrait sculpture; never has any people created a greater mass of artistic detail for their tombs, and presumably also for their dwellings now lost to sight. The personal character shown in the portraiture is most attractive; the firmness with kindliness, the dignity unspoiled by

mere pride, the vigour, insight, determination: all this agrees with the ideal character set out in the maxims of that age: "If thou art found good in the time of prosperity, when adversity comes thou wilt be able to endure"; "Let thy heart be overflowing, but let thy mouth be restrained"; "The cautious man succeeds, the accurate man is praised"; "I am one that smooths difficulties; I am one prudent in preventing and easing grief, quieting the mourner with pleasant speech"; "Make not terror among men." During the Vth and VIth dynasties Egypt retained its great civilization, diminished in some respects, with wider diffusion but less care and splendour. By the VIIth dynasty, about 4000 B.C., foreigners were pressing into the country. The old art lingered on in an absurdly degraded form during four centuries.

#### The Coming of the Syrians

The XIIth dynasty (about 3600-3400 B.C.), established the Fifth civilization. By the middle of the XIth dynasty the princes of Thebes began to spread their power, large tombs were again excavated, and monuments carved. The XIIth dynasty reunited all the country, and pushed into Nubia, civilizing and consolidating that region at least as far as the third cataract (lat. 20°). The most magnificent king of this age was Amenemhat III, whose sepulchre was a tank, cut and polished in a block of glass-hard sandstone, 22 ft. long inside, and weighing 100 tons. He reclaimed a large part of the Fayum which had been till then a swamp. The whole character of the age has less originality and freshness than before, more regularity and exact detail, and a more formal treatment of every subject. The Syrians were beginning to press into the country, and in the decadent dynasties, the XIIIth and XIVth, some even rose to be kings. These were the forerunners of the great Hyksos conquest about 2600 B.C.

The XVIIth-XXth dynasties (1587-1102 B.C.) established the Sixth civilization. The XVIIth dynasty was a Nubian family which headed the southern Egyptians against the Hyksos, who were finally expelled from Egypt by Aahmes, the founder of the XVIIIth dynasty. This revival centred specially at Thebes, which became the largest city of the time, and has left a great mass of temples and painted tombs. The most important aspect of this age was the foreign intercourse, by conquest in Syria and by trade with Babylonia, Crete, and Greece.

By about 1530 B.C. Thothmes I had conquered all Syria out to the Euphrates near Aleppo. All this was retained until the wars of Thothmes III, about 1460, and almost as much until the crumbling of the foreign hold under Akhenaton about 1370 B.C. In the XIXth dynasty Sety I recovered Syria entirely, about 1320 B.C.; and Rameses II, though pressed by the Hittites, kept the greater part of that land till about 1250. After that, Egypt barely held a little of the S. of Palestine. On the W. Egypt did not extend any political influence, and the connexion was only by trade, which is mainly seen by objects of Amenhotep III, about 1400 B.C., at Mycenae and other centres, and by great quantities of Greek vases imported into Egypt, especially about 1370 B.C. When Egypt became weakened, there were great coalitions of the Algerian and western peoples against it in 1229 B.C. in the reign of Merneptah, and again in 1197 in that of Rameses III. This was followed by a coalition of Syrians and western peoples in 1194, who were overthrown in a great naval battle.

#### Semitising of Languages and Art

The frequent wars in Syria led to the bringing of great numbers of Syrian men and women into Egypt, and so to the semitising of Egyptian language and art. A greater change took place in 100 years than had arisen in 1,000 years before. The fashion of the time was for a light and piquant style, as seen in Crete; and the sober matter-of-fact Egyptian responded to it, with fatal results to his own character. Graceful and pleasing as many of the tomb scenes are, they have none of the solidity of the old tomb sculptures or paintings on hard rock; a mere coat of plaster or mud over a very rough chamber, all askew and irregular, was sufficient grounding for the perishable colour washes, which would be ruined by a touch of water; the older work was so firm that it could be scrubbed without removing the colour.

The XXIIst dynasty (1102-952 B.C.) was an age of poverty and weakness. The land was amicably divided between a succession of priest-kings at Thebes, and the kings at Tanis in the Delta. The main interest at Thebes lies in the desperate attempts to save the mummies of the kings of the XVIIth-XXth dynasties from destruction by robbers. After many had been attacked, and most had been shifted about for safety, the priest-kings at last made one great *cache* at Deir el Bahri, which was left unopened

because it was known that no gold remained with the bodies. Thus it was left until our times, and we can now see most of the celebrated kings of this age face to face in the Cairo Museum.

The XXIInd and XXIIIrd dynasties (952-721 B.C.) revived the power of Egypt somewhat. They were due to the energy of a Mesopotamian adventurer, Sheshenq or Shishak, and his family, who settled at Bubastis. The gold masks and silver coffins of kings and principal officers suggest to what use the loot from the temple of Jerusalem was put. But there was no revival in the life of the country. The Ethiopian invasion about 727 B.C. found Egypt split up among 18 or more little states, but it seems to have put fresh life into the country. The Ethiopian kings who ruled till 664 B.C. were vigorous and able men, and they had a good system of appointing the crown-prince as viceroy of Egypt, so that there was energetic management under experienced control.

The XXVIth-XXXth dynasties (664-342 B.C.), founded the Seventh civilization. They were under Ethiopian influence and then largely controlled by Greek action, and under Persian rule. There was some revival of energy abroad. Necho in 609 raided all Syria to the Euphrates and held it more or less for four years, when the new power of Babylon defeated him, and he retired to Egypt. The Persians held the country from 525 to 401 B.C., and then the native Egyptians in the Delta revived for a couple of generations, forming the XXIXth and XXXth dynasties, 399-342 B.C. Ten years of miserable destruction under the degenerate Persian ushered in the golden age of Alexander's conquest.

#### The Rule of the Ptolemies

The transition from Alexander and his heir to the rule of the old general Ptolemy Soter (the Saviour) was very gradual. Ptolemy, it may be said, ruled from the death of Alexander in 323. The earlier of the family were very able men, wary, strong and enlightened, backed by powerful queens of their own family. Egypt had not been so peaceful and prosperous for some centuries as it was from 300 to 200 B.C. Even under the effete rule of the later Ptolemies, the country was one of the most learned and richest in the world. This dynasty possessed Cyprus and Cyrene for a long time, and parts of Syria and the S. of Asia Minor in the intervals of the perennial squabbles with the Antiochi.

THE ROMAN AGE (30 B.C. to A.D. 640). The end of Egyptian inde-

pendence was the death-stroke to the country. From being one of the richest lands, it became the milch-cow of the emperor of Rome, the private property of the Crown. It was steadily drained of all wealth, taxed in corn to feed Rome, taxed in money, and after three or four centuries even the shabbiest copper coin ceased to be struck, and the people were reduced to barter. Occasional massacres were about the only events that marked the Roman rule.

#### The Arab Rule (A.D. 640-1517)

This was the Eighth Civilization. The Roman government collapsed before a few thousand wild Arab horsemen. Yet such was the vitality of the country, that under the alien but just rule of the Arab, within two centuries the land tax alone produced six or seven million sterling—far the largest revenue of any country of that age. There can be no comparison between the advantages of Roman and of Arab rule. Yet that, like all other power, decayed, and the Mamluk dynasties, for some centuries before the Turkish conquest, were a ceaseless turmoil of fighting and plundering. This unrest was renewed when Turkish power waned, and only the strong hand of Mehmet Ali recovered the advantages of a united government.

THE PEOPLE. Egypt, in spite of its isolated position, has been subject to continued mixtures of race. Starting with an Algerian stock, there have been four or five inflows from the E., two more from the W., a large Greek population in the Delta, and continual mixtures of Southerners from slave labour. Yet the national type of character has remained much the same, and the skull measurements after each mixture return in a few centuries to the older size. Agriculture has always been the main industry of the country, the regular inundation and strong sunshine making it very profitable. Cattle are not kept in large numbers, as all the fertile land is inundated for a third of the year, and there is no permanent pasture. The usual feeding of cattle is by tethering in green crops, or by hand in the summer.

The ancient organization, which may still be seen in the remote country, is for each district to be the property of a great man—anciently an hereditary noble. The police and guards of his district were his personal servants. On his estate he kept workmen for all current purposes; in his great house lived all the artificers that were needed for manufactures; weavers, carpenters, smiths, jewellers, boat builders all belonged to the establishment, and worked as directed. Trade was

mostly in petty market wares, and in raw material not produced on the estate. The government was on the same model. The royal court was only the greatest of the nobles' estates, and the ordinary government was carried on by the officers of the king's household, who only interfered when needful with the local administration of the nobles. It was something like the British control over the native states of India. When a noble wanted great blocks of stone, or anything only produced on the royal estates, he applied, and was granted the present of the material. The tribute sent from different nobles to the court was trifling, merely pin-money for personal use, showing that all cost of government was borne locally by the nobles. The system gave great social stability to the country, everything went on as usual, whether the king was strong or weak. The only purpose of the kingdom was to prevent local fighting and to unify the land for defence.

The official class was probably always corrupt; the management of cases and witnesses under Rameses X reads like modern police work. Where a capable noble can be found, the purely local administration is more likely to be just than where a centralized professional police are in authority.

The army was originally on a small scale, probably the king's people from his estates. By the XIIth dynasty the scribe of recruits is found, and in the great military age of the XIIIth-XXth dynasties the recruiting was severe in Egypt.

#### Native Troops and Auxiliaries

The army was divided into four brigades, named after the great gods of different regions; the army of Amen from the Thebaid, that of Ptah from middle Egypt, that of Ra from the upper Delta, and that of Sutekh from the E. and lower Delta. Besides the native troops, there were many auxiliaries—Libyan and negro archers in early times, Sardinian and other Mediterranean folk later. The Greek accounts of the army forming a regular caste with hereditary lands, was probably a continuation of the Rameside system. The Ptolemies further settled Greek troops, largely in the basin of the Fayum, which they reclaimed by reducing the inflow of the Nile.

The position of women was always high until the Arab conquest. Property was essentially held by women. A man might even have to declare at marriage that all his earnings passed to his wife. Down to Coptic times a wife's

consent was necessary for a valid sale in an open market; even though a mere formula, it proves original intention. The wife always appears side by side with her husband on monuments, and parentage was almost always reckoned one or two generations farther back on the female than on the male side. Apparently the inheritance to the kingdom depended entirely on the female line, and whoever was king in fact had in law to marry the heiress. Polygamy was unusual but not prohibited; in one case of a childless wife the husband took six others. There is no ceremony of marriage preserved, and as in Christian Egypt it was a legal contract, rather than religious, it was doubtless so before then. In the Christian contract there was a divorce clause, stating that either party could cause divorce by proclaiming it in the congregation. The husband's gift was only 12s. and the divorce penalty seven times that sum. In the XXVth dynasty the penalty was only the returning of half the marriage portion.

#### Simplicity of Native Costumes

Dress was simple, befitting the climate. In prehistoric ages the men wore a girdle, the women a short linen petticoat like the Dyaks, or later the Malay *sarong*. The dynastic men wore a waist-cloth or kilt, like that enjoined by Mahomet, from the navel to the knees; the women wore a long, white wrapper, from below the breast to the ankles, held up by shoulder-straps. These remained the dress represented in art till the XIXth dynasty; but in reality, as early as the Vth dynasty women wore tight, high dresses with very tight sleeves, like the modern *galabiyeh*. At the same period, pleated linen drawn into folds was also used. In the late XVIIIth dynasty and onward, very full pleated linen dresses were used for men and women. For the winter, a thick, quilted robe was worn, as shown on an aged king of the Ist dynasty; thick, stiff, long wrappers were usual for viziers and high officers in the XIIth dynasty. In Greek times, thick outer wraps, often with fringes, were usual. Stuff with very long, loose threads all over it, like a shaggy fur, was woven in the XXist dynasty. The weaving of coloured patterns began in the XVIIIth dynasty, but was extremely rare. The common use of colour patterns on clothing is entirely of the Roman period, and most used in the Christian age, as satirised by Jerome.

**EDUCATION.** The Egyptian was always business-like, and kept tallies of all goods, from the Ist dynasty onward. A tally of the XVIIIth dynasty gives the ensign of the Nile boats and the number of blocks of stone which each carried. From these tallies elaborate accounts were drawn up, listing every goat or pigeon on an estate, or putting down as gifts to the gods every item of 106,792 loaves of one kind or 1,975,800 nosegays. Every noble had a staff of scribes on his estates to keep all the bailiff's accounts, and they are very often shown in the tomb sculptures. By far the greater part of the documents that are preserved of all periods are the accounts. This proves that there was a large class of men all through the country who could write, though probably the peasant or petty trader was not as well educated as in Babylonia.

Education was probably in general from father to son, but in the XVIIIth dynasty schools were attended in the towns. A rough and practical geometry was used by the scribes, for the areas of fields and the contents of conical granaries. There was certainly also a much more skilled geometry and astronomy by the pyramid builders, who were capable of setting out a building true to 1 in 10,000 and positions by the stars to 1 in 1,000. In the XVIIIth dynasty the clepsydra or water clock was made as a wide conical vessel, to compensate for the quicker flow of water at greater pressure, and was graduated for each month to compensate for the changes of temperature. In the same age botany was studied, and Thothmes III sculptured a chamber with the foreign plants of his Syrian wars, having separate figures of fruit and seed like a botanical work. The Egyptian always had a keen eye for differences of race, and showed on monuments the types of all the peoples that he visited.

#### Egyptian Literature

The literature begins in the pyramid period with maxims and wonder-tales of magicians, parallel to medieval tales of miracles. In the XIIth dynasty tales of foreign adventure were in fashion, succeeded in the XVIIIth dynasty by tales of character. The growth was therefore much the same as in the last few centuries in Europe. There were also serious works which showed the deeper thoughts of the time. In the XIth dynasty they wrote:

Since the time of the ancestors—  
The gods who were aforetime—  
Who rest in their pyramids . . .  
Their place is no more . . .

None cometh from thence . . .  
 That he may tell how they fare . . .  
 Until we depart  
 To the place whither they have gone.  
 Encourage thy heart to forget it  
 Making it pleasant for thee to follow  
 thy desire  
 Until that day of lamentation cometh  
 unto thee . . .

There is also the song of the man  
 who is weary of the world :

Death is before me to-day,  
 Like the recovery of a sick man,  
 Like going forth into a garden after  
 sickness.  
 Death is before me to-day,  
 Like the odour of myrrh,  
 Like sitting under the sail on a windy  
 day.  
 Death is before me to-day,  
 As a man longs to see his house  
 When he has spent years in captivity.

#### The Gods of the Egyptians

The earliest belief about gods so far as is known, is tribal monotheism, of which traces remain in the early historical writings. Each tribe in the Nile valley seems to have had a separate divinity. As the tribes amalgamated in prehistoric ages, they joined in worshipping two gods, as husband and wife, or father and son, or three gods as a triad. Later, in historic times, when the relationships were already settled, fresh gods were brought in by compounding names, as Ptah-Sokar-Osiris, belonging to three different sources of population. This process was not complete till the XVIIIth dynasty.

Four great classes of gods can be distinguished, the animal gods of the earliest population, the Osiride gods in human form of western origin, the Solar gods of eastern introduction, and the abstract gods, as the Father god, Mother goddess, Creator god, goddess of Truth, etc. All these classes had been mixed in Egypt before the historic times. The belief in passing over a water of death was as old as before the first prehistoric civilization, as the king is said to do so on a float of reeds, whereas boats were usual in the second age. The myths of hunting and killing the gods and feasting on their cooked limbs is older than the Osiris worship, as he is expressly said to have led the Egyptians from cannibalism and violence. From various such indications it is possible to restore several stages in the growth of beliefs long before the date of records that we have. Certainly there was a firmly accepted belief in a ritual for the dead, as from the earliest graves known until historic times the orientation is usually the same, and the funeral offerings do not alter but only increase as time goes on. There must have been an accepted ritual for the position of most of the

offerings, which proves settled and continuous beliefs.

In historic times the principal animal gods were the baboon and the ibis of Hermopolis, lions in some Delta towns, cats at Bubastis, bulls at Memphis, Heliopolis, Kanobos (Canopus), Hermonthis, rams at Mendes and Thebes, crocodiles in the Fayum, hawks at Hierakonpolis and Koptos, serpents at Buto, and several kinds of fish. The principal animal-headed gods were Khnumu the creator and Hershefi, both ram-headed, Bast of Bubastis, Anubis jackal-headed, Thoth ibis-headed, and Horus hawk-headed. The purely human gods were Osiris, Isis, Nebhat, Horus; Amen, Mut and Khonsu

open along the front. The next stage is to have a store chamber at the back, then a way to the roof: after that more chambers and then a roof chamber forming an upper storey. This was no doubt the growth of the superior house also, and as the temple was the house of the god, it is the plan of the temple. In the latest of the temples the old verandah remains as the vestibule hall open in front, the courtyard is the temple court, the store chambers come behind the hall. The peristyle court is an expansion of the verandah around the front court. The hypostyle hall, farther in, is the usual inner hall of the dwelling house. It has also been proved that the course

Egypt. Bird's-eye view of the ancient fortress of Semneh, as restored by Charles Chipiez

From *A History of Art in Ancient Egypt*, G. Perrot and C. Chipiez, by courtesy of Chapman & Hall, Ltd.

the triad of Thebes, and Neit of the Delta. The cosmic gods are Ra the sun, also called Aten, Anher the sky, Sopdu the zodiacal light, Nut heaven, Geb earth, Shu space, Hapi the Nile. The abstract gods were Ptah the Creator, Min the Father, Hathor the Mother, Maat Truth, Sefekh of writing, Nefertum of vegetation.

One great break in the religion must be mentioned, the entire dominance of a scientific worship of the radiant energy of the sun, called the Aten or "lord," to the exclusion of all other gods. This hardly survived the life of its founder, Akhenaton (1383-1365 B.C.).

#### Art and Architecture

The simplest beginnings of architecture are seen in the models of the peasants' huts that were placed on the graves for the spirits. The essential is a verandah with an enclosed court before it, perhaps developed from the Bedawi tent.

of daily worship of the priest was directly copied from the domestic service to a noble.

Generally temples grew through additions by different kings, as in London the building of Westminster Abbey extended over four or five centuries. Beside the house temple, just noticed, there were shrine temples, copied from the hut shelters put over the sacred ark of a god; these were open front and back, so that a procession could pass through them.

The earliest known temple is part of the great complex of buildings of the IIIrd dynasty surrounding the Step-pyramid at Sakkarah; its reeded and fluted pillars are of white limestone. Next in date is the temple of Khafra of the IVth dynasty at Gizeh; this has plain square monolithic pillars of red granite, 16-20 ft. high. When soft sandstone was

used in the XVIIIth dynasty, and later, the larger temples became choked by the bulky columns required, as at the Great Hall of Karnak. The decoration of the temple with scenes of offering was not for ornament, but in order that the representation should magically be equivalent to the perpetual performance of the successive acts of divine worship. The sculpture in the temples followed the general course of the art.

The complete temples remaining are, of the IVth dynasty, the granite temple at Gizeh; of the XVIIIth, of Hatshepsut at Deir el Bahri, Thothmes III at Medinet Habu, Thothmes I to Ptolemies at Karnak, Amenhotep III at Luxor and El Kab; of the XIXth, of Sety I at Abydos, Qurneh, and Redesieh, of Rameses II at Ramesseum, Abu Simbel, and various Nubian, of Rameses III at Medinet Habu, Ptolemaic at Edfu and Dendera, Roman at Esneh. Three series of royal tombs are known—the underground brick and timber chambers of the Ist and IInd dynasty at Abydos, the pyramids of the IIIrd–XIIth dynasty at Gizeh and, scattered for 40 m. S., the rock-cut chambers of the XVIIIth–XXth dynasty in the tombs of the kings at Thebes.

Remarkable excavations, confined chiefly to the Valley of the Kings in the Thebes district, were conducted by the 5th Lord Carnarvon (*q.v.*) and Howard Carter (*q.v.*). The latter on Nov. 5, 1922, in almost the last unexplored piece of ground, made the sensational discovery of the tomb of King

Egypt. Ancient riverside villa, as restored by Charles Chipiez

*By courtesy of Chapman & Hall, Ltd*

Tutankhamen (*q.v.*), and he superintended the removal of the treasures found therein.

The mummies of the kings from these Theban tombs have been preserved. Great cemeteries of private tombs with sculpture and painting are at Gizeh and Sakkarah for the pyramid age, at

Beni-Hasan for the XIIth dynasty, and at Thebes for the XVIIIth–XXth dynasties. Forts of massive brick enclosures, with panelled pattern outside, are of the IInd dynasty at Abydos, and of the XIIth dynasty in Nubia. Temples were often fortified with immense walls, as that 80 ft. thick at Tanis. The only complete plan of a town is of the XIIth dynasty; it has many large mansions of 60 rooms and rows of streets of workmen's houses, all laid out in a regular plan. The houses and the earlier temples were built of mud brick, which was covered with lime-wash or stucco, on which fresco painting was placed in the better houses; the early brick temples were sometimes lined with glazed tiling of large size.

Statuary is known from the Ist dynasty onward. It begins in limestone and ivory, with an entirely naturalistic style, full of character and life, and superior to later work in its truth and absence of convention. A copper statue is recorded in the IInd dynasty, and a large copper statue has been found of the VIth dynasty. Diorite and other hard rocks were also sculptured. In the XIIth dynasty the style was more finished and delicate, but less living. The XVIIIth dynasty had more vivacity, but

generally less able work; hard rocks were mostly used, and many colossal statues were carved, ranging to 900 and even 1,200 tons weight. Though work declined in the XIXth dynasty and onward, there was a revival in the XXVth and a modification by Greek influence after that; but there is no sculpture of merit after Alexander.

Metal work—mostly in copper—was skilfully wrought. Large vessels were made by hammer work, often figured in the tomb sculptures; a narrow-necked flask of copper is only 1.40th in. thick. The casting, a thin form of copper in place of a wax model, was carried on from the IIInd dynasty: for figures a core was made of ash and clay, a thin coat of wax was put over it and finely tooled, an outer mould was placed around that, the wax melted out, and copper or bronze run in. The metal is often not more than 1.50th in. thick. A ring handle playing loose in its ring attachment were cast all in one. Spinning thin metal bowls in a lathe was perfectly done in the XIXth dynasty.

Jewelry was delicately made as early as the prehistoric, when minute beads of gold, and thin gold worked over a core of limestone, are found. In the IInd dynasty gold was perfectly soldered, and in the XIIth dynasty there was the most delicate work of soldering cloisons of gold on an open-work basis, and inlaying with hundreds of minutely cut pieces of coloured stones—turquoise, lazuli, and cornelian. No later jewelry

exceeded this in beauty and delicacy, though the same style was maintained till Greek times. Granulated work was finely made in the XIIth dynasty; minute globules of gold in close rows were soldered on curved surfaces in regular patterns with perfect precision. In the XVIIIth dynasty there was less delicacy, and the favourite process was the inlaying of one metal in another to form figures and scenes.

Egypt. Harvest scene, as shown on a tomb at Gizeh

In the XXVth–XXXth dynasties this inlaying of gold thread in bronze was carried out so as to clothe statues completely with designs copied from embroidery.

Glazing was known from the beginning of the prehistoric civilization, and used to cover both faience and stone. Vases with two-colour glazing were made in the IInd dynasty, and tiles of many colours in the IIIrd dynasty. The great development of glazing in many colours was in the XVIIIth, for tiles, inlay of walls, vases, dress ornaments, and cheap jewelry. Innumerable statuettes were made of glazed ware, often with minute detail of features, especially in the XXVIth dynasty. Glass was brought in rarely in the second pre-

historic age, Ist and XIIth dynasties, from some unknown source. The great output of it in Egypt was after the Syrian craftsmen were brought in during the XVIIIth dynasty. Then there was an immense output of coloured glass vases, beads, and other work. This was revived in the Ptolemaic and Roman times as minute inlay or mosaic work of the greatest delicacy. Blown glass vessels were

not known till late in the Greek or Roman period. Alexandria was the main home of fine glass work in classical times, until superseded by Venice after the Arab invasion. Painted glass lamps were the form of this craft which was maintained by the Arabs. The fine work of furniture, gilding, stucco, weaving, and other kinds cannot be well described here; but the Egyptian was for thousands of years the supreme craftsman of the world.

**MODERN EGYPT.** The main physical features of Egypt are the Nile and the desert. Egypt is bounded N. by the Mediterranean, N.E. by Palestine, E. by the Red Sea, S. by the Anglo-Egyptian Sudan, and W. by Tripoli and the Libyan desert. The area of the country is roughly 383,000 sq. m., but only 13,600 sq. m. is habitable. A division is made between Lower, Middle, and Upper Egypt. Lower Egypt is the northern part—the delta of the Nile; Middle Egypt is the land between Cairo and Assuan; and Upper Egypt is the southern part—the middle Nile valley. The fertile portions of the country are mostly around the delta, the Nile valley, and the oases. With the continual improvement in drainage and irrigation the cultivable area is yearly increasing.

A census in 1947 gave the pop. as 19,087,304, with a density of 1,398 per sq. m. The majority are fellahen (peasants), and depend upon the resources of the Nile. Egypt's river has conquered the desert and by its annual overflowing has deposited much sediment, which it carries from the Abyssinian mountains through the Atbara and Blue Nile, converting sandy land into cultivable areas. In Upper Egypt the Nile valley is narrower and the desert on either side is bounded by hills. The valley lands in this region are well cultivated.

The Nile enters Egypt proper at Wadi Halfa, just N. of the second cataract, flowing through a narrow valley as far as 25° N.

The delta extends some 100 m. S. to N., and 155 m. on the shore

of the Mediterranean between Alexandria on the W. and Port Said on the E. The surrounding land, S., is watered by a network of canals and the two branches of the Nile, Damietta and Rosetta. The lakes of the Delta, Maryut, Edku, Burlus, and Menzala, are all shallow, the water being salt or brackish. Lake Menzala (780 sq. m.) is the largest.

The desert plateaux extend on either side of the Nile valley from the S. borders of Egypt to the delta in the N. The E. area, the Arabian desert, between the Nile and the Red Sea, varies between 90 m. and 350 m. in width. To the W. the Sahara extends unbroken for many hundreds of miles. The great oases, Siwa, Baharia, Farafra, Dakhla and Kharga, in the western desert, receive water from a sandstone bed about 400 ft. below the surface.

The flora of Egypt is scanty, the country being barren of woods or

are the hyena and gazelle, while the hare, fox, and jackal are often found in the desert, and the lynx, ibex, and bats in the desert in the Nile valley. Reptiles include the horned viper, the echis, and the hooded snake. Lizards are numerous; so are spiders, beetles, fleas, mosquitoes, and scorpions; locusts are not so common. Fish are

Egypt. Artists at work on a statue, from an inscription at Thebes

plentiful. Over 300 species of birds are found.

Egypt is virtually a rainless country; the annual rainfall in Alexandria and on the Mediterranean coast does not exceed 8 ins. Southwards rain is very irregular. The mean temperature at Port Said and Alexandria varies between 57° F. in January and 81° F. in July. At Cairo it is 53° F. in January, and 84° F. in July. The temperature is high by day and falls quickly at night. There is a prevailing north wind utilised by craft sailing up the Nile. The Khamsin, which fills the air with sand from the Sahara, raises the temperature to as much as 115° F.

The chief towns are Cairo, the capital; Alexandria, the chief seaport; and Port Said. The coastline is over 600 m. on the Mediterranean, and about 1,200 m. on the Red Sea. Part of it is rocky, but nowhere do the cliffs exceed a height of 1,000 ft.

**PEOPLE AND LANGUAGE.** The population has shown a large increase since the beginning of the Turkish occupation, when an estimate gave it as less than 2,500,000. About 91 p.c. are Muslims, 7 p.c. Copts. There are Turkish, Albanian, Kurdish, and Georgian elements in the upper classes, but dwindling. The most interesting type is the fellah; the most picturesque, the Beduin. The fellah has been often described as the backbone of the country. Tall, thin, and wiry, he reveals by his sad and weary aspect the tale of the last centuries. To the nomad Arab fellah is a term of contempt. The fellah leads a life of extreme simplicity; a *galabieh*, or blue cotton frock, and a turban comprise his wardrobe; his fare consists of millet bread and raw vegetables.

Egypt. Sculptor at work, from an inscription at Thebes

forests. The growth of most importance is the date palm, of which there are some 30 varieties all over the country. Other trees are the orange, clove, lemon, mulberry, and pomegranate. Sycamore, tamarisk, and milk trees are in evidence. Grapes are found in the Farafra. Egypt also grows limes, bananas, melons, prickly pears or Indian figs, and olives.

Of animals, the camel, ass, sheep, and buffalo are most used. The horse is not so much in evidence. Among the wild animals of Egypt

Egypt. Ancient representation of a table game, from an inscription at Beni-Hasan

On the left are side and front views of the famous painted limestone head of Nefertiti, wife to the heretic pharaoh Amenhotep IV (ruled 1375-1358 B.C.). This was discovered in the workshop of the sculptor

Thothmes at Akhetaton and later found a home in the Berlin Museum. Right: the gorgeous anthropoid casket containing the mummy of Tutankhamun (died 1353 B.C.), who was the son-in-law of Amenhotep

The Beduin presents a brighter picture. These "people of the tent" are shepherds and herdsmen of sturdy but somewhat undersized stature, with coarse, thick, black hair, and well-chiselled features. The Nubians, or Berberins, dwell in Upper Egypt, and are of mixed negro and Arab blood. The majority are peasants. The Copt is the native Christian of Egypt, and is usually of a studious or commercial type. According to the latest census the Coptic Orthodox Church numbers over 1,250,000 followers.

The women of Egypt have been described as models of beauty in body and limbs between the ages of fourteen and twenty, but few retain either good looks or fine physique beyond the age of forty. Many women of the upper classes are rapidly becoming Europeanised in both dress and habits. The maidens of Egypt marry at an early age, generally between ten and sixteen. Divorce is of a facile order. If the husband repeats the words "Thou art divorced" three times the divorce is a *fait accompli*. Arabic is the universal language

of Egypt. Turkish is rarely spoken, and until recently French was used by the better educated Egyptians. The English language, however, is coming into greater use. The literary record is scattered, since Arabic is also the language employed by other Eastern countries. After the fall of Bagdad, Cairo sprang into prominence as the chief literary centre of the Islamic world, and to the present day it retains this distinction through its university of Al Azhar.

HISTORY. The Turkish conquest of Egypt in 1517 effected

Egypt. Ancient deities. 1. Sekhet, goddess of war. 2. Tonaris, or Opet, goddess of childbirth. 3. Amen, or Ammon, the sun god worshipped at Thebes. 4. Hathor, goddess of love, mirth, and social joy

little change in the administration of the country. The apathy of its Turkish rulers led to a long period of unrest, which culminated in 1609 in a mutiny among the Turkish army of occupation. The rebellion, however, was curbed in Feb., 1610, by the governor, Mahomed Pasha. Risings among the Egyptians and the Turkish soldiers, plagues, pestilence, and famine mark subsequent years. Disease in the spring of 1619 carried off 635,000 persons, and similar ravages in 1643 completely wiped out 230 villages.

This rather doleful and somewhat obscure period of Egyptian history offered little opportunity for a great man, although in the next century Ali Bey appears to have succeeded in introducing a measure of order and reform. By stern methods he suppressed the notorious outlawry of the Beduin in Lower Egypt. In 1768 Ali declared the independence of Egypt, and was afterwards given the title of sultan. Turkey, however, defeated Ali in 1773, and much the same dismal state of things that existed during the previous Turkish occupation was re-established. A new epoch, however, opened with the short-lived conquest of Egypt by Napoleon. Insurrection broke out and after war with Turkey, in which the British intervened by landing a force in 1801. Napoleon evacuated the country. Turkey now concentrated her attention against the Mamelukes, and by treachery and massacre overcame this troublesome but brave band. The chief personage of this, the darkest period of Egyptian history, was Mehemet Ali, who in so far as massacres were concerned showed no disposition to depart from the rule of his predecessors, but nevertheless promoted several sound projects.

#### European Intervention

The financial chaos which characterised Egypt during this period reached a climax in 1876, when the khedive suspended payment of his treasury bills. The debt of Egypt was now £91,000,000. Corruption and maladministration generally were rife, and ultimately France, Italy, and Austria each nominated representatives on the commission of public debt which had been promulgated by khedival decree. Great Britain was unwilling to interfere, although she was invited by the khedive to nominate a British commissioner, and eventually this position was offered to Lord Cromer, then Sir Evelyn Baring. Financial affairs after this European intervention improved. But a political storm was brewing

**Egypt. The Sheikh-el-Beled.**  
Wooden figure from Boulak  
*By courtesy of Chapman & Hall, Ltd*

In 1879 Nubar Pasha, minister of public works, and Sir C. Rivers Wilson, the minister of finance, were assaulted by a crowd of Egyptian officers. Ahmed Arabi, an Egyptian of humble origin who had risen to be colonel of the 4th regiment, led a successful revolt of the army, and compelled the khedive to change his ministers. The country at this time had come virtually under the direction of

Arabi's party, and disturbances rendered foreign intervention necessary. Arabi's challenge by raising batteries at Alexandria with the intention of using them against the British fleet was followed by the bombardment of these batteries by the British. At Tel-el-Kebir Arabi's army was defeated and eventually surrendered. Even now the British government declined to remain in Egypt; its declared object was to establish order and stability.

#### Trouble in the Sudan

One of the difficulties of the British reformers was the trouble in the Sudan. In 1883 the Egyptian army, under the command of General Hicks, which had been sent by the British government to restore order in the more distant regions of the Sudan, was annihilated in Kordofan. The British government, reluctant to associate itself with any military enterprise in that direction, decided to abandon the Sudan and withdraw all the garrisons. In the meantime, however, Mahomed Ahmed, a religious fanatic known as the Mahdi, had risen to power. General Gordon, who was sent to report on the military situation and on the means necessary in order to accomplish the evacuation, arrived at Khartum and was killed by the Mahdi's troops in 1885. A relief expedition was sent but arrived too late. Sir Herbert Kitchener, sirdar of the Egyptian army, recaptured Khartum on Sept. 2, 1898.

The more settled state in the Sudan helped directly in the progress of Egypt, and a variety of reforms were instituted; harsh

**Egypt. Ancient sculptured figures of pyramid times from the Boulak Museum. Left, Ra-Hotep, an Egyptian prince; right, the princess Nefert, or Nefert, limestone figure**

*By courtesy of Chapman & Hall, Ltd.*

taxes were abolished, and the problems of drainage and irrigation were being solved. The contract for the construction of the Nile reservoirs was signed in 1898; post office savings banks were introduced in 1900; navigation dues on the Nile were abolished; and the Anglo-French convention was signed in 1904.

In 1907 Lord Cromer's work in Egypt came to a close, the country then experiencing prosperity unprecedented in its modern history. He was succeeded by Sir Eldon Gorst, but after a short regime, during which time a group of agitators took advantage of the friendly attitude of the new British agent, Sir Eldon broke down in health, and in 1911 Viscount Kitchener of Khartum was appointed. His efforts were directed towards increasing the water supply of Egypt by means of barrages and reservoirs; he also built roads, and succeeded in pacifying various religious and political factions. He devoted much attention to the interest of the fellah, and established cotton markets throughout the country which provided means of insuring the ignorant peasant against dishonest traders; another measure of interest to the smallholder was the Five Feddans Law, which prohibited the agricultural holdings of farmers who did not own more than five acres of land from being seized for debt.

The relationship between Lord Kitchener and the khedive was always strained, for it was known that Abbas II was not amicably inclined towards the British. In Dec., 1914, Abbas was deposed and Prince Hussein, his uncle, succeeded with the title of sultan of Egypt. Great Britain declared the Turkish suzerainty at an end, and a British protectorate was declared. Hussein died Oct. 9, 1917, and was succeeded by his youngest brother, Prince Ahmed Fuad.

During 1914-16 Egypt was on the whole prosperous and quiet, although when Turkey entered the war the country was overrun by spies and secret agents in the pay of Germany.

But the British were able to use the Egyptian army freely for policing the frontiers of the Sudan, and in the reconquest of Darfur. Egypt rendered assistance by its labour corps and camel transport,

Egypt. Alabaster vase and carved chair from the tomb of Inaa and Tuana, 15th cent. B.C.  
From Theodore Davis, "Tomb of Inua"

while the entry of the Egyptian Expeditionary Force into Palestine forestalled any hostile invasion.

In 1919 a group of nationalists advocated a degree of complete autonomy which would leave Great Britain only the right of supervision over public debt and facilities for shipping on the Suez Canal. The British government replied that it could not abandon responsibility for good order. Grave disturbances broke out, and Lord Allenby was appointed special high commissioner for Egypt and the Sudan. The unrest was general from Assiut to Alexandria. In both Cairo and the port outbreaks occurred in autumn. A mission went out under the colonial secretary, Viscount Milner, and negotiations lasted until 1922.

The British government on Feb. 28 that year declared Egypt an independent state. Ahmed Fuad Pasha was proclaimed king as Fuad I on March 16, and his first cabinet took office with Sarwat Pasha as premier. But independence was subject to what became known later as the "four reserved points." These points, which, until they could be regulated by mutual consent, were reserved solely to the discretion of the British government, related to the security of Imperial communications in Egypt; defence of Egypt against all foreign aggression or interference; protection of foreign interests in Egypt; and protection of minorities, and the Sudan. This was a unilateral declaration. It gave Egypt a measure of self-

government, but no effective control over foreign relations.

An election in 1924 returned the party of Zaghlul Pasha with a large majority. His avowed policy was the real independence of Egypt and the Sudan, with due respect to all foreign rights not conflicting with that independence. He visited England to demand that the Sudan should be united to King Fuad's dominions, and on the British government's refusal a serious situation arose. Disorders in the Sudan culminated in riots; General Stack, sirdar of the Egyptian army, was assassinated in Cairo. A British ultimatum demanded compensation for the outrage and a payment of £500,000 indemnity. All Egyptian officers and units were to be withdrawn from the Sudan, while reinforcements of British troops were sent to Egypt. Zaghlul resigned, and was succeeded by Ahmed Pasha Ziwar. Allenby resigned as high commissioner in 1925, and was succeeded by Lord Lloyd.

Wooden statuette, half life-size, from a tomb about 2000 B.C.  
Met. Mus., N. York

In 1926 elections were won easily by the Wafdists (Nationalists). But neither the palace nor the high commissioner wanted the Wafd in office, and recourse was had to minority governments. These being in no position to negotiate for an Anglo-Egyptian treaty to supersede the 1922 declaration, in 1928 a Wafdist-Liberal coalition, led by Nahas Pasha, took office. He was soon dismissed by Fuad, who installed Mahmoud Pasha as premier and dissolved parliament for three years.

Mahmoud Pasha made strenuous efforts to negotiate a treaty with the British, but the Wafdist opposition was too much for him. He resigned in 1929; Nahas became premier again; then the king called upon Sidky Pasha to form a government, which did obtain a majority. Sidky, however, precipitated a constitutional crisis, and virtually ruled as dictator until in 1935 reversion was made to the 1923 constitution. On April 28, 1936, Fuad died, to be succeeded by his son, Farouk (b. 1920). Partly as a consequence of internal difficulties, partly as a result of Italy's invasion of Abyssinia, a united front of all Egyptian parties was formed.

Conditions were ripe for an approach by Egypt for a treaty with Great Britain. Negotiations were begun in Cairo, the British delegation being led by Sir Miles Lampson (later Lord Killearn), the high commissioner, and the Egyptian delegation by Nahas Pasha. On Aug. 26, a 20-years' Anglo-Egyptian treaty was signed in London, agreeing on the termination of British military occupation, the entry of Egypt into the League of Nations, the exchange of ambassadors, and the right of Great Britain to retain 10,000 soldiers with 400 R.A.F. men in the Suez Canal zone. Egyptians, barred from the Sudan since 1924, were to be allowed to return. The treaty could be revised by mutual consent in 1946.

To this treaty the Egyptians were loyal when the Second Great War began. But national aspirations were rising; popular demands were made for complete independence, and for unity of the Nile valley—i.e. incorporation of the Sudan in the kingdom of Egypt; and on Dec. 20, 1945, the Egyptian govt. formally requested the opening of negotiations for the revision of the 1936 treaty. Anti-British demonstrations continued in Cairo and Alexandria; but on May 9, 1946, British and Egyptian delegations met in Cairo.

Agreement over the transfer of British military establishments in Cairo and the Nile delta was rapidly reached; begun in July, 1946, the change-over was completed on March 28, 1947, after which remaining British forces in Egypt were concentrated in the Suez canal zone.

#### Problem of the Sudan

The British recognized the sovereignty of the Egyptian crown over the Sudan during the condominium, but considered that the Sudanese when politically mature should have the right to choose, if they wished, full independence. The Egyptians demanded immediate union of the Sudan with Egypt. Matters dragged on until on Jan. 29, 1947, the premier Nokrashy Pasha announced that he had broken off negotiations and was submitting the question to the U.N. security council. That body discussed the dispute during Aug. 5-Sept. 10 before postponing further consideration of it.

In common with other members of the Arab League (*q.v.*) Egypt refused to recognize the partition of Palestine voted by the U.N. general assembly Nov. 30, 1947, and joined in the invasion of that

country at midnight of May 14-15, 1948, when the British mandate expired. During Oct. fighting developed in the Negeb. Damped down by the security council's order of Oct. 19 for a cease fire, it broke out again in Dec., Israeli forces penetrating 10 m. inside the Egyptian frontier, and shooting down, on Jan. 8, 1949, five R.A.F. aeroplanes on reconnaissance along the frontier. Negotiations in Rhodes conducted by Dr. Bunche, the U.N. mediator in Palestine, led to the signing of an Israeli-Egyptian armistice on Feb. 24.

On Dec. 8, 1948, Nokrashy Pasha ordered the dissolution of the Muslim brotherhood, an ultra-nationalist body responsible for much of the unrest in post-war Egypt. On the 28th he was assassinated by a member of the proscribed organization. His finance minister took over the premiership. Elections held on Jan. 3, 1950, gave the Wafdists (who had boycotted the elections of 1945) 225 seats out of a total of 319. Their leader Nahas Pasha immediately formed a new cabinet.

**CONSTITUTION AND GOVERNMENT.** Before 1913 the affairs of Egypt were controlled by two public bodies known as the legislative council and the general assembly. These bodies dated from 1882 and were in the main consultative only, legislation being in the hands of the khedive and his ministers. In 1913 the council and assembly were replaced by a new legislative assembly of 66 members elected by the people (but by an indirect vote), the ministers, and 17 nominated members. In 1923 a new constitution introduced cabinet responsibility and a parliament of two chambers, the senate as to two-fifths appointed by the king, the rest and the members of the lower house being elected on a basis of universal male suffrage. In abeyance from 1930, this constitution was restored in 1935.

**JUSTICE.** Until 1949 international (or mixed) courts, set up in 1876 under capitulatory rights dating from the time of the Ottoman empire, tried all civil cases in which foreigners were involved, up to 1937 under laws based on those of France. A foreigner accused of a criminal offence went until 1937 before his own consular court. Egyptian national courts, set up 1883 to deal with cases involving only Egyptians, modelled their methods on the excellent practice of the mixed courts; but developing national sentiment made the

existence of foreign courts a growing offence to Egyptians, and by a convention signed at Montreux May 9, 1937, the capitulatory powers agreed to abolish capitulations; and the former penal jurisdiction of the consular courts was transferred to the mixed courts, which were to come to an end in 12 years. New codes, applicable to both mixed and national courts, were promulgated, 1937; and on Oct. 14, 1949, mixed courts ceased to exist.

The national courts comprise summary tribunals, under one judge, for lesser offences; central tribunals, with three judges each, for more serious offences; three courts of appeal, at Cairo, Assiut, and Alexandria; a court of cassation, above the appeal courts, set up 1931; and one function of the council of state established 1946 was that of supreme court.

**EDUCATION.** Egypt possesses three universities: Al Azhar in Cairo, oldest university in the world, which attracts thousands of students from the whole world of Islam and has extended its curriculum to embrace modern languages in addition to Koranic learning; the King Fuad university in Cairo, founded 1908 and taken over by the govt. 1925; and the King Farouk university in Alexandria, founded by the govt. 1943. In 1947 there were 21,000 university students, 64,000 pupils in secondary schools, and over a million in primary schools. Arabic is the general medium of instruction; French and English are compulsory subjects.

**INDUSTRY.** The Egyptian is an agriculturist. Ancient Egypt was the granary of the Roman world, and exported great quantities of corn. With the coming of the Turks a different order of things was created, and a long period of depression and misery followed. The revival of Egyptian industry began with the elimination of the Turk by the British. Vast schemes of irrigation and drainage were developed until the cultivable area of Egypt proper was reckoned in 1918 at over 8,000,000 acres; at the time of the French occupation in 1798 the cultivable area totalled 3,520,000 acres.

Egypt, as the first sultan said, has three assets—the Nile, the Egyptian sun, and the fellah. Full use is made of both the sun and the Nile by the fellah. The sun shines all through the year, and the Nile is stored up so as to be available in any season. In addition, the fellah is extremely

hard-working, and it is towards helping him in making the fullest use of the Nile that British brains and science have been directed. In the past the fellah had to wait upon the flood-tides. Nowadays, instead of obtaining water for his land for only a portion of the year, he obtains a regular and sufficient supply all the year round. The whole system is being directed towards perennial irrigation—thus assuring two and often three crops every year.

Where perennial irrigation is impossible, the basin system has been adopted, whereby water is stored in Aug. and kept in reserve till Oct. when it begins to be used. The basin system is the oldest system of irrigation known to Egypt. Only one crop a year can be grown from it. Another system is used on the high lands near the Nile. These lands cannot be reached through canals, so a system of pumping the water is utilised. The British use of steam-pumps has been largely developed; but the water-wheel, worked by buffaloes, or the water-lift (*shaduf*), worked by hand, is still in favour with the conservative fellahs. There are three agricultural seasons: cotton, sugar, rice, and, in a lesser degree, millet and vegetables, are grown in summer; wheat, barley, flax, and vegetables in winter; maize, millet, and flood rice are grown between August and November.

#### Factors in Egypt's Prosperity

Egypt's potentialities have not been by any means fully tapped. But production of oil (she produced over a million and a quarter metric tons in 1943) and of manganese ore, for instance, and the growing of tobacco are being steadily developed. It is believed that gold, and more certainly, ores will be found alike in the deserts and near the Nile valley. The country waxed fat during the Second Great War, by supplying the needs of a large British army. But cotton remains the basic factor in Egyptian prosperity. In 1944 she produced 209,000 metric tons of cotton, compared with 2,322,500 tons of maize, 946,000 tons of wheat, 814,600 tons of rice, 226,800 tons of barley, 4,000 tons of ground nuts, and 322,400 tons of beans. In 1945 her exports amounted to £41,600,000 and her imports to £59,700,000. The export possibilities of onions, sugar, and dates are being intensely studied. Nor should the drive for further industrialisation in Egypt itself be overlooked, particularly when

sources of hydro-electric power are made available.

The lines of commercial communication to Egypt are, by virtue of the country's geographical position, the most important in the world. Besides being a distributing centre for the Levant, it holds a commanding position on the trade routes from Europe to the East. By the completion of the Suez Canal in 1869, a direct sea route was opened up between the Mediterranean and the Red Sea. Considerable use is made of Alexandria and Port Said by foreign steamship companies. Passenger traffic is at its height in the winter when there is an influx of tourists seeking pleasure or health. The latest available figures for the railway system, which forms the N. section of the Cape to Cairo scheme, are 3,686 m. (state-run); for main roads, 1,393 m., and for secondary roads, 4,497 m. Air services have naturally centred on Egypt, which has its own *Misr* Airways operating both to Europe and to the Middle East.

**Bibliography.** Nile Quest, Sir H. Johnston, 1906; Modern Egypt, Earl of Cromer, 2 vols., 1908; History of Egypt from 1763 to 1914, A. E. P. Weigall, 1915; Britain and Egypt, M. Travers-Symons, 1925; Egypt Since Cromer, Lord Lloyd, 2 vols., 1933-34; The Times Book of Egypt, 1937; Desert and Delta, C. S. Jarvis, 1938; The Economic Development of Modern Egypt, A. E. Crouchley, 1938; The Land of Egypt, R. Fedden, 1939; Independent Egypt, Youssef Bey, 1940.

**Egypt.** British P. and O. line steamship (7,912 tons), sunk, May 21, 1922, in a collision off the French coast with a loss of 86 lives. With over £1,000,000 of bullion aboard, she lay at a depth of 426 ft. Between June, 1932, and Aug., 1934, an Italian firm, the Sorima coy., recovered the bulk of the bullion.

**Egyptian Hall.** London place of amusement, 1812-1904. Situated at 171, Piccadilly, W.1, it was built in 1812 by G. F. Robinson, for the natural history collections of William Bullock, F.S.A., dispersed in 1819. Here were exhibited the Living Skeleton (Claude Amboise Seurat), in 1825, and the Siamese Twins, in 1829. B. R. Haydon (*q.v.*), in 1846, complained that while in one week "Tom Thumb" (C. S. Stratton) attracted 12,000 people, his own picture exhibition drew 133½—the ½ being a little girl. Later the hall was a centre for such entertainments as those of Albert Smith, Artemus Ward, and "Mrs. Brown." From

1873 until 1904 when he removed to St. George's Hall, Langham Place, J. N. Maskelyne made it "England's Home of Mystery." For many years the exhibitions of the Dudley Gallery Art Society were held here. The figures of Isis and Osiris at the entrance were by Gahagan.

**Egyptology.** The study of the civilization of ancient Egypt in all its aspects. The period covered begins with man's arrival in the Nile Valley and ends with the latest hieroglyphic inscriptions in the 4th century A.D. The subject thus overlaps with the study of Coptic, the form of the ancient Egyptian language which, written in Greek characters with the addition of five borrowed from Demotic, became the vehicle of Christian writings from the 2nd century, and which has continued in use in the Coptic (Christian) Church in Egypt till today.

Despite one or two earlier attempts to decipher the hieroglyphs with the aid of Coptic, and a few travellers' records from the 18th century, scientific observation of ancient Egyptian remains began only with the archaeologists attached to Napoleon's mission to Egypt in 1798: and no great progress was made until Champollion announced his discovery of the principles of the decipherment of hieroglyphic writing in 1823. The first 30 years of the 19th century also saw the formation in European capitals of the nuclei of the great collections of Egyptian antiquities. But while linguistic study developed steadily and inscribed monuments came to be treated with respect, the archaeological significance of the thousands of smaller objects continually being brought to light up and down Egypt was barely perceived until Flinders Petrie made his first expedition to the country in 1880. Mainly through his efforts, in the next 20 years excavation in Egypt developed to the high standard it has now reached, and archaeological and linguistic evidence cooperated with and controlled each other in revealing the ancient civilization.

Egyptology became an academic subject with the foundation of a professorship at Berlin in 1842. Fifty years later the first chair of Egyptology in England was created for Petrie in London. Chairs were also established in most European countries, at three or four universities in the U.S.A., and in Cairo, in addition to

posts of academic standing in museums possessing Egyptian collections. In 1939 excavations were being carried out under licence from the Egyptian government by museums or scientific societies from Great Britain, France, Germany, Belgium, Italy, Poland, and the U.S.A. Some of these had already resumed work in Egypt by 1947. This work, however, is gradually being taken over by Egypt's own department of antiquities which, originally staffed throughout its upper ranks by Europeans, now consists almost entirely of Egyptians.

In 150 years since Napoleon's expedition, a vast scientific literature has sprung up. It has already far outgrown the point at which individual students can keep up with every aspect of Egyptological studies, despite the aid of modern bibliographical methods; with the result that the word Egyptologist is now a catholic term which embraces scholars in various fields who are compelled to be specialists and confine themselves more or less to the archaeological, the aesthetic, or the linguistic side of the subject.

S. R. K. Glanville, F.B.A., F.S.A.

**Ehrenbreitstein.** A town of Germany. It stands on the right bank of the Rhine opposite Coblenz. Until 1919 it was a strong fortress, a rock nearly 400 ft. in height overlooking the Rhine and the Moselle being the centre of the system of fortifications. Originally a Roman *castellum*, it became the property of the Treves electors, and was fortified by Eugene of Savoy in 1734. It was besieged frequently by the French, and demolished by Napoleon in 1801. It fell to Prussia in 1815, was refortified, and after 1870 modernised. In 1919 under the Versailles treaty the fortress was destroyed. The pop. of some 3,500 were up to 1939 engaged in the wine trade and shipping.

**Ehrenburg, ILYA GRIGORIEVICH** (b. 1891). Russian writer. Educated in Russia, he began his literary career at 20, and during the First Great War acted as war correspondent. Returning to Russia during the revolution in 1917, he later lived mostly in France. In the Second Great War he was again a correspondent and broadcast regularly from Moscow. Influenced by Gorki, his novels and stories were remarkable for their vivid characterisation. The best known include *Out of Chaos*, *Trust D.E.*, *A Street*

in Moscow, *The Loves of Jeanne Ney*. In 1942 (for *The Fall of Paris*) and in 1948 (for *The Storm*) he received the Stalin prize for literature.

**Ehrlich, GEORG** (b. 1897). An Austrian etcher and sculptor. A Viennese, he was educated at the Vienna school of arts. Awarded a gold medal at the Paris art exhibition of 1937, he emigrated that year from Austria to live in London. His busts—among them a notable one of the actress Elisabeth Bergner—water-colours, drawings, and etchings were exhibited in many international galleries, at the Royal Academy from 1940 regularly. The Tate Gallery has his bronze head of a boy, and President F. D. Roosevelt owned a donkey in bronze by Ehrlich.

**Ehrlich, PAUL** (1854–1915). German physiologist, born of a Jewish family at Strehlen, Silesia. March 14, 1854.

Prolonged experimental researches brought him world-wide renown, and in 1908 he shared with Metchnikov the Nobel prize for physiology and medicine.

In 1899 he became director of the Speyer Institute of experimental therapeutics at Frankfurt, which he made famous by his laboratory work in connexion with cancer. The founder of chemotherapy Ehrlich also laboured to discover a safe and effective cure for syphilis, being latterly assisted by a Japanese doctor, Hata. It was not until 606 experiments had been made that in 1910 real success was in sight; the compound then discovered being called 606 or salvarsan. Ehrlich also invented new bacteriological stains, was one of the founders of serum therapy, and did important work on diphtheria antitoxin. He died Aug. 20, 1915.

**Eibar.** Manufacturing town of Spain, in the prov. of Guipúzcoa. It is 39 m. by rly. W.S.W. of San Sebastian. It makes guns, swords, bicycles, and sewing machines, and is noted for its damascened arms and other metal ware. Pop. 12,140.

**Eichendorff, JOSEPH, BARON VON** (1788–1857). German poet and novelist. He was born at Lubowitz, March 10, 1788, near Ratibor, Silesia, a member of a noble Catholic family. He published his first romantic novel, *Ahnung* und

Gegenwart, in 1815. Aus dem Leben eines Taugenichts, 1826, is well known; but Eichendorff ranks above all as a poet, his simple nature lyrics having taken their place in German popular song. He served against France, 1813–15, during 1820–44 occupied various public appointments, and in his later years was distinguished as a Catholic publicist. He died at Neisse, Nov. 26, 1857. His *Collected Works* (6 vols.) appeared in 1864.

**Eichhorn, JOHANN GOTTFRIED** (1752–1827). German scholar. He was born at Dorrenzimmern, Oct. 16, 1752, and in 1775 was appointed professor of Oriental languages at Jena, and in 1788 at Göttingen, where he lectured for the rest of his life, dying June 27, 1827. He was the first scholar to suggest that the synoptic gospels have one common source, and was a pioneer of the rationalist criticism of the Bible.

**Eichhorn, KARL FRIEDRICH** (1781–1854). German jurist. Born at Jena, Nov. 20, 1781, son of the above J. G. Eichhorn, he studied at Göttingen and lectured on law at Frankfurt-on-the-Oder, and obtained a professorship at Berlin. He fought against France in 1813, and after 1815 was professor at Göttingen and at Berlin. In his later years he held high positions in the public service. He died at Cologne, July 4, 1854. Eichhorn is perhaps the greatest authority on the laws and institutions of the Germans. Besides his great *Deutsche Staats- und Rechtsgeschichte* (1808–23) he wrote on private and ecclesiastical law, and helped to found a legal periodical.

**Eichstätt.** Ancient town of Bavaria, Germany. It stands on the Altmühl, 15 m. N.W. of Ingolstadt. Founded by S. Boniface in 740 and having urban rights since 908, it is chiefly famous for old buildings and episcopal associations, for its bishops were princes of the empire until their lands were secularised in 1802. The cathedral, which is dedicated to S. Wilibald and contains the tomb of that saint, is largely Gothic, but its towers are Romanesque. Among the other churches the most notable is S. Walpurgis, dating from the 17th century, which holds the saint's tomb and is visited by pilgrims on S. Walpurgis' day (May 1). There is a palace where the bishops and later the dukes of Leuchtenberg lived; this is now used as a law court, while another palace is used as a library and

Paul Ehrlich.  
German physiologist

museum. Above the town is the Wilibaldsburg, once also a residence of the bishops, but now a museum. From 1817 to 1855 Eichstätt was part of the duchy of Leuchtenberg; thereafter Bavarian. Pop. 8,160.

**Eider.** River of Schleswig-Holstein, Germany. It rises near Kiel, and flows N.W. and W. across the peninsula to Tönning, where it forms a bay. Its length is about 115 m. Before the opening of the Kiel Canal it was important for navigation. Vessels could go along it as far as Rendsburg, whence a canal took them to Kiel, thus uniting the Baltic and North Seas. This canal developed into the Kiel Canal.

**Eider Duck** (*Somateria*). Genus of wild duck. Including several species, it is famed for its soft

Eider Duck. Male, black and white; female, mottled brown

down, which it uses for lining its nest. Eiders have comparatively short beaks; the males have black and white plumage with green markings on the head, while the females have mottled brown plumage. The common eider (*S. mollissima*) is resident in Great Britain throughout the year, but breeds only on the Farne Islands. The king eider (*S. spectabilis*) and Steller's eider (*Polysticta stelleri*) are rare visitors.

All the eiders are divers, and feed upon shell-fish and small crustaceans. They keep to the rocky shores and nest on the ground. A pound of down can be obtained from about six nests.

**Eidograph** (Gr. *eidos*, form; *graphein*, to write). Instrument for copying drawings, designs, etc., reduced or enlarged, within limits, to any desired proportion. Somewhat on the lines of a pantograph,

Eidograph. Diagram of the instrument. The arms bearing tracer and pencil respectively move parallel in all directions, the connecting beam resting on a fulcrum

it comprises a slotted beam adapted to slide in a socket, having its axis in the centre line of the slot. Underneath each end of the beam is a wheel; the wheels are of the same diameter and geared together by a chain. Sliding in a guide in each wheel is an arm, one of which carries a tracer and the other a pencil, or the equivalent, for copying. The gearing together of the two wheels ensures that the arms will remain parallel for all positions of the instrument. The size of the copy is determined by the position of the beam in the socket.

**Eifel.** Plateau region of Germany, with small mt. ranges rising above it. Of low altitude (highest peak 2,500 ft.), they trend E. by S. between the Nette and the Ahr rivers towards the Rhine and the Moselle. The E. section is known as the Hohe Eifel, the W. section as Schnee Eifel, while the S. part, most pleasing scenically and most interesting geologically, is called Vorder Eifel. Near Cochem, on the steep wooded banks of the river Eltz, stood the castle of Eltz, a beautiful medieval building of wood and plaster, burnt in 1920. The area, left with only the *Volkssturm* to defend it, was conquered by the U.S. 1st and 3rd armies during the first week in March, 1945.

**Eifelian.** Name given to a stage of stratified rocks of Middle Devonian age. It consists of flagstones, shales, and beds of limestone attaining a thickness of 500 ft. in the Dinant district (Belgium). One series of shales (the Calceola shales) is named after a peculiar form of coral. It is well developed in Germany—in the Eifel district, whence the name, in the Rhine valley, the Hunsrück, the Taunus—and also in Bohemia.

**Eiffel, ALEXANDRE GUSTAVE** (1832–1923). French engineer. Born at Dijon, Dec. 15, 1832, he studied at the École Centrale, and executed his first notable work, the bridge over the Garonne at Bordeaux, in 1858. In 1865

he founded ironworks at Levallois-Perret, Seine. His outstanding engineering achievements include the bridge over the Douro at Oporto, 1876; the Garabit viaduct, Cantal, 1882; the great

Eiffel Tower, Paris, 1887–89; the movable dome of the Nice Observatory; and the frame work for Bartholdi's colossal statue of Liberty in New York harbour. He was one of the first engineers to use compressed-air caissons in bridge building, and invented movable section bridges. His investigations of air resistance were of service in the development of aeronautical engineering. He died in Paris, Dec. 28, 1923.

**Eiffel Tower.** Building in Paris. It was designed and erected by Gustave Eiffel, for the Paris exhibition of 1889. It is 984 ft. high, and is built of iron through-

Eiffel Tower, Paris. It is 984 ft. high

out, 7,300 tons of that metal being used in its construction. The shape is that of a curved pyramid. Electric lifts take tourists to the top. The tower became an important wireless telegraphy station and meteorological centre.

**Eigen Function.** One of a set of solutions of a differential equation, e.g. Schrödinger's equation, such that any solution of this equation can be represented as a linear combination of members of this set. See Wave Mechanics.

**Eiger.** Mountain of Switzerland, in the Bernese Oberland (q.v.), adjoining the Mönch; alt. 13,042 ft. It was first ascended by Charles Barrington, 1858.

**Eigg** or **Egg.** Island of the Hebrides, Inverness-shire, Scotland. It lies about 4 m. S.E. of Rum, facing the entrance to the Sound of Sleat, and is 6½ m. long and 4 m. broad. In the S.W. is the Scur of Eigg, a porphyritic peak 1,289 ft. high. The rocks have been described by Hugh Miller, the Scottish geologist, in his Cruise of the Betsy. *Prom. Egg.*

**Eight.** In rowing, a name applied collectively to the members of a racing crew, when such consists of eight men, in addition to the cox. For the Oxford and Cambridge and other important boat races it became usual to have crews of eight, and so in course of time the word came to be used in this sense. See Rowing.

Gustave Eiffel, French engineer

**EIGHT, PIECE OF.** Name given to the old Spanish silver coin, the piastre; it was so called because it was divided into eight silver *reals*. It circulated in Spain and Spanish America during the 17th and 18th centuries, and was commonly met with through W. Europe. Its value was about four shillings.

**Eighteenth Amendment, THE.** Famous modification of the constitution of the U.S.A., enforcing

prohibition. This article of amendment became effective on Jan. 16, 1920, one year after its ratification. It prohibited the manufacture, sale, transport, import, or export of intoxicating liquors for drinking purposes, and was held to be largely responsible for the subsequent rapid growth of gangsterdom in the U.S.A., particularly in the eastern towns and cities. The amendment was repealed on Dec. 5, 1933. *See* Prohibition.

## EIGHTH ARMY: FAMOUS BRITISH FORCE

Harry Gregson, formerly Editor of Eighth Army News

*Few British armies captured the imagination of the public as did the 8th, especially in the days when it was fighting in the desert and advancing rapidly from Alamein (q.v.) to Tunis. See also North Africa Campaigns; Montgomery; Second Great War; Tobruk, etc.*

The first British army to undertake large scale offensive operations against the Axis in the Second Great War was the 8th army; and its victory at Alamein against the combined German and Italian forces threatening Egypt was the first great success of British land troops, and a decisive battle of the world conflict. With the battle of Stalingrad, it marked the turning point in the fortunes of the Allies.

### First Offensive

Formed in Nov., 1941, from a nucleus of troops experienced in desert warfare, the 8th army, under Lieut.-Gen. Sir Alan Cunningham (replaced a few days later by Maj.-Gen. Neil Methuen Ritchie), opened its first offensive against the Axis in Libya on Nov. 18. Tobruk, beleaguered by the enemy since April, was relieved; Benghazi fell on Christmas eve, Bardia and Halfaya were captured in Jan., 1942. Then in April came retreat before General Rommel, the disastrous battle of Knightsbridge (q.v.), the gallant but vain Free French defence of Bir Hakeim (q.v.), followed by the breakthrough of the German and Italian forces, the loss of Tobruk on June 22, of Mersa Matruh a week later, and the advance of the Axis forces to Alamein, some 60 miles only from Alexandria. The 8th army had lost 80,000 men, and been driven back 400 miles in less than two months. Rommel's rapid advance having been made possible by the use of captured British stores and vehicles.

At this critical juncture the c.-in-c., Middle East, General Sir Claude Auchinleck, took over tactical command of the 8th army, and succeeded in stabilising a front. At the beginning of Aug.

Winston Churchill, who said later, "I had some reason to believe that the condition of the desert army was not entirely satisfactory," visited Cairo, where "it was clear to me that the army must have a new start under new leaders." General Sir Harold Alexander became c.-in-c., Middle East, and Lieut.-Gen. B. L. Montgomery was appointed to command the 8th army.

Under its new commander, the 8th in the early days of Sept. held an armoured thrust, between Ruweisat and El Hemeimat, aimed at Cairo. Then on Oct. 23 came the attack at Alamein which initiated the victorious battle of Egypt, and the 8th army's 80-day advance in pursuit of a demoralised enemy across the N. African desert to Tripoli (occupied Jan. 13, 1943), 1,400 m. to the W. The 8th army entered Tunisia in the last days of Jan., overcame the Mareth Line (q.v.) in March, crossed the Wadi Akarit on April 6, and next day W. of Gabes made contact with American forces advancing from N. Tunisia.

### Victory in Tunisia

At this point all the Allied forces in N. Africa came under the supreme command of Gen. Eisenhower, Alexander assuming fighting command of the British 1st army, the Americans, and the French troops in Tunisia as well as of the 8th. Tunis itself fell on May 7, the 11th Hussars (8th army) and the Derbyshire Yeomanry (1st army) being the first British units to enter the city. On May 16, Alexander sent a message to the prime minister, "Sir, It is my duty to report that the Tunisian campaign is over. All enemy resistance has ceased. We are masters of the N. African shore"

Preparations for the invasion of Sicily began immediately, and on July 10 the 8th army, now including the Canadian 1st division, made a landing in S.E. Sicily in conjunction with the U.S. 7th army. Sicily was conquered by Aug. 17, and on Sept. 3 British and Canadian troops of the 8th army landed on the Italian mainland, in Calabria. Fourteen days later they established contact at Agropoli with the hard-pressed 5th army, which had landed at Salerno. Other 8th army troops landed at Taranto had secured that port and Brindisi, and were advancing up the east coast of Italy.
